Uundun thurh thiu uuolcan.	Wound through the welkin.
Thea uuardos hordun,	The words they heard,
Huo thiu engilo craft	How the strength of the Angels
Alomahtigna God,	The Almighty God,
Suido uuerdlico,	Very worthily,
Uuordun louoduu.	With words praised.
" Diurida si nu," quadun sie,	" Love be there now," quoth they,
" Drohtine selbun,	" To the Lord himself
An them hohoston	On the highest
Himilo rikea ;	Kingdom of Heaven,
Endi fridu an erdu,	And peace on earth
Firiho barnum,	To the children of men,
Goduuilligun gumun,	Goodwilled men
Them the God antkennead,	Who know God,
Thurh hluttran hugi."	Through a pure mind."

Next in length to the Heliand come what are called the *Carolinian Psalms*.

Specimen.

FROM THE TEXT OF A. YPEIJ.

Taalkundig Magazijn. P. 1, No. 1.—p. 54.

Psalm LIV.

2. GEHORI got gebet min, in ne furuuir bida mina ; thenke te mi in gehori mi.

3. Gidruouit bin an tilogon minro, in mistrot bin fan stimmon fiundes, in fan arbeide sundiges.

4. Uuanda geneigedon an mi unreht, in an abulge unsuoti uuaron mi.

5. Herta min gidruouit ist an mi, in forta duodis fiel ouir mi.

6. Förthta in biuonga quamon ouer mi, in bethecoda mi thuisternussi.

7. In ic quad " uuie sal geuan mi fetheron also duuon, in ic fliugon sal, in raston sal."

8. Ecco ! firroda ic fliende, inde bleif an eudi.

9. Ic sal beidan sin, thie behaldon mi deda fan luzzilheide geistis in fan geuuidere.

10. Bescurgi, herro, te deile tunga iro, uuanda ic gesag unriht in fluoc an burgi.

11. An dag in naht umbefangan sal sia ouir mura ira, unreht in arbeit an mitdon iro in unreht.

12. In ne te fuor fan straton iro prisma in losunga.

13. Uuanda of fiunt flukit mi, is tholodit geuuisso; in of thie thie hatoda mi, ouir mi mikila thing spreke, ic burge mi so mohti geburran, fan imo.

14. Thu geuuisso man einmuodigo, leido min in cundo min.

15. Thu samon mit mi suota nami muos, an huse gode giengon uuir mit geluni.

16. Cum dot ouir sia, in nithir stigin an hellon libbinda. Uuanda arheide an selethe iro, an mitdon ini.

17. Ic eft te gode riepo, in herro behielt mi.

18. An auont in an morgan in an mitdondage tellon sal ic, in kundon; in he gehoron sal.

19. Irlosin sal an frithe sela mina fan then, thia ginacont mi, uuanda under managon he uuas mit mi.

20. Gehorun sal got in ginetheron sal sia; thie ist er uueroldi.

21. Ne geuuisso ist ini uuihsil; in ne forchtedon got. Theneda hant sina an uuitherloni.

Shorter than either the Heliand or the Carolinian Psalms is the third of the Old-Saxon compositions—*Hildebrand* and *Hathubrand*. Like the Heliand, it is in metre; but, unlike the Heliand, it is, if not a pagan poem, a poem founded on the legends of a semi-pagan period, Hildebrand and Hathubrand being heroes of that cycle of fictions of which the famous Diedrich of Berne (Theodoric of Verona) is the centre.

After this comes the so-called *Abrenuntiatio Diaboli*, which, like the Hildebrand and Hathubrand, points to the pagan period.

Forsachistu diobolae? Et *resp*. Ec forsacho diabolae, end allu diobolgelde. *Respon*. End ec forsacho allum diobolgeldae, end allu dioboles uuercum, anduuordum, Thunar ende Woden, ende Saxnote, ende allem them unholdum the hiro genotas sint.

Q. Gelobis tu in Got Alamehtigan Fadaer?

R. Ec gelobo in Got Alamehtigan Fadaer.

Q. Gelobis tu in Crist Godes Suno?

R. Ec gelobo in Crist Gotes Suno.

Q. Gelobis tu in Halogan Gast?

R. Ec gelobo in Halogan Gast.

In English.

Renouncest thou the Devil? *Answer.* I renounce the Devil, and all Devil-guilds. *Answer.* And I renounce all Devil-guilds, and all the Devil's works, and words; Thunar, and Woden, and Saxnot (?) and all the unholy (ones) who are their fellows.

Q. Believest thou in God, the Almighty Father?

R. I believe in God, the Almighty Father.

Q. Believest thou in Christ, God's Son?

R. I believe in Christ, God's Son.

Q. Believest thou in the Holy Ghost?

R. I believe in the Holy Ghost.

The remaining samples are of less importance, being equally fragmentary with the *Abrenuntiatio*, and less interesting. They may be found in Lacomblet's "Archiv für Geschichte des Niederrheins" (vol. i. pp. 4, 9), and in Graf's "Diutisca" (vol. ii. pp. 190, 192), consisting of a piece of legend relating to St. Boniface, a creed (quoted as *Confessionis Formula Essensis*), an extract from some monastic muniment (*Rotulus Essensis*), and a number of Glosses (*Glossæ Saxonicæ*). The so-called *Frekkenhorst Roll*, and the specimens in Lipsius, I have not seen. They are enumerated, however, by Schmeller, whose edition of the Heliand is the standard work on the Old Saxon. His third reference, too, to the "Diutisca" (vol. ii. pp. 195–230) is doubtful. The glosses there found seem to be Low German rather than Old Saxon,—though upon this point I speak with hesitation.

All these compositions represent the language of the German part of the Continent rather than of the island of Britain.

Of the Saxon parts of Germany, they represent Westphalia most especially.

They are certainly not Frisian.

They cannot be shown to be Ostphalian.

They are, then, so far as they are not absolutely and exclusively Westphalian, Angrarian or the Old Dutch of Holland, rather than aught else; Angrarian, when they come from the parts eastward, Old Dutch when they come from the parts westward.

CHAPTER X.

GERMAN ORIGIN OF THE ENGLISH LANGUAGE.—PARTS OF GERMANY, ETC.—INTERNAL EVIDENCE.—LANGUAGE.—THE FRISIAN.

§ 60. At the present moment, Friesland is one of the united provinces that constitute the kingdom of Holland.

The Frisian form of speech, however, has in it so much of what is peculiar that it generally passes for something more than a mere dialect of the Dutch. The following specimen is, undoubtedly, as like the ordinary language of the kingdom of the Netherlands as any outlying provincial dialect of our own island is to the standard English. Still it differs; especially in the form of the infinitive mood—*drieuwe* as opposed to *drijven*. And when we go into the more distant dialects, or into the older samples, the difference increases. Hence, in the more extreme forms it is convenient to keep the standard literary Dutch of Holland, and the provincial Frisian of Friesland, more or less separate.

FRISIAN.	DUTCH.
1.	1.
De noordewyn hu kaald en stoer En fel yn winterflaaigen, Al waait ze trog de laeae su soer, Ys mest nei uis behaaigen.	De noordewind zo koud en guur En fel in wintervlagen, Al waait hij door de leên zo zuur, Is meest naar ons behagen.
2.	2.
Al ys myn man den oppe see, Hy sol nei huis wol drieuwe, En yzzer tuis ov oppe ree, Su motter tuis wol blieuwe.	Al is mijn man dan op de zee, Hij zal naar huis wel drijven, En is hij 't huis of op de ree, Zo moet hij 'thuis wel blijven.

Besides the Frisian of the Dutch province of Friesland, there is the Frisian of Westphalia, or Hanover. This is

spoken only in the very fenny district called Saterland, or Sagelterland.

Besides the Frisian of the Dutch and Hanoverian Frieslands, there is the Frisian of the island of Heligoland.

And akin to that there is what is called the *North* Frisian. This is spoken in that part of the duchy of Sleswick, which faces the North Sea, and lies between the towns Bredsted and Husum. The North Frisian has a Dual number.

DER FREYER VOM HOLSTEIN.

Diar kam en skep bi Sudher Siöe
Me tri jung Fruers ön di Floot.
Hokken wiar di fördeorst?
Dit wiar Peter Rothgrun.
Hud säät hi sin spooren?
Fuar Hennerk Jerkens düür.
Hokken kam tö Düür?
Marrike sallef,
Me Krük en Bekker ön di jen hundh,
En gulde Ring aur di udher hundh.
Jü nöödhight höm en sin Hinghst in,
Död di Hingst Haaver und Peter wün.
Toonkh Gott fuar des gud dei.
Al di Brid end bridmaaner of wei,
Butolter Marri en Peter allüning!
Jü look höm ün to Kest
En wildh höm nimmer muar mest.

In English.

There came a ship by the South Sea,
With three young wooers on the flood;
Who was the first?
That was Peter Rothgrun.
Where set he his tracts?
For Hennerk Jerken's door.
Who came to door?
Mary-kin herself,
With a pitcher (crock) and beaker in the one hand,
A gold ring on the other hand.
She pressed him and his horse (to come) in,
Gave the horse oats and Peter wine.

Thank God for this good day!
All the brides and bridesmen out of the way!
Except Mary and Peter alone.
She locked him up in her box,
And never would miss him more.

In Dutch Friesland, the Frisian is the language of the agricultural population; so that, if Dutch be the language of the towns, it is Frisian which we find in the villages and farm-houses.

Frisian, too, is the language of that remarkable series of islands which runs like a row of breakwaters from the Helder to the Weser. Such are Ameland, Terschelling, Wangeroog, and the others—each with its dialect or sub-dialect.

But beyond this, the continuity of the range of language is broken; for Frisian is *not* the proper dialect of Groningen. Nor yet of Westphalia *generally*. Nor yet (notwithstanding the name) of East Friesland.

At present, then, the populations which speak the Frisian form of speech are broken and disjointed: inasmuch as the natural inference from their present distribution is the doctrine that, at some earlier period, they were spread over the whole of the sea-coast from Holland to Jutland, in other words, that they were the oldest inhabitants of Friesland, Oldenburg, Lower Hanover, and part of Holstein. If so, they must have been the *Frisii* of Tacitus. No one doubts this. They must also have been the *Chauci* of that writer, as has already been assumed.

The Frisian is a disjointed and broken population; its history being peculiar. In most cases where we find languages and peoples in a fragmentary condition there has been conquest, invasion, or amalgamation; in other words, the effects are the result of human agency. But the history of the Frisians, though human agencies have been important, is, to a great extent, a *physical* history. Some branches of the stem to which they belong have, certainly, been lopped off by the hand of man, by war, by famine, by oppression bravely withstood. But others have given way to a stronger and more unconquerable power—that of Nature. It is the Frisian area that most of the great inundations of the North Sea have

broken in upon. What Vesuvius has been to Campania, Ætna to Sicily, Hecla to Iceland, the Ocean has been to Frisia.

§ 61. *Stages of the Frisian Language.*—In Westphalia, Heligoland, and North Friesland, the specimens are all of recent date—all modern. But with Friesland Proper this is not the case. Over and above the numerous samples of the Frisian of the present century, there is a Frisian literature which dates as far back as the twelfth century. In this, are embodied the laws of the Free Frisians—both East (or Hanoverian) and West (or Dutch) Friesland.

The extent to which the *Old* Frisian of the laws resembles the Anglo-Saxon, and, as a consequence thereof, the English, has been enlarged upon by both jurists and philologues. The following extracts illustrate it:—

Asega-bog, i. 3. pp. 13, 14. (*Ed. Wiarda.*)

Thet is thiu thredde liodkest and thes Kynig Kerles ieft, theter allera monna ek ana sina eyna gode besitte umberavat. Hit ne se thet ma hine urwinne mith tele and mith rethe and mith riuchta thingate. Sa hebbere alsam sin Asega dema and dele to lioda londriuchte. Ther ne hach nen Asega nenne dom to delande hit ne se thet hi to fara tha Keysere fon Rume esweren hebbe and thet hi fon da liodon ekeren se. Sa hoch hi thenne to demande and to delande tha fiande alsare friounde, thruch des ethes willa, ther hi to fara tha Keysere fon Rume esweren heth, tho demande and to delande widuon and weson, waluberon and alle werlosa liodon, like to helpande and sine threa knilinge. Alsa thi Asega nimth tha unriuchta mida and tha urlouada panninga, and ma hini urtinga mi mith twam sine juenethon an thes Kyninges bonne, sa ne hoch hi nenne dom mar to delande, truch thet thi Asega thi biteknath thene prestere, hwande hia send siande and hia skilun wesa agon there heliga Kerstenede, hia skilun helpa alle tham ther hiam seluon nauwet helpa ne muge.

The same, in English.

That is the third determination and concession of King Charles, that of all men each one possess his own goods (house?) unrobbed. It may not be that any man overcome him with charge (tales), and with summons (rede), and with legal action. So let him hold as his Asega (judge) dooms and deals according to the land-right of the people. There shall no Asega deal a doom unless it be that before

the Cæsar of Rome he shall have sworn, and that he shall have been by the people chosen. He has then to doom and deal to foes as to friends, through the force (will) of the oath which he before the Cæsar of Rome has sworn, to doom and to deal to widows and orphans, to wayfarers and all defenceless people, to help them as his own kind in the third degree. If the Asega take an illegal reward, or pledged money, and a man convict him before two of his colleagues in the King's Court, he has no more to doom, since it is the Asega that betokens the priest, and they are seeing, and they should be the eyes of the Holy Christendom, they should help all those who may nought help themselves.

Old Frisian Laws—Later Form.

Friesche Volks-Almanak, pp. 84–85.

Dat oder landriucht is, hweerso dyo moder her kyndes eerwe foerkapet, jefta foerwixled mit har fryonda reed eer dat kind jerig is; als hit jerich se, likje him di caep, so halde hitt, ende likje him naet, so fare hit oen syn ayn eerwe sonder stryd ende sonder schulde.

So hwaso dat kind bifiucht jefte birawet op syn ayn eerwe, so breckt hy tyen lyoedmerck ende to jens dine frane (?) dat sint XXI schillingen: ende alle da lyoed agen him to helpen ende di frana, dat hij comme op syn ayn eerwe, deer hi eer bi riuchta aechte: hi ne se dat hio et seld habbe jef seth, jef wixled truch dera tria haudneda een, deer hio dis kyndes des lives mede hulp. Dyo forme need is: hweerso een kynd jong is finsen ende fitered noerd oer hef, jefta suther wr birgh, soe moet dio moder her kyndes eerwe setta ende sella ende her kynd lesa ende des lives bihelpa. Dyo oder need is: jef da jere diore wirdet ende di heta honger wr dat land faert, ende dat kynd honger stera wil, so moet dio moder her kyndes eerwe setta ende sella ende capia har bern ku ende ey ende coern, deerma da kynde des lives mede helpe. Dyo tredde need is: als dat kynd is al stocknaken jefta huusleas ende dan di tiuestere nevil ende calda winter oencomt, so faert aller manick oen syn hof ende oen syn huus ende an waranne gaten, ende da wylda dier seket dyn holla beam ende der birgha hly, aldeer hit syn lyf oen bihalda mey: sa weynet ende scryt dat onjeriga kynd ende wyst dan syn nakena lyae ende syn huusleas ende syn fader deer him reda schuld to jenst dyn honger ende winter nevil cald dat hi so diepe ende dimme mitta fiower neylen is onder eke ende onder da

eerda bisloten, ende bitacht; so moet dio moder her kyndes eerwe setta ende sella, om dat hio da bihield habbe ende biwaer also lang so hit onjerick is, dat hit oen forste ner oen hoenger naet forfare.

In English.

The other landright is: whenever the mother sells the inheritance of her child, or exchanges (it) with rede (counsel) of her friends before the child is of age; when he is of age, likes he the bargain, let him hold it, and does he not like it, let him fare (enter) on his own inheritance without strife and without debts.

Whoever fights or bereaves the child on his own ground, he forfeits ten ledemarks, and to the king's attorney the mulct is XXI schillings; and all the lede (people) ought to help him and the king's attorney that he may come to his own inheritance, which he owned before by right: unless she has sold, or set (pawned) or exchanged it through one of the three headneeds (necessities) by which helped the life of the child. The first need is: whenever a child is made prisoner and fettered northward over the sea, or southward over the mountains, the mother must set (pawn) and sell her child's inheritance, and release her child and save its life. The other need is; if the years become dear, and sharp hunger goes over the land, and the child will starve of hunger, then the mother must set and sell her child's inheritance, and buy her child's cows and ewes, and corn, wherewith the life of the child is helped. The third need is: when the child is stark-naked, or houseless, and then the dark fog and the cold winter come on, when every man fares (enters) his house and its appurtenances, and lurking-holes, and the wild deer (beasts) seek the hollow beam (tree) and the lee of the mountains, where it may save its life: then moans and weeps the minor child, and shows his naked limbs, and his being houseless, and (points at) his father, who should provide for him against hunger and the wintry fog-cold, that he so deep and dim is locked up and covered under the earth with four nails: so the mother must set and sell her child's inheritance, since she has the keeping and guarding as long as (the child) is under age, that it dies not from frost or from hunger.

The Middle Frisian.—Without determining too nicely at what exact time the *Old* Frisian stage ceases, we may take the middle of the seventeenth century (*say* A.D. 1650) as the date for the fullest development of the *Middle;* the chief classic of the

Middle Frisian literature being Gysbert (Gilbert) Japicx; not, however, without both an important forerunner and an important contemporary; Jan Janszoon Starter the forerunner, J. Althuijsen the contemporary. The following* is from G. Japicx:—

1.	1.
Swiet, ja swiet is 't, oere miete 't boaskien foar' e jonge lie;	Sweet, yes sweet is over measure The marrying for the young lede (people);
Kreftich swiet is 't, sizz' ik jiette, As it giet mei âlders rie.	Most sweet is it, I say yet, When it goes with the rede of the elders.
Mar oars tiget 'et to'n pleach, As ik oan myn geafeynt seach.	But otherwise it tends to a plague, As I saw on my village.
2.	2.
"Goune Swobke, lit uws pearje," Bea hy har mei mylde stemm. "Ofke," sei se, "ho scoe 'k it klearje!	"Golden Swobke, let us pair," He bade her with a mild voice. "Ofke," she said, "how should I clear it!
Wist du! rie to heite in mem?" "Ljeaf dat nim ik to myn laest." Dear mei wier de knôte faest.	Knowest thou! rede, father and mother?" "Love! I take this to my last." Therewith the knot was fast.
3.	3.
Da dit pear to gear scoe ite, In hja hiene nin gewin, Heite seach, as woe hy bite, Mem wier stjoersch in lef fen sin.	When this pair should eat together, And they had no gain, Father saw as if he would bite, Mother was stern and cross of humour.
"Ofke," sei se, "elk jier in bern. Wier ik fâem! ik woe 't so jern."	"Ofke," she said, "each year a child. Were I maiden! I would it so willingly."
4.	4.
Hoite in Hoatske Sneins to keamer Mekken it mei elkoarme klear. Tetke krigge Sjolle kreamer, To Sint Eal by wyn in bjear.	Hoite and Hoatske every Sunday in the inn Made it clear with each other. Tetke got Sjolle the pedlar To St. Alof's fair unto wine and beer.
Nu rint elk om as in slet, In bekleye 't; mar to let.	Now each runs about as a slut, And complains it; but too late.

* Taken from Bosworth's *Anglo-Saxon Dictionary* (p. lxxiii). See also *Vriesche Volk's Almanak* (pp. 95–96).

5.	5.
Oeds die better, nei ik achtje,	Oeds did better in my opinion,
Da hy Saets syn trou tosei :	When he said his troth to Saets:
Hy liet de alders even plachtje,	He let the elders even plight,
Hwet se oan elke ich joene mei.	What they on each edge (side) gave with.
Nu besit hy huws in schuwr',	Now he possesses house and barn,
In syn bern fleane all' man uwr.	And his children outdo all men.
6.	6.
Ork, myn Soan, wolt du bedye,	Ork, my Son, wouldst thou prosper,
Rin naet oan allyk ien moll' !	Run not on all like a mole ;
Jeld in rie lit mei dy frye,	Let age and rede woo with thee,
Bern, so gean' dyn saken wol.	Child, then thy affairs go well;
Den scil de himel uwr dyn dwaen	Then the heaven shall give over thy doings,
Lok in mylde seining' jaen.	Luck and mild blessings.

The *New* or *Modern* Frisian has been illustrated by the specimens with which we began the chapter.

§ 62. Attention was directed to the forms *drieuwe* and *drijven* in the first extract.

The Frisian of Friesland, &c., in its very oldest stage, forms its infinitive mood, as well as certain cases, in *-a*.

The Dutch of Holland, in its very newest stage, forms ts infinitive mood, as well as certain cases, in *-en*.

Now the form in *-en* has not grown out of that in *-a*. On the contrary, the tendencies to change are in the other direction.

Such being the case, it cannot be said that the Modern Dutch is derived from the Old Frisian, or that the Old bears the same relation to the Modern Dutch that the Anglo-Saxon does to the English.

The truer view is—

1. That two closely-allied forms of speech were once spoken in Holland and Friesland.

2. That from the Northern of these we have the Modern Frisian of Friesland.

3. From the Southern, the Modern Dutch of Holland.

Old Frisian grammar compared with Anglo-Saxon.—We begin with—

The Transition of Letters.

á in Frisian corresponds to *eá* in A. S.; as *dád, rád, lás, strám, bám, cáp, áre, háp*, Frisian; *deád, reád, leás, streám, beám, ceáp, eáre, heáp*, Saxon; *dead, red, loose, stream, tree* (boom), *bargain* (cheap, chapman), *ear, heap*, English.

é in Frisian corresponds to [a]), the A. S. *á*; as *Eth, téken, hél, bréd*, Fris.; *áþ, tácen, hál, brád*, Saxon; *oath, token, hale, broad*, English;—[b]), to A. S. *æ*; *hér, déde, bréda*, Frisian; Fris. *hær, dæd, brædan*, A. S.; *hair, deed, roast*, English.

e to *ea* and *æ* A. S.—Frisian *thet*, A. S. *þæt*, Engl. *that*. Fris. *gers*, A. S. *gærs*, Engl. *grass*.—Also to *eo*; *prestere*, Fr.; *preost* A. S., *priest* Engl.; *berch* Fr., *beorh* A. S.; *hill* (*berg*, as in *iceberg*) Engl.; *melok* Fr., *meoloc* A. S., *milk* Engl.

i to *eo* A. S.—Fr., *irthe*, A. S. *eorðe*; Friš. *hirte*; A. S. *heorte*; Fris. *fir*, A. S. *feor* = in English *earth, heart, far*.

já = *eo* A. S.; as *bjáda, beódan, bid—thet fjárde, feorðe, the fourth—sják, seóc, sick*.

ju = *y* or A. S.; *rjucht, ryth, right—frjund, freond, friend*.

Dz = A. S. *c g*; Fr. *sedza, lidzja*; A. S. *secgan, licgan*; Engl. *to say, to lie*.

Tz, ts, sz, sth = A. S. *c* or *ce*; as *szereke*, or *sthereke*, Frisian; *cyrice* A. S., *church* Engl.; *czetel* Fr., *cytel* A. S., *kettle* English.

ch Fr. = *h* A. S., as *thjach* Fr., *þeóh* A. S., *thigh*, Engl.—*berch, beórh, hill* (berg)—*dochter, dohtor, daughter*, &c.

As a general statement we may say, that in the transition of letters the Frisian corresponds with the A. S. more closely than it does with any other language. It must, moreover, be remarked, that, in such pairs of words as *frjund* and *freond*, the difference (as far at least as the *e* and *j* are concerned) is a mere difference of orthography. Such also is probably the case with the words *déd* and *dæd*, and many others.

The Anglo-Saxon inflection of [a]) Substantives ending in a vowel, [b]) substantives ending in a consonant, [c]) Adjectives with an indefinite [d]) Adjectives with a definite sense, [e]) Verbs

Active [f]) and verbs auxiliar, may be seen in the comparison between the A. S. and the Icelandic. The corresponding inflections in Frisian are as follows:—

(*a.*)

Substantives ending in a vowel.

		Neuter.	*Masculine.*	*Feminine.*
Sing.	*Nom.*	'Are (*an ear*)	Campa (*a champion*)	Tunge (*a tongue*).
	Acc.	'Are	Campa	Tunga.
	Dat.	'Ara	Campa	Tunga.
	Gen.	'Ará	Campa	Tunga.
Plur.	*Nom.*	'Ara	Campa	Tunga.
	Acc.	'Ara	Campa	Tunga.
	Dat.	'Aron	Campon	Tungon.
	Gen.	'Arona	Campona	Tungona.

(*b.*)

Substantives ending in a consonant.

		Neuter.	*Feminine.*
Sing.	*Nom.*	Skip (*a ship*)	Hond (*a hand*).
	Acc.	Skip	Hond.
	Dat.	Skipe	Hond.
	Gen.	Skipis	Honde.
Plur.	*Nom.*	Skipu	Honda.
	Acc.	Skipu	Honda.
	Dat.	Skipum	Hondum (-on).
	Gen.	Skipa	Honda.

With respect to the masculine substantives terminating in a consonant, it must be observed that in A. S. there are two modes of declension; in one, the plural ends in *-s*; in the other in *-a*. From the former the Frisian differs; with the second it has a close alliance; *e.g.*:—

		Saxon.	*Frisian.*
Sing.	*Nom.*	Sunu (*a son*)	Sunu.
	Acc.	Sunu	Sunu.
	Dat.	Suna	Suna.
	Gen.	Suna	Suna.

		Saxon.	*Frisian.*
Plur.	*Nom.*	Suna	Suna.
	Acc.	Suna	Suna.
	Dat.	Sunum	Sunum.
	Gen.	Sunena	(Sunena).

(*c.*)

Indefinite Declension of Adjectives.

		Neuter.	*Masculine.*	*Feminine.*
Sing.	*Nom.*	Gód	Gód	Gód.
	Acc.	Gód	Gódene	Góde.
	Dat.	Góda (-um)	Goda (-um)	Gódere.
	Gen.	Gódes	Gódes	Gódere.
Plur.	*Nom.*	Góde	Góde	Góde.
	Acc.	Góde	Góde	Góde.
	Dat.	Gódum (-a)	Gódum (-a)	Gódum (-a).
	Gen.	Gódera	Gódera	Godera.

(*d.*)

Definite.

		Neuter.	*Masculine.*	*Feminine.*
Sing.	*Nom*	Góde	Góda	Góde.
	Acc.	Góde	Góda	Góda.*
	Dat.	Góda*	Góda*	Góda.*
	Gen.	Góda*	Góda*	Góda.*
Plur.	*Nom.*	Góda*	Góda*	Góda.*
	Acc.	Góda*	Góda*	Góda.*
	Dat.	Góda (-on)	Góda (-on)	Góda (-on).
	Gen.	Góda (-ona)	Goda (-ona)	Goda (-ona).

(*e.*)

The Persons of the Present Tense.

Indicative Mood.

Sing.	1.	Berne	*I burn.*
	2.	Bernst	*Thou burnest.*
	3.	Bernth	*He burns.*

* In A. S. all these forms would end in *-n* ; as *godan.*

Plur.	1. Bernath	*We burn.*
	2. Bernath	*Ye burn.*
	3. Bernath	*They burn.*

In the inflection of the verbs there is between the Frisian and A. S. this important difference. In A. S. the infinitive ends in *-an*, as *macian*, to make, *læran*, to learn, *bærnan*, to burn; whilst in Frisian it ends in *-a*, as *maka*, *léra*, *berna*.

(*f.*)

The Auxiliar Verb Wesa, *To Be.*

Indicative.

	Present.		*Past.*	
Sing.	1. Ik ben		1. Ik	Was.
	2. ?		2. Thú	
	3. Hi is		3. Hi	
Plur.	1. Wi	Send	1. Wi	Weron.
	2. I		2. I	
	3. Hja		3. Hja	

Subjunctive.

	Present.	*Past.*
Sing.	1. 2. 3. Se	1. 2. 3. Wére.
Plur.	1. 2. 3. Se	1. 2. 3. Wére.

Infin. Wesa. *Pr. Part.* Wesande. *Past Part.* E-wesen.

The Frisian numerals (to be compared with those of the Anglo-Saxons, p. 43) are as fellows: — *E'n*, *twá*, *thrjú*, *fjúwer*, *fif*, *sex*, *sjúgun*, *achta*, *njugun*, *tian*, &c. Of these the first three take an inflection, e. g. *en*, like *gode* and the adjectives, has both a definite and an indefinite form, *en*, and *thet ene*; whilst *twa* and *thrjú* run as follows:—*Nom.* and *Acc. Neut.* twa; *Masc.* twene; *Fem.* twa; *Dat.* twam; *Gen.* twira; *Nom.* and *Acc. Neut.* thrju; *Masc.* thre; *Fem.* thrja; *Dat.* thrim; *Gen.* thrira.

In respect to the Pronouns, there is in the Old Frisian of *Dutch* Friesland no dual number (the *North* Frisian has one), as there is in Anglo-Saxon. On the other hand, however, the Frisians (whilst they have no such form as *his*) possess,

like the Icelandic, the inflected adjectival pronoun *sin*, corresponding to the Latin *suus:* whilst, like the Anglo-Saxons, and unlike the Icelanders, they have nothing to correspond with the Latin *se.*

In Frisian there is between the demonstrative pronoun used as an article, and the same word used as a demonstrative in the limited sense of the term, the following difference of declension:—

THE ARTICLE.

		Neuter.	*Masculine.*	*Feminine.*
Sing.	*Nom.*	Thet	Thi	Thjú.
	Acc.	Thet	Thene	Thá.
	Dat.	Thá		There.
	Gen.	Thes		There.
Plur.	*Nom.*	Thá.		
	Acc.	Thá.		
	Dat.	Thá.		
	Gen.	Théra.		

PRONOUN.

The demonstrative in the limited sense of the word.

		Neuter.	*Masculine.*	*Feminine.*
Sing.	*Nom.*	Thet	Thi	se.
	Acc.	Thet	Thene	se.
	Dat.	Tham		There.
	Gen.	Thes		There.
Plur.	*Nom.*	Se.		
	Acc.	Se.		
	Dat.	Thám.		
	Gen.	Théra.		

The Saxons draw no such a distinction. With them the article and demonstrative is declined as follows:—

		Neuter.	*Masculine.*	*Feminine.*
Sing.	*Nom.*	þæt	se	seo.
	Acc.	þæt	þone	þá.
	Dat.	þam		þæ′re.
Sing.	*Gen.*	þæs		þæ′re.
Plur.	*Nom.*		þá.	
	Acc.		þá.	
	Dat.		þám.	
	Gen.		þára.	

§ 63. *Specimen of Glossarial affinity.*—Taken from Rask's Preface to his Frisian Grammar:—

Frisian.	*Anglo-Saxon.*	*English.*
'Age	Eáge	*Eye.*
Háved	Heáfod	*Head.*
Kind	Cild	*Child.*
Erva	Eafora	*Heir.*
Drochten	Drihten	*Lord.*
Nacht	Niht	*Night.*
Réd	Ræ′d	*Council* (*Rede*).
Déde	Dæ′d	*Deed.*
Nose	Nasu	*Nose.*
'Ein	Agen	*Own.*
Kápie	Ceapige	*I buy* (*Chapman*).
Dua	Don	*To do.*
Slá	Sleán	*Slay.*
Gunga	Gangan	*Go* (*Gang*).

CHAPTER XI.

GERMAN ORIGIN OF THE ENGLISH LANGUAGE. — PART OF GERMANY FROM WHICH IT WAS INTRODUCED.—POINTS OF INTERNAL EVIDENCE.—LOCAL NAMES.

§ 64. As a general rule, the Angle names for geographical localities are compound words; compounds after the usual fashion of the English language; compounds wherein the element of the wider and more general signification comes *last*. In other words we have, in such names as *Stán-tún*, or *Sand-wic*, the *town* characterised, defined, or particularised by the presence of *stones*, or the *wic* characterised, defined, or particularised by the presence of *sand*. The nature of these second elements, although more or less varied, is still pretty constant. We often have the name of some natural feature of the country—a *hill*, a *stream*, a *ford*: often, too, the name of some artificial construction—*town*, *borough*, *ham*, *thorp*. This is nothing more than what we expect *à priori* from the nature of the subject.

§ 65. For studying these in their modern forms, a map of England, along with one of Northern Germany, is sufficient. For the local names of the Anglo-Saxon period, the great repertorium is the "Codex Diplomaticus" of Mr. Kemble. To this may be added a treatise on the "Local Nomenclature of the Anglo-Saxon" by Professor Leo, of Halle.

It is from the preface to the third volume of the Codex that the following list of those Anglo-Saxon words which enter into the composition of local names is taken.

Æsc, A. S.; *ash*, English. This tree is often mentioned in the boundaries of charters.

Bæc, A. S.; *beck*, English. It is the High German *bach*, and is a word of some importance. At present, it is found so much more in the northern than in the southern parts of

Britain, and it is so much commoner in the Norse than in the proper German parts of the Continent, that it has somewhat hastily been considered a Danish rather than an Angle element.

Botl, A. S.; *bottle*, English—as in *Harbottle*. It means *dwelling-place, building*. In Germany we find it in *Wolfenbüttell*, &c. It is particularly common in the western half of the Duchy of Holstein—*i. e.* in Ditmarsh.

Beorh, A. S.; *-berg*, English = *hill*.

Bróc, A. S.; *-brook*, English—*Spell-brook*, &c.

Brycg, A. S.; *-bridge*, English—*Wey-bridge*, &c.

Buruh, Burh, A. S.; *borough, burgh, bury*, English.

Clif, A. S.; *cliff*, English.

Cot, A. S.; *cot, cottage*, English.

Croft, A. S.; *croft*, English.—*Wudu-croft*, A. S.; *Wood-croft*, English.

Díc, A. S.; *dike, ditch*, English.

Ea, A. S. = *river, stream*.

Eg, Ig, A. S. = *island;* as in *Ceortes-ig* = *Cherts ey*.

Ecg, A. S.; *edge*, English.

Feld, A. S. Form for form, this is the English *field*. In A. S., however, it meant an open tract of land rather than an enclosure, as with us.

Fen, A. S. = *fen*, English.

Fleot, A. S.; *fleet* (as in the *Fleet Ditch*, or the river *Fleet*), in English. "Sometimes used alone, as the *Fleet* at Thorpe, near Chertsey, in Surrey; but generally, in composition, as *Byfleet*."—Kemble.

Ford, A. S.; *ford*, English. This is important. Word for word, it is the same as the Danish *Fiord;* a substantive which also has a place amongst the elements of the English compounds.

The confusion that this double form has a tendency to engender may be avoided by remembering that the Saxon *-fords*, lie inland, and are simply what the English word *ford* is, viz. the names of those parts of our rivers and streams which can be forded, *i. e.* walked over in the water. The Danish (Norse) *f-rd*, on the other hand, means an *arm of the sea*. Consequently, it occurs on the coast rather than in the parts inland. Its form varies; in Scotland becoming

Firth (*Frith*), as *Firth* of *Tay*. In Ireland it occurs in the compounds *Strang-ford*, *Carling-ford*, &c. The term *Firth of Forth* is remarkable. Both forms—the one in *-irth* and the one in *-orth*—come from Norse *F-rd*. They are, however, differentiated in the form; one meaning the *river*, which is more or less of an æstuary throughout; the other meaning the more special portion of its outlet. Roughly speaking, when *F-rd* = *vadum* it is Angle and German, when = *æstuarium* it is Danish, Norse, or Scandinavian. The application of this will appear in the sequel.

Gráf, A. S.; *grove*, English.

Hæg, A. S.; *hedge*, English.

Ham, A. S. This is the *-ham* in words like Notting-*ham*, Threeking-*ham*, &c.

Hangra, A. S.; *-anger*, English, as in Birch-*anger*, Pensh-*anger* = a *meadow* or *grassplat*, usually by the side of the road.

Hlaw, A. S.—*a rising ground*. This is the *-law* so frequent in Scotland, as applied to hills, *e.g.* Berwick-*law*, &c.

Hol, A. S.; *-hole*, English.

Holt, A. S.; *-holt*, English = *a wood*.

Hrycg, A. S.; *ridge*, English.

Hyrne, A. S. = *corner*, *angle*. This word is, to a certain degree, in the same category with *-beck*. It is Danish as well as Saxon, and from being found in the more Danish parts of Britain, has passed for an *exclusively* Danish word—which it is not.

Hyrst, A. S.; *-hurst*, English = *copse* or *wood*. This is one of the most characteristic words of the list, as may be seen from the inspection of any map of Northern Germany.

Hyð, A. S.; *-hithe*, English = "a place that receives the ship on its landing; a low shore, fit to be a landing-place for boats."

Lád, A. S.; *lode*, English. "In the fen countries, this denotes not only a water-channel, but the raised banks on each side."

Land, A. S. and English.

Lane, A. S. and English.

Leah, A. S.; *lea*, English. The usual form this word takes in English compounds is -*ley*, as Baddow-*ley*, Mading-*ley*.

Mæd, A. S.; *mead* (*meadow*), English.

Meane, A. S.; *mark* = *boundary*, English.

Mere, A. S. and English—Whittlesea-*Mere*.

Mersc, A. S.; *marsh*, English.

Mór, A. S.; *moor*, English.

Mós, A. S.; *moss*, English; as in Chat-*mos*, where *mos* = *moor* or *swamp*, i. e. a locality where *mosses* grow abundantly rather than the *moss* itself.

Myln, A. S.; *mill*, English, "generally, but not exclusively, watermills."

Næs, A. S.; *ness* (or *naze*), English — Shoebury-*ness*, *Walton-on-the-Naze*—Scandinavian as well as German. Indeed, it is more or less Slavonic and Latin as well—*Noss* and *Nas-us*.

Ofer, A. S. = *shore*.

Pæð, A. S.; *path*, English.

Pól, A. S.; *pool*, English.

Pyt, A. S.; *pit*, English.

Ræ'we, A. S.; *row*, English.

Seta, A. S. = *settlement*—Somer-*set*, Dor-*set*.

Slæ'd, a "low, flat, marshy ground."

Slóp, A. S.; *slough*, English.

Snæ'd, A. S. = a *portion or piece cut off*—Whip-*snade*.

Stán, A. S.; *stone*, English—Whet-*stone*, &c.

Steal, A. S.; *stall*, English—Heppen-*stall*.

Stede, A. S. = *place* = the -*stead* in words like Hamp-*stead*, &c.

Stow, A. S. = *place*—*Stow*, Wit-*stow*.

Tóft, A. S. = *toft*, as in Wig-*toft*, English.

Tún, A. S. = -*ton*, English — Nor-*ton*, Sut-*ton* = North-*town*, South-*town*, &c.

Weald, A. S. and English.

Weg, A. S.; -*way*, English—Strang-*way*.

Were, A. S.; -*weir*, English.

Wic, A. S.; *wi k*, *wich*, English—*Wick*, Aln-*wick*, Green-*wich*.

Worðig, A. S. = the -*worth* in Tam-*worth*, Box-*worth*.

Wudu, A. S.; *-wood*, English—Sel-*wood*, Wich-*wood*, &c.
Wyl, A. S.; *-well*, English—Ash-*well*, Am-*well*, &c.
Þorp, A. S.; *-thorp*, English—Maple-*thorp*, Addle-*thorp*, &c.

§ 66. As a general rule (as aforesaid), the Angle (and English) names for localities are compound words, of which the latter element is the more general. This is determined or limited by the former. Nearly all the words of the preceding list belong to the *second* part of the compound in which they occur.

The *pre*fixes (of less importance) can be well studied in Dr. Leo's work. Sometimes they are believed to represent the names of mythical or semi-mythical personages, *e.g.* the gods *Tiw*, *Woden*, *Thor*, and *Sæter*, appear in such names as *Tews*-ley, *Wan*-borough (*Wodnes*-burg), *Thurs*-ley, *Satter*-thwaithe, just as truly as in the days of the week—*Tues*-day, *Wedn*-esday, *Thurs*-day, *Satur*-day. Again, in words like *Offan*-dic and *Credian*-tun, we have the *dike* of King Offa, and the town of *Cridda*—real or fictitious sovereigns. *Ox*-ford, *Hazel*-hurst, *Sand*-hurst, give us names taken from the animal, vegetable, and mineral kingdoms.

§ 67. The application of the criticism which the nature and analysis of the *local* names of the English language suggests, will find place when the closely-allied question of *personal* names has been noticed. Meanwhile a point or two may be foreshadowed. Thus—

In investigating the distribution of similar local names, the physical features of the county must alway be borne in mind. We cannot expect the nomenclature of a mountainous county in a fen; or *vice versâ*.

Some of the local terms are common to England and to the whole of Germany; when this is the case, we must look minutely to the differences of form.

Others are peculiar to Great Britain. This is the case with the numerous forms in *-den* (such as Gad-s-*den*, &c.), so common in many counties, and so particularly common in Kent. The element *-ton* (in A. S. *-tún*), as in New-*ton*, Sut-*ton*, is eminently English.

Hence those names that are neither too general nor too exclusive help us the most.

It has been indicated that the *form* is a matter of importance. It is so. The element *-ham* (as in Threcking-*ham*) is found all over Germany; but it is not found in the same shape. In one part it is *-heim*, as in Oppen-*heim*; in another *-hem*, as in Arn-*hem*; in a third *-um*, as in Hus-*um*. The re-appearance of a particular element is one thing; the form in which it re-appears is another.

CHAPTER XII.

GERMAN ORIGIN, ETC.—PART OF GERMANY, ETC.—POINTS OF INTERNAL EVIDENCE.—PERSONAL NAMES.—LAWS, CUSTOMS, SUPERSTITIONS, ETC.

§ 68. As a general rule the Anglo-Saxon personal names are compound words.

If the principle and details of these compounds ran exactly parallel with the principle and details upon which the names of the Anglo-Saxon geographical localities of the preceding chapter were constructed, the question as to their development and signification would be easy. In such a name as Alf-red, or Ed-ward, we should have the exact analogues of such words as Stán-tun, or Sand-wíc; wherein the elements *-red* and *-ward* would be the names for some class of men invested with certain personal attributes (say *councillor*, or *warden*), and *Alf-* and *Ed-* would be qualifying nouns which told us what sort of *warden* or *councillor* the particular one under notice might be. They might mean *wise*, or *lucky*, or aught else. In such a case, the name would be one like Wise-man, Good-fellow, or some similar compound of the nineteenth century—all this being nothing more than what we expect *à priori* from the nature of the subject.

Now I do not say that this is not the case, and I also add that many good writers treat the whole subject of the Anglo-Saxon personal names as if it were so. At the same time, I deny that the names of the men and women who were our early ancestors come out in their analysis and explanation half as clear as do those of our early towns, villages, rivers, and mountains. This will become manifest as we proceed.

As the list of the preceding chapter was taken from Mr. Kemble's *Codex Diplomaticus*, the examples of the present are from a paper by the same distinguished author *On the*

Names, Surnames, and Nic-Names of the Anglo-Saxons, published in the *Proceedings of the Archæological Institute for* 1845.

Sometimes the name consists of a substantive preceded by an adjective, as *Æðel-stán* = *Noble-stone*. Without asking how it comes that a *man* gets to be called a *stone*, we may see at once that the *combination* itself is an eminently intelligible one. It is just such a one as *Wise-man* or *Good-fellow* (the instances already adduced), where the juxtaposition and nature of the two elements is transparently clear. They may not always give us a name of which we can see the origin, but they always give one of which we can see the principle.

Sometimes the name consists of a substantive preceded by a substantive; a substantive which in this case is, more or less, adjectival in character—*e.g. Wulf-helm* (*Wolf-helm*). This only differs from words like *Æðel-stán* in the way that such a compound as *Lock*-smith differs from *Black*-smith.

Sometimes the name consists of an adjective preceded by a substantive, as *Wulf-heáh* (*Wolf-high*). Here begin difficulties. If we were at liberty to translate this the *high wolf*, the meaning would be intelligible, though the origin of the name might be inexplicable. But *Wulf-heáh* (if it mean anything) means *as high as a wolf*. Now a *wolf* is not an ordinary standard of measurement.

Sometimes the name consists of two adjectives, or (to repeat the previous formula) of an adjective preceded by an adjective, as *Æðel-heáh* (*Noble-high*). The English parallels to this are combinations like *light blue*, *deep green*. Now these are not compounds, but pairs of separate words, as is stated at large in the chapter on Composition.

Again, the first element in pairs of words like *light blue*, &c., qualifies or defines the second in a manner which (to say the least) is doubtful in such compounds as *Aðel-heáh*. They suggest the notion not only of their contrary, but of that contrary being as common an element of compound ideas as they are themselves. Thus a *light* blue supposes a *deep* blue, and a *deep* green a *light* (or a *pale*) green. Hence, then, a correlation (so to say) in their qualifying, distinctive, or defining functions.

Now it is doubtful whether this be the case with such words as *Æthel-heáh*. It is *very* doubtful whether they suggested the idea of *Ignoble Height*, as their opposite. It is more probable that, so far as they meant anything at all, they meant *Noble-and-high;* so expressing two qualifications in juxtaposition rather than any particular kind of any single one.

Without saying how far these difficulties are great or small, important or unimportant, I limit myself to the statement that they are of far more frequent occurrence amongst the personal names of the Anglo-Saxons and their allied populations, than they are amongst the local ones. Hence the facts of the present chapter are of less value as instruments of criticism than those of the preceding one—at least in the present state of philological criticism.

§ 69. In the Anglo-Saxon personal, as in the Anglo-Saxon local, names, the latter of the two elements is the more important. Of these the following are the chief; the list and classification being Mr. Kemble's:—

Male.

Substantives: -bearn, -beorn, -gâr, -geld, -gist, -helm, -hûn, -here, -lâc, -man, -môd, -mund, -rod, -sige, -stan, -weald, -weard, -wig, -wine, -ðegn—as in Ed-*gar*, Beorht-*helm*, Ead-*mund*, &c.

Adjectives: -beald, -beorht, -fus, -heâh, -rîc, -heard, -nôð.

Female.

Substantives: -buhr, -hâd, -gyfu, -læd, -hild, -rûn, -waru, -wên, -ðryð.

Adjective: -swið.

Some of these may begin as well as end a name. Others, on the contrary, are either exclusively initial, or exclusively final.

Exclusively initial: Eâd-, Os-, Beado-, Heaðo-, Cyne-, Eormen-, Eorcen-.

Exclusively final: -gyfu, -waru, -ðegn.

§ 70. As a general rule (as aforesaid) the Angle (and English) personal names are compounds. It has also been

said, that, of these compounds the latter, or *final*, element claims our chief consideration. The initial syllables are, however, not without interest, as may be seen from the following extract: — "The Anglo-Saxon proper names have also very frequently a law of recurrence. It shows itself in the continued repetition of the first part of the compound in the names borne by members of the same family. Endless is the number of *Æthel*-helms, *Æƈel*-bealds, *Æthel*-ðryðs, and *Æthel*-stâns. In one family we shall find in succession, or simultaneously, *Wig*-mund, *Wig*-helm, *Wig*-lâf, *Wih*-stân, or *Beorn*-rîc, *Beorn*-môd, *Beorn*-heâh, *Beorn*-helm. A few examples drawn from history will make this abundantly clear.

"*Eormen*-ric was the father of *Æthel*-berht, the first Christian king of Kent; *Æthel*-bert's son *Eâd*-bald had issue two sons, *Eorcen*-berht and *Eormen*-ræd. Of *Eormen*-ræd's six children, three have their names compounded with *Eormen*-, three with *Æƈel*-; thus, *Eormen*-burh, *Eormen*-berg, *Eormen*-gyð, *Eƈel*-ðryð, *Æƈel*-ræd, *Æthel*-beorht. *Eorcen*-berht's daughters were *Eorcen*-gote and *Eormen*-hild.

"Of the seven sons of Æðelfrið, king of Northumberland, five bore names with *Os*-, thus, *Os*-laf, *Os*-lâc, *Os*-wald, *Os*-win, *Os*-widu. In the successions of the same royal family we find the male names *Os*-frið, *Os*-wine, *Os*-rîc, *Os*-ræd, *Os*-wulf, *Os*-bald, and *Os*-beorht, and the female name *Os*-ðryð, and some of these are repeated several times.

"Saint *Wig*-stan was the son of *Wig*-mund the son of *Wig*-lâf, king of Mercia; and the sons of *Æthel*-wine, Duke of East Anglia, were *Eƈel*-wine, *Æthel*-wold, *Ælf*-wold, and *Æthel*-sige. His grandson again was *Æƈel*-wine.

"Lastly, Ælfred's son, *Eâd*-weard, married *Eâd*-gfu; their children were *Eâd*-wine, *Eâd*-mund, *Eâd*-red, and *Eâd*-burh. *Eâd*-mund's children, again, were *Eâd*-wig and *Eâd*-gâr. *Eâd*-gar had children, *Eâd*-weard, *Eâd*-gyð, and *Eâd*-weard. His son *Eâd*-mund, again, had two sons, *Eâd*-mund and *Eâd*-gâr."—*Kemble, in Transactions, &c.*

In our fourth chapter this fact has been partially anticipated. In the same chapter, too, may be seen the extent to which it differs from the ordinary alliteration of the Angle metres. However necessarily it may follow that words beginning with

the same syllable shall also begin with the same letter, there is a broad difference between the two principles. It is one thing for so many words to begin with the same initial, another for so many compounds to be formed out of the same elements. If the latter carry with it the former, it is only in a secondary manner,

§ 71. *Forms in -ing.*—The same chapter, with its so-called pedigrees, is referred to for instances of the affix-*ing*. It has the same power as the -ιδης in the Greek Patronymics, so that Eâdgar-*ing* means the *son of Edgar*, and Eâdberht Eadgar-*ing*, *Eadbert the son of Edgar—Edbert Edgarson.*

Compounds of sunu = son.—Could such a word as *Edgarson* (allowing for a difference of form) occur in the Angle stage of the English language? Assuredly, it is common enough in the English stage of the Angle, *i. e.* in the language of the nineteenth century;—so it has been for some time.

Now the paper which has already supplied so much gives us the following extract:—"Ministro qui Leófwine nomine et Bondan *sunu* appellatur cognomine." (No. 1739.)

Hence our answer is in the affirmative, it being safe to say that in the Angle stage of our language the method of signifying descent by the affix of the patronymic -*ing* was *not* the only one. Over and above, there was the use of the word *sunu = son.*

Why, however, was the question asked? Because common as are the compounds of *son* in English they were rare in Angle. Again, common as were the forms in -*ing* in Angle, they are rare in English.

This is a reason, but it is only one out of two.

§ 72. The other is the weightier one.

a. The forms in -*son* are not only rare in Angle, but they are rare in all the *Proper* German dialects; and—

b. They are not only *rare* in all the *Proper* German dialects (the Angle included), but they are extremely *common* in the Danish, Norse, and Swedish, *i. e.* in all the languages of the Scandinavian branch.

The inference from this can hardly fail to be drawn, viz. that all the numerous Ander-*sons*, Thomp-*sons*, John-*sons*,

Nel-*sons*, &c., of England, are, more or less Danish, as opposed to Angle.

Now, as the previous extract stands, it invalidates this inference.

But it should be added that it comes from a charter of the *Danish* King, Cnut's (A.D. 1023). So doing, it leaves the original inference as it was.

Hence I have limited myself to saying that the use of the word *son* (*sunu*) occurs during the Angle stage of the English language. I do not say that it occurs in the pure and unmodified language of the Angles.

The Latin extract is from the beginning of the Charter. At the end of it we find the same combination in Anglo-Saxon: "Ðis is ðára VII. hida bóc tó Hanitúne ðe Cnut Ang. gebócode *Leófwine Bondan sunu* on éce yrfæ."—"*This is the book* (*deed*) *of the seven hydes at Hannington, which Cnut, the king, granted to Leofwine Bondeson for a heritage for ever.*"

§ 73. The application of the criticism which the structure and analysis of the personal names in the English language supply, will find its place along with that which arises out of the structure and analysis of the local names.

It will not, however, give equal results; this being what we are prepared to expect from the remarks that have been made on the unsatisfactory character of some of the compound appellations under notice.

Nor is this all. Other circumstances impede the free use of even our best lists as instruments of philological criticism.

a. Sometimes the full compound is abbreviated, as truly as *Thom*-as is abbreviated into *Tom*; *e.g.* "quare non et nobis porrigis panem nitidum, quem et patri nostro *Saba*," (sic namque illum appellare consuerant,) "dabas"?—*Beda, Ecc. Hist.* ii. 5. The evidence that this *Saba's* full name was *Sæbeorht* is found in the same chapter.

b. Sometimes the form is like that of an abbreviation, without there being any evidence of its actually being one; *e.g.* *Becca*, *Beonna*, *Ucca*, and the prominent and often-mentioned one of *Beda*.

c. Sometimes it is doubtful whether the name be truly

Angle, or even German, in the wider and generic sense of the word. Few names, in this respect, have been more discussed than that of one *Coifi*. When Christianity was making its way into Northumberland, no one was more active in breaking up the old pagan idols than an active and energetic priest so designated. "But the name," say some critics, "is a strange one. Is it so certainly an Angle, or Anglo-Saxon one, as it seems? May it not have been British, and, if so, the name of some Christian Briton; nay possibly, of some converted Druid?"—"No," says Mr. Kemble (though not exactly in these words), "it is only the West-Saxon word *Cêfi*, or *Cêfig*, in a Northumbrian form, just as *Cênræd* in Hampshire becomes *Coin*ræd in Durham. It is a derivative from the adjective *côf=strenuus*." The present writer says nothing; he merely quotes the name as an illustration,—firstly, of one of the bearings of the line of criticism involved in the discussion; and, secondly, of the difficulties that attend the investigation.

d. To those that more especially arise out of the possibility of Angle names being taken for British, and *vice versâ*, he draws particular attention. That a certain *Cædwealha*, although the son of a father with so Angle a name as Cênberht, bore a *British* name is suggested by Mr. Kemble, who, adding that his brother was named *Mûl*, infers that the mother was a Briton. Now the British-sounding name *Cædwealha* brings in that of *Cad*-wallader, who (we are told) was the son of *Cad*-wallon, who was the son of *Cad*-wal. What is this but a *fac-simile*, in Keltic Britain, of the process that in Angle England gave us the *Æthel*-wulfs, *Æthel*-stans, and a long line of similar compounds of *Æthel*-, and some varying affix, of *Æthel* + *x* (so to say)? Yet the process is too peculiar to be considered as one common to tongues so different as the Angle and British. Nor is it very likely that the one would borrow it from the other. In my eyes the fact of such compounds repeating themselves to the extent to which they are said to do is suspicious;—suspicious from the very fact before us. It cannot well be valid for both the Britons and the Angles; what, then, is the explanation of it?

§ 74. Can the forms in question be despatched to that realm

of *eponymies*, *alliterational pedigrees*, and events in *eight-year cycles*, to a notice of which a great part of our fourth chapter has been devoted? Not altogether. The fact that, with one exception, all the kings between Ecbert and Cnut bear names beginning with either *Æthel-*, or *Ead-*, is against this summary mode of dispensation.

The historical succession of such a series of kings as *Æthel*-wulf, *Æthel*-bald, *Æthel*-bert, *Æthel*-ræd, Ælf-ræd (the only exception), *Ead*-ward, *Æthel*-stan, *Ead*-mund, *Ead*-red, *Ead*-wig, *Ead*-gar, *Ead*-weard, *Æthel*-ræd, *Ead*-mund, forbids it. Nevertheless I hold that a large percentage of the individuals belonging to the majority of these peculiarly-formed pedigrees are fictitious, and inventions of the genealogists.

The alliterational character of the early German poetry has been noticed. This made it a metrical necessity that certain names should begin with the same letter. To proceed from one similar initial to two, and from two to a whole syllable, is by no means an improbable step; and such a step I believe to have been actually made.

Should the reader take the pains to analyse the numerous royal pedigrees which form a sort of appendix to each volume of Lappenberg's England under the Anglo-Saxon kings, he will find that the best-authenticated genealogies have the fewest of such recurrences; that Beda, Asser, and the Chronicle are referred to far seldomer than such subsequent writers as Florence of Worcester, William of Malmesbury, and the author of *Flores Genealogici;* and that, with the exception of the lists in *Æthel-* and *Ead-*, none come lower than the end of the seventh century. Lastly, in more than one unequivocally fictitious and transparently impossible genealogy the same phenomenon presents itself; *e. g.*—

From the A. S. Chronicle, A.D. 855.	*From Snorro's Edda.*
Finn.	Lo-*ride.*
Frithu-wulf.	Hen-*ride.*
Frea-laf.	*Vinge*-thor.
Frithu-wald.	*Vinge*-ner.

The objection may be made plainer by the following extract.

It is from the Genealogy of the Kings of Kent (*Vol.* i. *p.* 285.)

It gives the descendants of Eormenric.

The names that show the recurrence of the same initial are marked with *l*, *p* or *h*.

Of these—

The first (*l*) means that the name to which it is appended is found in no author anterior to the Norman Conquest. It means *late* (*too late* for historical purposes) or *legendary*.

The second (*p*) means that the date of the name to which it is appended belongs to the *P*agan period—a period too early for authentic history.

The third (*h*) stands for *h*istorical, and means that Beda, the Chronicle, or something approaching the nature of historical testimony, guarantees the existence of the individual whom it represents.

The recurrences that are at one and the same time historical, and limited to a single branch of a family are marked *.

Those that are historical, but extended to uncles, nephews, grandchildren, or cousins, are marked §.

Those that are unhistorical are marked †.

It is submitted to the reader that the strongest instances rest on the weakest evidence.

In each of the two cases marked * the second name is that of a *female*; *e. g.* *Ethel*-burh was *Ethel*-berht's daughter, and, *Earcon*-gote, *Earcon*-berht's.

† *Eormen*-ric (*p*).

Ricole.

* *Æthel*-berht (*h*).

* *Æthel*-burh (*h*).

§ Ead-bald (*h*).

Eardwulf.

§. 75. *Equivocal position of certain personal names in respect to the language to which they belong.*—In the preceding chapter, the word *-ness* gave rise to the remark that it was a root common to more languages than one. It was found in the Latin under the form *nas*-us, and in the Slavonic under that of *nos*. Hence its appearance in a given combination was by no means proof of that combination being German. This, of course, subtracted from its value as a characteristic.

The same applies to more than one element of the *personal* names. They are not exclusively German. Some (to go no further) are Slavonic as well; *e.g.* the terminations in *-ric*, *-laf*, *-ld*, *-rod*, *-ast*, and others.

§ 76. *Equivocal origin of certain elements in personal names.*—All the world over, a word, when it is placed as an element in a compound, has a tendency to depart from that full and complete form which it exhibited whilst it was separate and independent.

Take such a word as *feri*. It is easy to see how likely it would be to lose the *e* and become *fri*, or lose the *i* and become *fer*, when subordinated to another word, and with its accent removed.

Or take a pair of words like *-old*, and *-olf*, and let each lose the final consonant. The result is *ol*—a form which might arise from either.

Both these are points to be remembered in the application of personal names as instruments of criticism.

Indeed, I repeat the statement, that, though of great importance in some fields of philological and ethnological inquiry, they are, in the one before us, of subordinate value;—one reason for this lying in the fact of the study of them being in a more immature state than that of the names of geographical localities.

For this reason I have given the lists of p. 109, without any translation; inasmuch as the current renderings have not always been satisfactory. Some, indeed, are clear enough; *e.g.* *beald* = *bold*, *æthel* = *noble*, *heáh* = *high*. The majority, however, are by no means of the unequivocal character of the words *-hurst*, *-lea*, *-wudu*, &c., of the previous chapter.

In some cases I have even allowed myself to suppose that it is not within the pale of the German language that the etymologies are to be sought. This, however, is with the so-called Gothic, Vandal, and Burgundian names, rather than with the Angle. The possibility of certain words being German only in the way that *sparrow-grass* (an adaptation of *asparagus*) is English, may advantageously be recognised as a point of caution—the true language being the Slavonic.

§ 77. *Laws, customs, superstitions, &c.*—All that is said at present upon the evidence derived from the likeness between certain laws, customs, and superstitions of the Angles of England to those of the populations of Northern Germany is that the comparison is limited; but that, as far as it goes, it supports rather than invalidates the conclusions derived from the other more important sources, *viz.* the external testimony of authors, and the phenomena of language.

CHAPTER XIII.

GERMAN ORIGIN, ETC.—PARTS OF GERMANY, ETC.—AGREEMENT BETWEEN THE EXTERNAL AND INTERNAL EVIDENCE.—DEFINITION OF THE ORIGINAL SAXON AND FRISIAN AREAS.—THE SPECIALLY ANGLE PARTS THEREOF.

§ 78. *Retrospect.*—Let us now look back upon the facts and questions of the preceding chapters, review the different points from which the subjects have been contemplated, consider the connection between them, and ask what results they prepare us for.

1. That the English language came from Germany;

2. That it fixed itself in England between A.D. 369 and A.D. 597, has been admitted without doubt or reservation.—*Chapters I.* and *II.*

3. That by the middle of the eighth century it had displaced the Latin of the Roman conquest over the whole of the area from which the Latin had displaced the original British, has been inferred.*—*Chapter III.*

* Upon reviewing my notice of the Rate and Manner of the Diffusion of the English Language, I find that the argument in favour of the Latin of the extract from Beda having been the ecclesiastic Latin of the scripture translations rather than any spoken form of any Romanic language, has been put less strongly than it might (indeed than it should) have been. The following extract ought to have found place in p. 19:—"Omnes nationes et provincias Britanniæ, quæ in *quatuor* linguas, id est, Brittonum, Pictorum, Scottorum et Anglorum divisæ sunt, in ditione accepit."—*Hist. Eccl.* iii. 6. When the *spoken* languages are enumerated, nothing is said about the Latin.

Another point may be noticed.—It is assumed that "the Romans in Britain took the same steps in respect to their language as they did in all the countries they subdued—Greece alone excepted. It is assumed that they diffused the knowledge of their own tongue, and displaced the native."—p. 21, *ad finem.* Now, the more I consider, the more I doubt

With this ends the list of positive and admitted facts. They are evidently few enough. And not only are they few in number, but they are as little precise as numerous. Germany is a large place; the interval between A.D. 369 and A.D. 597 a long one. The commonest of the current histories tells us more than this, tells it in fewer words, and tells it in a less indefinite and roundabout manner. Be it so.

4. The fourth chapter justifies the hesitation and circumlocution of the preceding three, and is devoted to the exposition of some of the chief reasons which invalidate not only the current accounts, but the original *data*, on which they are founded. Doing this, it foreshadows the necessity of a different line of criticism. Special and direct evidence being wanting, we must betake ourselves to inference instead.

For the time and place under notice, we have neither maps nor descriptions; no map for Northern Germany, no description, during the fourth, fifth, sixth, and seventh centuries, for the North-German populations. We have, however, an accredited date for the first invasion of Britain—viz. A.D. 449, the year of the supposed advent of Hengest and Horsa.

Taking this as a sort of central epoch, we ask two questions:—

5. What accounts have we, in the way of external evidence, for the times nearest this date and *following* it?

the accuracy of this assumption; at the same time, I by no means see any reason why Britain should form an exception to the so-called general rule of the Romans introducing the Roman tongue in all barbarous countries conquered by Rome. I rather doubt the generality of the rule itself; and, in the case of the Servian language of Servia and Bosnia, conceive that I see the parallel of what happened in England and Wales. That Wales, in certain parts, was thoroughly reduced, we infer from the present existence of Roman remains, as well as from the *Notitia*, to say nothing about the Latin elements of the Welsh language. That the same was the case with Servia and Bosnia is implied by the name *Mœsia Superior*, the name of the province they formed. Nevertheless, in Servia and Bosnia there is as little of anything like a Romanic language as there is in Wales.

I think it, then, an open question whether the Roman language was ever spoken in Britain at all—to the displacement, at least, of the native tongue, and the evolution of a Romanic form of speech.

I think the same in respect to Servia.

6. What accounts have we, in the way of external evidence, for the times nearest this date and *preceding* it?

The fifth, sixth, and seventh chapters deal with these. To proceed:—

7. As it is clear that if we get the state of things on a given area at two different and distant periods and find them agree we get the state of things for any intermediate one, the extent to which changes have taken place during the interval is the next point that requires consideration. This is given in Chapter VIII. The result being—

8. That the notices of Northern Germany of the second century are essentially the same as those of the ninth, the differences being apparent rather than actual, and the changes which those differences imply being *nominal* rather than *real*. Hence the accounts of certain early classical, and of certain later Carlovingian writers are, to a certain extent, valid for the events of the interval between A.D. 369 and A.D. 597.

So much for the question of external evidence, which is not direct, but circumstantial. Respecting this, we have got at the fact that the two sets of witnesses that supply it agree with, rather than contradict, each other. At the same time, the agreement is by no means transparently visible on the surface, or complete when seen.

9. It requires strengthening, does this same external evidence.—This is done in the remaining four chapters, which deal with the Languages, Personal Names, &c., of Northern Germany, and supply so much evidence of the kind called *internal*.

10. The two kinds agree.

How closely?

§ 79. *Comparison of Maps.*—The maps will tell us this.

In a map of *England*, take the counties of Surrey, Herts, Beds, and Huntingdon, and note the character of the local names, looking out more especially for the forms in *-hurst* and *-beck*—the counties just named being the best for the following reason. They are the most purely Angle. Kent has some special peculiarities—real or supposed; whilst westward we get towards the Keltic frontier; and northwards into the Danish area. Cornwall, Lincolnshire, and Berkshire illustrate this—each differently. In the first we may note the compounds

of *tre-* (*Tre*-gonel); in the second, the compounds of *-by* (Spills-*by*); in the third, the absence of these forms. Now *tre-* is British, and *-by* Danish; *-by* Danish, a point to be more especially remembered, and one of wide and important application, as will be seèn in the sequel.

In a map of *Germany* take the tribes to which the classical writers refer—the Frisii, Chauci, Chamavi, Dulgubini, Cherusci, Fosi, Angrivarii, Angli, and Saxones; and then, for the Carlovingians, take the Westphalians, Angrarii, Eastphalians, and Nordalbingians.

The same will include the districts to which the extant specimens of both the Frisian and Old-Saxon languages have been referred.

The same will agree more closely with the more Angle parts of England than will any other part of Germany.

§ 80. *The -horsts of the Lower and Middle Weser.*—On the Lower Weser we shall find a whole mass of the characteristic *-horsts* — Delmen-*horst*, Fahren-*horst*, and Staf-*horst* north-west of Nienburg. Higher up we branch off into the valleys of the Aller and Leine, in each of which the *-horsts* are numerous. So they are about Minden, Herford, and *Engern* (important *Angri*-varian localities) *e. g.* Jen-*horst*, Bohn-*horst*, Schnat-*horst*, Wallen-*horst*. For the parts about Munster and Dulmen we have *Horst*-mar, Senden-*horst*, Frekken-*horst*, Wolf-*horst*, Issel-*horst*, and Borg-*horst*.

As we go south-east they decrease. Segel-*horst* is to be found in Hesse; but it is an outlier.

§ 81. *Holstein.*—Divide the Duchy of Holstein into two parts, a larger one and a smaller one; the larger one being on the west, the smaller one on the east; the larger one coinciding with the drainage of the Elbe, the smaller with that of the Plöner and other lakes, and the river Trave. The eastern, or smaller, portion will be Slavonic, the western, or larger, Saxon —Nordalbingian Saxon, Nordalbingian Saxon belonging to Stormar, Ditmarsh, and Holsatia.

Here, there is a well-defined region of forms in *-horst*. There are none in the extreme east, none in the extreme west. There are several in the middle district. Ditmarsh has only one or two on its eastern border. The parts east of Kiel and

Lübeck have none. The Eyder on the north, and two artificial lines, slightly irregular in outline, give us the boundaries. One is drawn from the most southern part of the bend of the Eyder to Glückstadt. The other joins Kiel and Lauenburg. This was Slavonic; so that the absence of Angle forms is accounted for.

In Ditmarsh, *-horst* is replaced by the equally Angle forms *-wisch*, and *-büttel*—the one being the *-was* in Alre-*was*, the other the *bottle* in Har-*bottle*, &c.

It is highly probable that what is now the barren Segeberger Heath was once the forest that gave their ships to the Nordalbingian part of the Angle invaders of Britain, and its name to the district of Holt-*satia*, *Hol*stein, or *Holt* (*wood*).

The Eyder, like the Elbe, was a Transalbingian boundary.

In *Sleswick* we find much that is Frisian, as will be noticed in another place; something Slavonic, which will support an hypothesis in prospect; much that is High German, and which is recent; and a good deal which is Danish, of uncertain date. But we find nothing distinctively and characteristically Angle —*not even in the district called Anglen.*

Lauenburg need scarcely be divided. For practical purposes it is Slavonic. An old division between the two populations is the river Bille.

§ 82. *Luneburg.* — Lüneburg, like Holstein, though probably, at one time, exclusively Slavonic, must have a line drawn through it. For the south, that of the railway will serve; for the north, one drawn from Bergedorf to Lüneburg. Or we may take the valley of the river Ilmenau, which, without being less accurate than either of the others, is *natural.* It can be followed as far as Bodenteich. On the right (or Slavonic bank) are flat alluvia; on the left (or Saxon) the barren Luneburg Heath. North of the town of Luneburg, and on the Slavonic side of the Ilmenau, lies the village of Bardowick, important from a complication it introduces, a complication arising from its name, and one which will be noticed in Chapter XXII.

§ 83. At Bodenteich a short line, drawn westward, will take us to the frontier of Altmark, the Old March, Border, or Debatable land. No part of Altmark can be claimed for

ancient Saxony, except under the doctrine that all its numerous signs of Slavonic occupation are referable to recent colonisation. The local names in Altmark are well nigh as Slavonic as in Mecklenburg, or Posen; *e. g.* Schap*litz*, Wiebe*litz*, Gieser*itz*, Peck*witz*, Kal*bitz*, &c., &c. The course of the river Ohre, from its source to its junction with the Elbe, gives us the line here.

The Ohre falls into the Elbe; and, instead of considering the latter river, as is often done, the boundary of Slavonia, we should remember that Altmark is Slavonic, and that the Ohre bounds Altmark.

The Ohre falls into the Elbe. On the other hand, the rivers of Brunswick, and the contiguous parts of Hanover, fall into the Weser.

The Elbe itself is now our boundary, as far as the junction of the Saale; afterwards, the Saale as far as Bernburg. For this district the Slavonic character of the eastern bank is much more certain than the Saxon character of the western—indeed, the common maps give us, for the German side, a few undoubted Slavonic forms, *e. g.* Schleib*nitz*, south-west of Magdeburg.

South and south-west of Bernburg, the western side of our line, even when German, ceases to be Saxon. Probably it had done so before.

Here, within a few miles of the town of Zerbst, are no less than three forms in* *-by*—Bar-*by*, Steck-*by*, and Brum-*by*—more than can be found in all the rest of Germany put together.

From Bernburg westwards the line is difficult and obscure.

There is the complicated ethnology of the Hartz for one complication.

There is the complicated ethnology of the Hessian frontier for another.

§ 84. *The Hartz—Eastern division.*—The Brocken is our centre here; and next to the Brocken the water-systems that diverge from it.

On the east the Elbe, on the west the Weser, have each their affluents from the Hartz.

* Unless the maps mislead me, and the *-by* be *-bg*, an abbreviation for *-burg*.

Let the eastern parts be taken first.

Of this eastern division there is a northern and a southern subdivision—the northern, with the drainage of the Holzeme and the Bode, the southern, with those of the Wipper and the Helme.

In the parts to the *north* and *north*-east of the Brocken, certain forms in *-s-leben* are at their *maximum*—*e. g.* in the parts about Quedlingburg, Aschers-*leben*, Oschers-*leben*, Halberstadt, Magdeburg, Brunswick. Here we have Barten-*s-leben*, Ermer-*s-leben*, Erx-*leben* (Erk-*s-leben*), Moor-*s-leben*, Alteringer-*s-leben*, Osteringerod-*s-leben*, Uhr-*s-leben*, Wefen-*s-leben*, Eil-*s-leben*, Scer-*s-leben*, Badel-*s-leben*, Oft-*s-leben*, Hoten-*s-leben*, Ohr-*s-leben*, Wacker-*s-leben*, Gun-*s-leben*, War-*s-leben*, Au-*s-leben*, Ott-*leben*, Hamer-*s-leben*, Branter-*s-leben*, Altenbranter-*s-leben*, Oscher-*s-leben*, Hadmer-*s-leben*.

The drainage of the Holzeme and Bode (as aforesaid) gives us these. The area, however, of the *-s-leben*-forms extends further. They will be found both due north, as well as due south of the Brocken. Nevertheless, their chief development is in an eastern and north-eastern direction.

In the *south*-east they decrease, and on the drainage of the Wipper and Helme the termination which characterises an extraordinary proportion of words is the vowel *a*; *e. g.* Stein-*a*, Sachs-*a*, Trebr-*a*, Wied-*a*, Wern-*a*, Berg-*a*, Tyr-*a*, Schwend-*a*, Kellbr-*a*.

I find few or none on the Bode northwards, or on the Weser, Oder, &c., westwards.

I consider that they lead toward another division of the German dialects, *viz.* the Thuringian.

§ 85. *Western division.*—To the north and north-west lie the parts about Brunswick, Wolfenbüttel, Schöpperstedt, Schöningen, Helmstedt, &c. In these certain forms in *-um* are at the *maximum*. We may almost fancy ourselves in Friesland—Ohr-*um*, Börs-*um*, Born-*um*, Rockl-*um*, Eil-*um*, Eitz-*um*, Ahl-*um*, Ahz-*um*, Volz-*um*, Hach-*um*, Gilz-*um*, Lechl-*um*, Eit-*um*, Watz-*um*, Saltzdal-*um*.

The *south*-western division has no such notable characteristics as the other three, or rather it is remarkable for the

absence of them. To the west and south-west of Andreasburg, and on the drainage of the Oder the Frisian (?) *-um*, the Thuringian (?) *-a*, are equally wanting, the forms in *-s-leben* being rare.

To recapitulate: on the Wipper the forms in *-s-leben* are rare; those in *-um* non-existent, those in *-a* common—Wippr-*a*, Horl-*a*, Gonn-*a*.

On the Oder, these are wanting, as are all forms in *-um*.

On the Helme, the *-a*'s attain the *maximum*.

Where the *leben*'s are most abundant the forms in *-um* decrease, and *vice versâ*.

Within the area of the forms in *-s-leben* signs of Slavonic occupancy may be discovered, increasing as we get eastward—Sel*ze*, Sil*ze*, Sel*ke*, Sul*ze*, Harb*ke*, Scherm*ke*, Scherben*itz*, *Wend*-essen.

Probably the Hartz was Eastphalian Saxon—less the part drained by the Wipper and the Helme; in which case a line may be drawn from (say) Bernburg to Andreasburg with Aschersleben, Quedlingburg, Ballensted, Güntersburge, and Elbengerode on the north; and Stolberg, and Nordhausen on the south. Near Andreasburg the line turns southwards, and we get into the valley of the Oder.

§ 86. The line now becomes both natural and political; for the watershed between the source of the Leine and its feeders and those of the Wipper and Helme is the southern boundary of the kingdom of Hanover.

It runs west and south-west, dipping downward, Gottingen and Grubenhage lie to the north of it, consequently may be claimed as portions of Saxon Germany. Nevertheless, it is not the local names that bring us to this result. Of these the words ending in *-beck* are the most important. *Beck*= *brook*, and is an English form, as in Wel-*beck*, &c. But it is Platt-Deutsch or Low German as well—the High German form being *bach*.

Now these forms in *-beck* and *-back* are irregularly distributed. They are by no means uncommon on the Upper Seine and in the parts about Gottingen—Sparr-*beck*, Kre-*beck*, &c. On the main stream, however, of the Weser itself we find a Golm-*bach*, a Lo-*bach*, and a Frost-*bach* to the north of

Hoxter, and *south* of these forms in *a*; a Beven-*beck*, a Rose-*beck*, and a Röhr-*beck* within the Hessian frontier.

§ 87. The external evidence respecting the Saxons of the Diemel (see p. 51), taken along with (what will be noticed more fully in the sequel) the Platt-Deutsch form of speech, must help us here. It justifies us in carrying our line from Andreasburg to Duderstadt, and from Duderstadt to Münden.

That a Saxon population of *some kind* lay further southwards, and dipped into and indented the Hessian frontier, is a matter of fact resting upon the special evidence of a passage already quoted (p. 51). Wolfshanger, in its immediate neighbourhood, was a joint-occupancy—Frank and Saxons—the two populations living together. Zeuss (in *voc. Hessi*) uses an expression which brings the Saxon frontier far downwards and southwards, for he speaks of the *Saxons that pressed forwards* (*vordringenden*).

I would not say that some of the Hessian Saxons were not *in situ*. I abstain, however, from refining on Zeuss' view; and, after remarking that the Saxon frontier was not very far off, pass from Hesse Cassel westwards.

In the southern extremity of the Principality of Waldeck is a *Sachsen*-berg, and in the centre a *Sachsen*-häusen. Were the Saxons that these names suggested *in situ?* Or were they conquering and intrusive populations? Or were they colonists, settled by the Franks? I think that they were *in situ*.

Due west of Waldeck lies the Sauerland, with the watershed between the Weser and the Rhine. The Ruhr has some of its head-waters here. Now *Sauer*-land is *Suther*-land, or *Southern*-land. Yet if we look at either the Hessian area, or the Frank, it lies quite at the *northern* extremity. This is just what we have in our own island, of which the most northern county is the *Southern*-land (*Suther*-land). Why is this? Simply because the name was given by a population which viewed it from the north; viz. the Norwegians of Orkney and Shetland, the old lords of northern Scotland.

Apply this view to *Sauer*-land. It is an intelligible name, if we suppose that a Saxon population gave it; but not otherwise. But in order for it to be given, the Saxon frontier

must have come down as far south as the Sauerland frontier. This it touched; perhaps included.

§ 88. *The forms in -um.*—If we look at a map of the Dutch province of Friesland, we shall be struck with the number of local names that end in *-um;* if we look to one of Germany, or England, we shall find an explanation of its meaning. It is the *-ham* in such English words as Notting-*ham*, Three-king-*ham*, &c. It is the *-heim* in such *High* German words as Oppen-*heim* and Mann-*heim*. It is the *-hem* in such Low German words as Arn-*hem*, Berg-*hem*. It is the German *heim*, the English *home*, the A. S. *hám*. It enters into composition, and varies in its form with the different forms of speech which coincide with the different divisions of the German area. In Friesland, at least, it takes its shortest form, having ejected the initial aspirate.

In Friesland itself, so abundant are these compounds of *-um*, that two out of three of the places within a few miles of Leeuwarden, end in that element. On the other hand, in *Zeeland* but few words are compounded of the equivalent to *-ham* and *-heim* at all; perhaps none except the word Rit*hem;* which is in *h* and *e*.

Thus we have within the kingdom of Holland the two extremes; *i. e.* the Frisian topography at its *maximum* in Friesland, and at its *minimum* in Zeeland.

Between these two extremes the following is the order of transition.

Groningen.—Here the Frisian compound predominates, and that with the Frisian form. In the *arrondissement* of Appingadam cnly, we have eighteen names in *-um*.

Drenthe.—Here they do not occur at all. But Drenthe seems to be recently-reclaimed land, and as such, the *habitat* of a population less aboriginal than that of Friesland and Groningen.

Oberijssel.—a. Arrondissement of Zwolle.—Here we have three compounds of *-hem, viz.*: Blanken-*hem*, Windes-*heim*, and Wils-*um*—all three different; one Saxon, one German, and one Frisian.

b. Arrondissement of Deventer.—One compound in *-um*, Hess-*um*.

c. Arrondissement of Almelo.—Three compounds—Ootmars-*um*, Rent-*um*, and Ross-*um*.

Notwithstanding this diminution of Frisian characteristics, there is between Almelo and Ommen a *Vriesen-veen = Frisian fen*.

Gelderland.—a. Arrondissement of Arnhem.—Here Arn-*hem* takes the form in *hem*. On the contrary, Hels*um* and Renk*um* occur, and so do Benneko*m* and Elleko*m*.

b. Arrondissement of Nimeguen.—Forms in -*um* rare, if any.

c. Arrondissement of Tiel.—Heukel-*um*, Gellic-*um*, and Ross-*um*.

North Brabant.—Three or four forms in -*um* at most.

d. Arrondissement of Zutphen.—Forms in -*em* almost (or wholly) to the exclusion of those in -*um*—Loch*em*, Zel*hem*.

Limburg.—Here are four forms, Wess*um*, Seven*um*, Wans-*um*, and Otters*um*; but they occur in the northern *arron-dissement* (that of Roermonde) only, and that in contact with Groet-*hem* and Baex-*hem*.

Utrecht.—Utter, or nearly utter, absence of Frisian forms.

South Holland.—Ditto.

North Holland.—a. In the arrondissement of Amsterdam. Blari*cum*, Helmers*um*, Buss*um*.

b. In the arrondissement of Hoorn.—Wogn*um*.

Notwithstanding this paucity of Frisian forms in North Holland, part of the province is called *West Friesland*; from which we may infer that, even though the termination -*um* be non-existent, there may have been a Frisian occupancy.

With this preponderance of the forms in -*um* in Friesland, and with the evidence as to its then Frisian character, are we justified in coming, at once, to the conclusion that they are definite and absolute signs of Frisian occupancy? They are certainly abundant enough in Friesland; whilst the High German, the Low German, the Anglo-Saxon, and the English forms are transparently different. Again—in Scandinavia, the normal form, at least, is -*jem*, as in Trond-*jem*. Thirdly, a very great proportion of the forms of -*um*, that occur beyond the limits of Holland, are either on the Dutch frontier, or else in localities where a Frisian population either exists at the present time, or is known to have once existed.

Thus—they occur in that part of the kingdom of Hanover which is called East Fries*land*, *i. e.* in the parts about Embden. But here the very name of the district explains their presence; to say nothing about the Frisian language being still spoken in the fenny tract called Saterland.

They occur all along the coast from Embden to Cuxhaven, from the Dollart to the Elbe, as also in the islands opposite—Wanger-oog, &c. But this is neither more nor less than the country of the ancient Chauci, who were members of the Frisian group.

They occur in the Duchy of Sleswick, on its western side, and in the parts north of the Eyder, between Bredsted and Hus-*um*—Olz-hus-*um*, Bogel-*um*, Lug-*um*, &c., &c. But this is neither more nor less than the country of the *North* Frisians at the present moment, a population whose language is neither Danish nor German, but Frisian, and who call themselves, and are called by their neighbours, *Friese*.

In the *islands* the form appears again; its distribution being as follows:—

a. In Föhr we have Duns-*um*, Utters-*um*, Hedehus-*um*, Vits-*um*, Niebel-*um*, Baldiks-*um*, Vreks-*um*, Oevens-*um*, Midl-*um*, Alkers-*um*, Borgs-*um*, Toft-*um*, Klint-*um*, Olds-*um*, Duns-*um*.

b. In Sylt, Horn-*um*, Mors-*um*, Arks-*um*, Keit-*um*, Tinn-*um* —*all in the southern half of the island*.

c. In *northern* Romö, Toft-*um*. In *southern* Romö, none.

d. In Fanö, none.

e. *f*. *g*. In Amröm, in Pelvorm, and in Nordstrand, none.

The islands, however, like the opposite part of the Contitent, are North Frisian.

Thus far, then, all is clear.

§ 89. But it is *not* clear when we move northwards. Premising that *-by* is an unequivocal sign of Scandinavian occupancy, let us look to the following list of local names for that part of North Sleswick which lies between Töndern and Ripe.

Oster-*by*.	Hus-*um*.
Wiis-*by*.	Ball-*um*.
Gammel-*by*.	Woll-*um*.
Nor-*by*.	Win-*um*.

Kohl-*by*.	Nust-hus-*um*.
Reis-*by*.	Bjerr-*um*.
Kirke-*by*.	———
Mol-*by*.	———
Meel-*by*.	———

Here there is intermixture—intermixture which should make us ask whether the form under notice may not be something else besides Frisian, *i. e.* Danish, Norse, or Scandinavian. The propriety of asking this increases when we look further. All over Jutland, all over the Danish Isles, in Sweden, and in Norway, do we find this form. Here, then, it is either not Frisian at all, or not Frisian in the strict, limited, and definite sense it was in Holland, Hanover, Oldenburg, Sleswick, and the North-Sea Islands.

Over and above this form in *-um* being Frisian and Scandinavian, can it be Old Saxon? There are forms in *-um* in certain parts of Germany, which are more likely to have been Old Saxon than Frisian, *e. g.* Drat-*um*, Stock-*um*, Boch-*um*, in Westphalia. A case in favour of the Old Saxons having left out the *-h* can be made out.

The English *her* in A. S. is *hire*, in O. S. *îr*.
„ *their* „ *hira*, „ *îro*, &c.

The answer, then, to this question is more *Yes* than *No*.

Over and above this form in *-um* being Frisian, Scandinavian, and (probably) *Old* Saxon, can it be *Anglo* Saxon? At one time I would have said more *No* than *Yes*. Now, it is more *Yes* than *No*. The main reason against it lies in the forms of the English of the nineteenth century being in *-ham*; with the aspirate retained, and with *a* for the vowel. But it by no means follows that because a form in *ham* should change but slightly in England, it should not change considerably on the Continent; neither is it certain that, *if we take the English forms as they are sounded rather than as they are written*, the difference is so great as it appears to be. Plenty of speakers say Notting-*am*, and even Notting-*um*—whether rightly or wrongly is another question.

Under this point of view I think that such forms in *-um* as occur in those parts of Germany which are more likely to have been Anglo-Saxon than Frisian, must be looked upon as Anglo-

Saxon, notwithstanding the English forms in *-ham*. At the same time, an important fact, which complicates many of our investigations, must be borne in mind, viz. the fact of there having been Frisian (we may also say Slavonic) colonies in different parts of the Carlovingian Saxonia.

At present this is sufficient; sufficient because it has been made clear that, whether the forms in *-um* were Anglo-Saxon and Old Saxon as well as Frisian and Norse, or whether they were not, the practical result, for the present investigation, is the same. They were not Low German, and they were not High German. They were not Thuringian, Hessian, or Frank. Neither is there a shadow of evidence for assuming that they were anything intermediate, *i. e.* referable to some division of the German stock which was neither High German nor Low German (Platt-Deutsch), neither Frank nor Frisio-Saxon.

§ 90. If so, we have an instrument of criticism, and can continue our line; which must include the parts about Boch *-um* on the Lower Ruhr, the forms in *-um* in the northern part of Limburg, and the few *-ums* of North Brabant.

Draw it, then, from Waldeck to Duisberg, from Duisberg to Roermonde, from Roermonde to Endhoven, and from Endhoven to Herzogenbosch (Bois le Duc).

Draw it from the Diemel to the Dommel, the Diemel a Waldeck, the Dommela North Brabant, river.

This contains Paderborn, Detmold, Buckeburg (Lippe Schaumburg), Callenburg, Hildesheim, Grubenhage, the northern Hartz, Brunswick, and the parts between that Duchy and the Altmark. It also contains Oldenburg and Hanover, and part of Luneburg. It also contains the western two-thirds of Holstein, but not the eastern third. It contains all Friesland and Westphalia.

In respect to the frontier—

1. The Northern was Danish.
2. The Eastern was Slavonic.
3. The southern was—
   a. Frank in the direction of the Rhine.
   b. Hessian in the parts south of Paderborn.
   c. Thuringian for the obscure parts about the Hartz.

Within these ethnological limits lay Saxonia + Frisia, or Frisia + Saxonia as determined both by internal and external evidence; for we have seen that they agree pretty closely.

Of this Saxon or Frisian area it is safe to say that—

The extreme south was either *Old* Saxon or Frisian, as opposed to Angle.

The extreme north was Angle, as opposed to Frisian and *Old* Saxon.

The extreme west was Frisian, as opposed to *Old* Saxon and Angle.

The more southern and eastern were the parts of *East*-phalia the less were they Angle.

The parts about Bremen, Verden, Celle, Hanover, along with the Duchy of Holstein, were, probably, the most Anglian. Hence—

The *Saxonia* of the Franks contained *Anglia*, *Engla*-land, or *Eng*-land, *and something more*.

This is what we arrive at if we look at a map of Germany as it was under the Carlovingians. But Germany as it was under the Carlovingians was not *exactly* the Germany that sent forth the invaders of Britain. It was the Germany of some three centuries *later*.

We must also look at the Germany of Tacitus, &c.; this being different from the Germany of the Angles of England; different because it was the Germany of some three centuries *earlier*.

What do we find here? That the most Angle part of the Carlovingian Eastphalia was the country of the *Angli;* the parts which, comparatively speaking, were less Angle than the others, being the districts of the Fosi, Cherusci, and Longobardi. (See Chapter XXII). Nevertheless, these are to be looked at as closely-allied populations—*Angli-form*, so to say; since Ptolemy brings the Angle name as far southwards as the Middle Elbe.

In the way of *internal* evidence the forms in *-um* help us, though not much. Without committing ourselves to the doctrine that they are not Angle, we may safely say that their Angle character (if Angle they be) is less marked and patent than

their Frisian. Neither is it so easily inferred as it was with the Old Saxons.

Now it is just in these parts where the Classics and the Carlovingians indicate an *Eng*land (*Anglia*, or *Angla*-land) that the forms in *-um* are rarest. They fringe the coast of Oldenburg and Hanover; where they may be Frisian. They thin off as we go inland; and without entirely disappearing when we get east of Bremen, Bremenvorde, and Stade, they are hard to find.* In Holstein I have not found them at all.

Hence, the two kinds of evidence agree, and point to the parts between Rendsburg and Hanover, between Verden and Lüneburg, and between Bremenvorde and Celle as the original area of those Angles of Germany who afterwards became the so-called Anglo-Saxons of Britain, and later still the English of England.

§ 91. I am far from believing that this rough way of indicating a district by drawing lines *across* it, without giving any that circumscribe it, is the one with which future investigators will be justified in contenting themselves. On the contrary, it is far from impossible that the original *Angla*-land may be defined rather than typified. At the worst an approximation to a definition is practicable; and that for both time and place, date and district.

To attain this, much investigation has to be conducted—much to be learnt, more possibly to be unlearnt. And the work should be distributed. It is quite enough for English scholars, when they employ themselves on points of minute and subtle ethnology, to deal with the *Angli* alone. The complementary labours upon the conterminous and allied populations should be undertaken by the critics of other countries. Thus the Varini, &c. should occupy the Slavonic, whilst the Reudigni should engage the Lithuanic ethnologist; the Dane being employed on the Northern, the Frieslander on the Western, and the Pole on the Eastern frontier of Holstein; the Pole, Russian, or Bohemian on the Eastern frontier of

* There is a Holt-*um* north of Verden, and a Bar-*um* north of Uelzen. Of the district about Brunswick I take no notice at present.

Holstein, because the parts of that Duchy that lie on the Baltic were originally as Slavonic as were Mecklenburg, Pomorania, the Isle of Rugen and (in the mind of the present writer) more than one of the Danish Isles, *e. g.* Laaland.

What applies to the northern part of the *Saxonia* of the Franks applies equally to the southern; where the ethnology, if less important, is more minute, and refined. Here, with the exception of the Slavonic frontier on the east, and the Keltic on the south-west, the ethnological, graphical philology lies within narrow limits, all the conterminous divisions being German, *i. e.* Thuringian, Hessian, Frank, Frisian, Saxon. The learned men of the Hartz, of Paderborn, of Gottingen, of Essen, of Duisberg, &c., have the field laid out for them here, a field which an Englishman may pass over *sicco pede*, or nearly so.

Further *minutiæ* then in the way of *South*-Saxon philology and ethnology will not be attempted; either in respect to place or time. That the area of the two great Saxon and Frisian names was, there or thereabouts, what it has been made out to be is a safe fact in geography. *When* such a line ran is another question; and no simple one either. It involves the ethnological position of certain populations on the frontier which interest the classical as well as the medieval investigator; *e. g.* that of the Bructeri, and Chattuarii (Boructuarii and Hetvære), also of the Chamavi, the Salii, and others. Some of these may have been (as the Salii and Chamavi, according to the current doctrines, actually were) Franks, indenting the Saxon, or Frisian area; some Saxons, indenting that of the Franks; some Frisians; some even Hessians. There is evidence, good or bad, on all these points.

Hence, the Frisio-Saxon, as I have given it, is not asserted to have been Frisio-Saxon in all its parts at the same time; nor yet is it said to include *all* the members of the Frisian or Saxon names. On the contrary, all that is intended is, that no populations be enumerated as Saxon or Frisian which were, originally, other than such, and that no portion of the Frisio-Saxon area be attributed to any Frisio-Saxon population, which, for a time at least, was not occupant of it.

The encroachments of the Frank upon the Saxon, and

of the Saxon upon the Frank, have been, if not equal, at least mutual; so that their history (except towards its conclusion) has been that of two equally-balanced powers. If it were otherwise our problems would be simplified. If the Frank, for instance, had *always* encroached, and the Frisio-Saxon *always* receded, the phenomena which occur between the Englishman of America and the American Indian, or the Northman of Scandinavia and the Lap, would repeat themselves. But such is not the case. Until the time of Charlemagne the Saxons seem to have forced the Frank, as much as the Franks forced the Saxon, boundary. The Frisians, perhaps, *have*, as a general rule, receded, but this is not certain.

§ 92. To recapitulate.

Saxonia + *Frisia* (or *Frisia* + *Saxonia*) was, in the eyes of the Franks of the Carlovingian period, West-phalia, East-phalia, Angraria, and Nordalbingia.

Of these, Nordalbingia, and the northern part of East-phalia, were the eminently *Anglo*-Saxon portions.

In the geography of the classical writers the Angli, + certain other populations, occupy them—one of these bearing the name of *Saxon*.

This may or may not have been allied to the Angles, it being by no means certain that the informants of Ptolemy, who first uses the word, and the Franks, used it in the same sense.

That the Angli of Tacitus were the Angles of the Anglo-Saxon conquests is certain. That any other of the populations with which they are associated were so is uncertain.

CHAPTER XIV.

SPECIAL AND DIRECT EVIDENCE OF BEDA, ETC., CONSIDERED. —JUTES.—JUTES (SO-CALLED) OF THE ISLE OF WIGHT.—WERE THERE ANY?—THE GOTHIC HYPOTHESIS.

§ 93. As opposed to the line of criticism that has been exhibited in the previous chapter, the evidence upon which the current doctrines respecting the Angle (or Anglo-Saxon) invasions are based may be called direct or special.

The palmary passage is the following; and it is, perhaps, unnecessary to say that it is from Beda; whose date, locality, and opportunities have already been so fully considered:—"Advenerant autem de tribus Germaniæ populis fortioribus, id est *Saxonibus, Anglis, Jutis*. De *Jutarum* origine sunt *Cantuarii* et *Vectuarii*, hoc est ea gens, quæ Vectam tenet insulam, et ea, quæ usque hodie in provincia Occidentalium Saxonum *Jutarum* natio nominatur, posita contra ipsam insulam Vectam. De *Saxonibus*, id est ea regione, quæ nunc Antiquorum Saxonum cognominatur, venere *Orientales Saxones, Meridiani Saxones, Occidui Saxones*. Porro de *Anglis*, hoc est de illa patria, quæ Angulus dicitur et ab eo tempore usque hodie manere desertus inter provincias Jutarum et Saxonum perhibetur, *Orientales Angli, Mediterranei Angli, Mercii*, tota *Nordhumbrorum* progenies, id est illarum gentium, quæ ad Boream Humbri fluminis inhabitant, ceterique Anglorum populi sunt orti. Duces fuisse perhibentur eorum primi duo fratres Hengist et Horsa; e quibus Horsa postea occisus in bello a Brittonibus, hactenus in Orientalibus Cantiæ partibus monumentum habet suo nomine insigne. Erant autem filii Victgilsi, cujus pater Vitta, cujus pater Vecta, cujus pater Voden, de cujus stirpe multarum provinciarum regium genus originem duxit."—*Eccl. Hist.* i. 15.

The following is from the Saxon Chronicle (A.D. 449) :—

"Ða comon þa men of þrim megðum Germaniæ, of Ald-Seaxum, of Anglum, of Jotum.

"Of Jotum comon Cantware and Wihtware, þæt is seo mæiað, þe nú eardaþ on Wiht, and þæt cyn on West-Sexum ðe man gyt hæt Iútnacyn. Of Eald-Seaxum comon Eást-Seaxan, and Suð-Seaxan, and West-Seaxan. Of Angle comon (se á siððan stôd westig betwix Iútum and Seaxum) Eást-Engle, Middel-Angle, Mearce, and ealle Norðymbra."

"Then came men from three powers of Germany, from Old-Saxons, from Angles, from Jutes.

"From the Jutes came the inhabitants of Kent and of Wight, that is, the race that now dwells in Wight, and that tribe amongst the West-Saxons which is yet called the Jute kin. From the Old-Saxons came the East-Saxons, and South-Saxons, and West-Saxons. From Angle (which has since always stood waste betwixt the Jutes and Saxons) came the East-Angles, Middle-Angles, Mercians, and all the Northumbrians."

The latter is little more than a translation of the former—the word *Germaniæ* serving to show which of the two was the original.

There were then, as accredited elements to the population of England,—

1. Angles.
2. Saxons, and
3. Jutes in three places—viz. in
   a. Kent (*Cantwære*).
   b. Hampshire (*Jutnacyn*).
   c. Isle of Wight (*Wihtwære*).

All these will be considered in detail, the last being taken first.

§ 94. *Preliminary remarks.*—Let us suppose the case of an American archæologist, who, in the absence of any authentic history, reasons about the origin of the three populations of Plymouth, New Jersey, and Portsmouth. He knows that, as a general rule, they are to be deduced from England; and he studies the map of the British Isles accordingly. On the south

he finds a Jersey, which he reasonably infers is the *Old* Jersey, the mother country of the *New*. He also finds a Plymouth, from which he draws the same equally-reasonable inference. Lastly, he sees a town named Portsmouth—and here he repeats his reasoning—reasoning which is eminently logical, cogent, and apparently conclusive. Nevertheless, it is all reasoning—all inference. As such, it passes without challenge or objection. But it has a tendency to change its character; and when this takes place, the doctrine as to the origin of the three populations gradually loses its inferential character, and assumes that of a fact founded upon *evidence*. Then it gets to be believed that the doctrine has an *historical* rather than a *logical* basis, and it passes for a fact founded upon records, or, at least, on tradition. In such a case a sentence like the following might easily be written:—"they" (viz. the populations of New Jersey, Plymouth, and Portsmouth) "came from three of the more powerful populations of England, *i.e.* those of Jersey, Plymouth, and Portsmouth. From those of Jersey came the men of New Jersey, from those of Plymouth the men of Plymouth, and from those of Portsmouth the men of the parts so-called." I say that such a sentence might be written, might pass as a fact, and (whether fact or not) would contain an argument so legitimate as to stand against ninety-nine objections out of a hundred. Yet the hundredth might set it aside, since certain facts might have been overlooked.

What if the name of an original Indian tribe had been Jersey (or Nujersi, or some name like it), or Portsmouth, or Plymouth? The chances, I admit, are against such an occurrence. But what if it really happened? It cannot be denied that it would materially shake the inference.

Still the original doctrine might be correct, and not only correct, but capable of having its correctness demonstrated. Let the name in question be the one last mentioned—*New Jersey*. Let the Old Jersey people of England be like those of Plymouth in general, but different from them in some definite characteristics. Let those characteristics reappear in the New-Jersey-men of America. In such a case, the exceptions taken to the statement from the present existence of an aboriginal Indian population called *Nujersi* (for such we will suppose the name to be) would fall to the ground.

But what, if no ethnological acuteness, no etymological sagacity, no minute analysis of names, traditions, or dialects had ever succeeded in detecting such *differentiæ;* so that, despite of the endeavours of learned antiquarians, the men of New Jersey could *not* be shown to differ from those of Plymouth and Portsmouth, whilst (all the while) the *Old*-Jersey-men *did* so differ? In such a case the objection that was originally taken from the previous name of the Indian tribe would stand valid.

But what, if over and above the original Indian *Nujersi*, there were actually an offset from the *Old*-Jersey-men of Europe besides? There would, then, be one *Nujersi* which was Indian, and in respect to which the previous hypothesis was false; and there would be another New Jersey which was European, and, in regard to this latter, the hypothesis would be true. At any rate, the question would become complicated.

But what, if the complication went still further, and there were *two* Jerseys in Europe, *either* of which might have supplied the population to an American one?

There would be a very difficult problem for the ethnological critic. We may safely say this.

Mutatis mutandis, this reasoning about a hypothetical *Nujersi* population of American Indians, unreal as it is, has an important application to the testimony before us.

§ 95. What is this? Not that the *Wiht-wære, Vectu-arii* (*Vecti-colæ*), or *Isle-of-wight-men* were of Jute origin.

This is only an opinion, based, perhaps, on historical testimony; but, perhaps, based only on the resemblance of names, and, if so, no piece of evidence at all (either direct or indirect), but an inference.

The real testimony—the testimony of Beda's informant—lies in the words *Vectuarii, hoc est ea gens quæ Vectam tenet insulam.* For this we may fairly consider that we have the personal knowledge of Bishop Daniel (see Chapter IV.) as a guarantee. We may also remark that the fact of there being a population known as *Wiht-wære* (*Vectuarii*) is spoken of as if it were generally and universally known.

This population is noticed by a third author—King Alfred—who writes—

"Comon of þrym folcum þa strangestan Germaniæ, þæt of Saxum, and of Angle, and of Geatum; of Geatum fruman sindon Cantwære and Wiht-sætan, þæt is seo þeód se Wiht þat ealond on eardaþ."

"Came they of three folk the strongest of Germany; that of the Saxons, and of the Angles, and of the Geats. Of the Geats originally are the Kent-people and the Wiht-settlers, that is the people which Wiht the Island live on."

Now, as Alfred is translating Beda, we have no new evidence in the extract from him. We have, however, the fact that his translation of the Latin Vectu-*arii* is not the same as that of the Chronicle. The Chronicle writes Wiht-*wære*, Alfred, Wiht-*sætan;* wherein the -*sæt* is the -*set* in Somer-*set*, Dor-*set*, &c. = *settlers*. Hence Wiht-*sætan* and Wiht-*wære* are synonyms = Vecti-*colæ*, or Vecti-*enses*.

Alfred's form is in G, as *Geat;* the Chronicle's in *W*, as *Wiht*.

The Chronicle follows Beda, and translates the words "*et ea quæ usque hodie in provincia Occidentalium Saxonum, Jutarum natio. nominatur, posita contra ipsam insulam Vectam,*" rendering *Jutarum natio* by *Jutna-cyn; Jutna* being the Genitive Plural of *Jute*, even as Jut-*arum* is of Jutæ. Alfred omits these second Jutes.

§ 96. Now *Wiht*-wære and *Wiht*-sætan mean simply the residents of the Isle of *Wight*, and the Nujersi illustration, in its simplest form, finds its application.

In England Beda found Angles, Saxons, and *Wiht*-wære, all in geographical juxtaposition.

On the Continent he found Angles, Saxons, and *Jutes;* all in geographical juxtaposition also.

That the Angles and Saxons of England came from Germany he knew. That the *Wiht*-wære came from *Jut*-land he *inferred*—he himself, or Daniel his informant.

But it may be objected that *Wit*-, and *Jut*- are not sufficiently alike to be thus confused. Perhaps they are not, if we only look at them *à priori*. But what say the texts themselves?

They say that they *were* confused. Beda deduces his *Vect*-uarii as decidedly from the *Jutæ*, as he does his *Jutarum natio*. The Chronicle does the same. Alfred, himself, though

he gives us the form in W- only, still connects them with the G-eats.

The *à priori* unlikelihood, then, of forms so different as *Jut-* and *Wit-* being dealt with as identical is not to be relied on. The real facts of the case before us tell us differently. They show that in the case of *Vectis*, or the Isle of Wight, a name which was as old as the time of the Romans, and of British rather than German origin, was current in the South of England long before the names of either Hengest or Horsa were invented. Hence, the confusion and assimilation actually took place.

And what took place in respect to *Jut*-land, the supposed mother country of these Isle-of-*Wight*-men? Precisely the same. The J became V, and the *u* became *i*. In the Saxon Chronicle for A. D. 952, we find "Dania Cismarina quam *Vit*-land appellant. We also find the form *Vith*-landia."—Zeuss in *v. Jutæ*, 500; *note*.

But even the *à priori* objection is inaccurate. The words *Wil*liam and *Gu*glielmus are to one another as *Wi*tæ and *Ju*tæ.

Again, the population which the majority of writers called *Ju*thungi, Sidonius Apollinaris calls *Vi*thungi.

"Nam post *Vi*thungos et Norica bella."—*Carm.* vii. 233.

§ 97. Were the *Wiht*-wære, then, simply Saxons, Angles, or Anglo-Saxons, differing from the population of the opposite coast only in the fact of their being islanders? As far as we have hitherto gone, we have found nothing to make us believe that they were not.

At the same time they may have been something very different. They may have been distinguished from the ordinary Anglo-Saxons by the fact of their being islanders, but also by other characteristics besides.

Nay, it by no means follows that because they are not shown to be Jutes from Jutland by the particular evidence before us, they may not have been so nevertheless. I have not yet denied their Jute origin. I have only denied that the extracts from Beda prove it. They *may* have been Jutes; and a very slight amount of independent evidence would make me believe that they were. But there is none such. The great Jute cha-

racteristic, the termination in *-by* for geographical localities, is wholly absent throughout the island; nor does any other equivalent characteristic replace it.

'What were they, then? There *is* some evidence to make them something; though it is not very good. A passage in Asser makes them Britons; Alfred's mother "Osburg nominabatur, religiosa nimium (*sic*) fæmina, * Nobilis ingenio, nobilis et genere; quæ erat filia Oslac†—qui Oslac *Gothus* erat natione, ortus enim erat de *Gothis et Jutis;* de semine scilicit Stuf et Wihtgar—qui acceptâ potestate Vectis Insulæ—paucos Britannos, ejusdem insulæ accolas, quos in eâ invenire potuerant, in loco qui dicitur *Gwitigaraburgh* occiderunt, cæteri enim accolæ ejusdem insulæ ante sunt occisi aut exules aufugerant." —*De Gestis Alfredi Regis.*

Now, just as Canterbury (in A. S. Cantwæra-burg) was the chief town of Kent (the *Cant-wære* or *Cant-uarii*), so was Gwit-i-gara-burg the chief town of the *Gwit-gare* (note the fresh form in *-gw*), *Wiht-wære, Wiht*-sætan, *Vect-uarii* or Isle-of-*Wight*-men, a town which, in the present English, has lost the prefix *Gwit-*, and become *Caris-brook.* According to Asser this was the last stronghold of the Britons of *Vectis* (Wight).

So far, then, as there is any separate substantive evidence for the *Wiht-wære* being anything other than ordinary Angles or Saxons, or Anglo-Saxons, it is in favour of their having been Britons.

Observe the words *Gothus—de Gothis et Jutis.*

* A pentametre, and as such a quotation.

† It must be owned that this name is eminently Norse, and (as such) Jute of Jutland.—*Aslaug.*

CHAPTER XV.

SPECIAL AND DIRECT EVIDENCE OF BEDA, ETC.—JUTES.—JUTES (SO-CALLED) OF HAMPSHIRE, JUTNACYN.—WERE THERE ANY?—THE GOTHIC HYPOTHESIS.

§ 98. We must bear in mind the illustrations and criticism of the preceding chapter, and that in its most complicated form.

We must also note the texts of Beda and the Chronicle:—(1) "De Jutarum origine sunt Cantuarii et Vectuarii, hoc est ea gens quæ Vectam tenet insulam, et ea quæ *usque hodie* in provincia Occidentalium Saxonum *Jutarum natio* cognominatur, posita contra ipsam insulam Vectam." (2) "Of Jotum comon Cantwære —— and þæt cyn on West-Seaxum ðe man *gyt hæt Jutnacyn*."

The real evidence lies in the word "*usque hodie*," and "*gyt hæt Jutnacyn*,"="*yet called Jute-kin*."

Jut-na-cyn has already been stated to be the translation of *Jutarum natio*, the syllable *-na-* being the sign of the Genitive case Plural.

Who is to be followed, Alfred or Beda? Alfred, who deduces the *Wiht*-sætan from the Geats, but says nothing about any Jutnacyn; or Beda, who deduces both the Jutnacyn and the Wiht-wære from the Jutes.

Alfred's text gives the fewest difficulties.

Beda distinguishes the Wiht-wære and the Jutnacyn. Each, indeed, is of Jute origin; yet each has its own locality and its own name—like, yet different.

§. 99. I once thought that these differences might be reconciled by supposing the Jutnacyn to be the *exules* of Asser, remnants of the original Britons who, having fled from the swords of their enemies on the island, settled on the opposite coast of Hampshire as a refuge. Without adopting the evidence of Asser as to the historical existence of Stuf and

Wihtgar, I adopted the not improbable circumstance of a flight across the Southampton water.

Still there were difficulties.

1. The word *Jut-na-cyn*, though easily getting confused with *Wiht-wære* (or *Wiht-sætan*) when the two terms had each a separate and independent existence, and were each current in one another's vicinity, was not a word that was very easily accounted for when we attempted to deduce one from the other in the way of derivation. It must have been in the island that the name originated. If so, its primary form would have been the one in *Wi-* rather than the one in *Ju-*. Form for form, however, if we take an etymological view of the subject, the order of development would be reversed, it being more in accordance with experience for *Wi-* to grow out of *Ju-* than for *Ju-* to grow out of *Wi-*.

Again, even if we suppose *Jut-* to have grown out of *Wiht-*, we have only the name of the *Island*, and not that of its *occupants*. That these may have been called *Wihts* I by no means deny. I only think that in the face of the forms Wiht-*wære* and Wiht-*sætan* it is unlikely.

2. The statement respecting the Jute origin of the *Cant*-uarii (*Cant*-wære) was an objection. If error were here at all, it was error that we could not see our way to. There were no names to which the statement could be traced—names at one and the same time sufficiently like the word *Jute* to raise the idea of *Jut*land, as the country from which they were derived, and, also, demonstrably referable to some other source. If Kent, then, were a country wherein Jutes might reasonably be looked for, why not Hampshire also?

The Jutnacyn, therefore, were *not* in the same category with the Wiht-wære. They were, on the contrary, a more probable Jute population.

§. 100. The criticism of the previous chapter repeats itself here, and we ask whether there are any confirmatory facts to the statement respecting them.

There are none—none, at least, that point to the existence of *the Jutes of Jut-land*. The forms in *-by* are as absent in Hampshire Proper, as in the Isle of Wight; neither are there any other characteristics to replace them.

But it does not follow that because the evidence in Hampshire to the former existence of *Jutes of Jut-land* is insufficient, the evidence to the former existence of Jutes of another kind is equally so. It was not for nothing that the reader's attention was directed to the words *Gothus—de Gothis et Jutis* in Asser.

What if the *Jut-na-cyn* were a population of *Goths?*

This—the Gothic hypothesis—will be considered when the Kentish Jutes (so-called) have been disposed of.

CHAPTER XVI.

SPECIAL AND DIRECT EVIDENCE OF BEDA, ETC.—JUTES.—JUTES (SO-CALLED) IN KENT.—WERE THERE ANY?

§ 101. WERE there *Jutes* in *Kent?* The extract from Beda still stands as our text—"De *Jutarum* origine sunt *Cant*uarii et Vectuarii," &c. In the Chronicle, "Of Jotum comon *Cant*-ware and Wihtware," &c.

For the two supposed Jute localities—for the *Wiht-wære* of the Isle of Wight, and for the *Jutnacyn* of Hampshire—we had clear and definite contemporary evidence; evidence, which, however we interpreted it, meant something. It might not mean all that has been deduced from it; *e. g.* a connection between Wessex and Jutland, and a Danish occupancy of the south coast of England. Still it was a special statement to a fact capable of being known to the witness—a contemporary fact. It was evidence to something in the way of an ethnological, or a philological, peculiarity. In one of the cases it was worth but little; less, perhaps, than nothing. Still it was contemporary evidence to something or other. It was contemporary evidence to the *then present* existence of *Wiht*-wære, and it was contemporary evidence to the *then present* existence of a *Jut*-na-cyn.

For the Jutes of Kent this contemporary evidence is wanting. *Any* occupants of the soil of Kent would be *Cant*-wære, whatever might be their lineage. The assertion that it was Jute is a matter of opinion rather than fact, and it is only in the shape of an opinion that it has come down to us.

On the other hand, it is the opinion of a *second* witness; a second, and, apparently, an independent one — Albinus, the authority of the Kent, as Daniel was for Wessex.

Again,—although the external evidence to the fact of there

having been any members of that particular division of the great German family that bore the name of Jute is weaker for Kent than it was in the case of the Jutnacyn of Hampshire; the internal evidence to the fact of the Kentish population having been in some point or other (at present undetermined) peculiar, and other than ordinary Anglo-Saxon, is stronger. The very name of the country shows this.

The parts around were designated as *Saxon*, *e. g.* Sus-*sex*, Middle-*sex*, Es-*sex*, and Wes-*sex* = South Saxons, &c. Kent is never so designated. *Pro tanto* this is in favour of Kent being *other than Saxon*, though, by no means, conclusive. Sus-*sex*, Es-*sex*, seem to have been what the Kentish population called them.

The criticism of the two previous chapters repeats itself here, and we ask (as before) whether there are any confirmatory facts to the statement respecting the, real or supposed, Jutes of Kent.

There are two—perhaps more.

§ 102. *The word* LATHE—I give the bearing of this in the words of Lappenberg:—"While the other English shires are parted into hundreds or wapentakes, the county of Kent alone is divided into six *lathes* of regular form, and nearly equal magnitude. These divisions, which have, in later times become mere districts for judicial purposes, served at an early period for the quartering and muster of the general levy. But in the Jutish Law a military expedition is still called a *lething* (in modern Danish *leding*): whence the district summoned together for such an expedition may have borne that name."—Vol. I. p. 96, *Thorpe's Translation*.

§ 103.—*Hengest, a Jute hero.*—The poem entitled Beowulf has already been mentioned. Amongst its heroes are,—

1. Fin, the son of Folcwalda (Fin Folcwalding), a Frisian.
2. Hildeburg his queen, a Hocing (the Hocings are the Chauci).
3. Healfdene, the king of the Danes.
4. Hnæf (the *eponymus* of Hanover) a Hocing, his vassal.
5. Hengist, a Jute, his (Healfdene's) vassal also.

These two last invade Fin's territory. Hnæf is slain; Fin's followers also. The bodies are burned. Hengest remains, and meditates vengeance; which he effects by killing Fin and

carrying off his queen. The text is as follows; the translation being Mr. Kemble's. It may also be found in a version of Mr. Thorpe's as an appendix to the first volume of Lappenberg:—

1. "Hroðgar's poet after the mead-bench must excite joy in the hall, concerning Finn's descendants, when the expedition came upon them; Healfdene's hero, Hnæf the Scylding, was doomed to fall in Friesland. Hildeburh had at least no cause to praise the fidelity of the Jutes; guiltlessly was she deprived at the war-game of her beloved sons and brothers; one after another they fell wounded with javelins; that was a mournful lady. Not in vain did Hoce's daughter mourn their death, after morning came, when she under the heaven might behold the slaughterer of her son, where he before possessed the most of earthly joys: war took away all Finn's thanes, except only a few, so that he might not on the place of meeting gain anything by fighting against Hengest, nor defend in war his wretched remnant against the king's thane; but they offered him conditions, that they would give up to him entirely a second palace, a hall, and throne, so that they should halve the power with the sons of the Jutes, and at the gifts of treasure every day Folcwalda's son should honour the Danes, the troops of Hengest should serve them with rings, with hoarded treasures of solid gold, even as much as he would furnish the race of Frisians in the beer-hall. There they confirmed on both sides a fast treaty of peace."

Again,—

"Thence the warriors set out to visit their dwellings, deprived of friends, to see Friesland, their homes and lofty city; Hengest yet, during the deadly-coloured winter, dwelt with Finn, boldly, without casting of lots he cultivated the land, although he might drive upon the sea the ship with the ringed prow; the deep boiled with storms, wan against the wind, winter locked the wave with a chain of ice, until the second year came to the dwellings; so doth yet, that which eternally, happily provideth weather gloriously bright. When the winter was departed, and the bosom of the earth was fair, the wanderer set out to explore, the stranger from his dwellings. He thought the more of vengeance than of his departing over the sea, if he might bring to pass a hostile meeting, since he inwardly remembered the sons of the Jutes. Thus he avoided not death when Hunláf's descendant plunged

into his bosom the flame of war, the best of swords; therefore were among the Jutes, known by the edge of the sword, what warriors bold of spirit Finn afterwards fell in with, savage sword slaughter at his own dwelling; since *Guðláf* and *Osláf* after the sea-journey mourned the sorrow, the grim onset: they avenged a part of their loss; nor might the cunning of mood refrain in his bosom, when his hall was surrounded with the men of his foes. Finn also was slain. The king amidst his band, and the queen was taken; the warriors of the Scyldings bore to their ships all the household wealth of the mighty king which they could find in Finn's dwelling, the jewels and carved gems; they over the sea carried the lordly lady to the Danes—led her to their people. The lay was sung, the song of the glee-man, the joke rose again, the noise from the benches grew loud, cupbearers gave the wine from wondrous vessels."

Another poem of the same character of Beowulf, only more fragmentary, is the battle of Finnesburg. In this, Ordlaf, Guðlaf, Hnæf, and Hengest are again mentioned,—

Ordlaf and Guðlaf,
And *Hengest* self
Followed in his tract.

Thus—there is evidence, to Hengest's having belonged to the cycle of Jute fiction—either as a real personage, or as a legendary one.

§ 104. The confirmatory facts to the statements as to the, real or supposed, Jutes of Kent have been said to be *two*—*perhaps more*. The *two* I have given *in extenso*.

The others are,—

a. Certain points of Law common to possibly Jute Kent and probably Jute Northumberland. Gavelkind, according to Lappenberg, is one of these. But Gavelkind, according to Lappenberg himself, is British rather than German.

b. Certain points of dialectical similarity between Kent and Northumberland. But these are not enough. It should be shown that the Kentish not only agrees with the Northumbrian but differs from the Wessex, Essex, Sussex, and the other contiguous forms of speech. I think this cannot be done, as will be seen in Part III.

c. The "earliest record known to us," writes Lappenberg, "of any of the customary laws of Kent, refers chiefly to circumstances arising out of the feudal system; whilst the Jutish Law of King Waldemar the Second, in the thirteenth century, has adopted many Saxon and other principles; both, however, contain the enactment that the son, in reference to the property of the deceased husband, shall be considered of age in his 15th year; a principle which, though on one side in accordance with the Danish laws, and on the other valid among the socmen in other parts of England, is, probably, not derived from the Saxon laws, but rather to be referred to the immigration of the Jutes." —Vol. I., p. 97, *Thorpe's Translation*.

It is submitted that the latter part of this extract is by no means conclusive; indeed it only professes to give us a probability.

§ 105. The other two, then, stand over for consideration.

The question of the *lathes* will be discussed in the next chapter.

Respecting Hengest there is a good deal to be said, perhaps to little purpose any way.

In the first place, it should be remarked, that the real, primary, and ultimate authority on all these points, Beda, is not answerable for the fact of Hengest and Horsa having invaded Kent; nor yet for Hengest having been a Jute, as may be seen by the text and context. He only states that the Cantuarii were of Jute origin, that Hengest and Horsa were brothers, that Horsa was killed in Kent, and that the two are *reported* (*perhibentur*) to have been the first leaders of—what? *Not* the Jutes of Kent. Possibly of the Angli. Possibly of the German invasion altogether. Certainly not of the Jutes of Kent. "Advenerant autem de tribus Germaniæ populis fortioribus, id est *Saxonibus, Anglis, Jutis*. Porro de *Anglis, Orientales Angli, Mediterranei Angli, Mercii,* tota *Nordhumbrorum* progenies, id est illarum gentium, quæ ad Boream Humbri fluminis inhabitant, ceterique Anglorum populi orti sunt. Duces fuisse *perhibentur* eorum primi duo fratres," &c.

Now, no principle of construction can make *eorum* apply to the Jutes exclusively. Hence, the evidence of Hengest's having been either pre-eminently a Jute, or pre-eminently the

invader of Kent, is not that of Beda. It is from the Chronicle, and the other later authorities, as is the name of Vortigern, &c.

Hence, the evidence to Hengest having been a Jute is by no means unimpeachable, even if we land him in Kent.

Again—

The enemies against whom Hengest and Horsa help Vortigern are the Picts and Scots. The strategy here is, to say the least, somewhat peculiar—a fleet from Jutland, an enemy from Scotland, and a battle-ground in the Isle of Thanet.

The following extract puts these improbabilities in a still stronger light, so decidedly do they point to the North.

After marrying his daughter to Vortigern, Hengest, amongst other things, says to him:—"Ego sum pater tuus, et consiliator ero tibi .... invitabo itaque filium meum cum fratrueli suo, ... ut dimicent contra *Scottos;* et da illis regiones quæ sunt in Aquilone, juxta murum qui vocatur *Gual?* Et jussit ut invitaret eos: quos et invitavit, Ochta et Abisa, cum xl. chiulis. At ipsi, cum navigarent circa *Pictos*, vastaverunt *Orchades* insulas, veneruntque, et occupaverunt plurimas regiones trans mare Fresicum, *id est quod inter nos Scottosque est, usque ad confinia Pictorum.* Et Hengistus semper chiulas ad se paulatim invitavit, ita ut insulas de quibus venerant absque habitatore relinquerent: cumque gens illius crevisset et in virtute et in multitudine, venerunt ad supradictam Cantuariam."—*Historia*, cap. 38.

Hence the evidence to Hengest having landed in Kent is by no means unimpeachable, even if we admit him to have been a Jute.

The doctrine that there were *Jutes from Jut*-land in Kent is but imperfectly supported.

CHAPTER XVII.

SPECIAL AND DIRECT EVIDENCE OF BEDA.—THE SAXONS.

§. 106. THE extract from Beda, with its Anglo-Saxon translation in the Chronicle, still stands as a text—"De *Saxonibus*, id est ea regione quæ nunc *Antiquorum Saxonum* cognominatur, venere Orientales *Saxones*, Meridiani *Saxones*, Occidui *Saxones*."

"Of *Eald-Seaxum* comon East-*Seaxa*, and Suð-*Seaxa*, and West-*Seaxa*," *&c.*

Nothing is less of a special definite name than the phrase of Beda, viz. *Antiqui Saxones*. It is a substantive *plus* an adjective—an adjective which we may translate by more names than one—*old, ancient, original*. It is, in short, a *description*, not a *denomination*. This difference is by no means unimportant.

Yorkshire lies to the north of the Humber; but (in the nineteenth century at least) to apply the name "Northumberland" to Yorkshire would be incorrect. Correct as the term might be in geography, it would be wrong *as a name*. It would be no name at all. It would be no name, because it was not borne as such. It would, instead, be a descriptive term under the guise of a name.

Now, this guise, or appearance of a name, *is* taken on when we get to the Chronicle. *Es*sex, *Sus*sex, and *Wes*sex are very different renderings of *Orientales* Saxones, *Meridiani* Saxones, and *Occidui* Saxones, to what *Eastern* Saxons, *Southern* Saxons, or *Western* Saxons would have been. *Es*sex, *Sus*sex, and *Wes*sex are true *names*; of which the Latin forms are, probably, the translation. But *Eald-Seaxe* (Old-Saxon) is in a different predicament. It is a translation of *Antiqui Saxones*; just such a translation as *Eastern Saxons* would have been of *Saxones Orientales*. It is no name at all. It only looks like

one. There were no such populations as the Eald-Seaxe (Old-Saxons), except in the way that Great Britain is *Old* England, as opposed to Connecticut and Massachusets, or *New* England.

This is one caution against over-valuing the term *Eald*-Seaxan (*Old*-Saxons).

Another lies in the necessity of distinguishing—though only to a certain extent—the Old-Saxon of the Chronicle from the same word as applied to the language of the Heliand. (See Chapter IX.) The latter is a word of wholly recent origin, one which has been created within the present century. It replaces the exceptionable compound *Dano*-Saxon, compared with which it is an accurate and convenient word. But it is neither accurate nor convenient on the whole. It is inaccurate, so far as it implies that the language is really older than the Anglo-Saxon, and it will be shown to be inconvenient by what follows.

The Old-Saxon of the Heliand is the Saxon of Westphalia, as opposed to the Saxon of Hanover and Holstein.

The *Old*-Saxon of Beda is the Saxon of the Continent, as opposed to that of Britain; the Saxon of the parent country as opposed to that of the colony or settlement.

Suppose the two to be identical, and the Saxons of Sussex, Essex, Middlesex, and Wessex were no Anglo-Saxons, in the strict sense of the term, but Westphalian Saxons.

What we call *Anglo*-Saxon, as opposed to Old-Saxon, was, in the eyes of Beda, actual Old-Saxon, provided a single representative of the population that invaded England could be found in any part of Northern Germany.

But it may be said that the Old-Saxon of the Continent became Anglo-Saxon in England. This is just the conclusion I wish to guard against. The difference between the language of the Heliand and the language of the Chronicle is not a question of *time*, but of *place*. The Old-Saxon of the Heliand was spoken over a part from which the invaders of England are *not* deduced. The Old-Saxon of Beda was spoken over the parts from which the Anglo-Saxon *was* deduced, and a vast tract of country beside. The *Old*-Saxon of Beda included the *Anglo*-Saxon. The *Old*-Saxon of the nineteenth century is opposed to the *Anglo*-Saxon.

The identity, then, of the two is no identity at all. It is an identity of less than fifty years old. It is an identity not based on fact; but one of our own making. Hence, we must guard against premature deductions by arguing as if it had never existed. Beda's term conveys a fact; ours is only a symbol, for the present inquiry an inconvenient one.

It might not, perhaps, expedite our reasoning if, discarding the word Old-Saxon altogether, we guarded against any undue influence of name, by speaking only of the "*Antiqui Saxones*" and the "*people who spoke the Language of the Heliand.*" It would, however, make our conclusions all the safer.

The latitude with which Beda used this word was very great. He calls the *Boructuarii*, the descendants of the *Bructeri* of Tacitus, *Antiqui Saxones*. They were, perhaps, Franks. But this is an open question. There is *no* question about what follows—sunt autem Fresones, Rugii, *Dani*, *Huni*, Antiqui Saxones. In the doctrine that the Huns and Danes were Old-Saxons we have a measure of the value of Beda's evidence in respect to the geography of Germany.

§ 107. One or two instances of the use of this word are remarkable. It was applied to the Saxons of Westphalia not only by the Angles of Britain, but in the Papal briefs—by the occupants of the Continent. At first this looks as if the name were native.

But it is not so. It was the Anglo-Saxons of England who converted the Westphalians to Christianity, so that the name by which the latter were known in the Church histories of the time was the name which the Angles gave them. Probably, it was little more than a synonym for *Pagan*.

The Britons used it in this way. After mentioning certain kings of Deira and Bernicia (Northumberland) Nennius adds: —"contra illos quatuor reges Urbgen, et Riderchen, et Guallaric et Morcant dimicaverunt. Deodric contra illum Urbgen cum filiis dimicabant (*sic*) fortiter. In illo autem tempore aliquando hostes nunc cives vincebantur; et ipse conclusit eos tribus diebus et tribus noctibus in insula Metcaud; et dum erat in expeditione jugulatus est, Morcanto destinante pro invidia, quia in ipso præ omnibus regibus virtus: et xii. millia hominum

in uno die baptizati sunt cum eo. St. Paulinus Eboracensis eos baptizavit; et per xl. dies non cessavit baptizare omne genus *Ambronum*, id est *Aldsaxonum*."—*Nenn.* c. 66.

Here the Old-Saxons are the Angles of England, the Angles of the Bishopric of York, Angles that required baptism, Angles that bear the strange name of *Ambrones*; probably = *Humbrian* = *of the Humber*, though there are other interpretations.

§ 108. Any undue inference from the word *Old-Saxon* has now been sufficiently (perhaps superfluously) guarded against; and the question of identity may be taken up on its own merits.

The Antiqui Saxones of the English invasion were not the Old-Saxons of the modern scholars—except so far as they both belonged to that part of Germany which was called *Saxonia*.

As far, too, as the *Antiqui Saxones* of the English invasion differed from the Angles, they differed differently from the population that spoke the language of the Heliand.

a. The Anglo-Saxon of Wessex is not the language of the Heliand; nor are there any traces of any such dialect in any of the counties ending in *-sex—Sussex*, &c.

b. The language of the Heliand belonged to Westphalia. The Antiqui Saxones of the English invasion were, partly at least, in Holstein. This will be shown more fully when the Angles are noticed.

The Antiqui Saxones, then, of the English invasion did not differ from the Angles in the way that the word "Old-Saxon" as applied to the language of the Heliand, and the "Ealdseaxan" of the Chronicle would lead us to believe.

Did they differ at all? This will be answered (in the *negative*) when the text concerning the Angles has been considered.

CHAPTER XVIII.

SPECIAL AND DIRECT EVIDENCE OF BEDA, ETC.—THE ANGLES.

§ 109. THE extract from Beda, &c., still stands as a text:—"Porro de *Anglis*, hoc est, de illa patria, quæ *Angulus* dicitur et ab eo tempore usque hodie manere desertus inter provincias Jutarum et Saxonum perhibetur, Orientales *Angli*, Mediterranei *Angli*, Mercii, et tota Northumbrorum progenies, id est, illarum gentium, quæ ad Boream Humbri fluminis inhabitant, ceterique Anglorum populi orti sunt."

"Of *Angle* comon (se a syþþan stod westig betwix Iutum and Seaxum) East *Engla*, Middel *Angla*, Mearca and ealla Norðhymbra."

The chief criticism turns on the word *Angulus*, and the statement of its having been left a desert from the days of the Angle migration until Beda's. In two passages of Alfred, and in one from Ethelweard, we find a commentary:—

Alfred.—"And be wæstan Eald-Seaxum is Albe muða and Frisland. And þanon west-norð is þæt land, the man *Angle* hæt, and Sillende, and summe dæl Dena."—Oros, p. 20.

"He seglode to þæm porte þe man hæt *Hæþum*; se stent betwuhs Winedum and Seaxum, and *Angle*, and hyrð in on Dene . . and þa twegen dagas ær he to *Hæðhum* come, him wæs on þæt steorbord Gothland and Sillende and iglanda fela. On þæm landum eardodon *Engle*, ær hi hiðer on land comon."—Oros. p. 23.

"And on the west of the Old-Saxons is the mouth of the river Elbe and Friesland; and then north-west is the land which is called *Angle* and Sealand, and some part of the Danes."

"He sailed to the harbour which is called *Hæðum*, which stands betwixt the Wends and Saxons, and *Angle*, and belongs to Denmark . . and two days before he came to *Hæðum*, there was on his starboard Gothland, and Sealand, and many islands. On that land lived *Engles*, before they hither to the land came."

Etherwerd (in the eleventh century) writes:—"*Anglia* vetus sita est inter Saxones et Giotos, habens oppidum capitale, quod sermone Saxonico *Slesuic* nuncupatur, secundum vero Danos *Hathaby*."

For a modern map Alfred's Saxons are carried a little too far east; or we may say that his Angles lie too much westwards. With Saxons to the east of the mouth of the Elbe, it is not easy to find a place for the Angles in a north-west direction. Of course, some parts of Sleswick can be made west of some parts of Holstein. Generally, however, the two Duchies lie north and south of each other. True, there is one part of Holstein which lies east of the most eastern part of Sleswick, the parts between Kiel, Lubeck, and the sea,—but this was *not* Saxon. It was Slavonic, or Wend.

Subject to this exception the geography is pretty clear. And it is interesting as well. The three names for Sleswick are remarkable: one is Saxon, one Danish, with its characteristic termination *-by*, and the third Frisian; *viz*. Hæð-*um*. None of these facts are unimportant. *Hæþaby* shows that the Jutes were Danes; and so confirms one of our postulates. *Hæþum* suggests the antiquity of the present North-Frisian population.

Beda's form is *Angulus* not *Anglia*. It means the district which is called *Anglen* at the present moment, which is a part of the Duchy of Sleswick, which is literally an *Angle; i. e.* a triangle of irregular shape, formed by the Schlie, the Flensborger Fiord, and a line drawn from Flensborg to Sleswick. It may be the size of the county of Rutland or a little larger; and it lies on the side of the Peninsula furthest from England. Although one of the most fertile parts of Sleswick, it was likely to have been a desert; inasmuch as it was a frontier land, or March, between the Danes and the Wends of East-Holstein. But it was not likely to have been the mother-country of any large body of emigrants—still less for an emigration across the German Ocean—least of all for such a one as conquered England. I believe that if it supplied the Angle parts of Britain with Angles it would be well emptied; and more than this I do not believe. At present it is German—showing signs of having once been Danish, showing no signs (except the

name) of having ever been Angle. Some of its local names end in *by* (Danish = *town*) as Hus-*by*, Herreds-*by*, Ulse-*by*, &c.; some in *gaard* (= *house*), as Oe-*gaard*; whilst the other Danish forms are *skov* = *wood* (*shaw*), *hofved* = *head*, *lund* = *grove*, &c.

At one time I was inclined wholly to disconnect the name *Anglen* with the *Angles*; holding that it meant the *Angle* (or *nook*) *of land*, and was, simply, a geographical term misunderstood. Since then, however, I have been in the country, and found that there is a *second Angle district* to the south of Leck, and in the Frisian country; a fact which invalidates the previous view.

But, even if this be granted, it is only evidence to the fact of there being Angles in Sleswick *at the time of Beda*.

§ 110. There is no objection to this. There is no objection to the *Anglen* of Sleswick having been *part* of the country of the Angles who invaded England. The only objection lies against its having been *coextensive with the mother country of the English*. Yet this it must have been, if the Saxons were different from the Angles, and the Saxons be rightly placed by Beda and Alfred. There is no room for its extension elsewhere with Danes on one side, Saxons on the other, Wends on the other. If Alfred and Beda be right, and if the Saxons be other than the Angles, the latter populations are limited to the corner assigned to them. They cannot have extended *continuously* in any direction

But there may have been Angles elsewhere; isolated Angles, distant Angles; Angles whose area was discontinuous. Granted. If so, however, the Angles of Anglen were only *a part of Anglia* (*Angle-land*, or *England*). This was, perhaps, the case. Or the Saxons may have been Angles. If so, the discontinuity is reduced, perhaps, to nothing.

The objections lie not so much against certain Angles having come from Anglen as against the notion that the Angles were one thing, the Saxons another, and that both came from a fraction of Sleswick-Holstein; of which the *Angle* portion is called, not *Anglia*, but *Angulus*.

But Beda was an Angle—a learned Angle. How could he be mistaken? Easily. He wrote as an ecclesiastic, his authorities wrote as ecclesiastics, and the ecclesiastics used the nomenclature of the Franks, from whom they received their Christianity. Now the Franks knew nothing of any Angles. They simply knew of Saxons—Cisalbingians, or the Saxons to the south of the Elbe, Nordalbingians or the Saxons to the north of the Elbe. The *Danes* might have known that part of Northern Germany for what (I believe) it actually was; viz. *Angle;* but not the *Franks;* not the writers of *Latin;* not the *Britons*. The *Frisians*, too, may have known the *Angles* to the same extent as might the Danes; but Beda's authorities were Latin, British, Frank, each and all of whom knew nothing of *Saxons*. To ask for Angles was like asking an Alexandrian for the *Greeks*, or a Roman for the *Hellenes*.

But why make the distinction? why not identify the two? why have one history for the Angles, and another for the Saxons? Remember how the Ecclesiastical History was written. It is only for the northern parts that Beda himself is, at one and the same time, the witness and the critic. For Essex, Kent, &c., he took the accounts of Nothelm, Albinus, &c., &c. These used the terms of the country around them, and may possibly have surprized Beda in talking of *Saxons* only—in ignoring (so to say) the *Angles*. These it is who give us such names as *Occidui Saxones*, &c.—names which Beda took as he found them, and explained—not (in my mind) rightly, but not unreasonably, according to the lights of his time.

His authorities, then, forced him to separate the Angles from the Saxons.

But the same authorities (along with many others) made *Saxonia* a large district.

The more they did this, the less room they left for *Anglia*, or *Angle*-land.

§ 111. The exceptions that lie against Beda's statement respecting the Angles are limited. No exception *at all* is taken to the statement that the East Anglians, Mercians, and Northumbrians, came from the Angles of Germany.

No *grave* exception is taken to the statement that they

came from that particular part of Sleswick which is called *Anglen*.

The real exceptions lie—

1. Against the doctrine that it was from this small district of *Anglen* that the Angles came *exclusively*; and—

2. Against the doctrine that the Angles and Saxons were notably different.

§ 112. *What was the district called Anglen?*—If we now ask what this small district of Anglen really was, we find that it was one of two things.

a. It was part of the original Saxon area; or—

b. It was a portion of an area *not* originally Saxon, but, on the contrary, either Danish or Slavonic (like East Holstein), which certain Angles from the parts to the south of it may have appropriated, even as they appropriated Britain.

I incline to the latter of these views. Let the Angles of the Holsatian part of Nordalbingian Saxony (so called by the Franks) press so far westward as to encroach upon the Slavonians of the parts about either Lübeck or Kiel, and touch the Baltic. Then the occupation of such a district as Anglen becomes easy.

What are we to say to the statement of this same *Angulus* being a desert from the time of the *Angle* emigration? I incline to the opinion that this is what it actually was; though not for the reason given by Beda. It lay on the confines of three different, and often hostile, populations: the Angles, or Anglo-Saxons, of Nord-albingia; the Danes of Sleswick, Jutland, and the Islands; and thirdly, the Slavonians of Eastern Holstein. Under such conditions, it may easily have been a Debatable Land or *March*, and (as such) a land not over-well cultivated or over-fully inhabited.

§ 113. *Saxon no native name.*—It is not difficult to perceive towards what conclusion the remarks upon the partial character of the district of Anglen, along with the prominence given to the Frank usage of the word *Saxon*, are directed. They lead to the inference that the Saxons of Great Britain, so far as they were not Westphalians or *Old*-Saxons in the newest sense of the word (which they were *not*), were simply Angles under

another name. This requires both further illustration and further proof. The opinion, as it stands, goes to the length of denying that the Saxons of Es-*sex*, Middle-*sex*, Sus-*sex*, and Wes-*sex* were *Sax*-ons *in their own eyes*, and in their own *original* nomenclature at all. They were *Saxons* only as the Hellenes were *Greeks*, *i.e.* in the language of their neighbours, but not in that of themselves.

Originally, or at the time of their first settlement, this is held to have been the case. At a later period, of course, the name was adopted by the Southern Angles themselves. If it were not so, we should have no such names as Es-*sex*, Middle-*sex*, &c. *Originally*, however, it was strange to the population which afterwards bore it. Their neighbours gave it. It was afterwards taken.

The support of this doctrine, when exhibited in the most general way, lies in the three following statements.

1. Firstly, that there is no evidence of the Saxons of even the most Saxon part of England having called themselves by that name, or, indeed, by any name different from the ordinary Angles of Norfolk, Suffolk, the Midland Counties, or the Northern Counties.

2. Secondly, that there are certain presumptions against their having done so; and—

3. Thirdly, that all the well-authenticated facts connected with the name are explicable by means of the hypothesis just suggested; *viz.* the hypothesis that the Saxons were Saxon only as the Hellenes were Greek, *i.e.* Saxon in the eyes of their neighbours and frontagers only.

The first and third of these lines of criticism go together, inasmuch as the fact of certain parts of England being undeniably designated by names ending in -*sex* (=*Saxon*), requires explanation. If the word were originally foreign, its adoption has been eminently complete. The German writers use it; Beda himself, Angle as he was, being one of them. As to the names Es-*sex*, Sus-*sex*, and Middle-*sex*, they are standing witnesses, even to the present day.

And over and above these, there was, in the period before the Norman Conquest, a Wes-*sex*. This is a primary and palmary

fact, patent and undeniable; and I admit at once that it is *primâ facie* evidence in favour of the name being native and indigenous, and against it being of foreign origin. Foreign, however, it was.

That the *Angles* were called *Saxons*, by their neighbours, is clear.

a. The Welsh, Gaels, and Armoricans call us, at the present time, not Englishmen, but *Saxons;* just as the Romans called the Athenians, not Hellenes, but Greeks.

b. The Romans did the same.

c. The Franks did the same.

There is neither doubt, nor shadow of doubt, upon any of these points; neither is there any as to the populations using the term, being not only in contact with the so-called Saxons, but in such contact as to make their nomenclature (whatever it might be) eminently likely to establish itself. Thus, the Romans and Britons were on the spot, agreeing with each other in the use of the particular name under notice; so that, supposing there were actually a native name, the chances against it would be two to one, *i.e.* there would be a Roman and a Keltic name against a German name single-handed. This, perhaps, is the language of the betting-ring rather than the library. It is, however, justifiable, if not necessary. The *double* source of the influences which would determine the preponderance of the one name over the other is an important item in our criticism.

But the Franks, a *third* population, used it also; and, like the Romans and Britons, the Franks came in contact with what they called Saxons — with the Saxons of the Continent certainly, with the Saxons of Britain, probably. In the sequel it will be shown that a special case can be made in favour of the Germans of Kent having been, more or less, Frank; a fact which, if real, strengthens the present view. But it is not considered necessary. The Frank origin of the Kentish and Saxon Christianity is sufficient.

It is submitted, then, that the presumed influences under which a name originally foreign to certain districts in the south of England came to be naturalised are sufficient.

Although the names Sus-*sex*, &c., form nine-tenths of the

evidence in favour of Saxon being a native name, they are not altogether the only points to be considered.

If we turn to the *Abrenuntiatio* (p. 85), we shall find the name *Sax*-neot. Without saying what this means (for the interpretations are more varied than satisfactory), we may say that it looks like the name of some mythic person, whom the populations to whom the *Abrenuntiatio* applied, on their conversion to Christianity, were compelled to forswear. It might be the name of an *Eponymus*. It might be this; and though it might not be anything of the kind, the probability of being so is a fact not without its value. At one time, I put it higher than I do now.

Secondly, comes the story of *nimeþ eowre Seaxas = take your knives;* in which judicious scholars have allowed themselves to believe. I class this, as an etymology, with those puerilities which abound amongst the Low-Germans.

Ask at Hamburg the derivation of the neighbouring town of *Altona*, and you may be told that it means *all-to-nah = all-too-near*. *Wolmirstadt*, again, is *wolh-mir-steht;* Charlemagne, or some one else, having looked at, and approved of it, and said so. In Temme's legends for Altmark, Pomorania, &c., the derivations of this kind are to be counted by the score. To the limbo of these I relegate the *nimeþ-eowre-Seaxas* story.

Against these put the presumptions in favour of the opposite view.

1. No clear distinction has ever been drawn between, *e.g.* an Angle of Suffolk and a *Saxon* of Es-*sex*.

2. The Romans, who knew, for some parts at least, every inch of the land occupied by the Saxons of Germany, as long as there is reason for believing that they took their names from German sources, never use the word *Saxon* at all. It is strange to Strabo, Pliny, and Tacitus. Ptolemy is the first who uses it; and Ptolemy it is whose sources more especially seem to have been other than German; at any rate less exclusively German than those of Tacitus.

3. Whenever we find a population called *Saxon*, we find that, for some reason or other, it has some other name as well. Thus, the so-called—

a. Saxons of Holstein are *Nordalbingians* when the name is general; *Ditmarsi, Holsati,* and *Stormarii* when we have them in detail.

b. Those of Northern Germany are *West-phali, Ost-phali,* and *Angarii.*

Of all such synonyms, *Saxon* is the least evidently German in respect to its form.

4. The king who is said to have determined that England should be called the *Angle*-land, was a king of the West-Saxons, Ecbert.

I consider this a difficulty on one side fully equivalent to all the others on the other put together. It is as if the king of Prussia should propose that all Germany should call itself *Austria.*

5. Throughout the whole range of the Anglo-Saxon literature the two terms are used indiscriminately; so that we have Angles in Wessex, &c., and Saxons in Mercia and Northumberland. The rule for this inconsistency has yet to be laid down. I believe it to depend upon the sources from which the historian derives his information. When Frank, Latin, or British, *Saxon,* when native, *Angle* is the term.

§ 114. *Diffusion and origin.* — How the name spread abroad, and took root when once originated, is transparently clear. The Franks (to go no further) promulgated it; the Franks, who knew of nothing between the Eyder, and the Rhine, and the Elbe, but themselves, Slavonians and *Saxons.* From them the Romans may have taken it; the Britons from the Romans, or *vice versâ.*

The *origin* is a hard question. When we look at the *Saxons* of Ptolemy, and consider both the distance and the smallness of their occupancy, the improbability of the diffusion of the name being owing to a diffusion of the population becomes manifest. The absolute bodily spread of the Saxons of Holstein and its three islands over half Germany and Britain is, of course, no physical impossibility. It is only an utterly unnecessary assumption. It was the *name* that went abroad, and that because a certain population which called some other population by a certain name enlarged itself.

Let us go back to a name that has already helped us to

an illustration, and look at the word *Greek*. What does it mean? The populations who called themselves *Hellenes;* and who did *not* call themselves *Greeks*. Yet we even in England talk of *Greece*. Why? Because a certain population which called the Hellenes *Græci* diffused its language over one vast section of Europe, and much of its civilisation over another. The name became current, important, widely spread. Why? Certainly not, because the *Græci* themselves were a nation of conquerors. On the contrary, they were, in and of themselves, the obscurest of the obscure; as much so as even the Saxons of a fraction of Holstein and its three islands. They never enlarged themselves at all. Yet their names grew great, and reached far. Why? Simply because the medium through which it circulated was an ever-widening one.

Hence, *mutatis mutandis*, the insignificant *Saxones* of the neck of the Cimbric Chersonese, and the three Saxon islands, first mentioned by Ptolemy, are the analogues of the equally unimportant *Græci* of Epirus; and these it was whose name eventually comprised populations as different as the Angles, and the Saxons of Saxony, even as the name *Græcus* in the mouth of a Roman comprised Dorians, Æolians, Macedonians, Athenians, Rhodians, &c.

With this view, there is as little need to consider the Saxons of the neck of the Cimbric Chersonese to have been *exactly* what the *Angles* were, as there is for considering the *Græci* of Greece to have been exactly what the Athenians were.

There need not have been much likeness. There need not have been any. There may, indeed, have been absolute difference.

It is by no means certain that the *Græci* belonged to the Hellenic at all. On the contrary, a strong case can be made out for their having been Illyrians. The fact of their name being afterwards applied to the Hellenes proves nothing in respect to its original power.

Neither is it certain that the Saxons of Ptolemy were Germans at all. On the contrary, a fair case can be made out for their having been Slavonians, or even Fins.

Still there was a real body of Saxons, though a small one.

And their name spread both west and east, north and south.

The Finlanders call the Germans *Saxons*. Why? I think that we can best explain this by supposing the Slavonians of the East promulgated the name much in the same way as did the Franks of the West.

§ 115. Let us now take a retrospect.

The evidence of Beda, and the writers after him, has been invalidated in three quarters, and upon three points.

1. As to there having been *Jutes from Jutland* in the Isle of Wight, in Hampshire, and in Kent.

2. As to there having been any notable distinction between the Angles and the Saxons.

3. As to the small district of Anglen having exclusively supplied its Angle population to England.

The denial of any original difference between the so-called Angle and the so-called Saxon parts of England is simply a common-sense view of the question. *De non apparentibus et non existentibus eadem habenda est ratio.* Nothing is explained by assuming a distinction; whereas the supposed necessity of finding traces of one has led to considerable exaggeration in the appreciation of certain local differences—whether of dialect or manners; the fuller exposition of which will appear when we treat of the dialects of the English language.

The same applies to the Jute question.

The questions as to the magnitude of the Angle area and the homogeneity of its population are connected. So is the question as to the rate of diffusion of the Angle form of speech. The larger the area, the smaller the time necessary for the displacement of the original British. So that it is not a matter of no importance whether the original Angle area be made large rather than small. Common sense requires it to be made as large as is compatible with the Slavonic, Danish, Frisian, and *Old*-Saxon areas.

The writer thinks it necessary to give prominence to this common-sense character of his results. Had they been positive rather than negative, and had they led to complications rather than to simplification, a greater amount of criticism would have been necessary. But such has not been the case.

Once admit that the evidence of our primary authorities is not so conclusive as to put further criticism out of the question, and the results at which we arrive by treating the subject on its own merits are all characterised by simplicity, and by the absence of complex movements in the way of migration, displacement, conquest, obliteration of characteristics, and the like.

On the other hand, the impugnment of evidence so respectable as that of the great luminary of the eighth century is a point upon which a difference of opinion may be expected. To some critics the credibility of old accounts is the rule, with others the exception.

CHAPTER XIX.

CONCURRENT, CONFEDERATE, AND SUBORDINATE INVASIONS. THE JUTES (SO-CALLED) OF KENT AND HAMPSHIRE.—WHO WERE THEY?—THE GOTHIC HYPOTHESIS.—THE FRANK.

§ 116. LET us suppose that, instead of the different parts of England being named according to the different divisions of the soil, they were named after the different divisions of the population; so that instead of the county Kent we talked of the *Kentings* or men of Kent, and, instead of the county Warwick, we talked of the *Hwiccas*, and so on. If we did this, we should do no more than was done by the Anglo-Saxons, with whom, *Kenting* and *Hwiccas* were real names. The supposition in question will make our illustration all the clearer.

With this nomenclature let us investigate the ethnology of the United States of America. The main population is English, some part of it from Kent, some part of it from Warwickshire, some part of it from elsewhere. Some part of the migration consisted of *Kentings*, some of *Hwiccas*, and so on. Now these Kentings and Hwiccas are mere details of the English name, to which an analysis of the component parts of the English population has led us. They are Angles under another designation.

Now, although nine out of ten of the elements of the American occupancy may be referable to the English name—constituents, elements, details (so to say) thereof—the concurrent existence of populations other than English is by no means precluded thereby. The English migration may not have been made single-handed. There are such things as un-English parts of England. To say nothing of Wales, Corn-

wall, the Isle of Man, Scotland and Ireland, there are Orkney and Shetland, which were more or less Norwegian when America was first discovered, though English in respect to their political relations. In a question of ethnology these could scarcely be called details of the English name.

Then there are the Dutchmen of Holland, and the Swedes of Sweden, the former of which colonised New York, and the latter those parts of Pennsylvania and Delaware which bore the name of New Sweden, a name now obsolete, but once current. These are, assuredly, no details of the English name.

So much in the way of illustration. To the populations in the predicament of the supposed Kentings and Hwiccas, the details, elements, or constituents of the English name, I shall attribute what will be called a *subordinate* part in the migration, and call them the *subordinates* of the Angles. To the populations in the predicament of the Dutch and Swedes, I shall attribute what will be called a *concurrent* part in the invasion, and call them the *concurrents* to the Angles.

Confederates.—A *subordinate* member of the Angle name is in the relation of the old Kentings and Hwiccas to the Angles (Anglo-Saxons) at large, or in that of a Cumbrian, a Lancastrian, or a Northumbrian, to the present Englishmen—the name being taken in its general sense.

A *concurrent* agrees with the Angles in having invaded Britain, and helped to effect certain changes in the original Roman, Britannic, or Romano-Britannic population. No necessary relation to the Angles is implied hereby, either ethnological or political. *One* concurrent invasion has already been indicated, viz. that of the Goths of Gaul. It is supposed to have been perfectly independent of the Angle movements.

Intermediate to the invasion of a concurrent and a subordinate is that of a *confederate* population. Supposing that it had been true that (the Jutes being one population and the Angles another) a leader like Hengest had succeeded in uniting them into a common league against Britain, what would have been the phenomenon? An invasion—but not that of a subordinate population, inasmuch as the Jute name was no detail of the Angle. Nor yet a concurrent invasion; since the movements of the two nations were, by no means, inde-

pendent of each other. It would be an instance of *confederacy*, the part that the Jutes took being that of members of an Angle league. Presuming the Angles to have been at the head of this, we may still speak of them as being subordinate. The subordination, however, is not ethnological but political, and the sum in which the Jute is an item, or detail, is not the Angle name, but the Angle political power.

As the criticism of the *concurrent* invasions is the simplest, it comes first in order.

§ 117. *Concurrent invasions—the Goths of Gaul—Gothic hypothesis.*—The reader is referred to Chapter XV., and to the term *Gothic hypothesis*.

This means that the *Jutnacyn* were no Jutes from Jutland, but Goths from Gaul.

If they were this, the invasion they effected was, to all probability, eminently independent of the movements of the Angles.

So that they were anything but members of an Angle confederacy.

Still less were they details of the Angle name. Hence—

The Gothic invasion from Gaul (if real) was eminently of the kind that has been called *concurrent*.

Until I find reasons to the contrary, I shall place the supposed Jutes of Kent in the same category with the supposed Jutes of Hampshire; holding both to be, no *Jutes*, but *Goths*.

It can easily be shown that a Gothic invasion of Britain from Gaul was both possible and probable.

A.D. 410, Alaric, who was neither Frank nor Burgundian, but a *Goth*, died, having sacked Rome for the third time and ravaged Italy. Adolphus, his successor, invades Gaul, and not only Gaul, but Spain.

A.D. 419, Goths are established in Aquitaine, which they hold until their final reduction by Clovis A.D. 508.

Britain and Armorica had become independent of Rome A.D. 409.

From A.D. 419 to A.D. 451 was the prosperous reign of the Gothic King Theodoric.

Spain, meanwhile, was more Gothic than even Gaul.

It can no more be denied that there were opportunities for a Gothic invasion of either Kent or Hants, or both, during the

first half of the fifth century, than it can be affirmed that such actually took place. There is no direct evidence either against or for this. There is, however, evidence that the Britons moved against the Goths, and what more likely than such a movement to bring on a retaliatory invasion of their own exposed coast?

A.D. 407, a private soldier named Constantine is raised to the Purple by the Legions of Britain. He attempts the reduction of Gaul. Amongst his generals we find a Nevigastes, and a Gerontius—the former with a German, the latter with a British name (Geraint, Grant). Sarus, the *Goth*, is ordered by Honorius to oppose him. *Ulphilas*, too, with his eminently Gothic name, is employed against him.

A.D. 411 Constantine dies.

There is evidence, then, during a period when evidence is pre-eminently scanty, to warlike relations between the Britons and the Gallic Goths—and this (considering the times) is as much as can be expected.

§ 118. I will now go to another series of facts.

Take the names of the first Norman Kings of England—William, Henry, Richard.

They are not Saxon—*Edward* does not come in till later.

Nor yet scriptural—*John* is the first that is so.

Nor yet French—*Charles* and *Louis* have no place in the list.

Nor yet (as might be expected) Scandinavian—*Harold, Olaf, &c.*

They are more Frank than aught else; but—

They are not so much Frank as they are Gothic—

Henry = Hunneric;

Richard = Reccared.

William, probably, belongs to the same class.

Now I think that two of these names appear in the earliest history of Wessex—in the earliest but not in the later—in the hypothetically Gothic period, but not in the unequivocally Saxon.

Cynric (I think) = Hunneric,

Cwichelm = William.

In Cuth-*gils* and Cyne-*gils* the final syllable is, at least, as Gothic as aught else. So is the *-fus* in Cen-*fus*.

Ceawlin and Cerdic, be it remembered, have not been recognised as historical.

Again—believing the whole story of *Vortigern* and *Vortimer* to be legend and confusion, I now ask whether these are British names at all—whether they are not rather German, and (if German) whether one, at least, is not Gothic; whether *Vortigern* is not *Fritigern*—due allowance being made for it having passed through a British or Roman-British *medium?*

Vortimer, again, is suspiciously like the Gothic *Withimer;* though not less like the Allemannic *Fraomar*. It is also like the Frank *Riotimus*.

Then, whether historical or not, we have the Kentish *Eormenric* to compare with the Gothic *Hermanric*.

§ 119. The explanation of the word *lathe* still stands over. It is not required to be good of itself. It is only required to be good against the Jute *leding*.

Now a word nearer in form to *lathe* than *leding* is a word which we get in the Latin form *Leti, Læti, Liti*. It was a word belonging to the military nomenclature of Rome during the fourth century, as well as earlier and later. It applied to the parts opposite Britain—*viz.* Gaul and Western Germany. It denotes a certain kind of military retainers; the service which they were in being the Roman. Julian, in Ammianus (xx. 8) writes of them thus:—"Equos præbebo Hispanos, et miscendos gentilibus atque scutariis adolescentes *Lætos* quosdam, cis Rhenum editam barbarorum progeniem, vel certe ex deditiis, qui ad nostra desuescunt."

Zosimus gives the form Λετοί. He speaks of the emperor as being a barbarian by blood, who by residence amongst the Λετοὶ, a Gallic nation, acquired some Latin cultivation (2, 54).

Μαγνέντιος, γένος μὲν ἔλκων ἀπὸ βαρβάρων, μετοικήσας δὲ εἰς Λετοὺς, ἔθνος Γαλατικὸν, παιδείας τῆς Λατίνων μετασχών.

Belgium, Gaul, and the Rhine, being the chief localities in which they were settled, we are not surprised to find certain gentile adjectives connected with their name. The *Frank* Læti were settled by Maximianus, as we learn from Eumenius (*Panegyric. Constant. Cæs.* A.D. 296):—"Tuo—natu Ner-

viorum et Treverorum arva jacentia *Lætus* postliminio restitutus et receptus in leges *Francus* excoluit."

The Notitia has a long list of them—Præfectus *Lætorum* (p. 581) Teutoniciarum, Carnunto Senoniæ Lugdunensis.

Præfectus *Lætorum* Batavorum et gentilium Suevorum *Bajocas* et Constantiæ Lugdunensis secundæ (observe the word *Bajocas* = *Bayeux*).

Præfectus *Lætorum* gentilium Suevorum, Cenomannos Lugdunensis tertiæ.

Præfectus *Lætorum Francorum*, Redonas Lugdunensis tertiæ.

Præfectus *Lætorum* Lingonensium, per diversa dispersorum Belgicæ primæ.

Præfectus *Lætorum* Actorum, Epuso Belgicæ primæ.

Præfectus *Lætorum* Nerviorum Fanomartis Belgicæ secundæ.

Præfectus *Lætorum* Batavorum Nemetacensium, Atrebatis Belgicæ secundæ.

Præfectus *Lætorum* Batavorum Contraginensium Noviomago Belgicæ secundæ.

Præfectus *Lætorum* gentilium Remos et Silvanectas Belgicæ secundæ.

Præfectus *Lætorum* Lagensium, prope Tungros Germaniæ secundæ.

Præfectus *Lætorum* gentilium Suevorum, Arvernos Aquitaniæ primæ.

In this list we find the numerous genitive cases take two forms—one in *-nsium*, and one in *-orum*. The former seems to denote the particular head-quarters, the latter the nation, of the different *Let* companies, or colonies. Of these it may be remarked that the former are Gallic rather than German, the latter German rather than Gallic; so that the general view of the *Læti* is that they were German settlers on Keltic soil.

Zeuss (*v. Leti*) to whom all the texts that have been laid before the reader are due, concludes with a notice touching the question of the Kentish *lathes* most closely. The Theodosian Code states "That the lands appointed to the *Læti*, who were removed to them, were called *terræ Læticæ*."

Such a word, then, as *lathe* may have grown out of [*terra*]

Lætica, such a [*terra*] *Lætica* having previously grown out of *Læti*.

That there were *Læti* and [*terræ*] *Lætiæ*, and possibly *lathes* in Romano-Keltic Gaul, has been shown abundantly. That these were the same in the Romano-Keltic Britain (especially in the parts nearest Gaul) is probable. At any rate the Kentish *lathe* is the Germano-Gallic *Læt.* rather than the Jute *led-ing*.

At the same time the *Notitia* gives no *Læti* to Britain: a fact which may be considered conclusive against there having been any there when that document was composed. But the latest date of the *Notitia* is A.D. 408; previous to the disturbances that so broke up the Roman Empire in Gaul. Pending these, the system of *Læti* may have been extended across the Channel from *Bayeux* or *Artois* (*Bajocas* and *Atrebates*) to *Dover*, *Lymne*, or *Richborough* (*Dubris*, *Lemanis*, *Rutupium*); from one portion of the *Litus Saxonicum* to another.

At any rate the present etymology is good against the Jute one.

§ 120. *The Frank complication — Hampshire, Gothic; Kent, Frank.* It has been shown that the *Læti* were Germans. But it has not been shown that they were *Gothic* Germans. Yet this is required by our hypothesis—in its present form, at least.

Can it be done? What say the previous extracts? It cannot be said that they say much in favour of the Gothic division of the Germans being the one to which the *Læti* were peculiar. Perhaps, it may be said that they are adverse rather than favourable to this view. They are so. If the particular division of the Germans to which the *Læti* are most particularly referred must be named, the evidence points chiefly to the *Franks*—to the Franks rather than to the *Goths*.

If so, the suggested explanation of the word *lathe* proves too much. It proves not that the *Jutes* were *Goths*, but that the Jutes were *Franks*. Nor is it the only word that points in this direction. *Vortimer* was fully as Frank as it was Gothic. So, perhaps, were the rest.

This Frank character of certain words introduces a complication, and leads to the following doctrine, *viz.*:—

1. That in Hampshire the population was simply Gothic, whereas—

2. In Kent it was Gothic and Frank as well.

There is some nice balancing of facts here; inasmuch as the direct and special external evidence is more in favour of the Goths than the Franks, whilst the internal is more in favour of the Franks than the Goths. So weak, indeed, is the internal evidence in favour of these latter, that, were it not for the texts of Beda and others, the names of *Cyneric* and *Cwickhelm* would have received no notice; in other words, they would have been thought too unimportant to serve as the basis of even a suggestion. Though just more Gothic than Angle, they would never have been contrasted with the other Anglo-Saxon names if the locality to which they belonged had not previously been contrasted with the other apparently more Angle parts of Britain. So that they were simply subsidiary facts in a case resting upon other grounds. To the names *Vortimer* and *Vortigern* this appears even still more strongly. They were just considered Gothic, because the area which supplied them was possibly a Gothic one. In East Anglia, or Mercia, they would have passed in the crowd of ordinary Angle appellations.

So that, practically, it is the external evidence that assigns the Goths to Kent and Hants rather than the internal; the internal evidence merely being in favour of the *Goths* rather than the *Jutes* having supplied the true Jutnacyn and Cantuarian populations. For, upon this point, it may be said with truth, that however slight may be the value of such names as *Cyneric* and *Vortigern*, in favour of a Gothic, they are stronger than anything that can be adduced in support of a Jute, hypothesis.

The greater geographical proximity of the Goths of Gallia, as compared to that of the Jutes of Jutland, points in the same direction.

The Gothic hypothesis, then, means that the Jutnacyn and Cantuarii were Goths rather than Jute, *assuming that they were either one or the other*. This it does upon the strength of the evidence of Beda, &c., evidence which it takes as it is found. It is supposed to mean *something*, *i. e.* not to be erroneous altogether. It is supposed, too, to mean something connected with the root, *G-t* (or *J-t*); though not exactly what its author is considered to make it mean.

It is supposed to mean *something*, on the principle of not multiplying objections against the testimony and opinion of respectable writers unnecessarily. At the same time, the likelihood of its being (like *Wiht-wære*) an error altogether must be borne in mind. Hence, the Gothic hypothesis means not so much that there were absolute Goths from Gaul in Hants and Kent, as that there were *Goths or nothing*—nothing, at least, connected with the roots *G-t* and *J-t*.

If it were not for a certain amount of special and direct evidence on the part of Beda, and others, there would be no question of *Goths*.

If it were not for a certain amount of internal and circumstantial evidence, deduced from the collation of names, and scattered texts, there would be no question of *Franks*.

If either series of facts were abandoned, the question would be simple; *i. e.* one of Franks alone, or one of Goths alone.

If both are admitted, the hypothesis becomes—

1. Simply Gothic for Hampshire.
2. Frank and Gothic for Kent.

§ 121. But there are further complexities. Up to the present time, we have admitted the special and direct external evidence of Beda and others to the existence of Goths in the south of Britain *in toto*, *i. e.* as good for Kent and Hants equally. What, however, if it is to be admitted only *partially*, *i. e.* as valid for the Jutnacyn of Hants, but not as valid for the Cantuarii of Kent? In such a case our views must change, and our hypothesis (though still assuming both Franks and Goths,) becomes—

1. Simply Gothic for Hampshire; and
2. Simply Frank for Kent—simply Frank instead of Frank and Gothic.

To this doctrine I incline. The evidence as to the population of Kent being other than ordinary Angles, or Anglo-Saxons, is stronger than it is in the case of Hampshire. The evidence, however, of these same Kentish *differentiæ* being referable to a *Gothic* invasion, is weaker. On the other hand, the indications of Frank occupancy are decided in Kent, non-apparent in Hants.

In this we find a reason for *not* following Beda, &c., who

places both Kent and Hants in the same category. Indeed, we must rather charge him with an inaccuracy, slight and natural, but still an inaccuracy. That Kent and Hants had, each, certain *differentiæ*, he knew. That the same explanation served for both, he inferred. From the origin of the Jutnacyn he argued to that of the Cantwære.

Such are the two forms of the Gothic and Frank hypotheses —one making Kent Gothic as well as Frank, the other making it Frank only. I incline to the latter,—only incline.

The evidence to a Frank occupancy in Kent has already been given—in part, at least. Now—

a. Strengthen the inference (p. 162) from the contrast between the name *Kent*, on one side, and Sus-*sex*, &c., on the other, by the following fact, a fact of considerable weight against the Jute doctrine. *Saxon* was a name which a Frank population would give to its neighbours, even if they were *Angle* in the strictest sense of the term. *Angle* is the name which a Jute population would give to a Saxon. The Jutes know nothing of any Saxons. They are all Angles. The Franks know little of any Angles. They are all Saxons.* If a Jute had given a name to Es-*sex*, it would have been East-*Angle*. If a Frank had given a name to East-*Anglia*, it would have been Es-*sex*. What the Goths would have called an Angle population is uncertain.

b. The name *Hhlothære*, as that of a king of Kent, is eminently Frank, and not at all Angle.

The chief facts, however, are the word *lathe* (if the suggested etymology be correct) and the names in -*sex*.

The date of this supposed Frank settlement is uncertain.

In the Panegyric of Mamertinus on the Emperor Maximian, one of the emperors who shared the divided power of Diocletian, we find the following extract, which gives us an army of Franks in the City of London, as early as A.D. 296. It is a passage of which too little notice has, hitherto, been taken:—"By so thorough a consent of the Immortal Gods, O unconquered Cæsar, has the extermination of all the enemies, whom you have attacked, *and of the Franks more especially*, been

* This assumes that the name in -*sex* (Sus-*sex*, &c.) originated in Kent. (See p. 162.)

decreed, that even those of your soldiers, who, having missed their way on a foggy sea, reached the town of London, destroyed promiscuously and throughout the city the whole remains of that mercenary multitude of barbarians, that, after escaping the battle, sacking the town, and, attempting flight, was still left—a deed, whereby your provincials were not only saved, but delighted by the sight of the slaughter."

Was Kent the only Frank locality? Probably not. There is evidence to the presence of *Alemanni* in Britain A.D. 372. These may have been Franks under another name. At any rate, they were a closely-allied population. Valentinian, writes Ammianus Marcellinus, placed Fraomarius as king over the Buccinobantes, a nation of the Alemanni, near Mentz. Soon afterwards, however, an attack upon his people devastated their country. He was then translated to Britain, and placed over the Alemanni, "*at that time flourishing both in numbers and power*, as tribune."

There was an Alemannic king, Eroc, mentioned by Ammianus also.

§ 122. The term *hypothesis* shows that the doctrine of the present chapter is a suggestion rather than an admitted fact. Whether it will receive further confirmation is uncertain. The Frank Code of Laws, minutely criticised, promises most. The possible confirmation of the Gothic hypothesis for Hampshire is more obscure. Nevertheless, it may, perhaps, sooner or later, be effected. If this be the case, an amount of conjecture, now inadmissible, may become legitimate, and some of the names which now sound strange may be restored to their probably original forms—those forms being Gothic; Gothic, but distorted by having passed through a British medium. At present, I doubt whether *Stuf* and *Wihtgar* are the names of historical personages at all; the latter more especially. If, however, they be, it is in the Gothic that their proper forms are to be sought. Herein, the former may be *Astolf*, the latter *Wittich* (*Vitiges*).

Another point in the minute history of what is conveniently called Roman Britain, but which is more properly Britain during a transition period from Romano-Britannic to German, is the history of the usurpers of the latter part of the Western Empire. *Some* were, undoubtedly, German. *Tetricus*,

for instance, whose name I believe to have been the German *Diedrich*, was one such. Respecting him we get the following inscription found at Bittern (the ancient Clausentum) near Southampton. (*Monumenta Britannica, No.* 276.)

IMP . C . C
POTESVIO . (?)
TETRICO
P . E . A . G.

Date between A.D. 267 and A.D. 274—too early for the Goths Proper, but not too early for other German supporters.

Mention of a *Dalmata Marca* (*Dalmatian March*) on the Western coast of Gaul is made in the *Notitia*. Whether the *Dalmatians* of this same *March* were German or not is unimportant. Perhaps, they were absolutely Goths. Perhaps, they were no Germans at all, but Slavonians. At the same time, whatever they were, they were on a German frontier, and a German frontier that supplied the eminently and characteristically German word *March*.

Note.—In looking back, I find that an argument in favour of the Keltic character of the names *Vortimer* and *Vortigern* has been kept back. It is to the effect that the syllable *Vor* = *Mawr*, *môr* = *great*. Then (in one of the cases), as *-teyrn* = *king* or *chief*, *Vor-tigern* = *the Great Chief*.

Valeat quantum.—The modern British for such a combination would be, not *mawr teyrn*, but *teyrn mawr*.

I may also add that Vortimer and Vortigern are not the only names of chieftains who are, in my eyes, German rather than British—though stated to be British rather than German.

The following extract is from Jornandes:—"Euricus ergo Vese*gothorum* rex crebram mutationem Romanorum principum cernens, Gallias suo jure nisus est occupare. Quod comperiens Anthemius imperator, protinus solatia Britonum postulavit. Quorum rex *Riothimus* cum xii. millibus veniens in Biturigas civitatem oceano, e navibus egressus, susceptus est. Ad quos rex Vese*gothorum* Euricus innumerum ductans exercitum advenit, diuque pugnans *Riothimum* Britonum regem, antequam Romani in ejus societate, superavit. Qui amplâ parte exercitus amissâ, cum quibus potuit fugiens, ad *Bur-*

gundionum gentem vicinam, Romanis in eo tempore fœderatam, advenit.—*Jornandes, De Rebus Geticis*, c. 11.

A German is more likely to take refuge amongst the Burgundians than a Briton. But this is not all. In the middle of the fifth century (*i. e.* the time of Hengest and Vortigern), a king from Britain, with a name so like *Vortimer* as *Riothimus*, is fighting against a population with a name so like *Jute* as *Goth*.

Such is a sketch of my reasons for holding that as early as the middle of the *third* century, Germans other than either Anglo-Saxons or Jutes of Jutland had effected settlements in Hants and Kent—under the names of Franks, Alemanni, and Goths;

That in some cases these Franks, Alemanni, and Goths, so far comported themselves as Britons or Romans as to defend the soil against the true *Anglo-Saxon* invaders;

That the influence of these *non*-Angle Germans has in no case been sufficient to preponderate over that of the Anglo-Saxons; *i. e.* that it has, in no case, given us absolute Frank, Alemann, or Goth districts as opposed to the English;

But that it has determined, and that it does explain, certain *minor* points of difference between such localities and the rest of England, especially in the county Kent.

Of such German populations, chiefly consisting of Kentish (Cantian, or Cantuarian) Læti, I believe Vortigern and Vortimer (truly historical personages) to have been chiefs—German, not British—German chiefs, more or less, perhaps, wedded to the British soil, and more or less British or Romano-Britannic in nationality, but still German.

CHAPTER XX.

CONCURRENT OR CONFEDERATE INVASIONS. — THE FRISIANS.

§ 123. THAT neither the Gothic nor Frank Germans were a detail of the Angle name, is beyond question. They were no *subordinates*, as the proposed term is.

That they were not *confederate* is, by no means, so certain. There is no reason, however, for believing them to have been such.

As far, then, as our knowledge goes, the invasion that they effected was of the kind called *concurrent*—*i. e.* it was independent, but directed towards the same results, *viz.* the displacement of a Keltic, and the substitution of a German form of speech in Britain.

Whether this were the case with the population now coming under notice is uncertain.

This population is the *Frisian*, allied to the Angle, or Anglo-Saxon, but, still, different; no portion of the Angle name, but rather a name which was, itself, substantive, separate, and independent.

Whether, however, such Frisian descents as may reasonably be supposed to have taken place were simply concurrent, or concurrent and confederate as well, is doubtful. I name them "concurrent *or* confederate."

Respecting the Frisians, Lappenberg writes that "It is hardly probable that, in those days of national migrations and military services, so splendid an enterprise as the conquest of Britain should not have allured many bands from the kindred tribes of Germany: these, however, were not, it seems, sufficiently numerous to claim notice in the most authentic narratives. Frisians, on account of their proximity, their skill in seamanship, their language so nearly resembling the Anglo-Saxon, and the traditions already mentioned, we might expect

to meet with before all others; but from affinity of language, however, no inference is to be drawn, as it would tend to the exclusion of the remoter German races; nor should too much importance be attached to such words as *seax*, the long knife of the Saxons, from which they are supposed to have derived their name, and which was common also to the Frisians, and is still to be met with in that country, as on the same ground the Icelanders must also be considered as Saxons. Even the striking similitude between the old Frisic and the Anglo-Saxon public and private law, although affording the most decisive testimony as to the relationship of the two nations, does not allow us to make any further inference with regard to Britain; more especially as our oldest accounts of the Frisians are too defective to enable us to ascertain what influence the connection with the Anglo-Saxons and the migration of the latter may have had on the tribes of Friesland. The assertion of Procopius that Angles and Frisians dwelt on the isle of *Brittia*, notwithstanding the fables in the rest of the narrative, appears credible on account of its antiquity and other circumstances to be discussed hereafter. Later testimonies show with greater certainty the existence of the descendants of Frisic forefathers in England, but do not prove the establishment of any state or considerable settlement of that people in the country."

The traditions to which Lappenberg alludes lie in a claim put in by the Frisians for Hengest having been one of their countrymen. For these see Lappenberg, vol. i. p. 79, with notes of both the original author and his translator. Neither seems to lay much stress on them. They first appear in a writer of the tenth (?) century named Ocka Scharlensis.

Not having seen the work of Ocka, I am unable to go into the criticism of the tradition. The note, however, of Mr. Thorpe, supplies two suggestive names, *viz.* that of *Odilbalt*, and that of *Gormund*. Name for name, these are *Æthelbald* and *Wærmund*—names belonging to Angle and Danish history, or if not to Angle and Danish *history*, to that cycle of legend which simulates it.

It is sufficient, however, to remark, that the fact of there having been Frisians in England, by no means depends upon Hengest having been one of them.

In the genealogies; Fin, the son of Folcwalda (Fin, Folcwal*ding*), is the king of the Frisians.

§ 124. The statement of Procopius is that "three numerous nations inhabit Bretha, the Angles, the Frisians, and the Britons."

"Βριττίαν δὲ τὴν νῆσον ἔθνη· τρία πολυανθρωπότατα ἔχουσι, βασιλεὺς τε εἷς αὐτῶν ἑκάστῳ ἐφέστηκεν, ὀνόματα δὲ κεῖται τοῖς ἔθνεσι τούτοις Ἀγγίλοι τε καὶ Φρίσσονες καὶ οἱ τῇ νήσῳ ὁμώνυμοι Βρίττωνες. Τοσαύτη δὲ ἡ τῶνδε τῶν ἐθνῶν πολυανθρωπία φαίνεται οὖσα ὥστε ἀνὰ πᾶν ἔτος κατὰ πολλοὺς ἐνθένδε μετανιστάμενοι ξὺν γυναιξὶ καὶ παισὶν ἐς Φράγγους χώρουσιν.— Procop. B. G. iv. 20.

The extent to which this applies to Britain has been already considered (pp. 66, 67). It is difficult to give its true application here. Upon the whole, however, I refer it to Britain.

§ 125. The term "later testimonies" probably means the following passage in the Anglo-Saxon Chronicle:—"That same year,* the armies from among the East-Anglians, and from among the North-Humbrians, harassed the land of the West-Saxons chiefly, most of all by their *æscs*, which they had built many years before. Then King Alfred commanded long ships to be built to oppose the æscs; they were full-nigh twice as long as the others; some had sixty oars, and some had more; they were both swifter and steadier, and also higher than the others. They were shapen neither like the Frisian nor the Danish, but so as it seemed to him that they would be most efficient. Then some time in the same year, there came six ships to Wight, and there did much harm, as well as in Devon, and elsewhere along the sea-coast. Then the king commanded nine of the new ships to go thither, and they obstructed their passage from the port towards the outer sea. Then went they with three of their ships out against them; and three lay in the upper part of the port in the dry; the men were gone from them ashore. Then took they two of the three ships at the outer part of the port, and killed the men, and the other ship escaped; in that also the men were killed except five; they got away because the other ships were aground. They also were aground very disadvantageously, three lay aground on that side of the deep on which the Danish ships were aground, and all the rest upon the other side, so that no one of them could get to the others.

* A.D. 897.

But when the water had ebbed many furlongs from the ships, the Danish men went from their three ships to the other three which were left by the tide on their side, and then they there fought against them. There was slain Lucumon the king's reeve, and Wulfheard the Frisian, and Æbbe the Frisian, and Æthelhere the Frisian, and Æthelferth the king's *geneat*, and of all the men, Frisians and English, seventy-two; and of the Danish men one hundred and twenty."

In the life of St. Swibert we have the following passage:—"Egbertus sitiens salutem *Frisionum* et Saxonum, eo quod Angli ab *eis* propagati sunt."—*See Lappenberg*, vol. i. p. 99.

The word *eis*, here, appears to apply to the Frisians and Saxons collectively. The passage, however, is not a very important one.

§ 126. *Details of the Frisian name—Chauci or Hocings.*—With the Carlovingian writers, at least, the Frisian name included something beyond the Frisians Proper, or the Frisians in the strictest sense of the term. The *Chauci* were a detail of it.

Apparently, this name belongs to the classical period only, being lost when we approach the Carlovingian times. But it is only apparently. Its German form is *Hoc*-ing; at least, such is the reasonable opinion of the majority of investigators—the *-ing* being a gentile termination, and, as such, no original part of the word. As to the change from *Ch-*, to *H-* it creates no difficulty. It is the same which occurs in *Ch*atti and *H*essi. In *A*ttuarii, as compared with *C*hattuarii, it disappears altogether. Now the Hocings have a prominent position in the earliest Frisian history; or if not in the earliest Frisian history, in that cycle of legend which simulates it. Hildeburh, the Queen of Fin, the Frisian, is a *Hoc*-ing. Her son is *Hnæf* the *Eponymus* of *Hanover*.

§ 127. *The Frisians as confedcrates.*—How far the Frisian descents upon Britain (for such it seems there were) were concurrent or confederate, is doubtful.—See § 123.

Consider them to have been confederate, and a new question presents itself: the Frisian area was a large one. It was remarkable, too, for its outline and direction. It extended as far South as the Rhine, and as far North as the frontier of Jutland.

It touched the Franks at one end; the Danes at the other. One of its sides was bounded by the ocean; the other by the Angles. What we call the *German Ocean* was called by the Carlovingians and their contemporaries the *Frisian Sea* (*Mare Fresicum*). For further details see Chapter X., special attention being directed to the *North*-Frisian area.

Supposing, then, the Frisians to have effected *some* of their descents as *confederates*, the population to which they were attached may have varied on the frontier. Thus—

1. In the North the confederacy may have been *Dano*-Frisian, consisting of Frisians and Jutes.

2. In the South it may have been *Franco*-Frisian, consisting of Frisians and Franks.

3. In the intermediate parts it may have been *Anglo*-Frisian, consisting of Frisians and Angles.

Let us now look to the internal evidence of Frisian occupancy in England.

1. The parts where we find the closest approach to the Frisian form in *-um* is the * fenny district of Holderness, opposite Friesland, and, like Friesland, low, alluvial, and moist.

2. The compounds of *Fris-* are numerous; it being reasonable to believe that this syllable means *Frisian*. And we have it in two forms—

a. The Angle form in *-ton* as Fries-*ton*, and—

b. The Danish form in *-by*, as Fris-*by*.

* Rys*om* and Holl*ym* occur here; the *om* and *ym*, however, are, probably, *holm* rather than *hám*.

CHAPTER XXI.

THE SUEVI OF SWABIA, ETC.—WHAT WAS THEIR RELATION TO THE ANGLES?

§ 128. To the reader whose interest is chiefly concentrated upon the history of the English Language, *within the realm of England*, the present Chapter, along with the two which follow, will appear more or less episodical; partaking of the nature of interpolations, and interrupting the continuity of the investigation. And this, to some extent, is the case. It is a point connected with the Angles of *Germany* rather than of *Britain*, to which the present remarks more especially apply.

Hence, the perusal of the chapters in question may be deferred until the remainder of Part I. has been studied.

The name *Suevi* introduces a complication.

Suevi is the name of the occupants of *Suevia;* and *Suevia* is the modern name *Suabia*, *Schwaben*, or *Schwaben*-land in an older form. Now the modern Suabia lies far away from the Lower, far away from even the Middle, Elbe. It lies on the Upper Rhine, a locality as little *Angle* or *Angli-form* as any in all Germany.

Looking at these localities alone, it is clear that no two words are less likely to be equivalent than *Suevus* and *Anglus*, Σουήβος and Ἄγγειλος, *Schwab* and *Angle*.

We have seen, however (in p. 68), how they occur in Ptolemy. They occur, not as the names of two distinct populations, but either as synonyms or as terms indicative of *genus* and *species; Suevus* being the name for the class, *Anglus* for a particular division of it.

§ 129. And this is what Tacitus suggests:—"Nunc de Suevis dicendum est, quorum non una, ut Chattorum Tencterorumve, gens: majorem enim Germaniæ partem obtinent,

propriis adhuc nationibus nominibusque discreti, quamquam in commune *Suevi* vocentur. Insigne gentis obliquare crinem, nodoque substringere. Sic Suevi a ceteris Germanis: sic Suevorum ingenui a servis separantur. In aliis gentibus, seu cognatione aliquâ Suevorum, seu (quod sæpe accidit) imitatione, rarum et intra juventæ spatium; apud Suevos, usque ad canitiem, horrentem capillum retro sequuntur, ac sæpe in ipso solo vertice religant: principes et ornatiorem habent: ea cura formæ, sed innoxiæ. Neque enim ut ament amenturve; in altitudinem quamdam et terrorem, adituri bella, compti, ut hostium oculis, ornantur."

"Vetustissimos se nobilissimosque Suevorum Semnones memorant. Fides antiquitatis, religione firmatur. Stato tempore in silvam, auguriis patrum et priscâ formidine sacram, omnes ejusdem sanguinis populi legationibus coeunt, cæsoque publicè homine celebrant barbari ritûs horrenda primordia. Est et alia luco reverentia. Nemo nisi vinculo ligatus ingreditur, ut minor, et potestatem numinis præ se ferens: si fortè prolapsus est, attolli et insurgere haud licitum: per humum evolvuntur: eoque omnis superstitio respicit, tanquam inde initia gentis, ibi regnator omnium deus, cetera subjecta atque parentia. Adjicit auctoritatem fortuna Semnonum: centum pagis habitantur: magnoque corpore efficitur, ut se Suevorum caput credant."

From the Suevian Semnones he passes to the Langobardi, and from the Langobardi to the Angli, &c. "Contra Langobardos paucitas nobilitat," &c. (as in p. 60).

The section that follows begins—"Et hæc quidem pars Suevorum in secretiora Germaniæ porrigitur."

The whole of these notices should be taken together, the context being fully as important as the simple texts.

The Langobards are certainly in the same category with the Semnones—the Semnones, who are "the head of the Suevi. On the other hand, the Lombards," &c.

"Reudigni deinde," &c., and, then, "hæc pars Suevorum."

Tacitus' *Suevi*, then, are anything but the occupants of modern Suabia.

Neither are wholly unconnected with the Angli; though the connection is got at by a somewhat indirect method.

§ 130. Both these points, *viz.* the difference between the ancient *Suevia* and the modern *Suabia*, and the Angle affinities take prominence and definitude in Ptolemy; the extract from this author already alluded to running thus—"Of the nations lying inland and midland, the greatest are those of the *Suab Angles* (Σουήβων τῶν Ἀγγειλῶν) who lie east of the Langobards, stretching northwards to the middle of the river Elbe, and those of the *Suab Semnones*, who come afterwards on the Elbe, and reach from the parts aforesaid as far as the river *Suēbus*, and the country of the Buguntæ, and so on to the Vistula."

Upon the whole the statements of Ptolemy and Tacitus coincide.

§ 131. *The Suabians High-German.*—We must now anticipate a little. Except in the way of an incidental notice nothing has yet been said respecting different divisions of the German language into dialects; nothing concerning such words as High-German, Low-German, and Mœso-Gothic. Yet such words will soon become conspicuous, and the distribution of the different forms of the German language into different groups of dialects will be made.

Now when this has been done, no two varieties of the German tongue will stand further apart than the Suabian, and the Angle. It is evident that this difference of dialect increases the complication engendered by the difference of locality.

A migration is not enough. Whether we assume a movement of the Angle Suevi from Suabia, or one of the Suabian Suevi from the Angle country, or deduce both from some intermediate area, we must assume a change of dialect as well. Zeuss does this; and deriving, more or less, the Suabians from the ancestors of the English, believes that the former took a High-German dialect in place of their own. Otherwise we may presume, that *English* would be spoken at the present moment in Baden and Würtemburg,—nay, possibly in Switzerland, and Bavaria.

A migration, then, *plus* a change of dialect, is the hypothesis. Zeuss' view, that the Suevi of what was afterwards Suabia were in the same category with the Angles, who were afterwards Englishmen, is legitimate, however composite may be the character of the phenomena implied by the identity, and however much

we must make a *double* assumption—first of a long migration, next of a change of dialect. If this be granted, what follows? That the Angles were what the Suabian descendants of the Suevi were, viz. High-Germans, or, that the Suevi were originally Angle or English, as Zeuss suggests? There must have been change on one side. Why upon that of the Suevi of Suabia? Originally they were—by hypothesis—what is called Low-German in speech. They change to High-Germans. But why may not the change have been with the Angles? They, it may have been, who adopted a new dialect. High-Germans once, they may have become Low-German subsequently.

I submit that this is an open question; but as my own view is different from either of the ones suggested by the previous alternative, I pass to another portion of the subject.

§ 132. Supposing a migration from the Elbe to the Rhine, from the district of the Suevi of Tacitus and Ptolemy to Suabia, to have actually taken place, what is the *date* of it? Niebuhr mentions an inscription noticing a *Victoria Suevica* in the reign of *Nerva*. But there is no evidence of this having been a victory over the *Suevi* of *Suabia*. Cæsar's victory over the *Suevi* of Ariovistus was a *Victoria Suevica*, but no victory over the people of the *Decumates agri*, or Modern *Suabia*.

On the other hand the *Decumates Agri* had become *Suevic* by the reign of Alexander Severus (ending A.D. 235)—the Tabula Peutingeriana being supposed to be referable to that date. Therein, ALAMANNIA and SUEVIA appear together—as terms for that part of Germany which had previously gone under the name of *Decumates agri*, and the parts about the *Limes Romanus*.

With this, then, begins the history of the *Suevi* of *Suabia*, or, rather, of the *Suabians*. Their alliances were chiefly with the Alamanni and Burgundians; their theatre the German side of France, Switzerland, Italy, and (in conjunction with the Visigoths) Spain. Their epoch is from the reign of Alexander to that of Augustulus; in round numbers, from about A.D. 225 to A.D. 475, a period of two hundred and fifty years.

Their *maximum* amount of historical prominence was the time when Ricimer the *Suevian*, and Gundobald the *Burgun-*

dian, made and unmade such emperors as Severus and Olybrius, the immediate predecessors of Augustulus.

The history, then, of these *Suevi* is as little Angle as their dialect and locality.

§ 133. Nevertheless, there may have been the migration and change of dialect alluded to.

Now, although migrations are never to be assumed unnecessarily, the case of the *Suevi* is a peculiar one. It is peculiar because, if we admit a certain etymology, we get a reason for making them not only as migratory as the other Germans in general, but *more so*. The name, say several respectable German scholars, means *migrant*—*Swabe* in Middle High-German; *Suâpa*, Old High-German; *Svæſas*, Anglo-Saxon, are derived from the root *swiban* = *sway*, *move unsteadily*; and, hence, *Suevi* (or *Suebi*) is the designation of a people of unsteady migratory habits—"*unstäten* (*schwebenden*) *Lebensweise*."—Zeuss, p. 56.

It cannot be denied that the passage of Strabo confirms this view:—

Κοινὸν δ' ἐστὶν ἅπασι τοῖς ταύτῃ τὸ περὶ τὰς μεταναστάσεις εὐμαρὲς, διὰ τὴν λιτότητα τοῦ βίου καὶ διὰ τὸ μὴ γεωργεῖν, μηδὲ θησαυρίζειν, ἀλλ' ἐν καλυβίοις οἰκεῖν ἐφήμερον ἔχουσι παρασκευήν· τροφὴ δ' ἀπὸ τῶν θρεμμάτων ἡ πλείστη, καθάπου τοῖς Νομάσιν· ὥστ' ἐκείνους μιμούμενοι, τὰ οἰκεῖα ταῖς ἁρμαμάξαις ἐπάραντες, ὅποι ἂν δόξῃ, τρέπονται μετὰ τῶν βοσκημάτων.

Still, I think it unsatisfactory or, at any rate, inconclusive.

Strabo's previous notice of the *Suevi* was to the effect that they extended from the Rhine to the Elbe; some of them lying beyond that river; his text, or that of his authorities, being, probably, the basis of the statements both of Tacitus and Ptolemy.

§ 134. *Hypothesis as to origin of the name.*—The more I consider the difficulties connected with the word, the more I become satisfied that the criticism which applied to the word *Saxon*, applies to the word *Suevi* also; so that the conclusion to which I come is that it was no *native* name at all for any population, either Angle, or akin to the Angles. I hold, indeed, that *originally* it was not native to any German population; although to certain German populations it, undoubtedly, came afterwards, to be applied.

I think the language from which the Romans took it was the Keltic of Gaul.

It is in Cæsar that we first find it; but it has long been held, and that on reasonable grounds, that a great deal which that writer says about the *Suevi* applies to the population which, soon afterwards, takes a prominent place in history, under the name of *Chatti*. Grimm, who, as a Hessian, (*Hesse* being but the modern and *High*-German form of *Chatti*,) has entered upon the minute ethnology of his native country, *con amore*, adopts this view, and adds some new and interesting observations confirmatory of it.

The ordinary reasoning, however, is based upon the—

a. Absence of the name *Chatti* in the *Bellum Gallicum:* though they were the people most immediately in contact with Gaul.

b. The history of the war with Ariovistus.

c. The magnitude of the two populations; each requiring too large an area to be in juxtaposition with one another within the assignable limits.

d. The absence of the evidence of any considerable movements in the way of conquest or migration between the times of Cæsar and Strabo, this latter writer mentioning the Chatti.

Then comes the question *why* Cæsar called the Chatti *Suevi;* the answer being twofold. The name may have changed in the interval; either by the preponderance of a different branch of the Confederation, or by some other means.

The two names may have belonged to different languages, and *Suev-* have been the one by which the Chatti were known to Cæsar's informants, the Gauls; just as the *Kymry* are known to the English by the name of Welsh.

The latter view is the one adopted. That *Suevi* was the Gallic name of the Germans of the Middle Rhine, I feel certain. Whether it was exclusively Gallic, *i. e.* foreign to these same Germans themselves, requires further investigation.

The strongest argument against this view lies in the name *Suevia*. It goes back to the reign of Alexander Severus, at least, perhaps further. Before then we hear of *Suevi*, but their locality is not *Suabia*.

What does this prove? That *Suev-* was a German name

previously? By no means. It merely proves that a certain area was called by the Romans after a population named *Suevi*, and that certain Germans who settled there took their name from the area. Kent, at the present moment, is English, and the *Kent-ings* who occupied part of it during the Anglo-Saxon period were English. But does this make Kent an English word? No. It is British = *Cant*-ium, as is well known.

Up, then, to the reign of Alexander Severus, the known facts are quite as much against *Suev-* being a German root as in favour of it. Cæsar's *Suevi* are described by Gauls, and Tacitus' are in a locality which at one and the same time is different from Cæsar's, and *Slavonic*. No one, who has realised the extent to which national names vary with the language of the informants, will say that the root *Suev-*, as applied to the subjects of Ariovistus, may not be as *exclusively* Gallic, as the word *Welsh* is *exclusively* German.

Hence, up to the time in question, *Suevia* is simply the name of the country of a population that the Romans and Kelts called *Suevi*—a population which need not even be German. Still less, need they have necessarily called themselves *Suev-*.

It is only when we find an undoubtedly German population in this country of *Suevia* calling themselves *Suevi*, that the reasons in favour of its *native* origin begin to preponderate; since the indigenous use of the name at one time is strong *primâ facie* evidence of its indigenous use at another. It is not, however, conclusive.

It is not a question whether certain populations called *Suevi* were Germans, but whether such Germans called themselves *Suevi*.

It is not a question whether the root *Suev-* was Keltic or not. It is known to have been so. Neither can there be *much* doubt about its having been from the Gauls that the Romans took it: since it was Gauls from whom Cæsar learned the names of the allies and subjects of Ariovistus.

The only doubt is about its having been *exclusively* Keltic, or, if not exclusively Keltic, other than German. Now:—

a. The term was *general*. This we learn from Tacitus himself.

b. The same Tacitus tells us that a general name for the Germans collectively was long wanting, and that the name *German* itself was recent.

c. The same Tacitus, who places the *Chatti* in Cæsar's locality for the Suevi, places the Suevi further east.

A migration will, of course, explain this; but it has already been stated that there is no evidence of one; besides which Tacitus is not the first author who carries his Suevi to the East of the Chatti. Strabo does so too; and Strabo lived under the reign of Augustus—Julius Cæsar's successor. So that there is not only no evidence to a migration, but very little time for one.

The doctrine that the two words are synonymous is the simpler. Nothing, however, better accounts for the existence of a synonym than a second language, especially when that second language (like the Keltic of Gaul in the present question) is no fiction, but a reality.

Were the Germans the only population thus designated by the Kelts? I think not. I think that it was applied to such *Slavonic* populations as came in contact with the Gauls, as well as to certain Germans who did so. More than this, I think that it was to a *Slavonic* frontier that it was applied originally, and in the first instance. If this be true more than one difficulty finds its solution.

In the first place, we can account for so many Slavonic populations being designated as *Suevi*.

In the second, we find a plausible origin for the word itself.

The phonetic systems of the Slavonic and the Keltic, each so peculiar, are sufficiently different to make such a root as *Serb*, *Sorb*, or *Serv*, the native designation of the Slavonians, take, in the mouth of a Gaul, the form *Suav*, *Suab*, or *Suev*.

The evidence that, at some early period, the Slavonic and Keltic areas met is too lengthy, as well as too indirect in its character, to find place here. It forms part, however, of the third Preliminary Dissertation.

We may, then, treat the Angli as if there had been nothing said about their relations to the *Suevi*—so indefinite is the latter name.

§ 135. *Suevi Transbadani, &c.*—I now notice two Suabian settlements of a later period than that of the Suevi of either Tacitus or Ptolemy.

a. Not far from the Harte-*go*, was a Suevo-*go* (*pagus Suevorum*), said to have been settled by the Frank King Sigebert, in the time of Alboin, King of the Lombards. *Suevi Transbadani*, or *Suevi* beyond the river *Bode*, was a designation of these colonists—"*Suevi* vero *Transbadani* illam quam incolunt regionem eo tempore invasere quo Saxones cum Langobardis Italiam adiere."—*Witekind of Corvey*, i. p. 634.

b. Then there were the *Norsavi* or *Nordosquavi*, more correctly *Nordsuavi*, or *Suevi of the North.* These are mentioned in an Epistle of King Theodobert to the Emperor Justinian—"subactis Thuringis . . . . *Norsavorum* gentis nobis placata majestas colla subdidit." Again, in the Annales Mettenses ad an. 748—"Pippinus adunato exercitu per Thuringiam in Saxoniam veniens fines *Saxonum, quos Nordosquavos vocant*, cum valida manu intravit. Ibique duces gentis asperæ Sclavorum in occursum ejus venerunt, unanimiter auxilium illi contra Saxones ferre parati, pugnatores quasi centum millia. *Saxones* vero, qui *Nordosquavi* vocantur, sub suam ditionem subactos contritosque subegit."—*Pertz.* i. 330.

Now Zeuss identifies these *Nordsuavi* with the *Suevi Transbadani;* and, for some time, I followed his view. But a little consideration will show that it by no means follows, that because the *Suevi Transbadani* were *Suevi* in the *North* they were, therefore, the *Nordsuavi.*

A Lincolnshire colony in the East Riding of Yorkshire would certainly be Englishmen *North of the Humber*, yet they would not be *North-umbrians.*

I am induced to draw the distinction from the following facts:—

a. All the extracts in Zeuss—the ones on which all my knowledge of the subject rests—call those *Suevi* of whose colonial character there is the clearest evidence, not *Nordsuavi*, but simply *Suevi.*

b. The *Nord-suavi* are spoken of as a *gens.*

This seems a sufficient reason for disconnecting—

a. The *Suevi* of the settlement founded in Alboin's time from the—

b. *Nord-suavi* of the *gens*, conquered by Theodobert.

The former were certainly settlers in one part of Germany transplanted from another. They were also, according to the evidence, other than Saxon.

The latter were *Saxons*, and probably *in situ*.

§136. *The Angli and Werini of the Lex Anglorum, &c.* The heading of a code of laws runs thus:—"*Incipit lex Anglorum et Werinorum, hoc est Thuringorum.*" It is to be found in Canciani (*Leges Barbarorum*), where it may be compared with the Anglo-Saxon Laws (so-called) of England. It is too short to give us much. Nevertheless, as far as it goes, it is *English*. It gives us, for instance, the word *Adaling*-us= *Ætheling*, a word upon which Lappenberg lays great stress, pointing out its appearance in the word *Telling*-städt in Ditmarsh, originally *Etheling*-stede.

Then the wergild of a freeman is fixed at two hundred shillings in both codes, *i. e.* the Anglo-Saxon of England, and the Anglo-Werinian; though its *proportion* to the other fines or forfeits is not the same. This Lappenberg accounts for by supposing that the conquest of England altered the relations of some of the grades of Angle society to each other, partially changing the terms by which they were denoted.—Vol. i. p. 93.

Again—the valuation of the different kinds of bodily injuries is alike.

The Anglo-Werinian Code, then, was Angle, Anglo-Saxon, or English.

But who were the *Werini?* Doubtless descendants of the *Varni* of Procopius, the *Varini* of Tacitus, and the *Werns* of the Traveller's Song, over whom Billing ruled—no Germans of Hanover, but Slavonians of Mecklenburg.

And how come they to be called Thuringian (*hoc est Thuringorum*)? I submit that the translation of the heading is not—"Here beginneth the Law of the Angles and Werini, that is, the Thuringians," but—

"Here beginneth the Law of the Angles and Werini, that is, of the Angles and Werini of Thuringia."

This difference is, by no means, unimportant; inasmuch as one makes them Thuringians, which neither an Angle nor a Werinian could well have been, the other only makes them settlers in Thuringia, which either, or both, may easily have been.

Settlers, or colonists, they most probably were; though the fact is by no means sure. The whole of the Saxon and Thuringian frontier was, more or less, distributed amongst recent occupants—Frisians, Suevi (as we have already seen), and Angles, and Werini, as we see now.

The connection of the names, *Angle* and *Werini*, is important from its supplying us with an instance of a political relation between a German and a Slavonic population. Not that such instances are really wanted, but because writers are unwilling to admit them. The whole history of the Goths and Vandals is a history of this kind, and it is nothing but the blinking of the difficulties that attend all efforts to make the root *V-nd* other than a German designation of a Slavonic people, combined with the tendency to exaggerate the magnitude of everything German, that prevents it being recognised as such.

This has been noticed partly as a point of general criticism, partly with a view to a suggested Slavono-German union, in the next chapter.

Note.—From a note of Lappenberg's, to which his translator reasonably demurs (vol. i. p. 90), I find that Dahlmann proposes to read "Angliorum *Etve*rinorum or *Het*verinorum," instead of "Angliorum et Werinorum."

Without knowing the reasons that support this change, I cannot, at once, condemn it. It seems, however, both illegitimate and unnecessary. It seems illegitimate, because no terms should be less tampered with than geographical names; which, as a general rule, are so little explained by the context as to give us a question of *letters* rather than of *words*. A proper name, in many cases, can as little be collected from the words which precede and follow it, as the unmeaning combination which forms a chorus can be collected from the words in the body of the song.

To prefer one reading to another because it will give us cer-

tain results is to argue in a circle, *i. e.* to infer the reading from the result, and the result from the reading.

It seems unnecessary (indeed it increases the difficulty of the passage), because, instead of simply *connecting* the two populations whom Tacitus, Procopius, and other authors have connected already, it *identifies* them. Now there is no ground for doing this. The *Hetvære* were, undoubtedly, a real population, though it is by no means certain that *Hetverini* is the proper derivative from that name. They occupied the banks of the Roer, and the parts about Limburg. They appear in Beowulf and the Traveller's Song, and that in an important passage illustrative of another in Gregory of Tours. Finally, they appear in a writer so early as Velleius Paterculus as *Attuarii* (*Chatt-uarii*); as also (later) in Ammianus Marcellinus. In the Carlovingian times we hear of a *pagus* and *comitatus* of the *Hattuarii, Hazzoarii, Hettera,* &c.

They were as undoubtedly a population that came in contact with certain Angles; at least so runs the evidence of Gregory. The king, whose son was the hero of the great Angle epic, Beowulf, bore a name the form of which was—

In Angle, *Higelac;*
In Icelandic, *Hugleikr;*
In Latin, *Chochilaichus*—

being variously called, a Dane, a Geat, and an Angle.

His descent upon one of the *pagi* of King Theoderic is thus mentioned:—"His ita gestis Dani cum rege suo, nomine *Chochilaicho*, evectu navali per mare Gallias appetunt, egressique ad terras *pagum* unum de regno Theodorici devastant atque captivant, oneratisque navibus tam de captivis quam de reliquis spoliis reverti ad patriam cupiunt. Sed rex eorum in litus residebat, donec naves altum mare comprenderent, ipse deinceps secuturus; quod cum Theodorico nuntiatum fuisset, quod scilicet regio ejus fuerit devastata, Theodebertum, filium suum, in illas partes cum valido exercitu ac magno armorum apparatu direxit. Qui, interfecto rege, hostes navali prœlio superatos opprimit, omnemque rapinam terræ restituit."—iii. 3.

It is Beowulf whence we learn that this *pagus* was that of the *Hæt-wære.*

Political relations, however, with an Angle population are

by no means equivalent to Angle blood, or Angle language.

The reading, then, "et Werinorum" should stand, *i. e.* unless the reasons for altering it be better than those suggested.

The form that *Suevi* takes in the Traveller's Song (so-called) is *Swæf-*, in the Plural *Swæf-as*. Witta is their king. They are named along with the Angles.

Mid Englum ic wæs,	With Angles I was,
And mid Swæfum.	And with Swæfs.

The etymology of p. 191, to those who think it probable, is *pro tanto* an argument against the views of the present chapter, viz. the Keltic, Slavonic, or Slavono-Keltic origin of the root *Sw-b*, as opposed to the German.

CHAPTER XXII.

THE LANGOBARDI.—WHAT WAS THEIR RELATION TO THE ANGLES?—THE MAURINGIANS.

§ 137. LAPPENBERG writes—"Of the participation of the *Franks* there exist some, though not sufficiently specific, accounts. The same may be observed with respect to the *Langobards*. Little doubt can, however, be entertained regarding either the one or the other, as we elsewhere, in similar undertakings, find *Saxons* united with Franks and *Langobards;* the latter especially, when the complete occupation of the British, southern or eastern coasts made a new field for conquests desirable."

The Franks have already been under notice.

The Langobards will command even more attention than the Franks; not so much, however, because they took a part in the conquest of Britain, either as concurrents or confederates (for there is no evidence that any Langobard, *eo nomine*, ever set foot in England), but because, whilst the part they played in history is prominent and conspicuous, they can also be shown to be, if not absolutely Angle, *Angliform* beyond most (perhaps, any) of the other sections or sub-sections of the German name; it being previously assumed that they *are German at all.* Even, however, if they were not so in their origin and ethnological relations, they, nevertheless, became eminently Angliform in respect to the points wherein they Germanised. The bearings of this qualification will appear towards the end of the chapter, when the reasons will be given for considering them to have been Slavonians under German chiefs—those chiefs being either Angle or something very near it.

Now, so far as these Angle affinities are the subject of investigation, there is nothing episodical in the chapter that treats of the Langobards. But more than this will be dealt with.

The obscurity of the early Langobard history will serve as an excuse for the introduction of a considerable amount of matter less relevant to the present work, than their simple Angle affinities; and the somewhat extraneous question as to their migrations will be gone into. I call this *extraneous*, because (as has been already suggested) it was not to Britain, not across the sea at all, that they were directed. It was towards the South rather than the West, towards Italy rather than towards England. Nevertheless, the doctrine to which I commit myself is, that the Langobard history of the conquerors of Lombardy is the most *Angliform* history of all Germany—more so, perhaps, than even that of the Cherusci.

It may be useful to go back to these same Cherusci for a preliminary in the way of criticism; for if we do this, we shall be reminded of the difference between Common and Proper names. *Cherusci*, was Common; whence it followed that there might be more Cheruscan populations than one. *Langobardi* is a Common name also; whence it follows that there may be more Langobard populations than one.

It may further help our criticism to recollect an observation upon the *Suevi;* viz. the difference between their language and that of the Angli, along with Zeuss' doctrine concerning it. This was to the effect that the Suevi of Suabia had changed their original Angle for their subsequent *High*-German form of speech. Without adopting this view, I held it to be reasonable.

Now this change of language which Zeuss saw in the case of the Suevi and Angli, and which, in the eyes of the present writer, might or might not have taken place, is absolutely necessary in the case of the Langobards. So long as they were on the Angle frontier their language belonged to what the Franks called *Saxony*. In Lombardy, however, it is a *High*-German form of speech; such, at least, is the opinion of Grimm in the *Deutsche Sprache*, and (I believe) of all other competent philologues. The Lombard Code of Laws is sufficient to supply a multiplicity of names, and these names are all said to take a High-German form.

The subject, then, is complex; but the population is important, and its relations interesting.

Number of populations called Langobard.—We are prepared

for finding more *Langobard* populations than one. The name has a meaning, so that it is Common rather than Proper. It is evidently, too, a compound; a compound of which each element enters into different combinations. Thus, in the Anglo-Saxon poem known as the Traveller's Song we have the name Long-*beard*, as the name of a population over whom Sceafa ruled—

Síge-here lengest	Sigehere longest
Sæ'-denum weóld,	The Sea-Danes ruled,
Hnæf Hocingum,	Hnæf the Hocings,
Sceafa *Long-beardum.*	Sceaf the *Longbeards*, &c.
(*l.* 64).	

Again—

Mid Scottum ic wæs	With Scots I was
And mid *Long-beardum.*	and with *Longbeards.*
(*l.* 160).	

Here the first element is *Long-*. Elsewhere, however, in the same poem it becomes *Heaþo-*, assuming that the same population is intended.

For-heowon at Heorote	Hewed down at Heorot
Heaþo-beardna þrym (*l.* 98).	The glory of the *Heaþo*-bards.

Lastly, we have the phenomenon of ***substitution***, or the prefix *Heaþo-* with a different affix—

Mid Hreonum ic wæs	With Hrons I was
And mid *Heaþo-Reamum*	And with *Heaþo*-Reams.
(*l.* 127).	

§ 138. The *Λαγγοβάρδοι and Λαγκοβάρδοι of Ptolemy.*—If we now go to the classical authors for populations whose names end in *-bard*, we shall find that Ptolemy gives us two of them. First, he places a nation whose name, throughout the MSS. is *Lango*-bard (*Λαγγοβάρδοι*) to the west and south of the Suevi Angli (*Σουήβοι οἱ Ἀγγειλοί*), these latter being on the middle Elbe. He then has a nation whose name is *not* uniform throughout the MSS., but which is, in some, *Lakko*-bard (*Λαγκοβάρδοι*), between the Chauci Majores and the Suevi.

Are we justified in identifying these Lakko-bardi and Lango

bardi? Perhaps, not. We must remember that the word in question is a compound, of which the qualifying element comes first. Hence, it is far from impossible that whilst *Langobardi* means *men with bards* (*beards* or *halberts*, as the case may be) of one sort, *Lakkobardi* may mean *men with bards* (*beards*, &c.) of another kind. True it is that the elements *Lang-* and *Lakk-* are suspiciously alike; neither can any satisfactory meaning be given to the latter word. Nevertheless, the inference of their being the same word is far from conclusive. Compound words may be alike and yet different; as are *Wessex* and *Essex*.

That there were more compounds of *-bard* than one has been shown by the word *Heaþo*-bard. That *Heatho*-bard is a different compound from *Lango*-bard is certain: that La*k*-*k*obard is the same is *not* certain.

But there is another question. The words may be the same, and, yet, the populations to which they apply be different. Or — *vice versâ*—the words may be different, and, yet, the populations to which they apply be the same.

a. There may just as easily have been several populations of Germany which took their names from the character of their *bards*, as there are, in America, several populations who, because they flatten their heads, are called *Flat-heads*.

b. Or, there may have been only one such a population, whose name in the dialect of one of its adjacent populations was La*ng*obard, in that of another La*kk*obard, and in that of a third *Heaþo*-beard.

As a proof that these distinctions are of some importance I may state that Zeuss in two places (p. 95 and p. 109) draws a distinction between the La*ng*obards and La*kk*obards.

Lastly.—The simple form *-bard* is to be found in more parts of Europe than one;—in parts beyond the pale of the German populations.

§ 139. *The* Λαγγόσαργοι of *Strabo*.—Strabo has neither La*ng*o-bards nor La*kk*o-bards, nor any form in *-bard* at all. But he has a population called Λαγκόσαργοι. These lie beyond the Elbe, and are nomadic rather than agricultural in their habits.

Μέγιστον μὲν τὸ τῶν Σοήβων ἔθνος· διήκει γὰρ ἀπὸ τοῦ Ῥήνου μέχρι τοῦ Ἄλβιος· μέρος δέ τι αὐτῶν, καὶ πέραν τοῦ Ἄλβιος νέμεται, καθάπερ Ἑρμόν-

δοροι καὶ Λαγκόσαργοι· νῦν δὲ καὶ τελέως εἰς τὴν περαίαν οὗτοί γε ἐκπεπτώκασι φεύγοντες.

To recapitulate—We have a compound name, Common rather than Proper, with a definite meaning, and with two elements.

In the classical writers, assuming the accuracy of the MSS., we get—

1. The root *b-rd* + a prefix, and
2. The root *l-ng* + an affix, giving—

1. *Lang-o-bardi*, or the men with either *long beards* or *long halberts*.

2. *Lakko-bardi*, or the men with *beards* (or *halberts*) endowed with some quality expressed by *l-k*—

3. *Lango-sargi*, or the men whose *sargs* (whatever they were) were *long?*

Then there are in the German compositions—

4. The *Heaþo*-bards, and,—

5. The *Heaþo*-Reams, over and above the *Longbeards*, which they supply in common with Tacitus and Ptolemy, and with whose *Langobardi* they coincide.

§ 140. *The forms Bard and Bardowieck.* — We have hitherto seen the root *b-t* (*bart, bard, beard, &c.*) only as the *af*fix element of a compound word; this being the form it takes in authors. But if we turn from authors to the map we shall find it as a *pre*fix—*bard*. There is a district in Lüneburg, called Bardowieck; low down on the Elbe, and not far from Hamburg. These are parts which have commanded considerable attention on the part of ethnologists, and which, oftener than once, have been claimed as the original home of the Langobards. With this view, *Bardo-wieck* = the *wick* of the *-bards;*—the Bards *minus* any prefix.

§ 141. *The Lombards of Lombardy.—Lombard* is only *Langobard* in a shortened form; so that Lombardy is a Langobard occupancy.

§ 142. *Meaning of the elements -bart, Heaþo-, and Ream-.*—The third of these I know nothing about.

The second finds its explanation in the following extract from Mr. Kemble's Glossary to Beowulf:—

"Heaþo, a prefix denoting war, and probably representing a

perished Goth. haþus, having moreover nothing whatever to do with heáh, *altus*. The corresponding Ohd. form hadu subsists in several proper names; Hadu-brant, Hadu-praht (*in bello splendens*), Hadu-frit, Hadu-funs (*in bellum paratus*), or is the *funs* a substantive and the meaning of the name, like Hadu-prant, *titio vel ignis belli?* (A. S. hilde-leóma.) Hadumár (*gloriosus in pugna*), probably the Catumerus of Tacitus; but which is merely used as an epithet, heaðo-mæ′re, in l. 5599 of our poem; so Catualda for Catu-walda (*rex pugnæ*). In A. S. the word is very common, and is exactly parallel in composition to hilde, beado, and gúð. Thus heaþo-byrne (gúð-byrne, hilde-byrne), heaþo-deór (hilde-deór), *bellua pugnæ*, heapo-rinc (beado-rinc, hilde-rinc, gúð-rinc, here-rinc), heaðo-wæ′d, heaðo-lác, heaþo-bearn, heaðo-fyr, heaþo-láf, heaþo-reâf, heaþo-sceard, heaþo-swát (hilde-swât), *sanguis bello fusus*, heaþo-swenge (heoro-swenge), *ensis vibratio*, heaþo-weorc, heaþo-wylm; and in the adj. heaþo-grim (beado-grim, heoro-grim, níð-grim, wæl-grim), heaþo-róf, heaþo-seóc, *vulneratus* heaþo-torht, all of which, and many besides, are found in Beówulf. The word heaþu in l. 3721, and in the compound heaþu-liðende, l. 5901, is not the word explained above, but denotes *profunditates maris*.

Bart-, has generally had one of the two meanings assigned to it.

"Longobardos vulgo ferunt nominatos a prolixâ *barbâ* et nunquam tonsâ."—Isidor. Hispal. Origg. ix. 2. "Certum est, Longobardos ab intactæ ferro *barbæ longitudinæ*, cum primitus Winili dicti fuerint, ita postmodum appellatos; nam juxta illorum linguam *lang* longam *bart* barbam significat."—Paul. Diacon. i. 9.

This is the etymology which was first received, and which is, perhaps, most generally credited. I do not know who first suggested the idea that the *-bard* in Lango-*bard* was the *bart* in hal-*bert* and *part*-izan, the name of warlike weapons; but in such a case the *Langobardi* are not the *Long-beards* but the *Halberdiers*.

The choice between these two etymologies is not very important.

§. 143. The Λαγγόσαργοι, *Lango-sargi*.—The question as to how far these different names mean different populations now finds place.

It is convenient to begin with the Λαγγόσαργοι of Strabo.

The texts of Strabo and Tacitus so far agree as to represent a population warred against by its neighbours—ἐκπεπτώκασι φεύγοντες writes the one, *paucitas nobilitat*, &c. the other. The localities, too, agree. It is safe to identify them.

Neither are there any very strong reasons for refining on the Λαγκόβαρδοι.

In Staffordshire, and many other parts of England, syllables ending in *-ing* are pronounced *ingk*. Suppose this to have been the case with some dialect in Germany, from which the notice of a people called *Langobardan* was derived. The sound would then be *Langk-o-bardan*. To a Greek no way of spelling this would be more natural than by *-κκ-*; since it was by *-γγ-* that he already spelt the sound of *-ng*.

On the Heapo-*Reams* I can throw no light.

The Heapo-*bards* are, certainly, referable to the same part of Germany as the Λαγγόσαργοι, Λαγγόβαρδοι, and Λαγκόβαρδοι; that is, if I am right to suppose *Heorot* to mean the *Hartz*—even though, in the text before us, it may mean a more specific locality.

All these names, then, may reasonably be supposed to mean the same population.

How originated the name Bardowieck?—This may stand over, until the fuller and more important question of the *Lombards of Lombardy* has been gone into.

§ 144. Are the Langobards, who gave their name to Lombardy, and who take a prominent place in history no earlier than the sixth century (A. D.) the earlier Langobards of Tacitus, Strabo, and Ptolemy?

The chief authority for the history of the Lombards of Lombardy is Paul the son of Warnefrid, deacon of Friuli, and secretary to Desiderius, the last king of the Lombards. He is quoted as *Paulus Diaconus*, and also as *Paul Warnefrid*. The chief writer on the German nations who had preceded him was Jornandes. Now Jornandes had deduced the Goths, &c., from Scandinavia, and Paulus Diaconus does the same. Jornandes had written—"Ex hac igitur Scanzia insula, quasi officina gentium—cum rege suo nomine Berich *Gothi* quondam memorantur egressi," &c. Paulus Diaconus writes—"*Winilorum* hoc est, *Longobardorum* gens– ab insula quæ *Scandina-*

via dicitur adventavit." He proceeds with the details; which will now be given in his own words. However, as the text is somewhat discontinuous, they will be given separately.

"Ea pars, cui sors dederat genitale solum excedere, exteraque arva sectari, ordinatis super se duobus ducibus, *Ibor* scilicet et *Ayone*, qui et Germani erant, et juvenili adhuc ætate floridi, et cæteris præstantiores, ad exquirendas quas possint incolere terras, sedesque statuere, valedicentes, suis simul et patriæ, iter arripiunt. Horum erat ducum mater nomine *Gambara*, mulier quantum inter suos et ingenio acris, et consiliis provida; de cujus in rebus dubiis prudentia non minimum confidebant."

This is followed by a long episode on Scandinavia, containing a notice of the Maelstrom. Then—

"Egressi de Scandinavia Winili, cum Ibor et Ayone ducibus, in regionem quæ appellatur Scoringa venientes, per annos illic aliquot consederunt. Illo itaque tempore Ambri et Assi, Wandalorum duces, vicinas quasque provincias bello premebant. Hi jam multis elati victoriis, nuncios ad Winilos mittunt, ut aut tributa Wandalis persolverent, aut se ad belli certamina præpararent. Tunc Ibor et Ayo, adnitente matre Gambara, deliberant melius esse armis libertatem tueri, quam tributorum eandem solutione fœdare, mandant per legatos Wandalis, pugnaturos se potius, quam servituros. Erant siquidem tunc Winili universi ætate juvenili florentes, sed numero exigui; quippe qui unius non nimiæ amplitudinis insulæ, tertia solummodo particula fuerint.

"Refert hoc loco antiquitas ridiculam fabulam: quod accedentes Wandali ad Wodan, victoriam de Winilis postulaverint, illeque responderit, se illis victoriam daturum, quos primum oriente sole conspexisset; tunc accessisse Gambaram ad Fream, uxorem Wodan, et Winilis victoriam postulasse, Freamque consilium dedisse, ut Winilorum mulieres, solutos crines erga faciem ad barbæ similitudinem componerent, maneque primo cum viris adessent, seseque a Wodan videndas pariter e regione, qua ille per fenestram, orientem versus, erat solitus adspicere, collocarent: atque ita factum fuisse. Quas cum Wodan conspiceret oriente sole, dixisse: *Qui sunt isti Longobardi?* Tunc Fream subjunxisse, ut quibus nomen tribuerat, victoriam condonaret: sicque Winilis Wodan vi-

ctoriam concessisse. Hæc risu digna sunt, et pro nihilo habenda. Victoria enim non potestati est adtributa hominum, sed e cœlo potius ministratur.

"Certum tamen est Longobardos, ab intactæ ferro barbæ longitudine, cum primitus Winili dicti fuerint, ita postmodum appellatos. Nam juxta illorum linguam, *Lang longam*, *Bart barbam* significat. Wodan sane, quem adjecta litera Gwodan dixerunt, ipse est, qui apud Romanos Mercurius dicitur, et ab universis Germaniæ gentibus ut deus adoratur; qui non circa hæc tempora, sed longe anterius, nec in Germania, sed in Græcia fuisse perhibetur."

The words in italics are those that will form the chief text for remarks :—

"*Winili* igitur, qui et Longobardi, commisso cum *Wandalis* prœlio, acriter, utpote pro libertatis gloria decertantes, victoriam capiunt; qui magnam postmodum famis penuriam in eadem Scoringa provincia perpessi, valde animo consternati sunt.

"De qua egredientes, dum in *Mauringam* transire disponerent, *Assipitti* eorum iter impediunt, denegantes eis omnimodis per suos terminos transitum. Porro Longobardi, cum magnas hostium copias cernerent, neque cum eis, ob paucitatem exercitus, congredi auderent, dumque quid agere deberent, decernerent, tandem necessitas consilium reperit. Simulant se in castris suis habere *Cynocephalos*, id est, canini capitis homines: divulgant apud hostes hos pertinacitur bella gerere, humanum sanguinem bibere, et si hostem assequi non possint, proprium potare cruorem. Utque huic assertioni fidem facerent, ampliant tentoria, plurimosque in castris ignes accendunt. His hostes auditis, visisque creduli effecti, bellum quod minabantur, jam tentare non audent.

"Habebant tamen apud se virum fortissimum, de cujus fidebant viribus, posse se proculdubio obtinere quod vellent, hunc solum præ omnibus pugnaturum objiciunt. Mandantque Longobardis, ut unum quem vellent suorum mitterent, qui cum eo ad singulare certamen exiret, ea videlicet conditione, ut si suus bellator victoriam caperet, Longobardi itinere quo venerant abirent: sin vero superaretur ab altero, tunc se Longobardis transitum per fines proprios non vetituros.

Cumque Longobardi, quem e suis potius adversus virum bellicosissimum mitterent, ambigerent, quidam ex servili conditione sponte se obtulit, promittit se provocanti hosti congressurum; ea ratione, ut si de hoste victoriam caperet, a se suaque progenie servitutis nævum auferrent. Quid plura? gratanter quæ postulaverat esse facturos pollicentur. Aggressus hostem expugnavit et vicit; Longobardis transeundi facultatem, sibi suisque ut optaverat, jura libertatis indeptus est.

"Igitur Longobardi tandem in Mauringam pervenientes, ut bellatorum possint ampliare numerum, plures a servili jugo ereptos, ad libertatis statum perducunt; utque rata eorum haberi posset libertas, sanciunt more solito per sagittam, immurmurantes nihilominus, ob rei firmitatem, quædam patria verba. Egressi itaque Longobardi de Mauringa, applicuerunt in Golanda, ubi aliquanto tempore commorati dicuntur. Post hæc Anthaib et Banthaib, pari modo et Wurgondaib, per annos aliquot possedisse: quæ nos arbitrari possumus esse vocabula pagorum, seu quorumcunque locorum.

"Mortuis interea Ibor et Ayone ducibus, qui Longobardos a Scandinavia eduxerant, et usque ad hæc tempora rexerant, nolentes jam ultra Longobardi esse sub ducibus, regem sibi ad cæterarum instar gentium statuerunt. Regnavit igitur super eos primus Agelmundus, filius Ayonis, ex prosapia ducens originem Guningorum, quæ apud eos generosior habebatur. Hic, sicut a majoribus traditur, tribus et triginta annis Longobardorum tenuit regnum.

"His temporibus quædam meretrix uno partu septem pueros enixa, beluis omnibus mater crudelior, in piscinam projecit necandos. Hoc si cui impossibile videtur, relegat historias veterum, et inveniet non solum septem infantulos, sed etiam novem unam mulierem simul peperisse. Et hoc certum est maxime apud Ægyptios fieri. Contigit itaque ut rex Agelmundus, dum iter carperet, ad eandem piscinam deveniret. Qui cum equo retento miserandos infantulos miraretur, hastaque quam manu gerebat, huc illucque eos inverteret, unus ex illis manu injecta hastam regiam comprehendit. Rex misericordia motus, factumque altius admiratus, eum magnum futurum pronuntiat: moxque eum e piscina levari præcipit, atque nutrici traditum, omni cum studio mandat alendum. Et quia eum de

piscina, quæ eorum lingua Lama dicitur, abstulit, Lamissio eidem nomen imposuit. Qui cum adolevisset, adeo strenuus juvenis effectus est, ut et bellicosissimus extiterit, et post Agelmundi funus, regni gubernacula rexerit. Ferunt hunc, dum Longobardi cum rege suo iter agentes ad quendam fluvium pervenissent, et ab Amazonibus essent prohibiti ultra permeare, cum earum fortissima in fluvio natatu pugnasse, eamque peremisse, sibique laudis gloriam, Longobardis quoque transitum paravisse: hoc siquidem inter utrasque acies prius constitisse, quatenus si Amazona eadem Lamissionem superaret, Longobardi a flumine recederent; sin vero a Lamissione, ut et factum est, ipsa vinceretur, Longobardis eadem permeandi fluenta copia præberetur. Constat sane quia hujus assertionis series minus veritati subnixa est. Omnibus etenim, quibus veteres historiæ notæ sunt, patet, gentem Amazonum longe antea, quam hæc fieri potuerunt, esse deletam; nisi forte quia loca eadem, ubi hæc gesta feruntur, non satis historiographis nota fuerunt, et vix ab aliquo eorum vulgata sunt, fieri potuerit, ut usque ad id tempus hujuscemodi inibi mulierum genus haberetur. Nam et ego referri a quibusdam audivi, usque hodie in intimis Germaniæ finibus gentem harum existere feminarum.

"Igitur transmeato Longobardi, de quo dixeramus, flumine, cum ad ulteriores terras pervenissent, illic per tempus aliquod commorabantur. Interea cum nihil adversi suspicarentur, et essent quieti, longa nimis securitas, quæ semper detrimentorum mater est, eis non modicam perniciem peperit. Noctu denique cum negligentia resoluti quiescerent cuncti, subito super eos Bulgares irruentes, plures ex iis sauciant, multos prosternunt, et in tantum per eorum castra debacchati sunt, ut ipsum Agelmundum regem interficerent, ejusque unicam filiam sorte captivitatis auferrent.

"Resumptis tamen post hæc incommoda Longobardi viribus, Lamissionem, de quo superius dixeramus, sibi regem constituerunt."

§ 145. In the first, second, and fourth of these extracts we have pure fable; possibly, but not necessarily, with some basis of fact as a groundwork. I do not, however, at present, ask how far this was the case. It is only into the origin of the fictional elements that I inquire, asking whether they can be

referred to any particular cycle of fable. When we hear that the Britons are descended from Brute grandson of Anchises, we know that the fact is wrong, *i. e.* that it is no fact at all. Nevertheless, we know that the name of Anchises belongs to the Tale of Troy. What is such a fact worth? To one interested in the History of Fiction it *has* a value—and the History of Fiction is the history of ideas. To the historian of Fiction, the name of Brute, the grandson of Anchises, shows that the range of mythologic, mythic, or legendary ideas connected with Troy reached Britain.

Let us apply this principle to the fables before us, and see if we can measure the range of the mythologic lore of the Lombards.

a. In extract I. and II., *Ibor* is a name found in Slavonic and Scandinavian legend, also in Scandinavian history.

b. In extract II., Wodan is the Deity who gives his name to *Wedn*-esday, as *Frey* does to *Fri*-day.

c. In extract IV., *Lama* and *Lamissio* are names in the Bohemian mythology.

d. The third extract I believe to contain a real historical account of an actual migration or march; more probably a march than a migration; more probably a military march of warriors, than a migration of husbands, wives, and children.

Winili I believe to have meant *Vindelicians*—

Mauringia, the country of the Μαρουίγγοι of Ptolemy—

Assipiti, the *Usipetes* of the Lower Rhine—

Antaib, a district of the Wends, here called *Ant*-,—

Wurgondaib, a district of either the *Urugundi* or the *Burgundi*.

Between the time of Ptolemy and Justinian there is but one notice of the Langobardi. It occurs in a fragment of Petrus Patricius. Taken with the extract from Paulus, it furnishes an undesigned coincidence of so remarkable a character that it has led me to the previous identifications.

The notice runs thus:—

Ὅτι Λογγιβάρδων καὶ Ὀβίων ἑξακισχιλίων Ἴστρον περαιωθέντων, τῶν περὶ Βίνδικα ἱππέων ἐξελασάντων καὶ τῶν ἀμφὶ Κάνδιδον πεζῶν ἐπιφθασάντων, εἰς παντελῆ φυγὴν οἱ βάρβαροι ἐτράποντο. Ἐφ' οἷς οὕτω πραχθεῖσιν ἐν δέει καταστάντες ἐκ πρώτης ἐπιχειρήσεως οἱ βάρβαροι, πρέσβεις παρὰ

Αἴλιον Βάσσον τὴν Παιονίαν διέποντα στέλλουσι, Βαλλομάριόν τε τὸν βασιλέα Μαρκομάννων καὶ ἑτέρους δέκα, κατ' ἔθνος ἐπιλεξάμενοι ἕνα. Καὶ ὅρκοις τὴν εἰρήνην οἱ πρέσβεις πιστωσάμενοι οἴκαδε χωροῦσιν.

It is this word *Obii* which justifies the identification of *Assipitti* with *Usipetes*, for the *Ubii* and *Usipetes* were contiguous nations; and, I think, that whilst Petrus Patricius has taken the name of the former, Paulus Diaconus has taken that of the latter. The exact details of the triple relation I do not pretend to make out. I only infer that the Langobard march touched the populations about Cologne and Wisbaden, the Ubian and Usipetan localities.

The Danube (Ἴστρον) was the Upper Danube; *i.e.* the parts nearest the Rhine.

Βίνδικα justifies the identification of Winili and Vindelicia.

The names Marcomanni and Pæonia (Pannonia) suggest a movement further eastwards.

I even think that a plausible guess may be made as to the origin of the story of the *Dog-heads* (*Cynocephalæ*). The Traveller's Song gives us a tribe of *Hundings* (*Hound-ings*), of whom Mearcholf was king.

The Langobard migration, then, may be considered as a true historical fact: not, however, because it accounts for the presence of certain Langobards in Lombardy; since these may have been a population so-called nearer Italy than the Langobards of Tacitus.

Nor yet because it is supported by statements; since the story of Paulus Diaconus is, upon the whole, impossible.

The reasons for considering it an historical fact is the undesigned coincidence in the evidence as to the passage through the parts about Cologne—the undesigned coincidence manifested in the names Ὄβιοι (= *Ubii*), and Assipitti (= *Usipetes*).

Let us say that the account of Petrus Patricius takes us from the Lower Rhine to the frontiers of Bohemia; and we shall find that that line is that of Paulus Diaconus from the Assipitti to the locality of Lamissio.

§ 146. The Lombards, then, reached Lombardy after a migration of no ordinary length, a migration by land rather than by sea, a migration from north to south, a migration obscurely

narrated by the national historian, and only illustrated through the collation of scattered notices and by means of emendatory criticism applied to some of the names in the account.

Furthermore, as that migration is from the parts in the direction of the *Langobard* localities of Tacitus and Ptolemy, there is no reason to refine further upon the *common* character of the name, and to doubt about deriving the conquerors of Italy from the hardy warriors of the Elbe.

§ 147. To fix their *original* locality we must go back to the earlier notices. Those of Petrus Patricius and Paulus Diaconus carry the line of migration no further northwards than the parts about Cologne. It is unnecessary, however, to show that they were not indigenous here. Add to this, that all evidence brings them from either the east or north-east. The Semnones and the Angli are the populations to which they lie nearest; and we may change their locality just as we attach them the more closely to the one or to the other. The parts about Göttingen may be a Lombard locality. So may the parts about Halberstadt; so may the parts about Brunswick. Göttingen gives us the least amount of migration. The Halberstadt and Brunswick neighbourhoods have each certain peculiar characteristics which may or may not be Langobard, viz. the forms in *-s-leben* (see p. 125). Lastly, Luneburg, on the strength of the *Bard*owieck district, has its claims.

At present it is enough to remark that, wherever we place the early Langobard area, we place it near that of the Angles.

Hence, the geographical relations of the two populations are *primâ facie* evidence of an ethnological affinity.

§ 148. *Certain names, &c., Angle and Langobard.*—Can we support this *primâ facie* view of a Langobard and Angle connection by any further facts? We can; and we should remember that they need not be either numerous or definite. Our evidence is of the kind called *cumulative*, wherein facts, which by themselves are both small and unimportant, derive weight from their juxtaposition; each strengthening the other.

Let us look at the legends first. Beowulf, the hero of the

Angle poem already mentioned, was an Angle hero. He was also a *Scylding*, *i. e.* a descendant of a real or fictitious personage named *Scyld*, even as Agamemnon was an Atrides. Now Scyld was a *Scef*ing, *i. e.* he stood in the same relation to a *Sceaf*, as Beowulf did to him. But Sceaf was a Langobard hero also; as we have seen already—"Sceaf ruled the Langobards."—*Traveller's Song*, l. 65.

From the legends let us turn to the personal names. Three Angle names, at least, appear in the list of Lombard kings, viz. *Clapa* = *Clepho*, *Ælfwine* and *Eadwine* (*Edwin*), who are, name for name, = the *Alboin* and *Audouin* of Paulus Diaconus.

Swylce ic wæs on *Eatule*	Also I was in Italy
Mid *Ælfwine*,	With *Ælfwine*,
Se hæfde mon-cynnes	Who had of all mankind,
Míne ge-fræ'ge,	To my knowledge,
Leohteste hond	The lightest hand,
Lófes to wyrcenne.	Praise to effect;
Heortaṇ un-hneáweste,	The amplest heart
Hringa ge-dáles,	In the distribution of rings;
Beorhtra beága,	Of bright bracelets,
Bearn *Ead-wines*.	The child of *Eadwine*.

Traveller's Song, ll. 139–148.

From the personal names we may go to the Laws.—The Lombard give us the eminently Angle custom of the *morning-gift*, *i. e.* a pecuniary settlement made by the husband upon the wife the morning after their marriage.

Without enlarging upon these points, we may safely predicate concerning the Langobards that they were a population sufficiently connected with the Angles to have a portion of the same mythologic ideas, and also to have, more or less, leaders with the same names.

§ 149. *Objections—Slavonic hypothesis.*—At the beginning of the chapter it is suggested that, German as is the history of the Langobards, it is by no means absolutely certain that their blood and language were German *in the first instance*. All that is beyond doubt is the fact of their having comported themselves as Germans in the fifth, sixth, and subsequent

centuries; of their having conquered Lombardy as Germans. They may have been *Slavonians under German chiefs*. (See p. 200.)

Why is this view entertained? Because the statement of Paulus Diaconus, already laid before the reader, cannot be ignored; the statement that they were "*Winili—Winilorum*, hoc est, *Longobardorum* gens." Why such a word as *Winili* indicates a Slavonic population may be seen in the third Preliminary Dissertation.

I say that this statement must by no means be ignored. On the contrary, we must take it as we find it, and deal with it as the word *Jute* in Beda was dealt with. We must ask whether the other facts of the Langobard ethnology confirm, or whether they invalidate it.

I think, as far as they go, they confirm it.

a. The obscurer points of the Lombard mythology are, at least, as Slavonic as German.

b. Two out of three of these probable localities are on the Slavonic frontier. This they were if they lay *east* of the Angles, and on the Elbe—which they probably did.

§ 150. *The Bardowieck locality*.—It has already been stated that there is a district in Lüneburg, low down on the Elbe, and not far from Hamburg, called *Bardo*-wieck, to which the attention of investigators has been drawn by the name, a name which gives us the root *b-rt* (*b-rd*) in the form wherein we get it in Lang-o-*bard*. In the case of *Bardo*-wieck, however, it is a *pre*fix rather than an *af*fix. (See p. 204.)

Can this have taken its name from the Lango-bards? Can it have given its own name to them?

As far as we have hitherto gone in our translations of the root *b-rt*, we have found nothing in favour of the former view. The two interpretations of Lango-*bard* have been *long-beard*, and *long-halbert*; names which, whether likely or unlikely to have been borne by any one in their compound, are by no means very probable ones in their simple form. Twenty bodies of men would call themselves by such a designation as *Long-beard* or *Long-spear*, for one that would indulge in such

a name as *Beard* or *Spear*. I do not, then, think that *Bardowieck* = the *wick* of the *Bards*.

Can we entertain the second alternative, and derive the name of the population from that of their occupancy? If this is to be done, *b-rt* must mean something very different from either *beard* or *halbert*. It must be a geographical term of some kind or other. Now I owe to a note of Dr. Smith's, in his valuable edition of Gibbon, the knowledge of the fact of the word *Börde* (or *Bord*) still signifying, on the banks of the Elbe, "a fertile plain by the side of a river," and that "a district near Magdeburg is still called the *Lange Börde*." According to this view the Langobardi would signify "inhabitants of the *Long Bord* of the river," &c.—*Decline and Fall of the Roman Empire*, chap. xlii. note, vol. v., p. 165.

Whatever else may come of this interpretation, nothing comes in favour of the claim of Lüneburg as a Langobard locality, to the exclusion of the parts about Magdeburg. The former is simply the *Bord*, the latter the *Long*-bord.

There is no doubt as to the specific likeness between name and name being in favour of the southern occupancy.

But this is not all. There may have been Langobards wherever there was a *Long Bord*, and there may have been a Long-bord wherever there was a river within a given philological area with a moderately long tract of alluvial soil on its banks. All this is what we have seen before, viz. with the Cherusci, who may have been here and there and everywhere, provided only that there was a tract of forest, and a population that called it *ch-r-t*. (See pp. 57–59.)

Now comes another series of facts, viz. that the root *b-rt*, as a *geographical* term, is Slavonic and Lithuanic—fully as Slavonic and Lithuanic as it is German, and, perhaps, more so. This is seen in the following extract from Dusberg (iii. 3. See Zeuss in *v. Prussi*) :—

"Terra Pruschiæ in undecim partes dividitur. Prima fuit *Culmensis et Lubavia*, quæ ante introitum fratrum domus Teutonicæ quasi fuerat desolata. Secunda *Pomesania*, in qua *Pomesani*. Tertia *Pogesania*, in qua *Pogesani*. Quarta *Warmia*, in qua *Warmienses*. Quinta *Nattangia*, in qua

Nattangi. Sexta *Sambia,* in qua *Sambitæ.* Septima *Nadrovia,* in qua *Nadrovitæ.* Octava *Scalovia,* in qua *Scalovitæ.* Nona *Sudovia,* in qua *Sudoritæ.* Decima *Galindia.* Undecima *Barthe et Plica Bartha, quæ nunc major et minor Bartha dicitur,* in qua *Barthi vel Barthenses* habitabant. Vix aliqua istarum nationum fuit, quæ non haberet ad bellum duo millia virorum equitum, et multa millia pugnatorum."

That this name is *native* in Prussia is inferred from the traditional account of it:—

"Duces fuere duo, nempe Bruteno et Wudawutto, quorum alterum scilicet Bruteno sacerdotem crearunt, alterum scilicet Wudawutto in regem elegerunt. . . Rex Wudawutto duodecim liberos masculos habebat, quorum nomina fuerunt *Litpho, Saimo, Sudo, Naidro, Scalawo, Natango, Bartho, Galindo, Warmo, Hoggo, Pomeszo, Chelmo. . . Warmo* nonus filius Wudawutti, a quo Warmia dicta, reliquit uxorem *Arma,* unde Ermelandt."

This particular country of the Prussian *Barthi*—Barthia and Bartha in the old documents—lay to the east of the river Aller, and to the north of the land of the Galindæ in East Prussia.

The extent to which this is the same as the root *V-rth, P-rth* in the names of so many Slavonic rivers (*Wrta, Pruth*), may be advantageously investigated by the special Slavonic scholar. All that is said, at present, is—*a.* That the complications engendered by the word *Bardowieck* are insufficient to set up a claim in favour of Lüneburg, rather than the parts about Magdeburg, having been the original Langobard locality.

b. That the geographical signification attributed to the root *b-rt* is in favour of the parts about Magdeburg and Brunswick, rather than those about Gottingen, having been this same original Langobard locality.

c. That, such being the case, the area of the forms in *-s-leben* may have been Langobard.

d. That this area was, to say *at least* of it, adjacent to the Slavonic frontier; and—

e. That (more than this) it may once have been actually Slavonic (or Lithuanic).

I continue this long, but not altogether irrelevant, episode with a notice of a population associated with the Langobards.

§ 151. *The Mauringians.*—We have seen (p. 208) how Paulus Diaconus mentions them—"de quâ" (*i. e.* the Province of *Scoring*) "egredientes, dum in *Mauringam* transire disponerent, Assipitti eorum iter impediunt," &c.

In the so-called Traveller's Song the notices of the Myrgings are numerous—Meaca being then king. In the first place the geographer himself has had something to do with them.

ANGLO-SAXON.	ENGLISH.
Wíd-síð maðolade,	Widsith spake,
Word-hord on-leác,	His word-hoard unlock'd,
Se ðe mæst	Who a vast many [had met with]
Mærða ofer eorðan,	
Folca geond ferde.	Wonders on earth,
Oft he flette ge-þáh,	Travell'd through many nations;
Myne-lícne máþþum.	Oft he had in hall receiv'd
Hine from Myrgingum	A memorable gift.
Æþele on-wócon.	Him from among the Myrgings,
He mid Ealh-hilde,	Nobles gave birth to.
Fælre freoþu-webban,	He with Ealhild,
Forman síþe.	Faithful peace-weaver,
Hreð-cyninges	For the first time,
Hám ge-sóhte,	Of the Hreth-king,
Eástan of Ongle;	Sought the home
Eorman-ríces	East of Ongle,
Wráþes wǽr-logan.	Of Eormanric,
On-gon þá worn sprecan.	The fierce faith-breaker;
Fela ic monna ge-frægn,	Began then much to speak:
Mægþum wealdan.	Of many men I 've heard,
	Ruling o'er tribes, &c.

Again:—

þá ic to hám bi-cwom,	When to my home I came,
Leófum to leáne,	In requital to my friend,
þæs þe he me lond for-geaf,	For that he me had given land,
Mínes fæder éþel,	My father's home,
Freá Myrginga;	The Myrging's Lord;
And me þá Ealh-hild	And to me then Ealhild

O'þerne for-geaf,
Dryht-cwen dúguþe,
Dohtor Eád-wines.

Another gave,
The noble queen of chieftains,
Eadwine's daughter.

Again:—

Mid Moidum ic wæs, and mid Persum,
And mid Myrgingum,
And Mofdingum,
And ongend Myrgingum,
And mid Amoþingum.

With the Medes I was and with the Persians,
And with the Myrgings,
And the Mofdings,
And again with the Myrgings,
And with the Amothings.

More important is an extract which brings the Angle Offa in contact with them, and with the *Heaþo-bards*.

Offa weóld Ongle,
Alewih Denum;
Se wæ's þára manna
Mód gast ealra.
Nó hwæþre he ofer Offan
Eorl-scype fremede;
Ac offa ge-slóg,
Ærest monna,
Cniht-wesende,
Cyne-ríca mæ'st.
Næ'nig efen eald him
Eorl-scipe máran,
On orette,
A'ne sweorde;
Merce ge-mæ'rde,
Wiδ Myrgingum,
Bi Fífel-dore,
Heóldon forδ siþþan
Engle and Swæ'fe
Swá hit Offa ge-slóg.
Hróþ-wulf and Hróδ-gar
Heóldon lengest,
Sibbe æt somne,
Suhtor-fædran:
Siþþan hý for-wræ'con
Wi-cynga cynn,

Offa rul'd Ongle,
Alewih the Danes,
Who of those men was
Haughtiest of all.
Yet not o'er Offa he
Supremacy effected,
For Offa won
Earliest of men,
Being a youth,
Of kingdoms greatest.
No one of like age with him
Dominion greater
Had in contest gain'd
With his single sword;
His marches he enlarged
Towards the Myrgings,
By Fifel-dor.
Continued thenceforth,
Engles and Swæfs,
As Offa it had won.
Hrothulf and Hrothgar
Held very long
Peace together,
The paternal cousins,
After they had expell'd
The race of Wikings,

And Ingeldes	And Ingeld's
Ord for-bigdan,	Sword had bow'd,
For-heówan æt Heorote,	Slaughter'd at Heorot
Heaðo-beardna þrym.	The host of Heathobeards.

Lastly, we get the name *With*-Myrgings.

Eád-wine sóhte ic, and Elsan,	Eadwine I sought and Elsa,
Ægel-mund, and Hungar,	Ægelmund and Hungar,
And þa wloncan ge-dryht,	And the proud host
Wið Myrginga.	Of the With-Myrgings.

In the later writers there is a *Mauringian* district in the parts north of the Elbe, *i. e.* in the parts that the Franks called Nordalbingia.

To explain the details of every notice of these *Mauringians* or *Myrgings* is neither easy nor necessary; and, hence, it is only the Mauringians of Paulus Diaconus that will be considered in the present chapter. There were the *Marovingi* (Μαρουίγγοι) of Ptolemy; who writes "again east of the Abnobæan Mountains" (*i. e.* the Black Forest) "dwell—above, the Suevi, the Kasuari, then the Nertereanes, then the Danduti, under whom the Turoni and *Marovingi*;" or—

Πάλιν ἀπ' ἀνατολῶν μὲν τῶν Ἀβνοβαίων ὀρῶν οἰκοῦσιν ὑπὲρ τοὺς Σουήβους Κασονάροι, εἶτα Νερτερέανες εἶτα Δανδοῦτοι, ὑφ' οὓς Τούρωνοι καὶ Μαρουίγγοι.

Between these Marovingians of Ptolemy and the Langobards of Paulus Diaconus there was no ethnological connection, but only a political, or historical, one. There was a certain tract of Mauringian (Marovingian) territory which the Assipitti (Usipetes), in so far as they hindered the march of the Langobards, may be said to have defended. And this tract lay south of the Usipetan country (which was in Nassau), and east of the Upper Rhine. It lay in that part of Germany from which the north-eastern part of Gaul was conquered; in that part of Germany which sent forth the Franks of the Upper Rhine, and the Burgundians. Of this Frank and Burgundian confederacy I believe the Marovingians to have been a part, and I also believe that it is their name which supplied that of the so-called

Merovingian dynasty. The exact details by which this transfer of denomination took place, I do not pretend to give. I only hold that it originated amongst the Franks of Franche Compté and the Burgundians of Burgundy rather than among the Salian Franks of Clovis. If so, the history of the name *France* is as follows. There was a double introduction of it. There was a partial provincial conquest effected in the south and east, by which a certain district took the name of Franche Compté—the Franks that gave this name being Franks of the Upper rather than the Lower Rhine, Franks whose confederates and neighbours were the Burgundians of Suabia and Bavaria, Franks whose name is preserved in the modern word Franken, or Franconia. These it was whose descent was from the Marovingi of Ptolemy, rather than from the Salii, Marsi, Sicambri, and the other allied populations of the parts below Cologne; and these it was who may also have been in Ptolemy's time Nertereanes, Danduti, and other similar details of a name that afterwards became so formidable.

So much for the partial and provincial conquest which gave the partial and provincial name of Franche Compté. The *general* reduction of *France* by the Franks of Clovis was a wholly different event. Its agents were the Franks of the Lower rather than the Upper Rhine, and its earliest area the southern parts of Belgium, and the northern parts of Gaul.

Between the two, there was originally no apparent connection —the Franks of Franche Compté being Merovingian, but not dominant as conquerors; whereas the Franks of Clovis were dominant conquerors, but not Merovingian. Hence, it was only when the Franch Compté history became incorporated (and confused) with that of the Salian Franks that the dynasty so-called passed for the original ruling dynasty of Gaul in general, or to use an expression borrowed from the style of the *Czar of all the Russias*, the king of *both the Frances*—France and Franche Compté.

The Marovingians were, probably, *Burgundian* rather than aught else.

It has not been for nothing that this hypothesis of the Burgundian origin of the Merovingian name has been exhibited. In the *Deutsche Sprache* the two divisions of the German

name which are most closely associated are the Langobard and the Burgundian. However, if the preceding views be true there were no two groups more different. The original Burgundian locality was south, the original Langobard locality, north. The former touched Gaul; the latter was in contact with the Transalbian portion of Northern Slavonia. The original Burgundians, so far as they were German, belonged to the High-German division. The Langobards, on the other hand, so far as they were German, were pre-eminently Angliform—*i. e.* Low-German. At the same time, the Burgundian area was taken by the Langobards during the course of their migration, and, as such was the case, it is by no means unlikely that their body may have been increased by Burgundian accessions. Originally, however, the Langobards, so far as they were German at all, were Angliform, which the populations with which they were subsequently connected were *not*. Hence, no important complications are introduced by the names *Mauringii*, *Assipitti*, *Burgundii*, &c., no important complications in the way of *ethnology*. In the geographical question as to the details of the Langobard migration from North to South they have a value.

CHAPTER XXIII.

VILLAGE ETHNOLOGY—FORMS IN -ING.

§ 152. THE contents of the present chapter are wholly based upon some remarks of Mr. Kemble's in his "Saxons in England." They are founded upon the termination *-ing*, and indicate the possibility of our arriving at a much more minute ethnology than that of the previous chapters. So minute is it that it descends even to the particular populations of particular villages, and suggests an opinion as to the particular family, locality, or political chieftainship of the particular Germans who first occupied them.

The fundamental facts in this line of criticism are the following:—

1. The termination *-as* is, like the *-s* in the modern English, the sign of the plural number in Anglo-Saxon.

2. The termination *-ing* denotes, *in the first instance*, a certain number of individuals collected together, and united with each other as a clan, tribe, family, household.

3. In doing this, it generally indicates a relationship of a *personal* or *political* character. Thus, two *Baningas* may have been connected with each other, and (as such) indicated by the same term from any of the following causes—relationship, subordination to the same chief, origin from the same locality, &c.

4. Of these *personal* connections, the one which is considered to be the commonest is that of *descent* from a common ancestor, so that the termination *-ing* in this case is a real *patronymic*.

5. Such an ancestor need not be real; indeed, he rarely if ever is so. Like the *eponymus* of the classical writers, he is

the hypothetical, or mythologic, progenitor of the clan, sept, or tribe, as the case may be; *i. e.* as Æolus, Dorus, and Ion were to the Æolians, Dorians, and Ionians.

Now, by admitting these facts without limitation, and by applying them freely and boldly to the German populations of England, we arrive at the following inferences.

1. That where we meet two (or more) households, families, tribes, clans, or septs of the same name (that name ending in *-ing*), in different parts of England, we may connect them with each other, either directly or indirectly; directly when we look on the second as an offset from the first; indirectly, when we derive both from some third source.

2. That when we find families, tribes, &c., of the same name, both in Britain and in Germany, we may derive the English ones from the continental.

Now where do we find these names, and in what form?

They are taken more especially from two sources—viz.:—

1. The present maps of England, and—

2. The Anglo-Saxon charters.

In *form*, they are either simple or compound. Thus, in such words as *Mall-ing*, *Bill-ing*, &c. (names of villages at present existing), we have the real, or supposed, patronymic in its simple state. But we have also the same patronymic as the part of certain compounds, so that instead of *Malling*, or *Billing*, we have Malling-*ton*, Billing-*borough*. Such are the modern forms.

In the Anglo-Saxon (as aforesaid) the simple names end in *-as;* so that *Barling* becomes *Beorlingas*—" hujus autem terræ termini sunt isti; ab oriente et a meridie, *Boerlingas*, ab occidente *Uurotaham*, ab aquilone, *Meapaham.*—*Chart.* A. S. clii.

As may be expected, they also appear as the elements of compounds. Thus from the *Annings* (*Anningas*) we have Anninga-*dún* = Anning-*down.*—*Chart.* A. S. 445.

The *a-* is the sign of the genitive plural; so that *Anning-a-dún* = *Anning-orum* planities.

All this looks as if the names in *-ing* were personal—even when we find them applied to geographical localities.

Let us consider them to be so, and then turn our eyes

towards Germany—seeking what we may find in the names there.

In Germany there is no want of geographical terms in *-ing* —*ing* followed generally by *-en*—as, Harl-*ing-en* in Holland, Gött-*ing-en* in Germany Proper.

Neither is there any want of them, both as *geographical* terms and as *names of families*, and that both in history and legend. We need go no further than the *Traveller's Song* to see this; *e. g.*:—

Ætla ruled the Huns,
. . . .
Becca the Ban*ings*,
. . . .
Wada the Hæls*ings*,
Meaca the Myrg*ings*,
Mearchealf the Hund*ings*,
. . . .
Thyle the Rond*ings*,
Breaca the Bund*ings*.—Ll. 35–46.

The German historians speak to the same effect; from Gibbon to the humblest chronicler. Each nation has its royal family, and each royal family has a name ending in *-ng*; sometimes in *-ing*, sometimes in *-ung*. Thus—

The Visogoth line is that of the Balt-*ungs*;
The Ostrogoth that of the Amal-*ungs*;
The Vandal that of the *Ast-ings* (*Ard-ings* in the O. H. G.);
The Burgundians that of the Gun-*ings*.

The total number of names that, partly in the *Codex Diplomaticus* and partly in the ordinary maps, Mr. Kemble either finds or infers is 627; some of which occur more than once, *i. e.* in different parts of England. The *Billing-s*, for instance, are to be found in Bedford, Durham, Kent, Lancashire, Lincolnshire, Norfolk, Northamptonshire, Northumberland, Salop, Sussex, and the Isle of Wight.

These names fall into two divisions:—

a. Those which we have no reason to think other than Angle or Saxon.

b. Those which indicate elements of the migration other than Angle or Saxon.

There is nothing to be said about the former, except that some of them are not only to be considered as Angle on the strength of no other division claiming them, but on the strength of a certain amount of positive evidence (little or much, good or bad, as the case may be), to their Angle character. Thus—if Mr. Kemble be right in naming such places as *Shav*-ing-ton in Cheshire, and *Shev*-ing-ton in Lancashire, *Skef*-ing-ton in Leicestershire, along with *Skeld*-ing in Yorkshire, from the early occupancies of certain *Sceaf*-ings and *Scyld*-ings, respectively, and if he also be right in connecting these forms in *-ing* with the legendary heroes of Beowulf, and the *Traveller's Song*, who are named *Sceaf* and *Scyld*, we may thence proceed to a third step in our investigation, and that will be a sure one. Whatever may be the case with the *Sceafings* and *Scyldings*, *Sceaf* and *Scyld* are Angle heroes — Angle, and specially Angle, Angle rather than Frisian, or Frank—Angle, but (in the case of Sceaf) Lombard also.

The second class is more important. Herein the names are both German and English. In Germany, however, they are something concerning which all that is known is something other than Angle—Frisian rather than Angle, or Frank rather than Angle, or (perhaps) Norse rather than German.

Are there many of these names? Whether many or few, what are they?

1. *The Myrgings.*—Is *Myrging* the patronymic which we are to see in such names as *Merr-ing*-ton? Mr. Kemble suggests that it is.

2. *The Wæls-ings.*—Is *Wæls*-ing the patronymic which we are to see in such local names as *Walsh-ing*-ham? Mr. Kemble suggests that it is.

3. The *Dhyr-ings.*—Is *Dhyr*-ing the patronymic which we are to see in such local names as *Thor-ing*-ton, *Terr-ing*-ton, &c.? Mr. Kemble suggests that it is.

Assume this view to be unexceptionable, and, then, as—

1. *The Wælsings* are (probably) *Frank;* and as—

2. *The Myrgings* are (probably) *Burgundian;* and as—

3. *The Dhyrings* are (probably) *Thuringian* — we have the evidence of so many patronymics in favour of believing that certain Burgundians, certain Franks, and certain Thurin-

gians, formed part of the Angle invasion—these, at least; possibly others besides.

And why should this view be other than unexceptionable? Do we not in North America believe, that, *as a general rule*, the families with particular names coincide with the families so called in England; that the names of certain places, *sometimes*, at least, indicate a population originating in places similarly designated here? that the Smiths and Johnstons are English in origin, and that the O'Connors and O'Neils are Irish? We certainly believe all this, and, in many cases, we believe it on the ground of the identity of name only.

Exceptions.—Still there are exceptions. Of these the most important are as follows:—

1. The termination *-ing* is sometimes added to an undoubtedly British root, so as visibly to have originated within the island, rather than to have been brought from the Continent, *e.g.* the *Kent-ings = the people of Kent.*

2. The termination *-ing* is often appended to ordinary *local* names; names so thoroughly local as to put the notion of any personal *eponymus* out of the question. This, indeed, was the case with the word *Kenting* just quoted. But there are numerous others as well. The *Syrians*, for instance, to go no further than the *Traveller's Song*, are Ex-syr-*ings* (Qu.? *As*-syrians.)

Mid Israelum ic wæs,	*or*,	With the Israelites I was,
And mid Ex-*syringum.*		And with the Ex-*syrings.*

3. The termination *-ing* is more than once the *third* element of a compound and derivative name, the *second* being an undoubted *geographical* form. Thus the *Codex Diplomaticus* gives us the names Bryt-*ford*-ing-as, and Ugga-*ford*-ing-as.

The evidence, then, is strong against the notion of the forms in *-ing* being *exclusively* of personal origin; *i.e.* it is strong against the forms in *-ing*, *patronymic as they may be*, being *exclusively* like such names as *Cornelii* in Rome, or *Campbell* in the Scotch Highlands. On the contrary, *some* of them are names as purely local, or geographical, as *Kent*, *Syria*,

or *Brentford*, names which need not necessarily, *even on English soil*, be of Angle origin, names which may, in some cases, be even British.*

On the other hand, it may fairly be admitted, that *some* of such names are actually personal: the proportion of them being a point for future investigators.

Say, however, that a certain number of these are known. Say, for instance, that the three before us may safely be dealt with as the names of a *clan*, *sept*, *gens*, or *company* of the Myrgings, Thurings, and Wælsings. It by no means follows that, when they reappear in the *Non*-angle parts of Germany, they do so *exclusively*. They may (any or each) be Angle as well—Angle, though not known to be so. In Belgium there is a place called *Dorringen*. Is this the English *Thorington?* Perhaps it is. If so, and if *Thor*-ington be *Thur*-ingian, *Dorr*-ingen is Thuringian also. Why, however, should not the same root be original and indigenous to the two countries?

§ 153. The following extract gives us the distribution of these forms in *-ing*:—

Bedford	22	Kent	60
Berks	22	Lancashire	26
Bucks	17	Leicester	19
Cambridge	21	Lincolnshire	76
Cheshire	25	Middlesex	12
Cornwall	2	Monmouth	0
Cumberland	6	Norfolk	97
Derby	14	Northampton	35
Devon	24	Northumberland	48
Dorset	21	Nottingham	22
Durham	19	Oxford	31
Essex	48	Rutland	4
Gloucester	46	Salop	34
Hereford	15	Somerset	45
Hertford	10	Southampton	33
Huntingdon	16	Stafford	19

* They may even be *Roman*. I have long thought that the famous Wat-*l*-*ing*-street may be *Via Vitaliana*, the road made by *Vitalis*, whose name as that of an engineer we find in an inscription.

Suffolk	56	Westmoreland . . .	2
Surrey	18	Wilts	25
Sussex	68	Worcester . . .	13
Warwick	31	York (3 Ridings) . .	127

"It is remarkable how many of these names still stand *alone*, without any addition of -wíc, -hám, -worƀig, or similar words. The total number of patronymical names thus found (in the nominative plural) is 190, or very nearly one-seventh of the whole: they are thus distributed: in Kent, 25; Norfolk and Sussex each 24; Essex 21; Suffolk 15; Yorkshire 13; Lincoln 7; Southampton 6; Berks and Surrey, 5 each; Bedfordshire, Lancashire, Middlesex, and Northampton, 4 each; Hertford, Huntingdon, Northumberland, and Nottingham, 3 each; Cambridge, Derby, Dorset, Gloucester, and Oxford, 2 each; Bucks, Devon, Leicester, Salop, Somerset, Warwick, and Wilts, 1 each; and none at all in the remaining ten counties. When now we consider that of 190 such places, 140 are found in the counties on the eastern and southern coasts; and that 22 more are in counties easily accessible through our great navigable streams, we shall be led to admit the possibility of these having been the original seats of the Marks bearing these names; and the further possibility of the settlements distinguished by the addition of -hám, -wíc and so forth to these original names, having been filial settlements, or as it were colonies, from them."—(Vol. i., pp. 478, 479).

I lay all this before the reader for his consideration and criticism. That *some* exceptions lie against the line of criticism has been seen. On the other hand, the *distribution* of the forms in *-ing* is remarkable.

If we turn to the map of Germany and investigate it minutely, we may possibly find something to explain it. I have not, however, undertaken the investigation. All that I can say is, that whatever may be the proportion of the forms in *-ing* to the other terminations of local names in the other parts of Germany, they are conspicuously abundant in Hanover, Oldenburg, Holstein, and East Friesland.

Their form is either simple or compound—when simple, the final syllable is *-en* rather than *-as*—*e.g.* Gött-ing-*en*, Harl-ing-*en*, &c. In this latter word the initial element is equally English and German—as is the case with some other names.

The commonest addition to the syllable *-ing* in English is *-ton*, as Terring-*ton*.

The commonest addition to the syllable *-ing* (*-ing-en*) in German is *-häusen* or *husen* (*houses*), a form which may be said to replace *-ton*—*e. g.* Kell-ing-*husen*.

Admitting that *some* of the initial elements of the compounds and derivatives in question are *personal* names, how did they originate? It is no answer to say that they were the names of certain *eponymi*.

What was the relation of the *eponymus* to his *eponymia*? My own opinion is, that if any explanation of this obscure point be to be found at all it lies in the following text of Tacitus: "Principes pro victoriâ pugnant: comites pro principe. Si civitas in quâ orti sunt longâ pace et otio torpeat, plerique nobilium adolescentium eas petunt ultro nationes, quæ tum bellum aliquod gerunt," &c.

This gives us something like a free company. Of this let the captain be named (say) *Heard*, and his followers may become Heard-*ing*-as.

I only suggest this; and, along with it, I also suggest an element of doubt. The twelfth chapter has shown how large a proportion of the Angle names were compound, whereas the forms in *-ing* generally give us a simple and monosyllabic initial element.

CHAPTER XXIV.

RELATIONS OF THE ENGLISH TO THE LANGUAGES OF GERMANY IN GENERAL.

§ 154. THREE German forms of speech have been noticed —the Old Saxon, the Angle, and the Frisian.

But they are only three out of several; we may say, three out of many.

Forms of speech such as the Frank, the Thuringian, &c., have been named. So have forms of speech called Norse, Icelandic, or Scandinavian.

All this means that, just as the English is one division of a group containing the Old Saxon and the Frisian besides, so may the Old Saxon and the Frisian (along with the English) constitute a division of some higher group or genus.

Which of the members of this same group or genus shall we take first; the Frisian, the Angle, and the Old Saxon, having already been considered? Of the remaining languages of the German class we begin with the ones which are most like those that have already been illustrated.

Now these *diverge*, *i. e.* the Frisian leads in one direction, the Old Saxon in another.

Each of these tongues is conterminous with some other member of the German division, some known member with which we can compare it. The Anglo-Saxon, on the other hand, had such portions of its frontier as have not already been under treatment—such portions of its frontier as were not either Frisian or Old Saxon—either Slavonic (and, as such, not German at all), or else North Hessian and Thuringian. Hence, it was only in the direction of those two forms of speech that it could graduate into any other member of its class.

But the early forms of the North Hessian and North Thuringian are as unknown as the southern forms of the Angle.

Hence—the two *outside* and *osculant* languages (so to say), the languages that lead to other members of their class, are the Frisian and Old Saxon.

Of these the former points to Scandinavia; the latter to Southern Germany.

The former leads to the Icelandic, Danish, Swedish, Norwegian, and Feroic, the latter to the Platt-Deutsch, and High German—also to the Mœsogothic.

Whether we begin with the Frisian or the Old Saxon we come to the same class of dialects. These are, on the south and south-west of the Old Saxon and Frisian frontiers the Dutch of Holland, and on the south and south-east the numerous Platt-Deutsch (so called) forms of speech of Westphalia, and the Lower Rhine.

§ 155. *The Dutch of Holland.* — Nearly akin to the English, and still more nearly akin to the Frisian on its northern and the Platt-Deutsch of Westphalia on its eastern frontier is the Dutch of Holland, of which the Flemish of Belgium is only a modification. South of the Flemish frontier comes the French of Artois and Picardy, no German tongue at all but one belonging to another class of languages. The Dutch of Holland extends a little into Germany, the dialect of part of Cleves being more Dutch than Platt-Deutsch—so far, at least, as the two are distinguished from each other.

The Dutch of Holland falls into dialects and sub-dialects, *e.g.* the Groningen, the Guerderland, the Zealand, the Brabant, &c.

The *stages* of the Dutch of Holland are somewhat indistinct. Samples of any dialect of the Seven Provinces of equal antiquity with the oldest Frisian, the oldest Old Saxon, and the Anglo-Saxon there are none. On the other hand the Old Frisian and Old Saxon are closely akin to what such specimens would be if they existed—indeed more than one scholar has dealt with the *Carolinian Psalms* as if they were Old Dutch, and noticed them under that name.

The earliest important work in true Dutch is the Chronicle of Melis Stoke, about A.D. 1300.

SPECIMENS.

Mark, chap. i.

1. Het begin des evangelies van Jesus Christ, den Zoon van God.

2. Gelijk geschreven is in de Profeten: ziet, Ik zend mijnen Engel voor uw aangezigt, die uwen weg voor u heen bereiden zal.

3. De stem des roependen in de woestijn: bereidt den weg des Heeren, maakt zijne paden regt!

4. Johannes was doopende in de woestijn, en predikende den doop der bekeering tot vergeving der zonden.

5. En al het Joodsche land ging tot hem uit, en die van Jerûzalem; en werden allen van hem gedoopt in the rivier de Jordaan, belijdende hunne zonden.

6. En Johannes was gekleed met kemelshaar, en met eenen lederen gordel om zijne lendenen, en at sprinkhannen en wilden honig.

7. En hij predikte, zeggende: na mij komt, die sterker is dan ik, wien ik niet waardig ben, nederbukkende, den riem zijner schoenen te ontbinden.

8. Ik heb ulieden wel gedoopt met water, maar hij zal u doopen met den Heiligen Geest.

Now compare the following with the Old Saxon of the *Carolinian Psalms* (p. 84).

2. Hoor God! mijn gebed, en verwerp niet mijne bede! denk tot (aan) mij, en hoor mij.

3. Ontroerd ben ik en mijne bezigheheden en misstrootig ben ik van de stem des vijands en van het leed (mij) van den zondigen (aangedaan).

4. Want zij neigden op mij het onregt, en in verbolgenheid waren zij mij onzoet.

5. Mijn hart is ontroerd in mij, en de vries des doods overviel mij.

6. Vries on beving kwamen over mij en duisternis bedeckte mi.

7. En ik zeide, wie zal mij geven vederen als van eene duif; en ik sal vliegen en zal rusten.

In English.

2. Hear God bidding mine; and not fore-warp (reject) biddings mine; think to me; and hear me.

3. Saddened be (I) on toil mine; and mistrust be (I) from voice enemies' (fiends), and from labour (of the) sinful.

4. When then they charged on me unright, and on rage unsweet were (to) me.

5. Heart mine is troubled on me, and fright deaths' fell over me.

6. Fright and trembling came over me, and decked (covered) me darkness.

7. And I quoth, who shall give me feathers al-so-as (of a) dove; and I flee shall, and rest shall.

§ 156. *The Platt-Deutsch* Dialects.—Platt* means *Broad* or *Flat.* For some reason or other it has become current as a term in German philology. The Germans of Suabia, Franconia, and the countries on the upper parts of the Rhine, Weser, and Oder, thus denominate the dialects of the *Lower* Rhine, the *Lower* Weser, the *Lower* Oder, the *Lower* Vistula, &c.

Such is the meaning of the word in its narrower and more limited sense—the meaning which it takes in the mouth of an ordinary German who names the dialects of his country according to the current nomenclature.

But there is a wider meaning as well. Each and all of the languages that have up to the present time commanded our attention are not only German, but German with special Platt-Deutsch affinities. Thus the Frisian, the Dutch of Holland, the Anglo-Saxon, the English, and the Old Saxon are all liker to the dialects of the Lower Rhine, the Lower Weser, &c., than they are to the Suabian, the Franconian, the Bavarian, &c.

This engenders a complication. Sometimes the word means some particular dialect of Westphalia, Oldenburg, Hanover, Holstein, Sleswick, Mecklenburg, &c., to the exclusion of the English, Frisian, and Dutch of Holland; and sometimes it means the English, Dutch, Westphalian, &c., collectively. Hence, it is correct to say, that the language of Overysel or Guelderland is Dutch rather than Platt-Deutsch, Dutch like the literary language of Holland, rather than any provincial

* Pronounced *Doitsh.*

dialect of Westphalia. And it is also correct to say that the English of England is a Platt-Deutsch form of speech.

All this is correct. Whether it be convenient is another matter.

In the present work *Platt-Deutsch* (the German term) will represent the provincial dialects of Northern Germany—the provincial dialects of the *Lower* (and Middle) Rhine, Weser, Oder, &c.; whereas the more generic expression for the group containing the English, &c., will be *Low-German*, *i. e.* the German of the *Lower* course of the Rhine, &c.

Hence there is a *Platt-Deutsch* sub-section of the *Low-German* section.

I cannot say whether any Platt-Deutsch dialect absolutely graduates into the Dutch of Holland, nor yet can I give (either geographically or philologically) an exact line of demarcation between the southern Platt-Deutsch and the northern High-German divisions. I cannot even say in which quarter the relationship is the closest, *i. e.* whether the most like forms of the Dutch of Holland and the Platt-Deutsch of Westphalia, are liker each other than the likest dialects of the Platt-Deutsch and High-German. Such divisions, however, are often drawn. Few writers make the Hessian of the middle parts of Hesse other than High-German. Yet, it contains more than one of the so-called Low-German characteristics.

The points connected with the Platt-Deutsch which are the most certain, and not the least important, are the following:—

1. It is more High-German than any of the forms of speech hitherto noticed—more High-German than the Old Saxon, the Anglo-Saxon, the Dutch, the Frisian. Hence—

2. Its original *situs* is to the south (south-west) of those forms of speech, *i. e.* on the High-German frontier. No one has ever said that any of the above-named languages graduate into the Franconian, or the Hessian; many have said that some of the Rhenish forms of the Platt-Deutsch do.

3. From this it spread northward and north-eastwards—the Franks of the Carolinian period being its chief propagators, and the districts it invaded being Westphalia, Oldenburg, Hanover, Altmark, Brunswick, Lauenburg, Holstein, Sleswick,

Mecklenburg, Pomerania, West Prussia, East Prussia, Courland, Livonia, Esthonia (these last imperfectly).

To all these countries it was originally foreign—the native languages being—

1. In Westphalia, Oldenburg, Hanover, Brunswick, and part of Holstein, the Old and Anglo-Saxon.

2. In Lauenburg, part of Holstein, Altmark, Luneburg, Mecklenburg, and Pomerania, the Slavonic.

3. In West (?) and East Prussia, Courland, and South Livonia, the Lithuanic or Lett.

4. In North Livonia and Esthonia (German being spoken at Reval, and even in Narva), the Fin of Esthonia.

To these add the original districts from which it was diffused, which I hold to have been the parts on the Lower and Middle Rhine about Cologne, and you have the vast area of the Platt-Deutsch of Germany—the descendant of the Carolinian (or Carlovingian) Frank.

The *stages* of the Platt-Deutsch are equally obscure with those of the Dutch of Holland—more so. Of the different forms of it, as spoken at the present moment, there are abundant specimens, specimens of which the collection of Firminich * is a rich repertorium. But the analogues of the Anglo-Saxon, the analogues of the Old and Middle English, are scarce, in some cases non-existent. For the term in its wider and more general sense—for the Low-German—we have them, *e. g.* there are the *Carolinian Psalms*, the *Heliand*, &c.; but these are Old Saxon—Old Saxon of Westphalia.

Now linear descendants of these last-named forms of speech we have none. They were displaced on the spot where they were spoken by the Carolinian Frank. But this was not written and preserved until a comparatively late period—later in some parts than in others, late in the parts where the Slavonic was the original tongue, later still where the Lithuanic was. I cannot say when and where, for each particular portion of the present Platt-Deutsch area, the earliest extant specimen was put to paper, and handed down. I believe it was in the parts about Hamburg, Lübeck, &c. As a general rule, however, we may state that the forms of speech of that

* Firminich Volkenstimmen Germaniens.

part of the present Platt-Deutsch area, which, without being Frank, was originally German, have left no modern representatives, and that the Frank which displaced them is not known in any old form—*i. e.* no form contemporary with the Anglo-Saxon, or Old Frisian.

But there was the *original* Frank area, the part of Germany where the form of speech took birth, and whence it spread. What have we here? What have we for the Lower and Middle Rhine, for South-Western Westphalia? Nothing which is at one and the same time sufficiently definite to represent a separate substantive division, and also of high antiquity. The *Gospel Harmony* of Tatian is generally called *Frank* (*Francic*), but it has much which is more High-German than Platt-Deutsch. Shall we say that even in the earliest times, and in their most special localities, the Frank (the mother of the Platt-Deutsch) was, for the purposes of literature, more or less High-German? I speak on this point with diffidence, but, at the same time, think that such a view is far from incorrect.

§ 157. *The High-German.*—By taking extreme forms we may easily get High-German specimens which differ visibly from the Platt-Deutsch.

We may get this from two quarters, *i. e.* either from the literary language of the present Germans and their forerunners, or from the more extreme provincial dialects, *e. g.* the Bavarian, or the Swiss.

How far is the literary High-German of the present time a real language; or how far is it a language of the author and the schoolmaster?

In the work of Firminich, already quoted, there is no part of Germany of the size of the county of Leicester, without a sample of its dialect. Yet it is safe to say that none of these approaches the written language so closely as the ordinary language of Huntingdon and Northampton approaches the written English.

Again,—ask in Germany where the best German is spoken —*best* meaning the *highest*. The answer is, in Hanover or Brunswick—Platt-Deutsch districts.

SPECIMENS.

1.

From Lessing's Fables.

HERKULES.

Als Herkules in den Himmel aufgenommen ward, machte er seinen gruss unter allen Göttern der Juno zuerst. Der ganze Himmel und Juno erstaunte darüber. "Deiner Feindin," rief man ihm zu, "begegnest du so vorzüglich?" "Ja, ihr selbst;" erwiederte Herkules. "Nur ihre Verfolgungen sind es, die mir zu den Thaten Gelegenheit gegeben, womit ich den Himmel verdienet habe."

Der Olymp billigte die Antwort des neuen Gottes, und Juno ward versöhnt.

In English.

As Hercules in the Heaven up-taken was, made he his greeting, under (among) all Gods, to Juno at (to) first. The whole Heaven and Juno were astonished thereon (over). "Thy female enemy (fiend)," cried they him to, "meetest thou so preferably?" "Yes, herself," answered Hercules, "only her persecutions are it, which me to the deeds opportunity (have) given, wherewith I the Heaven earned have.

The Olympus approved the answer of the new God, and Juno was reconciled.

2.

From Herder.

Horch, horch die Lerch' am Himmelsthür singt,
Die liebe Sonn' wacht auf;
Aus allen Blümkelchen trinkt
Sie schon ihr öpfer auf.
Das Hochzeitknöspfchen freundlich winkt,
Und thut sein Aüglein auf;
Was hold und lieb ist, freundlich blinkt,
Wach schönes Kind wach auf,
Wach auf;
Wach schönes Kind wach auf.

This is a translation from the song in "Cymbeline":—

Hark! the lark at Heaven's gate sings;
The sun begins to rise:

His steed to water at those springs,
On chaliced flowers that lies.
And winking Mary-buds begin,
To ope their golden eyes;
And everything that pretty bin;
My Ladye sweet arise,
Arise,
My Ladye sweet arise.

Literally.

Hark! Hark! the lark at Heaven's door sings,
The dear (*love*) Sun wakes up;
Out of all bloom-chalices drinks
She (the *sun*, which is feminine) already their offering up
The batchelor's button friendly looks.
And does its eye-ling up (= opens little eye).
What gracious and dear is friendly winks,
Wake, fair child, wake up.
Wake up, &c.

From New Testament, MARK i. 1–8.

1. Diess ist der Anfang des Evangelii von Jesu Christo, dem Sohne Gottes.

2. Als geschrieben stehet in den Propheten: Siehe, Ich sende meinen Engel vor dir her, der da bereite deinen Weg vor dir.

3. Es ist eine Stimme eines Predigers in der Wüste: Bereitet den Weg des Herrn, machet seine Steige richtig.

4. Johannes der war in der Wüste, taufte und predigte von der Taufe der Busse, zur Vergebung der Sünden.

5. Und es gieng zu ihm hinaus das ganze Jüdische Land, und die von Jerusalem, und liessen sich alle von ihm taufen im Jordan, und bekannten ihre Sünden.

6. Johannes aber war bekleidet mit Kameelshaaren, und mit einem ledernen Gürtel um seine Lenden, und ass Heuschrecken und wilden Honig;

7. Und predigte und sprach: Es kommt einer nach mir, der ist stärker, denn ich, dem ich nicht genugsam bin, dass ich mich vor ihm bücke, und die Riemen seiner Schuhe auflöse.

8. Ich taufe euch mit Wasser, aber er wird euch mit dem heiligen Geiste taufen.

The Old High-German, called also Francic and Alemannic, was spoken in the ninth, tenth, and eleventh centuries, in Suabia, Bavaria, and Franconia. It is in the Old High-German that the *Krist* of Otfrid, the *Psalms* of Notker, the *Canticle* of Willeram, the *Glosses* of Kero, the *Vita Annonis*, &c., are composed.

  Himilisgu menigi, sus alle singenti—
"In himilriches hohi si Gote guallichi;
  Si in erdu fridu ouh allen thie fol sin guates uuillen."

The Same, in English.

Then there was in the land herdsmen feeding:
  Of their cattle they made watch against foes.
To them came a messenger fair, an angel shining,
  And they became lit with heavenly light.
They feared, suddenly as on him they looked;
  And followed much the words of God's messenger:

Spake there God's messenger strait, "I shall to you say wonders.
To you shall there be from God health; fear nothing at all.
I shall to you say a message, the bidding of the heavenly God:
Also there is none who has heard so glad an errand.
Therefore becomes his world for ever blythe,
And all creatures that in the world are treading this earth.
Newly borne has this land the heavenly Savior,
Who is the Lord Christ, good, from a young mother.
In Bethleem, of the kings they were all thence—
From them was also born his mother, a maid fair.
I say to you, good men, how ye him shall find,
A sign and token, through this wonder.
To your burgh fare hence, ye find, so as I to you said,
A child, new born, in a crib lying."
Then came, while he to them spake, of angels a host,
A heavenly retinue, thus all singing:
"In the heavenly kingdom's highth be to God glory;
Be on earth peace also to all who are full of God's will."

The Middle High-German ranges from the thirteenth century to the Reformation.

§ 158. *The Mœso-Gothic.*—The Goths who sacked Rome under Alaric, and who succeeded to the empire of Augustulus under Theodoric, were of German origin, and the language that they spoke was German also. It is called the Mœso-Gothic.

Of this language we have a specimen, not later than the fourth century; and as no Anglo-Saxon work is of equal antiquity, the Mœso-Gothic is considered to be the oldest of all the German tongues. The meaning of the word will be understood if, by following the course of the Danube, we reach the Roman province of Mœsia. The *earliest* inhabitants of this province were not akin to any of the tribes of Germany, any more than the original Britons of England were akin to the Anglo-Saxon invaders. Before the end, however, of the second century they were conquered by tribes from the south-eastern parts of Germany. These were called Goths, or, more specifically, the Goths of Mœsia.

To the first eight verses the following notes apply, the remainder being to be made out by reference to the chapter from which the extract is taken.

Mœso-Gothic.

Anastodeins, beginning, lit., up-standing—*ga-meliþ*, written, painted, German, *mahlen* = *paint*. The *ga* is the sign of the participle; one word in English preserves it, viz. y-*clept* = *called*; A. S. *clepian* = *to call*—*aggilu*, ἄγγελος—*gamanveiþ*, prepare—*stibna*, voice; German, *stimme*—*vopjandins*, crying; weep-ing—*auþidai*, German, *öde* = *waste*.—*Fanins*, of the Lord, one of the many Slavonic words in Ulphilas = *Pan* = *dominus*—*staigos*, ways = German, *steig*; Danish, *stie* = *way*—*daupjands*, baptize = *dip*—*merjands*, proclaiming, preaching—*idreigos*, repentance. This has been looked upon as a Keltic word *aflageina*, away-laying; *fravaurhté*, of sins; *fore*works; the *fore*, as in *for*swear—*usiddjedun*, out-goed, out-yode—*awai*, water, river; *aha*, Old German, *aa*, Norse—*andhaitandans*; *and* = *coram*, *hait* = *voco*, as in *hight* = *is called*, *bears the name*: = *proclaiming*, *confessing*; *gavasiþs*, clothed; from *vasjan* = *to clothe*—*taglam*, hair (word for word); *tail*, *tægel*, A. S.—*ulbandaus* (word for word) *elephant*—*gairda filleina*—fell (as in *fell*-monger), girdle—*hup*, hips—*þramsteins*, twigs (such the translation, not *grasshoppers*)--*mileþ haiþivisk*, heath-honey; *qipands*, saying (*queathing*, as in *quoth*, *bequeathe*)—*swinþoza*, stronger, A. S. *swiðe* = *very*. Comparative in *z* (s). *Sa* = who; *anahneivands*, stooping, bending (*kneeling*); — *skauda-raip*, latchet; *izvis*, you; *vatin*, *water*; Lithuanic, *wandu*; Danish, *vand*; Swedish, *vatn*; *ahmen*, spirit; *veihamma*, holy.

§ 159. *The Scandinavian languages*.—Allied to each other, and allied to the languages of Germany are the following forms of speech; forms of speech which we may call *Scandinavian*, or *Norse*:—

1. The Icelandic of Iceland; closely akin to which is the
2. Feroic of the Feroe Isles; and also
3. Several of the more archaic provincial dialects of Norway, Sweden, and Denmark.
4. The literary language of Sweden, and
5. The literary language of Denmark and Norway.

§ 160. *The literary Danish*.—This is Norwegian as well.

SPECIMEN.

1.

Kong Christian stod ved höien Mast,
I Rög og Damp;
Hans Værge hamrede saa fast,
At Gothens Hjelm og Hjerne brast;
Da sank hvert fiendtligt Speil og Mast
I Rög og Damp.
Flye, skreg de, flye, hvad flygte kan!
Hvo staaer for Danmarks Christian
I Kamp?

Niels Juel gav Agt paa Stormens Brag,
Nu er det Tid!
Han heisede det röde Flag,
Og slog paa Fienden Slag i Slag;
Da skreg de höit blandt Stormens Brag:
Nu er det Tid!
Flye, skreg de, hver, som veed et Skjul!
Hvo kan bestaae for Danmarks Juel
J Strid?

Nordhav! Glimt af Vessel bröd
Din mörke Skye.
Da tyede Kæmper til dit Skjöd;
Thi med ham lyned' Skræk og Död.
Fra Vallen hörtes Vraal, som bröd
Din tykke Skye.

Fra Danmark lyner Tordenskjold;
Hver give sig i Himlens Vold,
Og flye!

Du Danskes Vei til Roes og Magt,
Sortladne Hav!
Modtog din Ven, som uforsagt
Tör möde Faren med Foragt,
Saa stolt, som du, mod Stormens Magt,
Sortladne Hav!
Og rask igjennem Larm og Spil
Og Kamp og Seier för mig til
Min Grav!

In English.

1.

King Christian stood by high-*the* mast
In reek and damp,
His weapon hammered so fast
That Gothland's helms and brains burst;
Then sank each hostile (fiendlike) stern and mast
In reek and damp.
Fly, shrieked they, fly, what fly can:
Who stands against Denmark's Christian
In battle?

Niel Juel gave heed on storms-*the* crash,
Now is it time.
He hoists the red flag,
Eke slew on fiend-*the* blow on blow,
Then shrieked they high amid storms-*the* crash,
Now is it time,
Fly, shrieked they, who knows a shelter:
Who can stand against Denmark's Juel
In fight?

O North Sea! flash of Vessel broke
Thy murky cloud (sky):
Then took refuge warriors (*champions*) in thy bosom
For with him flashed fright and death.
From battle-fields, heard-*was* cry which broke,
Thy thick cloud (sky).
From Denmark flashes Tordenskiold!
Each give himself in Heaven's power (wealding)
And fly.

Thou Dane's way to glory and might,
Dark Sea!
Accept (*take in meeting*) thy friend, who reckless
Dare meet danger with contempt,
So proud as thou, against storms-*the* might,
Dark Sea!
And swift through noise and music,
And fight and victory bear me to (*til*)
My grave.

2.

NORWEGIAN NATIONAL SONG (*concluding stanzas*).

Frihedens Tempel i Normandens Dale
Stander saa herligt i Ly af hans Fjeld;
Frit tör han tænke, og frit tör han tale,
Frit tör han virke til Norriges Held.
Fuglen i Skove,
Nordhavets Vove
Friere er ei end Norriges Mand;
Villig dog lyder han selvgivne Love,
Trofast mod Konning og Fædreneland.

Elskede Land med de skyhöie Bjerge,
Frugtbare Dale og fiskrige Kyst!
Troskab og Kjærlighed fro vi Dig sværge!
Kalder Du, blöde vi for Dig med Lyst.
Evig Du stande,
Elskte blandt Lande!
Frit som den Storm, der omsuser Dit Fjeld;
Og medens Bölgen omsnoer Dine Strande,
Stedse Du voxe i Hæder og Held!

In English.

Freedom's temple in Normans-the dales
Stands so noble in lea of his rock (fell)
Free dares he think, and free dares he speak,
Free dares he work til Norway's weal.
Bird (*fowl*)-the in woods (*shaws*)
North-sea's-*the* waves
Freer is not than Norway's man;
Willing, however, obeys he self-given laws
True-fast towards king and fatherland.

Loved land with the sky-high hills (bergs),
Fruitful valleys, and fish-rich coast!
Truth and love glad we for thee swear;
Callest thou, bleed we for thee with pleasure.
Ever thou stand
Loved amongst lands,
Free as the storm that roars round thy fell;
And (eke) whilst billow-the laps round thy strand,
Ever thou wax in praise and wellfare.

Danish New Testament.—MARK i. 1–8.

1. Jesu Christi Guds Søns Evangelii Begyndelse.
2. Ligesom skrevet er i Propheterne: See, jeg sender min Enge for dit Ansigt, som skal berede din Vei for dig.
3. Det er hans Røst, som raaber i Örken: bereder Herrens Vei, gjører hans Stier rette.
4. (Saaledes) døbte Johannes i Örken, og prædikede Omvendelsens Daab til Syndernes Forladelse.
5. Og det ganske Land Judæa gik ud til ham, og de af Jerusalem; og alle de, som bekjendte deres Synder, døbtes af ham i Jordans Flod.
6. Men Johannes var klædt i Kameel-Haar, og med et Læderbelte om sin Lend, og aad Græshopper og vild Honning;
7. Og prædikede, og sagde: der kommer den efter mig, som er stærkere end jeg, hvilken jeg ikke er værdig til at bukke mig ned for, og oplose hans Skoerem.
8. Vel har jeg døbt eder med Vand, men han skal døbe eder med den Hellig Aand.

§ 161. *The Literary Swedish.*—This is easily understood by an educated Dane or Norwegian.

SPECIMEN.

From Frithiof's Saga, Canto ix.

1.

1.	1.
Nu är att säga huru	Now is it to say how
Jarl Angantyr satt än	Earl Angantyr sat
Uti sin sal af furu,	In his hall of fir,
Ock drack med sina män;	And drank with his men.
Han var så glad i hågen,	He was so glad in spirit,
Såg ut åt blånad ban,	Looked out on the blue way,
Der solen sjunk i vågen,	Where the sun sank in the wave,
Allt som än gyllne svan.	All as a golden swan.
2.	2.
Vid fönstret gamle Halvar	At the window old Halvar
Stod utanför på vakt.	Stood outside at watch;
Hann vaktade med allvar,	He watched with earnestness,
Gaf ock på mjödet akt.	And eke gave heed to the mead.

En sed den gamle hade;
Hann jemt i botten drack;
Ock intet ord hann sade;
Blott hornett in han stack.

A habit the old one had;
He drank even to the bottom,
And not a word did he say,
He only stuck the horn in.*

3.

Nu slängde han det vida
I salen in och qvad,
" Skepp ser jag böljan rida;
" Den färden är ej glad.
" Män ser jag döden nära,
" Nu lägga de i land:
" Ock tvenne jättar bära
" De bleknade på strand."

3.

Now he flung it in far
The hall and said,
" I see a ship ride the waves;
" Whose fare is not glad.
" I see men near death,
" They now make the land;
" And two giants bear
" The pale ones on shore."

4.

Utöfver böljans spegel,
Från salen Jarl såg ned:
" Det är Ellidas segel,
" Och Frithiof, tror jag, med.
" På gången och på pannan,
" Känns Thorstens son igen:
" Så blickar ingen annan
" I Nordens land som den."

4.

Over the billows' mirror,
From his hall the Earl looked down:
" That is Ellida's sail,
" And Frithiof, I trow, with it.
" By gait and front
" Thorsten's son is known;
" So looks no other
" In the Northland as he."

5.

Från dryckesbord held modig
Sprang Atle Viking då,
Svartskäggig Berserk, blodig
Ock grym at se uppå.
" Nu," skrek han, " vil jag pröfva,
" Hvad rycktet ment dermed,
" At Frithiof svärd kann döfva;
" Och alldrig ber om fred."

5.

From the drinking-board heroic
Sprang Atle the Viking then,
Blackbearded Berserk, bloody
And grim to look on.
" Now," shrieked he, " will I prove
" What Fame meant thereby,
" That Frithiof can dull the sword; †
" And never prays for quarter."

6.

Och upp med honom sprungo
Hanns bistra kämpar tolf:
På forhand luften stungo,
Och svängde svärd ock kolf.

6.

And up with him sprung
His fierce champions twelve;
Beforehand they beat the air,
And swung sword and javelin.

* Through the window into the drinking-room.
† Of his enemy, *i.e.* is sword-proof.

De stormade mot stranden,
Hvor tröttadt drakskepp stod.
Men Frithiof satt å sanden
Ock talte kraft och mod.

They stormed to the strand,
Where tired the ship stood;
But Frithiof sat on the sand,
And talked strength and courage.

7.

"Lätt kunde jag dig fälla,"
Skrek Atle med stort gny.
"Vill i ditt val dock ställa,
"Att kämpa eller fly.
"Men blott om fred du beder
"Fastän än kämpe hård,
"Jag som än vän dig leder,
"Allt up til Jarlens gård."

7.

"Lightly could I fell thee,"
Shrieked Atle, with great roar.
"But I will give you choice,
"To fight or fly.
"Only ask for peace,
"And though a champion hard,
"I 'll lead you as a friend
"Up to the Earl's house."

8.

"Väl är jag trött af färden;"
Genmälte Frithiof vred,
"Dock må vi pröfva svärden,
"Förr än jag tigger fred."
Då såg man stålen ljunga,
I solbrun kämpehand;
På Angurvadels tunga,
Hvar runa stod i brand.

8.

"Well am I tired of the voyage,"
Answered Frithiof angry;
"Yet we must try the sword,
"Ere I beg peace."
Then did one see the steel flash
In the tanned champion-hand.
On Angurvadel's tongue
Each rune stood a-burning.

9.

Nu skiftas svärdshugg dryga,
Och dråpslag hagla nu;
Och begges skjöldar flyga,
På samma gång itu.
De kämpar utan tadel
Stå dock i kredsen fast;
Men skarpt bet Angurvadel,
Och Atles klinga brast.

9.

Now heavy sword-cuts are exchanged,
And death-strokes hail now;
And both their shields fly
At the same time in two.
The warriors without reproach
Stand still in their circle;
But sharp hit Angurvadel,
And Atle's sword broke.

10.

"Mod svärdlös man jag svänger,"
Sad Frithiof, "ei mitt svärd.
"Men lyster det dig länger,
"Vi pröfva annan färd."

10.

"Against a swordless man I swing,"
Said Frithiof, "not my sword.
"But if it list thee longer,
"We try another fashion."

Som vågor då om hösten,
De begge storma an;
Ock stållbeklädda brösten,
Slå tätt emot hvarann.

As waves then in autumn
The two storm on;
And steel-clad breasts
Dash close against each other.

11.

De brottades som björnar,
Uppå sitt fjäll af snö;
De spände hop som örnar,
Utöfver vredgad sjö.
Rodfästad klippa hölle
Vel knappast ut att stå;
Ock lummig jernek fölle
För mindre tag än så.

11.

They wrestled as bears
On their hill of snow;
They grappled as eagles
Over an angry sea.
Root-fast cliffs would scarcely
Hold out to stand;
And thick iron-oaks would fall
For lesser blows than such.

12.

Från pannan svetten lackar,
Och bröstet häfves kallt;
Och buskar, sten, ock backar,
Uppsparkas öfver allt.
Med bäfvän slutet bida
Stållklädde män å strand;
Det brottandet var vida
Berömdt i Nordens land.

12.

From the brow the sweat plashes,
And the breast heaves cold;
And bush, stone, and hill
Are lit-up over all.
With fright they await the upshot
The steel-clad men on the shore;
That tussle was wide
Famed in Northland.

13.

Til slut dock Frithiof fällde
Sin fiende til jord,
Hann knät mod bröstet ställde,
Och tallte vredens ord.
"Blott nu mitt svärd jag hade,
"Du svarte Berserksskägg,
"Jag genom lifvet lade,
"På dig den hvassa ägg."

13.

At last, however, Frithiof felled
His foe to earth,
He placed his knee against his breast,
And spoke words of rage.
"If I only had my sword,
"Thou black Berserk-beard,
"I would through thy body
"Pass its sharp edge."

14.

"Det skal ei hinder bringa,"
Sad Atle stolt i håg.
"Gå du, ock ta din klinga,
"Jag licgar som jag låg.

14.

"That be no hindrance,"
Said Atle proud in spirit.
"Go thou; and take thy sword,
"I will be as I have lain.

" Den ena, som den andra,
" Skal engång Valhall se:
" Idag skal jag väl vandra;
" I morgon du kanske."

15.

Ei lange Frithiof dröjde;
Den lek han sluta vill:
Han Angurvadel höjde;
Men Atle låg dock still.
Det rörde hjeltens sinne;
Sin vrede då hann band;
Höll midt i huggett inne,
Ock tog den fallnes hand.

" The one like the other
" Shall one day see Vallhall.
" To-day I go,
" To-morrow you maybe."

15.

Not long did Frithiof delay;
He will close the game:
He lifted Angurvadel,
But Atle lay still.
That touched the hero's heart,
He checked his rage,
Stopped himself half-way in the blow,
And took the fallen-man's hand.

From Frithiof's Saga, Canto xvii.

Kung Ring han satt i högbänk om julen och drack mjöd,
Hos honom satt hans drottning så hvit och rosenröd.
Som vår och höst dem båda man såg bredvid hvarann,
Hon var den friska våren, den kulna höst var han.

Då trädde uti salen en okänd gubbe in,
Från hufvud och till fötter han insvept var i skinn.
Han hade staf i handen och lutad sågs han gå,
Men högre än de andra den gamle var ändå.

Han satte sig på bänken längst ned vid salens dörr;
Der är de armas ställe ännu, som det var förr.
De hofmän logo smädligt och sågo till hvarann,
Och pekade med fingret på luden björnskinnsmann.

Då ljungar med två ögon den främmande så hvasst,
Med ena handen grep han en ungersven i hast,
Helt varligen han vände den hofman upp och ned
Då tystnade de andre; vi hade gjort så med.

In English.

King Ring he sat in high-bench at Yule (*Christmas*), eke drank mead,
By him sat his queen so white and rosy-red.
As Spring and Autumn (*harvest*) them both man saw aside-by each other,
She was the fresh spring, the chill harvest was he.

Then trod out-in hall-*the* an unknown (*unkenned*) old-man in;
From head and (*eke*) to feet he covered was in skin;
He had staf in hand-*the*, eke bent was-seen he (to) go,
But higher than the others the old-man was still.

He sat-him on bench-*the* along below by halls-*the* door;
There is the poor's place (*stall*) still-now, as that was before.
The court-men laughed scornfull, and saw till each-other;
And pointed with finger-*the* at ragged bear-skin man.

Then flashes with two eyes the stranger so sharp,
With one hand he griped a young-swain in haste.
Right (*whole*) tenderly he turned the court-man up and down (*nether*),
Then kept silent the others; we had done (*gar* Scoticé) with (also).

Swedish New Testament.—MARK i. 1–8.

1. Thetta är begynnelsen af Jesu Christi, Guds Sons, Evangelio:
2. Såsom skrifwit är i Propheterna: Si, jag sänder min Aengel framför titt ansikte, hwilken bereda skal tin wäg för tig.
3. En ropandes röst är i öknen: Bereder Herrans wäg, görer hans stigar rätta.
4. Johannes war i öknen, döpte, och predikade bättringens döpelse, til syndernas förlåtelse.
5. Och til honom gingo ut hela Judiska landet, och the utaf Jerusalem, och låto sig alle döpa af honom, i Jordans flod, och bekände sina synder.
6. Och Johañes war klädd med camelahår, och med en lädergjording om sina länder, och åt gräshoppor, och wildhoning.
7. Och predikade, och sade: En kommer efter mig, som starkare är än jag, hwilkens skotwänger jag icke wärdig är at nederfalla och uplösa.
8. Jag döper eder med watn; men han skal döpa eder med then Heliga Anda.

§ 162. *The Icelandic.*—This is remarkable for the small extent to which it has changed since the thirteenth century, with the written language of which the modern Icelandic closely agrees.

SPECIMENS.

1.

Icelandic (Fareyïnga-Saga—Ed. Mohnike).

Ok nú er þat eitthvert sinn um sumarit, at Sigmundr mælti til þoris: "Hvat mun verða, þo at við farim í skóg þenna, er hèr er norðr frá garði?" Þórir svarar: "á því er mèr eingi forvitni," segir hann. "Ekki er mèr svâ gefit," segir Sigmundr, "ok þangat skal ek fara." "Þú munt ráča hljóta," segir þûrir, "en brjótum við þa boðorð fóstra míns." Nu fóru þeir, ok hafði Sigmundr viðaröxi eina i hendi sèr; koma i skóginn, ok í rjôðr eitt fagurt; ok er þeir hafa þar eigi leingi verit, þá heyra þeir björn mikinn harðla ok grimligan. Þat var viðbjörn mikill, úlfgrár at lit. Þeir hlaupa nu aptra á stiginn þan, er þeir höfðu þángat farit; stigrinn var mjór ok þraurigr, ok hleypr þórir fyrir, en Sigmundr síðar. Dýrit hleypr nú eptir þeim à stiginn, ok verðr því þraungr stigrinn, ok brotna eikrnar fyrir þvi. Sigmundr snyr þá skjótt út af stignum millum trjánna, ok biðr þar til er dyrit kemr jafn-fram honum. Þa höggr hann jafnt meðal hlusta á dŷrinu með tveim höndum, svâ at exin sökkr. En dýrit fellr áfram, ok er dautt.

Feroic.

Nú vär so til ajna Ferina um Summari, at Sigmundur snakkaji so vi Towra: "Kvat man bagga, towat vìd färin uj henda Skowin, uj èr hèr noran-firi Gärin?" Towrur svärar, "Ikkji hävi e Hu at forvitnast ettir tuj," siir han. "Ikkji eri e so sintur," siir Sigmundur, "og häar skäl e fara." "Tù fert tå at råa," siir Towrur, "men tå browtum vid Forbo Fostirfäjir mujns." Nù fowru tajr, og Sigmundur heji ajna öksi til Brennuvì uj Hondini; tajr koma in uj Skowin, og å ajt väkurt rudda Plos men ikkji häva tajr veri här lájngji, firin tajr hojra kvödtt Brak uj Skownun, og bråt ettir sujgja tajr ajna egvulia stowra Bjödn og gruiska. Tä vä ajn stowr Skowbjödn grågulmut å Litinun. Tair lejpa nù attir å Råsina, sum tajr höddu gingji ettir; Råsin vär mjåv og trong; Towrur lejpur undan, og Sigmundur attanå. Djowri leipur nù ettir tajmum å Råsini; og nù verur Råsin trong kjå tuj, so at Ajkjinar brotnavu frå tuj. Sigmundur snujur tå kvikliani útäf Råsini inimidlum Trjini, og bujar här til Djowri kjemur abajnt han. Tå höggur han bajnt uj Ojrnalystri å Djowrinum vi båvun Hondun, so at öxin sökkur in, og Djowri dettir bajnt framettir, og er standejt.

Swedish.

Och nu var det engång om sommaren, som Sigmund sade till Thorer: "Hvad månde väl deraf warda, om vi åter gå ut i skogen, som ligger der norr om gården?" "Det är jag alldeles icke nyfiken att veta," svarade Thor. "Icke går det så med mig," sade Sigmund, "och ditret mäste jag." Du kommer då att råda," sade Thor, "men dermed öfverträda vi vår Fosterfaders bud." De gingo nu åstad, och Sigmund hade en vedyxa i handen; de kommo in i skogen, och strat derpå fingo de se en ganska stor och vildsinnt björn, en dråpelig skogsbjörn, varg-grå till färgen. De sprungo då tillbaka på samma stig som de hade kommit dit. Stigen var smal och trång; och Thorer sprang fråmst, men Sigmund efterst. Djuret lopp nu efter dem på stigen, och stigen blef trång för detsamma, så att träden sönderbrötos i dess lopp. Sigmund vände då kurtigt retaf från stigen, och ställde sig mellan träden, samt stod der, tills djuret kom fram midt för honom. Då fattade han yxan med begge händerna, och högg midt emellan öronen på djuret, så att yxan gick in, och djuret störtade framåt, och dog på stället.

Danish.

Og nu var det engang om Sommeren, at Sigmund sagde til Thorer: "Hvad mon der vel kan flyde af, om vi end gaae hen i den Skov, som ligger her nordenfor Gaarden?" "Det er jeg ikken nysgjerrig efter at vide," svarede Thorer. "Ei gaar det mig saa," sagde Sigmund, "og derud maa jeg." "Du kommer da til at raade," sagde Thorer, "men da overtræde, vi vor Fosterfaders Bud." De gik nu, og Sigmund havde en Vedöxe i Haanden; de kom ind i Skoven, og strax derpaa saae de en meget stor og grum Björn, en drabelig Skovejörn, ulvegraa af Farve. De löb da tilbage ad den samme Sti, ad hvilken de vare komne derhen. Stien var smal og trang; og Thorer löb forrest, men Sigmund bagerst. Dyret löb nu efter dem paa Stien, og Stien blev trang for det, og Træerne brödes i dets. Löb Sigmund dreiede da nu hurtig ud af Stien, og stillede sig imellem Træerne, og stod der indtil Dyret kom frem lige for ham. Da fattede han öxen med begge Hænder, og hug lige imellem örerne paa Dyret, saa at öxen sank i, og Dyret styrtede fremad, og var dödt paa Stedet.

English.

And now is it a time about the summer, that Sigmund spake to Thorir: "What would become, even if we two go into the wood (shaw), which here is north from the house?" Thorir answers, "Thereto there is to me no curiosity," says he. "So is it not with me," says Sigmund, "and thither shall I go." "Thou mayst counsel," says Thorir, "but we two break the bidding-word of foster-father mine." Now go they, and Sigmund had a wood-axe in his hands; they come into the wood, and into a fair place; and as they had not been there long, they hear a bear, big, fierce, and grim. It was a wood-bear, big, wolf-grey in hue. They run (leap) now back (after) to the path, by which they had gone thither. The path was narrow and strait; and Thorir runs first, and Sigmund after. The beast runs now after them on the path, and the path becomes strait, and broken oaks before it. Sigmund turns then short out of the path among the trees, and bides there till the beast comes even with him. Then cuts he even in between the ears of the beast with his two hands, so that the axe sinks, and the beast falls forwards, and is dead.

2.

From the Edda.

Upp reis 'Oðinn
alda gautr,
ok hann á Sleipni
söðul um lagði;
reið hann niðr ðaðan
Niflheljar til,
mætti hann hvelpi
þeim er or helju kom.

Sá var blóðugr
um brjóst framan,
ok galdrs föður
gól um lengi.
Framm reið Oðinn.
foldvegr dundi,
hann kom at háfu
Heljar ranni.

In English.

Up rose Odin,
Of men king;
Eke he on Sleipner
Saddle on-laid.
Rode he nether-wards thence
Nifhel til;
Met he the whelp;
Which out of hell came.

He was bloody
On breast in front;
Eke at the spell's father
Barked long.
Forward rode Odin
The fieldway dinned:
He came at the high
Hell's house.

Note.—This is one of the Norse poems, translated by Gray.

Up rose the king of men with speed,
And saddled strait his coal-black steed, &c.

Note.—The Danish, Swedish, and Icelandic place the definite article at the end of the word it agrees with. Hence *storm* = *storm*, storm-*en* = *the* storm (storm-*the*).

Again, the same languages have a true passive voice. Hence *höre* = *hear*, *höre-s* = *is heard*, *hörte* = *heard*, *hörte-s*, *was heard* (*heard-was*).

From Snorro's Heimskringla.

III.

Y'NGLINGA SAGA.

KAP. I.

Sva er sagt, at kringla heimsins, sú er mannfólkit byggir, er mjök vag-skorin: gánga höf stór úr útsjánum inn í jordina. Er þat kunnigt, at haf gengr af Njorvasundum, ok allt út til Jórsala-lands. Af hafinu gengr lángr hafsbotn til landnordrs, er heitir Svartahaf:

sa skilr heims þridjúngana: heitir fyrin austan Asia, en fyrir vestan kalla sumir Evrópa, en sumir Enea. En nordan at Svartahafi gengr Sviþjod in mikla eda in kalda. Svíþjód ena miklu kalla sumir menn ecki minni enn Serkland hít mikla; sumir jafna henni vid Bláland hit mikla. Hinn neyrdri lutr Svíþjódar liggr óbygdr af frosti ok kulda, swa sem hinn sydri lutr Blálands er audr af sólarbruna. I Svíþjód eru stór hérut mörg: þar eru ok margskonar þjodir undarligar, ok margar túngur: þar eru risar, ok þar eru dvergar: þar eru ok blámenn; þar eru dýr ok drekar furdulega stórin. Ur Nordri frá fjöllum þeim, er fyrir utan eru bygd alla, fellr á um Svíþjód, sú er at rettu heitir Tanais; hún var fordum köllut Tanaqvísl edr Vanaquísl; hún kémur til sjávar inu i Svarta-haf. I Vanaqvíslum var þa kallat Vanaland, edr Vanheimr; sú á skiir heimsþridjúngana; heitir fyrir austan Asia, en fyrir vestan Evrópa.

Fyrir austan Tanaqvísl í Asía, var kallat Asa-land edr Asaheimr; en höfutborgina, er í var landinu, kölludu þeir Asgard. En í borginni var höfdíngi sá er Odinn var kalladr, þar var blótstadr mikill. Þar var þar sidr at 12 hofgodar vóru æztir; skyldu þeir ráda fyrir blótum ok dómum manna í milli; þat eru Diar kallàdir edr drottnar: þeim skyldi þjónustu veita allr folk ok lotníng. Odinn var hermadr mikill ok mjök vidförull, ok eignadiz mörg riki: han var sva Sigrfæll, at í hvörri orustu feck hann gagn. Ok sva kom at hans menn trúdu því, at hann ætti heimilann sigr í hverri orustu. Þat var háttr hans ef ann sendi menn sína til orustu, edr adrar sendifarar, at hann lagdi adr hendur í höfut þeim, ok gaf þeim bjanak; trúdu þeir at þá mundi vel faraz. Sva var ok um hans menn, hvar sem þeir urdu í naudum staddir á sjá edr á landi, þá kölludu þeir á nafn hans, ok þóttuz jafnan fá af því fro; þar þottuz þeir ega allt traust er hann var. Hann fór opt sva lángt í brot, at hann dvaldiz í ferdinni mörg misseri.

In English.

It is said that the earth's circle which the human race inhabits is torn across into many bights, so that great seas run into the land from the out-ocean. Thus it is known that a great sea goes in at Niorvasund, and up to the land of Jerusalem. From the same sea a long sea-bight stretches towards the north-east, and is called the Black Sea, and divides the three parts of the earth; of which the eastern part is called Asia, and the western is called by some Europa, by some Enea. Northward of the Black Sea lies

Swithiod the Great, or the Cold. The Great Sweden is reckoned by some not less than the Saracens' land; others compare it to the Great Blueland. The northern part of Swithiod lies uninhabited on account of frost and cold, as likewise the southern parts of Blueland are waste from the burning of the sun. In Swithiod are many great domains, and many wonderful races of men, and many kinds of languages. There are giants, and there are dwarfs, and there are also blue men. There are wild beasts, and dreadfully large dragons. On the north side of the mountains which lie outside of all inhabited lands runs a river through Swithiod, which is properly called by the name of Tanais, but was formerly called Tanaquisl, or Vanaquisl, and which falls into the ocean at the Black Sea. The country of the people on the Vanaquisl was called Vanaland, or Vanaheim; and the river separates the three parts of the world, of which the eastermost part is called Asia, and the westermost Europe.

The country east of the Tanaquisl in Asia was called Asaland, or Asaheim, and the chief city in that land was called Asgaard. In that city was a chief called Odin, and it was a great place for sacrifice. It was the custom there that twelve temple godars should both direct the sacrifices, and also judge the people. They were called Diars, or Drotners, and all the people served and obeyed them. Odin was a great and very far-travelled warrior, who conquered many kingdoms, and so successful was he that in every battle the victory was on his side. It was the belief of his people that victory belonged to him in every battle. It was his custom when he sent his men into battle, or on any expedition, that he first laid his hand upon their heads, and called down a blessing upon them; and then they believed their undertaking would be successful. His people also were accustomed, whenever they fell into danger by land or sea, to call upon his name; and they thought that always they got comfort and aid by it, for where he was they thought help was near. Often he went away so long that he passed many seasons on his journeys.

IV.

From the New Testament.

MARK i. 1—8,

1. Þetta er upphaf evangelii um Jesum Christum Guds son, svo sem skrifad er hiá spámönnunum.

2. Siá! Eg sende minn engel fyrer þer, sá sem tilreide þinn veg fyrer þer.

3. Ðar er ein predikara rödd í eydemorku: "greided þer veg drottins og gered hans stigu retta."

4. Johannes var í eydemörku, skírde og predikade um idranar skírn, til syndanna fyrergefningar.

5. Og þar geck út til hans allt Juda land, og þeir af Jerusalem, og þeir letu aller skíra sig af hon um í Jordan, játande sínar synder.

6. Enn Johannes var klæddur med ulfballds hárum, og eitt ólarbelte um hans lendar, og hann át eingesprettur og skógarhunang.

7. Og predikade og sagde: Ðar kemur einn efter mig, sem er sterkare enn eg, hvers eg em eigi verdugnr frammfallande upp at leysa þveinge hans skófata.

8. Eg skíre ydur med vatne, enn hann mun skíra ydur med heil ögum anda.

§ 163. The comparison between the chief inflections characteristic of the most important of the preceding languages is as follows.

Declension of Substantives ending in a Vowel.

		Anglo-Saxon.	Icelandic.
		Neuter.	*Neuter.*
Sing.	*Nom.*	Eáge (eye).	Auga (eye).
	Acc.	Eáge.	Auga.
	Dat.	Eágan.	Auga.
	Gen.	Eágan.	Auga.
Plur.	*Nom.*	Eágan	Augu.
	Acc.	Eágan	Augu.
	Dat.	Eágan	Augum.
	Gen.	Eágan	Augna.
		Masculine.	*Masculine.*
Sing.	*Nom.*	Nama (*a name*).	Bogi (*a bow*).
	Acc.	Naman	Boga.
	Dat.	Naman	Boga.
	Gen.	Naman	Boga.
Plur.	*Nom.*	Naman	Bogar.
	Acc.	Naman	Boga.
	Dat.	Namum	Bogum.
	Gen.	Namena	Boga.

		Saxon.	Icelandic.
		Feminine.	*Feminine.*
Sing.	*Nom.*	Tunge (*a tongue*).	Tunga (*a tongue*).
	Acc.	Tungan	Túngu.
	Dat.	Tungan	Túngu.
	Gen.	Tungan	Túngu.
Plur.	*Nom.*	Tungan	Túngur.
	Acc.	Tungan	Túngur.
	Dat.	Tungum	Túngum.
	Gen.	Tungena	Túngna.

Declension of Substantives ending with a Consonant.

		Saxon.	Icelandic.
		Neuter.	*Neuter.*
Sing.	*Nom.*	Leáf (*a leaf*).	Skip (*a ship*).
	Acc.	Leáf	Skip.
	Dat.	Leáfe	Skipi.
	Gen.	Leáfes	Skips.
Plur.	*Nom.*	Leáf	Skip.
	Acc.	Leáf	Skip.
	Dat.	Leáfum	Skipum.
	Gen.	Leáfa	Skipa.
		Masculine.	*Masculine.*
Sing.	*Nom.*	Smiƀ (*a smith*).	Konungr (*a king*).
	Acc.	Smiƀ	Konung.
	Dat.	Smiƀe	Konungi.
	Gen.	Smiƀes	Konungs.
Plur.	*Nom.*	Smiƀas	Konungar.
	Acc.	Smiƀas	Konunga.
	Dat.	Smiƀum	Konungum.
	Gen.	Smiƀa	Konunga.
		Feminine.	*Feminine.*
Sing.	*Nom.*	Spr′æc (*a speech*).	Brúƀr (*a bride*).
	Acc.	Spr′æce	Brúi.
	Dat.	Spr′æce	Brúƀi.
	Gen.	Spr′æce	Bruƀar.
Plur.	*Nom.*	Spr′æca	Brúƀir.
	Acc.	Spr′æca	Brúƀir.
	Dat.	Spr′æcum	Brúƀum.
	Gen.	Spr′æca	Brúƀa.

The most characteristic difference between the Saxon and Icelandic lies in the peculiar position of the definite article in the latter language. In Saxon the article corresponding with the modern word *the*, is *þæt*, *se*, *seó*, for the neuter, masculine, and feminine genders respectively; and these words, regularly declined, are *prefixed* to the words with which they agree, just as is the case with the English and with the majority of languages. In Icelandic, however, the article, instead of preceding, *follows*, its noun, *with which it coalesces*, having previously suffered a change in form. The Icelandic article corresponding to *þæt*, *se*, *seó*, is *hitt* (N.), *hinn* (M.), *hin* (F.): from this *the* *h* is ejected, so that, instead of the regular inflection (*a*), we have the forms (*b*).

a.

		Neut.	*Masc.*	*Fem.*
Sing.	*Nom.*	Hitt	Hinn	Hin.
	Acc.	Hitt	Hinn	Hina.
	Dat.	Hinu	Hinum	Hinni.
	Gen.	Hins	Hins	Hinnar.
Plur.	*Nom.*	Hin	Hinir	Hinar.
	Acc.	Hin	Hina	Hinar.
	Dat.	Hinum	Hinum	Hinum.
	Gen.	Hinna	Hinna	Hinna.

b.

Sing.	*Nom.*	—it	—inn	—in.
	Acc.	—it	—inn	—ina (-na).
	Dat.	—nu	—num	—inni (-nni).
	Gen.	—ins	—ins	—innar (-nnar).
Plur.	*Nom.*	—in	—nir	—nar.
	Acc.	—in	—na	—nar.
	Dat.	—num	—num	—num.
	Gen.	—nna	—nna	—nna.

whence, as an affix, in composition,

		Neut.	*Masc.*	*Fem.*
Sing.	*Nom.*	Augat	Boginn	Túngan.
	Acc.	Augat	Boginn	Túnguna.
	Dat.	Auganu	Boganum	Túngunni.
	Gen.	Augans	Bogans	Tungunnar

		Neut.	*Masc.*	*Fem.*
Plur.	*Nom.*	Augun	Bogarnir	Túngurnar.
	Acc.	Augun	Bogana	Túngurnar.
	Dat.	Augunum	Bogunum	Túngunum.
	Gen.	Augnanna	Boganna	Túngnanna.

In the Swedish, Norwegian, and Danish this peculiarity in the position of the definite article is preserved. Its origin, however, is concealed; and an accidental identity with the indefinite article has led to false notions respecting its nature. In the languages in point the *i* is changed into *e*, so that what in Icelandic is *it* and *in*, is in Danish *et* and *en*. *En*, however, as a separate word, is the numeral *one*, and also the indefinite article *a*; whilst in the neuter gender it is *et*—en Sol, *a sun*; et Bord, *a table*: Solen, *the sun*; Bordet, *the table*. From modern forms like those just quoted, it has been imagined that the definite is merely the indefinite article transposed. This it is not. To apply an expression of Mr. Cobbett's, *en* = *a*, and *-en* = *the*, are *the same combination of letters, but not the same word.*

DECLENSION OF ADJECTIVES.

SAXON.

*Definite.**

Singular.

	Neut.	*Masc.*	*Fem.*
Nom.	Góde	Góda	Góde.
Acc.	Góde	Gódan	Gódan.
Abl.	Gódan	Gódan	Gódan.
Dat.	Gódan	Gódan	Gódan.
Gen.	Gódan	Gódan	Gódan.

Plural.

Nom.	Gódan	Gódan	Gódan.
Acc.	Gódan	Gódan	Gódan.
Abl.	Gódum	Gódum	Gódum.
Dat.	Gódum	Gódum	Gódum.
Gen.	Gódena	Gódena	Gódena.

ICELANDIC.

*Definite.**

Singular.

	Neut.	*Masc.*	*Fem.*
Nom.	Haga	Hagi	Haga.
Acc.	Haga	Haga	Högu.
Abl.	Haga	Haga	Högu.
Dat.	Haga	Haga	Högu.
Gen.	Haga	Haga	Högu.

Högu is the Plural form for all the Cases and all the Genders.

* The meaning of these terms is explained in p. 268. This order of the cases and genders is from Rask. It is certainly more natural than the usual one.

	Saxon. *Indefinite.* *Singular.*			Icelandic. *Indefinite.* *Singular.*		
	Neut.	*Masc.*	*Fem.*	*Neut.*	*Masc.*	*Fem.*
Nom.	Gód	Gód	Gód.	Hagt	Hagr	Hög.
Acc.	Gód	Gódne	Góde.	Hagt	Hagan	Hög.
Abl.	Góde	Góde	Gódre.	Högu	Högum	Hagri.
Dat.	Gódum	Gódum	Gódre.	Högu	Högum	Hagri.
Gen.	Gódes	Gódes	Gódre.	Hags	Hags	Hagrar.
	Plural.			*Plural.*		
Nom.	Góde	Góde	Góde.	Hög	Hagir	Hagar.
Acc.	Góde	Góde	Góde.	Hög	Haga	Hagar.
Abl.	Gódum	Gódum	Gódum.	Högum	Högum	Högum.
Dat.	Gódum	Gódum	Gódum.	Högum	Högum	Högum.
Gen.	Gódra	Gódra	Gódra.	Hagra	Hagra	Hagra.

Observe in the Icelandic forms the absence of the termination *-an*. Observe also the neuter termination, *-t*, as *hagr*, *hagt*. Throughout the modern forms of the Icelandic (*viz.* the Swedish, Danish, and Norwegian languages) this termination is still preserved: *e.g. en god Hest*, a good horse; *et godt Hjært*, a good heart; *en skön Pige*, a beautiful damsel; *et skarpt Svœrd*, a sharp sword.

Amongst the pronouns the following differences present themselves. The Saxon forms are, for the pronoun of the second person, *þu* (thou), *git* (ye *two*), *ge* (ye); whilst in Icelandic they are *þu*, *þiᵭ*, *þer*, respectively. Again, in Saxon there is no reflective pronoun corresponding with the Latin *se*. In Icelandic we have *sik*, *sér*, *sin*, corresponding to the Latin *se*, *sibi*, *suus*. Besides this, the word *sin* is declined, so that like the Latin *suus* it becomes adjectival.

Sing.	*Nom.*	Sitt	Sinn	Sín.
	Acc.	Sitt	Sinn	Sína.
	Dat.	Sinn	Sínum	Sinni.
	Gen.	Sins	Síns	Sinnar.
Plur.	*Nom.*	Sín	Sínir	Sínar.
	Acc.	Sín	Sína	Sínar.
	Dat.	Sínum	Sínum	Sínum.
	Gen.	Sinna	Sinna	Sinna.

In Saxon there is of course no such an adjectival form

There the Possessives of the Third Person correspond not with the Latin *suus, sua, suum;* but with the Latin *ejus* and *eorum.* The English words *his* and *her* are *genitive* cases, not *adjectives.*

Further remarks upon the presence of the Reflective Pronoun *sik* in Icelandic, and its absence in Saxon, will appear in the sequel.

THE NUMERALS.

Saxon.	Icelandic.
1. 'An	Eitt, einn, ein.
2. Twá	Tvö, tveir.
3. þreó	þrju, þrir.
4. Feower	Fjögur, fjórir.
5. Fíf	Fimm.
6. Six	Sex.
7. Seofon	Sjö.
8. Eahta	'Atta.
9. Nigon	Niu.
10. Tyn	Tiu.

Of the Icelandic verbs the infinitives end in *-a;* as *kalla,* to call; *elska,* to love; whereas the Saxon termination is *-an;* as *lufian,* to love; *wyrcan,* to work.

The persons are as follows:—

		Saxon.	Icelandic.
Pres. Sing.	1.	Bærne	Brenni.
	2.	Bærnst	Brennir.
	3.	Bærnð	Brennir.
Plur.	1.	Bærnað	Brennum.
	2.	Bærnað	Brennið.
	3.	Bærnað	Brenna.

The characteristic, however, of the Icelandic (indeed, of all the Scandinavian languages) is the possession of a *passive* form, or a *passive* voice, ending in *-st:—Ek þu, hann brennist = I, thou, he is burnt; Ver brennumst = We are burnt; þér brennizt = ye are burnt; þeir brennast = they are burnt.* Past tense, *Ek, þu, hann brendist; ver brendumst, þêr brenduzt, þeir brendust.* Imperat.: *brenstu = be thou burnt.* Infinit.: *brennast = to be burnt.*

In the modern Danish and Swedish, the passive is still pre-

served, but without the final *t*. In the *older* stages of Icelandic, on the other hand, the termination was not *-st* but *-sc;* which *-sc* grew out of the reflective pronoun *sik*. With these phenomena the Scandinavian languages give us the evolution and development of a passive voice; wherein we have the following series of changes:—1st, the reflective pronoun coalesces with the verb, whilst the sense changes from that of a reflective to that of a middle verb; 2nd, the *c* changes to *t*, whilst the middle sense passes into a passive one; 3rd, *t* is dropped from the end of the word, and the expression that was once reflective then becomes strictly passive.

Now the Saxons have no passive voice at all. That they should have one *originating* like that of the Scandinavians was impossible. Having no reflective pronoun, they had nothing to evolve it from.

The Auxiliary Verb.

		Saxon.	Icelandic.
		Indicative. Present.	
Sing.	1.	Eom (*I am*)	Em.
	2.	Eart	Ert.
	3.	Is	Er.
Plur.	1.	Synd (Syndon)	Erum.
	2.	Synd (Syndon)	Eruð.
	3.	Synd (Syndon)	Eru.
		Indicative. Past.	
Sing.	1.	Wæ's	Var.
	2.	Wæ're	Vart.
	3.	Wæ's	Var.
Plur.	1.	Wæ'ron	Vorum.
	2.	Wæ'ron	Voru.
	3.	Wæ'ron	Voru.
		Subjunctive. Present.	
Sing.	1.	Sy'	Sé.
	2.	Sy'	Sér.
	3.	Sy'	Sé.
Plur.	1.	Sy'n	Séum.
	2.	Sy'n	Seuð.
	3.	Sy'n	Séu.

		Saxon.	Icelandic.
		Subjunctive. Past.	
Sing.	1.	Wæ′re	Væri.
	2.	Wæ′re	Værir.
	3.	Wæ′re	Væri.
Plur.	1.	Wæ′ron	Værum.
	2.	Wæ′ron	Væru.
	3.	Wæ′ron	Væruð.
		Infinitive.	
		Wesan	Vera
		Participle.	
		Wesende	Verandi.

Recapitulating, we find that the characteristic differences of the greatest importance between the Icelandic and Saxon are three in number :—

1st. The peculiar nature of the definite article.

2nd. The neuter form of the adjectives in *-t*.

3rd. The existence of a passive voice in *-sc*, *-st*, or *-s*.

In the previous comparison the substantives were divided as follows :—1st, into those ending with a vowel; 2ndly, into those ending with a consonant. In respect to the substantives ending with a vowel (*eáge*, *nama*, *tunge*), it may have been observed that their cases were in Anglo-Saxon almost exclusively formed in *-n*, as *eágan*, *tungan*, &c.; whilst words like *skip* and *smiðð* had, throughout their whole declension, no case formed in *-n* ; no case, indeed, wherein the sound of *-n* entered. This enables us (at least with the Anglo-Saxon) to make a general assertion concerning the substantives ending in a *vowel* in contrast to those ending in a *consonant*, *viz.* that they take an inflection in *-n*.

In Icelandic this inflection in *-n* is concealed by the fact of *-an* having been changed into *-a*. However, as this *-a* represents *-an*, and as fragments or rudiments of *-n* are found in the genitive plurals of the neuter and feminine genders (*augna*, *tungna*), we may make the same general assertion in Icelandic that we make in Anglo-Saxon, *viz.* that substantives ending in a vowel take an inflection in *-n*.

Along with the indication of this difference may be introduced the terms *weak* and *strong*, as applied to the declension of nouns.

Weak nouns end in a vowel; or, if in a consonant, in a consonant that has become final from the loss of the vowel that originally followed it. They also form a certain proportion of their oblique cases in *-n*, or an equivalent to *-n*—Nom. *augô*, gen. *aug-in-s*.

Strong nouns end in a consonant; or, if in a vowel, in one of the vowels allied to the semivowels *y* or *w*, and through them to the consonants. They also form their oblique cases by the addition of a simple inflection, without the insertion of *n*.

Furthermore, be it observed that *nouns* in general are *weak* and *strong*, in other words, that adjectives are *weak* or *strong*, as well as substantives. Between substantives and adjectives, however, there is this difference:—

1. A substantive is *either* weak or strong, *i. e.* it has one of the two inflections, but not both. *Augô*, = *an eye*, is weak under all circumstances; *waurd*, = *a word*, is strong under all circumstances.

2. An adjective is *both* weak and strong. The Anglo-Saxon for *good* is sometimes *god* (strong), sometimes *gode* (weak). Which of the two forms is used depends not on the word itself, but on the state of its construction.

In this respect the following two rules are important:—

1. The definite sense is generally expressed by the weak form, as *se blinde man* = *the blind man*.

2. The indefinite sense is generally expressed by the strong form, as *sum blind man* = *a blind man*.

Hence, as far as adjectives are concerned, the words *definite* and *indefinite* coincide with the words *weak* and *strong* respectively, except that the former are terms based on the syntax, the latter terms based on the etymology of the word to which they apply.

Declension of Weak Substantives in Mœso-Gothic.

Neuter.

	Singular.	*Plural.*
Nom.	'Augô (*an eye*)	'Augôna.
Acc.	'Augô	'Augôna.
Dat.	'Augin	'Augam.
Gen.	'Augins	'Augônê.

Neuter.

	Singular.	*Plural.*
	Masculine.	
Nom.	Manna (*a man*)	Mannaus.

CHAPTER XXV.

ON THE CLASSIFICATION OF THE GERMAN GROUP OF LANGUAGES.

§. 164. Up to the present chapter the statements of the author respecting the mutual relations which the different languages of the German group bear to each other have been any but tabular, systematic, or classificational. No general view of the family has been given—no such view as the naturalist gives of an order, a family, or a genus with sub-genera. No division into primary and secondary sections and sub-sections has been attempted; nor yet has there been much said about *stems* and *stocks* falling into *branches*, whilst the *branches* divided into *ramifications* and similar sub-divisions, with names more or less metaphorical. Indeed, the language of the genealogist—the talk about *roots* and *pedigrees*—has been carefully eschewed. Nevertheless, it has not been found convenient to discard it altogether; inasmuch as more than one term has been found necessary which has suggested the existence of a greater amount of systematic classification than has been exhibited. Such a term is the word *Scandinavian* (or *Norse*); a word which is evidently the generic name for a natural group of tongues, more or less akin to those of Germany Proper, but, at the same time, more or less opposed to them. Such a word as this indicates the likelihood of such a system as the following:—

The Gothic class (or stock) falls into two orders (or branches)—the Proper German, and the Scandinavian or Norse. Again,—

The German Proper contains the High-German, Platt-Deutsch, Dutch, &c.; whilst the Norse contains the Icelandic, Swedish, and Danish.

Each of these fall into dialects and sub-dialects.

No doubt, this is, to a great degree, the case. Yet it is also equally undoubted that the view which would illustrate it has been kept in the back-ground. Instead of this, our notices have been to the effect that the Frisian was likest the Dutch, the Dutch likest certain Platt-Deutsch dialects, certain Platt-Deutsch dialects likest certain High-German ones—and so on throughout.

The reason of this lies in the importance of rightly ascertaining the extent to which a systematic classification of languages, dialects, and sub-dialects into primary, secondary, and other subordinate divisions is an actual philological phenomenon. *Can* languages be thus conveniently arranged? *Can* tabulated exhibitions of them be constructed? If they can *not* it is certainly a serious error to think that they *can*. It is a serious error, because it engenders the idea that definitions of an unattained, or perhaps unattainable, degree of clearness and precision are practicable. It is a serious error, because it substitutes lines of demarcation and distinction for lines of connection and transition; so subverting the true and natural principles of philological arrangement, and replacing them by false and artificial ones.

Hence, the chief method by which the mutual affinities of the German tongues have been shown, has been the exhibition of the points wherein one language agreed with another, and that other with some third, that third with a fourth—and so on.

This is the plan of the present edition; but it was not the plan of the earlier ones. Therein, the exhibition of the mutual relationships of the German, or Gothic, forms of speech took the following shape:—

Of the great *Gothic* (*German*) stock of languages, there were—

Two branches; the *German Proper* (or *Teutonic*), and the *Scandinavian* (or *Norse*).

I. The *Teutonic* branch fell into

Three divisions, (1) the Mœso-Gothic, (2) the High-German, and (3) the Low-German.

The Low-German comprised (1 and 2) the Anglo-Saxon

and the English, (3) the Old-Saxon, (4 and 5) the Old-Frisian and Modern-Dutch, (6) the Platt-Deutsch dialects.

II. The Scandinavian branch comprehended the Icelandic, Feroic, Swedish, and Danish, with their dialects and sub-dialects in all their stages.

In a tabular form such a system as this might be expressed thus:—

- GERMAN
  - GOTHIC
    - *Mœso-Gothic*
    - *High-German*
      - Literary German
      - Suabian
      - Bavarian
      - Hessian, &c.
    - *Low-German*
      - Angle
      - Old Saxon
      - Frisian
      - Platt-Deutsch, &c.
  - SCANDINAVIAN
    - Icelandic
    - Feroic
      - Dalecarlian
    - Swedish
      - Smaaland
    - Danish
      - Halgoland, &c.

This is a classification which actually exists; being that which we find in the works of Grimm, Rask, and the chief philologues for the German family of languages. No one has adopted it more implicitly than the present writer—*up to the present time*. Yet it is exceptionable; so exceptionable that, unless it be abandoned, it must be taken with great caution and considerable qualifications. Of these the naturalist, whether zoologist or botanist, best understands the nature. He anticipates it, seeing the difficulties it has a tendency to engender beforehand. It has a tendency to engender the notion that all the forms of speech comprehended in the same division are more like each other than they are to any one in any other. Yet such is not the case. The Platt-Deutsch runs in the High-German, the Frisian is as much Dutch as Angle. It is only the extreme forms of each section that are widely separated from each other, and definitely characterised.

The truth is that, whatever may be the case when our knowledge has come to be enlarged, at the present moment, we must classify according to *types* rather than *definitions*; contrasting

and comparing the typical and central members of each group. With this proviso the tabular form is safe, without it dangerous.

§ 165. Akin to this question of classification, or rather part and parcel of it, is the still more difficult one of the *value of characteristics*. Some writers lay great stress upon the absence or presence of certain sounds, in other words upon the Phonêsis of Languages. Others, on the other hand, think but little of a few vowels and consonants more or less, and accordingly attend chiefly to something else. At times, this is the inflection or grammatical structure; at times it is the dictionary or glossarial part of the language. "Such a language," writes A, "has a passive voice, which some other (naming it) has not; hence, I separate them somewhat widely."

"But their sound systems are alike," writes B, "and, consequently, I unite them." A practical instance of this kind of criticism will show itself after we have looked at some of the more usual characteristics of the different German forms of speech;—some of those which lie most on the surface.

1. The use of *p* and *k* for *b* and *g* respectively is High-German rather than Low, and of the High-German dialects more particularly Bavarian.

COMMON HIGH-GERMAN.	BAVARIAN.	ENGLISH.
*B*erg	*P*ir*k*	Hill (*berg*).
*B*aiern	*P*aiern	Bavaria.
*B*lind	*P*lin*t*	Blind.
*G*ott	*K*ott	God.
Ge-birgg-e	*Ke-pirk*-i	Range of hills, &c.

2. The use of *-t* or *-tt* for *-s* or *-ss* is Low-German, in opposition to High; as—

PLATT-DEUTSCH.	HIGH-GERMAN.	ENGLISH.
Wa*t*er	Wa*ss*er	Wa*t*er.
Swê*t*	Schwei*ss*	Swea*t*.
He*t*	E*s*	I*t*.

What applies to the Platt-Deutsch, generally, applies *à fortiori* to the Saxon, Frisian, and Norse.

3. The Frisian chiefly differs from the Old-Saxon and Anglo-

Saxon in the forms of the plural noun and in the termination of the infinitive mood.

The plurals which in Anglo-Saxon and Old-Saxon end in *-s*, in Frisian end in *-r*.

The infinitives, which in Anglo-Saxon and Old-Saxon end in *-an*, in Frisian end in *-a*.

ANGLO-SAXON.	FRISIAN.	ENGLISH.
Cyning-*as*	Kening-*ar*	King-*s*.
Bærn-*an*	Bærn-*a*	Burn.

4. In Norse the preference for the sound of *-r* to *-s*, and of *-a* to *-an* is carried further than even in Frisian.

5. But the great characteristics of the Norse tongues, as opposed to the Frisian, and, *à fortiori*, to all the others, are the so-called passive voice, and the so-called *post*-positive article.

a. The reflective pronoun *sik* = *se* = *self* coalesces with the verb, and so forms a *reflective* termination. In the later stages this reflective (or middle) becomes passive in power. *Kalla* = *call*, and *sig* = *self*. Hence come *kalla sig*, *kallasc*, *kallast*, *kallas*; so that in the modern Swedish *jag kallas* = *I am called* = *vocor*.

b. The definite article in Norse not only *follows* its substantive, but amalgamates with it; *e. g. bord* = *table*, *hit* = *the* or *that*; *bord-et* = *the table* (*board*).

What is the *value* of any one of these characteristics? He is a bold philologue who answers this question offhand.

The *value* of a characteristic is not only an obscure and difficult question in itself, but the *measure of value* is so unfixed as for practical purposes to be wholly arbitrary.

Question. "Why do you lay so much stress upon, or, changing the expression, put so *high* a value, on the presence of a post-positive article?"

Answer. "Because it implies some important fact in the history of the development of the tongues wherein it appears. It implies that the tongues wherein it occurs were separated from those wherein it does not occur at an early period. If so, the relationship must be distant."

"Not so," it may be answered, "the separation may be but

recent, in which case it only shows a considerable amount of activity in the processes by which language is changed."

"But this is itself important, so that, consequently, the sign is of value under either point of view."

No doubt it is. At the same time the measure of value is uncertain and fluctuating, inasmuch as all that has been shown in the preceding dialogue is, that under either of two views, a case can be made out for the importance of a certain characteristic. A sign that a language has changed quickly is of value and interest; and so is a sign of a language having separated itself from some mother-tongue common to it and certain other forms of speech at an early period.

Nevertheless, it is bad philology to deal with the two facts as equal and indifferent, and to argue at one time from the one, and at another, from the other.

§ 166. All these difficulties are increased when we bring under notice, and add to our other points of criticism, the important question *of time;* inasmuch as the same exceptions that lie against any overclose classification in the way of order and genus, stem and branch, division and subdivision, lie against any unduly strict lines of demarcation between the different *stages* of a language; indeed, in this field of study more than usual circumspection is required. It is an easy matter to take a specimen from the reign of (say) King John, and another from that of our present Queen, and compare them—easy, too, to arrive at certain results from such a comparison. There will be likeness and there will be difference; there will be the older forms and the newer ones. And the latter will be supposed to have followed, succeeded, or grown out of the former; as, in many cases, they will have done. But in many cases they will not. What if the two samples not only belong to two different periods, but to two different dialects also. In such a case the sequence, or succession, though nearly linear is not so altogether. Whether the proximity of the two lines may not be sufficiently close to make the difference immaterial is another question. For most purposes of investigation it is so—for most, but not for all.

A little consideration will show that the *à priori* view of the relationship that languages bear to each other favours this prin-

ciple of classification. We cannot but suppose that the streams of population by which the several portions of the earth's surface have been occupied were *continuous*. In this case a population spreads from a centre like circles on a still piece of water. Now, if so, *all changes must have been gradual, and all extreme forms must have passed into each other by means of a series of transitional ones.*

It is clear that such forms, when submitted to arrangement and classification, will not come out in any definite and well-marked groups, but that, on the contrary, they will run into each other, with equivocal points of contact, and indistinct lines of demarcation; so that discrimination will be difficult, if not impracticable. If practicable, however, it will be effected by having recourse to certain typical forms, around which such as approximate most closely can most accurately and conveniently be grouped. When this is done, the more distant outliers will be distributed over the debateable ground of an equivocal frontier.

But as man conquers man, and occupant displaces occupant on the earth's surface, forms and varieties, which once existed, become extinct. The more this extinction takes place, the greater is the obliteration of those transitional and intermediate forms which connect extreme types; and the greater this obliteration, the stronger the lines of demarcation between geographically contiguous families. Hence a variational modification of a group of individuals simulates a difference of species; forms which were once wide apart being brought into juxtaposition by means of the annihilation of the intervening transitions.

As a general rule—

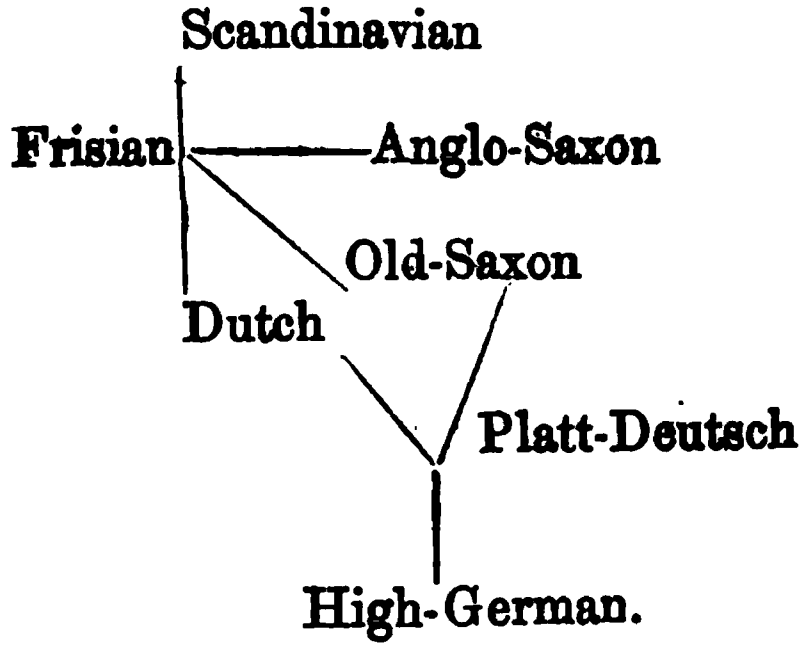
The more definite the class the greater the displacement.

Also—the smaller the differences of dialect the later the diffusion of the language, such, at least, is the *primâ facie* view.

In Paris we hear French; in Madrid, Spanish; in Languedoc, Gascony, and Bearn an intermediate language. But what will be the case when the provincial forms of speech on each side of the Pyrenees have been replaced by the literary languages of the two great kingdoms of France and Spain? The geographical contact of two typical, if not extreme, forms of speech.

§ 167. For the German group of tongues (*minus* the Mœso-Gothic, of which the relations are obscure), the following series of circles and lines may serve as illustrations. The inner circle represents the form of speech to which the name by its side applies in its typical form, anterior to its diffusion. The larger circumscribes the fresh points over which it spreads, the original forms of speech there prevalent being departures from the strict type of the centre, and in proportion as they are so, approximations to something else, *e.g.* in the case of the Anglo-Saxon to the Frisian on one side, and the Old-Saxon on the other.

The lines give us the directions in which certain forms propagated themselves.



It may not be unnecessary to add that, whatever may be the exceptions taken to the ordinary classification into divisions and sub-divisions (the exceptions to which are provisional rather than absolutely valid), the points of contact between the different members of the Gothic family of languages are those that the generality of philologues admit. They admit, for instance, that the Platt-Deutsch dialects touch the High-German on one side and the Old-Saxon and Dutch on the other; that

the Frisian is closely akin to the Saxon, and, above all, that it is the most Scandinavian of all the German forms of speech.

The present writer, too, admits that the division between the two primary branches of the family—the Scandinavian and the German Proper, is, if not absolutely natural, a near approach to nature; inasmuch as it is, probably, not very wrong to say that all the languages in the former division are more like each other than any one of them is to any form of speech from Germany Proper. Nevertheless, he hesitates — and that, because, whatever measure of value he take as to the importance of the two leading Scandinavian characteristics—the so-called Passive Voice, and the Post-positive article—he sees less in them than is seen by the majority of investigators.

Let us examine them—taking the former first.

It is called a Passive, but it has grown out of a *Middle* form, which *Middle* has grown out of a combination of two words—viz. the active, or transitive verb, and the pronoun of the third person.

In this there is nothing extraordinary, every process being capable of the clearest and most appropriate illustration.

a. The older forms of the Icelandic give us not only the conjunction of the *third* person with the verb, but that of the *first* person also. Thus, whilst *mik* = *me*, *þik* = *thee*, and *sik* = *se*. The ejection of the vowel, the change from *-sc*, to *-st*, and lastly, the loss of the *t* are points of phonêsis.

The use of the pronoun of the *third* person to the displacement and exclusion of those of the first and second is a point of logic. How come such a combination as the verb + *þik* to have become wholly, and such a combination as the verb + *mik* to have become nearly obsolete so long ago as the twelfth and thirteenth centuries; for such is the date of the early Icelandic literature. Whatever may be the exact nature of the confusion of idea that thus extended the use of the *sik* in Icelandic at the expense of the other two pronouns, it gives us a phenomenon which reappears elsewhere in the Greek, the High-German, and the Lithuanian, *at least*.

It cannot, then, be said that a formation so naturally evolved as the so-called passive voice of the Scandinavian languages is a philological characteristic of very high value, a philological

characteristic which effects between the languages wherein it is found, and the languages wherein it is not found any notably broad line of demarcation.

b. Now as to the peculiar position of the definite article, the article which may conveniently be denominated *post*-positive. Undoubtedly it is a very palpable characteristic, and one which tells a great deal upon the language, as any one may discover for himself who passes from the study of the English or German to that of the Danish, Swedish, or Icelandic. It makes the reader look to the end of the word where he has hitherto looked at the beginning, putting the sequence of his ideas, more or less, out of joint. It gives, too, compactness to the Scandinavian sentences, and enriches the metres with a large amount of the so-called trochaic feet.

Undoubtedly this post-positive article is a very palpable characteristic. Yet it is very doubtful whether it be the measure of any important phenomenon in the way of evolution or development. It is very doubtful whether it indicates any long separation in time between the languages wherein it occurs and the languages wherein it is wanting. It is also doubtful whether it indicates that any inordinate amount of change took place within a comparatively short period. It is a peculiarity easily evolved, *i. e.* without any extraordinary activity of the processes by which languages are changed, and without any extraordinary length of the time for the working of the usual changes, at an average rate. It is safe to say that a period of three centuries is long enough for its development—long enough, and, perhaps, more than long enough. How do we get at this? for the statement is something better than a mere guess—is something better than a mere *à priori* speculation. We get at it by certain phenomena supplied by the history of the Latin language and the languages derived from it. A hundred years before our era none of these latter had any existence beyond the Italian Peninsula. Five hundred years A.D., there were no less than four new growths, one in France, one in the Spanish Peninsula, one in Switzerland, and one in the Danubian Principalities. Now, of these, the first three formed their definite articles after the fashion of the Germans Proper—viz. the French, the Spaniards (and Portuguese), and the Swiss of the Grisons. And the original Romans did

the same. But the fourth formed their articles after the fashion of the Scandinavians, the Wallachian and Moldavian equivalents to *l'homme*, *il huomo*, and *el hombre*, being *homul* (= *hom-ul* = *homo ille*).

In this, then, we have a form which has been developed since the Conquest of Dacia—the reign of Trajan.

As the relationship of certain languages has been illustrated by circles and lines, the *stages* may be similarly exhibited by lines and points.

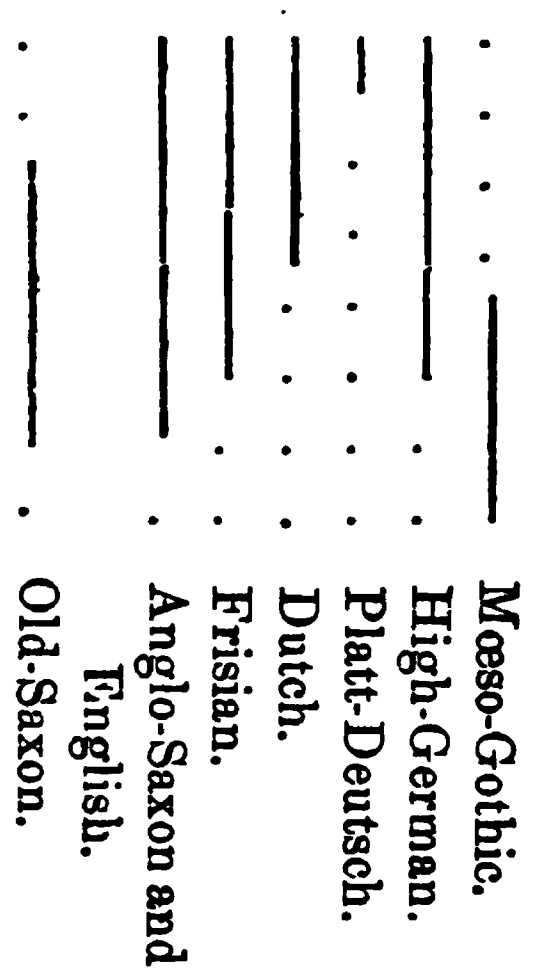
Let the points and lines that run vertically represent the period between the fourth and nineteenth centuries, the lines denoting the time to which the different samples of the different forms of speech are referrible.

Some begin soon, but soon cease, *e.g.* the Mœso-Gothic, which we find as early as the fourth century, but lose before we reach the sixth.

Some come down late but begin late, *e.g.* the Dutch and Platt-Deutsch.

The Anglo-Saxon extends through nearly the whole period; but—

The Old Saxon neither ascends so high as the Mœso-Gothic, nor comes down so low as the others.



The more these lines are kept distinct the better the philology.

CHAPTER XXVI.

ON CERTAIN POINTS OF NOMENCLATURE.

§ 168. THE last chapter dealt with the question of classification; the present takes cognizance of certain points of nomenclature. The extent to which such remarks are necessary or superfluous may be collected from the remarks themselves. The words which will command our attention are the following —1. Gothic. 2. German. 3. Dutch. 4. Teutonic. 5. Anglo-Saxon. 6, 7. Icelandic and Old Norse.

Gothic (and Mœso-Gothic). — This is a name (perhaps, we may say *the* name) for the *genus* of which such forms of speech as the High-German, the Danish, the English, &c. are *species*. Such, at least, is the language we may use for the sake of illustration, even though in some points it may be exceptionable. *Gothic*, then, is a generic name.

With the prefix *Mœso-* it becomes specific, denoting the particular language of the Ulphiline Translation. *Mœso-* is from *Mœsia*, the name of the present countries of Servia and Bulgaria during the later periods of the Roman history. In the fifth century the *Lower* Mœsia (Bulgaria) was occupied by a German population. That this gave us the *Germans* of Mœsia, or Mœso-*Germans*, is evident. Whether, however, it gave us a population that is either correctly or conveniently called the *Goths* of Mœsia, or Mœso-*Goths*, is another question.

No grave exception lies against the use of the word *Mœsian* as applied to the language of Mœsia in the time of Ulphilas— no *grave* exception. The likelihood of its being supposed to denote the original vernacular tongue of Mœsia, as spoken

before the German invasion, is of no great importance in the way of an objection. Still, it is worth remembering.

What are the merits or demerits of the word *Gothic?* Its merits are that—

a. It is in current use; that—

b. It would not easily be replaced if thrown out of use. Say that we substituted, for it, the word *German*. The following inconvenience would arise. It would have one power when it applied to the *class*, and another when applied to particular languages of Germany as opposed to Scandinavia; that—

c. It is, to a certain extent, correct; *but only to a certain extent*. That the speakers of the language of the Ulphiline translations were called *Goths* at a period not later than the third century, and by a population not less important than the Roman, is generally and reasonably believed—a fact which gives us an argument in favour of the use of the word as an element in the term Mœso-Gothic, *i. e.* as a denomination for the particular Goths of Mœsia; that—

d. It has as good a claim as any other word equally specific in its origin to take an extension of power, and to enlarge itself into a more general term. Even though other members of the family to which the speakers of the language of the Ulphiline translation belonged were of equal historical importance with the Goths of Mœsia, the latter have in their favour the highly important fact of their language being the one which supplies us with the earliest specimens of the group to which it belongs. The Ulphiline translations are the earliest Gothic, or German, compositions extant; that—

e. The term *Gothic*, as applied to architecture, is a similar extension of the term.

The question as to the demerits of the word is complex; neither are the facts which it includes beyond doubt. They are doubted, however, by no one so much as by the present writer.

He holds that the term *Gothic*, as applied to the Germans of Mœsia, is as ethnologically incorrect as the term *Briton* applied to the Angles of *Britannia*—and that for the same reason. The invaders of neither country took their names

with them. On the contrary, they took them from the countries to which they went; having left their own under different ones. That no *Britons, under that name,* left Germany to conquer Britannia is universally admitted. That no Goths, *under that name,* left Germany to conquer Mœsia is not universally admitted. It only ought to be.

Just as a certain country which was called *Britannia* long before it became German, engendered the name *Britain,* which certain *Englishmen* occasionally adopt, did a certain country, of which the original occupants were the GET-Æ, attach to certain invaders the name GOTH-I, a name which they never bore at home, which they cannot be shown to have adopted themselves, and which (when all is said about it that can be said) was only a *Roman* name for the occupants of the country of the *Getæ,* who in the fourth and fifth centuries were of German origin.

If this be true, the objections against the word *Goth,* as applied to a German of Mœsia, are the objections against the word *Briton* as applied to an Angle of the Heptarchy. They lie against the name even in its more limited sense. *A fortiori,* they lie against it in its general sense. It would be wrong to call the East Anglians Britons; but it would be wronger still to call the Hessians or the Westphalians so.

But though incorrect, the word may be convenient, or, at least, allowable. This was the case with the word *Mœsian;* a word against which, though an objection lay, it was only a slight one—too slight to be of much practical importance, inasmuch as Mœsian philology and Mœsian history, so far as they are other than German, is *nil*—or nearly *nil.*

But not so British philology and British history.

Nor yet (according, at least, to the views of the present writer) Gothic philology and Gothic history.

For reasons exhibited elsewhere, I have long satisfied myself that the history of a population, at one and the same time, *other than German, and, yet, more truly Gothic than any Germans ever were,* is no obscure and unimportant history at all, but, on the contrary, a history of great interest and influence, a history of which the vast area bounded by the Gulf of Bothnia on the one hand, and the Indian Ocean on

the other, was the field. The fuller exposition of this view will appear in the third Preliminary Dissertation.

§ 169. *German.*—The chief points concerning this name, are—

1. That it was, originally, no national name at all, but one given to the nations on the East and North of Gallia by the Romans, the Romans having, probably, taken it from the Gauls.

2. That, with few exceptions, it has applied to the Germans proper of Germany. Except in philology and ethnology, we do not find either English or Scandinavian writers calling their countrymen *Germans*.

3. That the two German divisions most generally meant, when the word is used in a *limited* sense, are the Franks and Alemanni.

4. That the words *Frank* (or Francic) and Alemann (or *Allemannic*) have been occasionally used as synonymous with *German*.

5. That the origin of the word *Germani*, in the Latin language, is a point upon which there are two hypotheses.

a. That it is connected with the Latin word *Germani* = *genuine*.

b. That it grew out of some such German word as *Herman*, *Irmin*, *Wehrmann*, or the *Herm-* in *Hermunduri*, *Herminones*, &c.

Neither of these views satisfies the present writer, who as little believes the word to have been of *native*, as he believes it to have been of *Roman* origin. It by no means follows that because the Romans called a certain population by a certain name, that that name was Roman. Strabo, from whom we get the notion, was not only a Greek, but a Greek who gives his view of the origin of the word more in the way of an etymological fancy than aught else; his statement and text being as follows:—"The parts immediately beyond the Rhine, beyond the Kelts, and turned towards the East, the *Germans* occupy, differing but little from the Keltic stock; chiefly in their excess of wildness, size, and yellowness. In size, habits, and manner of life they are as we have described the Kelts to be. Hence, the Romans seem to me to have given them their name on good grounds, wishing to designate them as the

genuine Gauls. For in the Roman speech *German* means *genuine*:"—

Εὐθὺς τοίνυν τὰ πέραν τοῦ Ῥήνου μετὰ τοὺς Κελτοὺς πρὸς τὴν ἕω κεκλιμένα Γερμανοὶ νέμονται, μικρὸν ἐξαλλάττοντες τοῦ Κελτικοῦ φύλου, τῷ τε πλεονασμᾷ τῆς ἀγριότητος καὶ τοῦ μεγέθους, καὶ τῆς ξανθότητος· τἆλλα δὲ παραπλήσιοι καὶ μορφαῖς, καὶ ἤθεσι, καὶ βίοις ὄντες, οἵους εἰρήκαμεν τοὺς Κελτούς. Διὸ δίκαιά μοι δοκοῦσι Ῥωμαῖοι τοῦτο αὐτοῖς θέσθαι τοὔνομα, ὡς ἂν γνησίους Γαλάτας φράζειν βουλόμενοι· γνήσιοι γὰρ οἱ Γερμανοὶ κατὰ τὴν Ῥωμαίων διάλεκτον.

The name *German* seems not to have been of Roman—Nor yet of native origin.

Although, the Romans and the Gauls knew the populations beyond the Rhine by a certain *collective* term, no such common *collective* term seems to have been used by the Germans themselves. *They had none.* Each tribe had its own designation; or, at most, each kingdom or confederation. Only when the question as to what was common to the whole country, in opposition to what was *Roman* or *Gallic*, became a great practical fact, did a general ethnological term arise; and this was not *German* but *Dutch.*

This is a common phenomenon. In Hindostan we hear of the wilder mountaineers of Orissa and the Mahratta country under the names of Kól and Khond; and this is a collective term. But it is only this in the mouth of a Hindu, or Englishman. Amongst themselves the separate names of the different tribes is all that is current.

The evidence of Tacitus is strong upon the point. Speaking upon their origin he writes:—" Celebrant carminibus antiquis (quod unum apud illos memoriæ et annalium genus est) Tuistonem deum terrâ editum, et filium Mannum, origionem gentis conditoresque. Manno tres filios adsignant, e quorum nominibus proximi Oceano Ingævones, medii Hermiones, ceteri Istævones vocentur. Quidam autem licentiâ vetustatis, plures deo ortos, pluresque gentis appellationes, Marsos, Gambrivios, Suevos, Vandalios adfirmant: eaque vera et antiqua nomina. Ceterùm Germaniæ vocabulum recens et nuper additum: quoniam qui primi Rhenum transgressi Gallos expulerint, ac nunc Tungri, tunc Germani vocati sint: ita nationis nomen, non gentis evaluisse paullatim, ut omnes primùm à vic-

tore ob metum, mox à seipsis invento nomine, Germani vocarentur."

Notwithstanding the words "à seipsis invento nomine," I believe the word German to have been of *Gallic* origin, so that, whilst the Germans had no *collective* name at all, the Romans called them as they were called by their neighbours—the neighbours through whom they (the Romans) more especially came in contact with them—their neighbours the Gauls.

The *first use* of the word is *early* in one sense, *late* in another. It is early if we look only to the date of the events with which it is connected. It is late if we look to the historian who records it. This distinction is necessary; though often overlooked. The earliest date assigned to a given event is one thing: the earliest historian who mentions such an event is another. A very early event may be recorded by a very late historian. Now the word *Semi-germanis* was applied to certain nations who came across Hannibal as he crossed the Alps; the historian who tells us being Livy.

Again—the nation of the Bastarnæ took a prominent part in the wars of Philip, the father of Perseus, against the Romans. Persuaded to become his allies, they cross the Danube; Cotto, one of their nobles, being sent forward as ambassador. They enter Thrace. The Thracians retire to Mount Donuca. Here the Bastarnæ divide. Thirty thousand reach Dardania. The rest cross the Danube homewards. This is what Livy tells us.

Strabo's evidence is more remarkable.

Ἐν δὲ τῇ μεσοραίᾳ Βαστάρναι *μὲν τοῖς* Τυριγέταις *ὅμοροι καὶ* Γερμανοῖς, *σχεδόν τι καὶ αὐτοὶ τοῦ* Γερμανικοῦ *γένους ὄντες, εἰς πλείω φῦλα διῃρημένοι. Καὶ γὰρ* Ἄτμονοι *λέγονταί τινες, καὶ* Σιδόνες, *οἱ δὲ τὴν* Πεύκην *κατασχόντες, τὴν ἐν τῷ* Ἴστρῳ *νῆσον,* Πευκινοί.

This has given the Bastarnæ great prominence in ethnology; since they have the credit of being the first Germans mentioned *by name* in history.

Thirdly—In the Fasti Capitolini for B.C. 222, occurs the following entry:—"M. CLAUDIUS M. F. M. N. MARCELLUS AN. DXXXI. COS. DE GALLEIS INSUBRIBUS ET G[ER]MANIS K. MART. ISQUE SPOLIA OPI(*ma*) RETTULIT DUCE HOSTIUM VIR (*domaro ad Cla*)STID (*ium interfecto*)."—Græv. Thes. Antt. Rom. ii. p. 227.

This is a notice of some pretension. Polybius, however, calls the allies of the Insubrian Gauls not Germans but *Gæsatæ*.

More than this—the record itself is not above suspicion. The part of the stone which contains the letters ER, has been repaired, "and" (the extract is from Niebuhr) "whether ER was put in at random, or whether it was so on the original stone, I can neither assert nor deny. I have often seen the stone, but although a friend of mine wished me particularly to ascertain the truth, I was never able to convince myself whether the corner containing the syllable is part of the original stone or not. It is evident that the name cannot have been Cenomanis, since they were allied with the Romans, and the *g* is quite distinct. *Gonomani* does not occur among the Romans. If the author of these Fasti actually wrote *Germanis*, the nation is mentioned. The thing is not at all impossible." Lecture LVIII. Dr. L. Schmitz's edition.

The word *German*, then, is more probably of *Gallic* than of either native or Roman origin. It was introduced into English through the Latin, *German* and *Germany* being translations of *Germanus* and *Germania*. In France, Italy, and Spain, the equivalent terms are *Allemagne* and *Lamagna*, from the Latin *Alemanni*. Hence, the words in question, however convenient in Great Britain, are of *English* rather than *European* currency. More upon this point, however, will be considered, when we have noticed two other terms—*Dutch*, and *Teutonic*.

§ 170. *Dutch.—Germany* is not the name by which a German denotes his own country. He calls it *Deutschland*.

Neither is it the name by which a Frenchman designates *Germany*. He calls it *Allemagne*.

Whence the difference? The different languages take the different names for one and the same country from different sources.

The German term *Deutsch* is an *adjective;* the earlier form of the word being *diutisc*. Here the *-isc* is the same as the *-ish* in words like *self-ish*. *Diut*, on the other hand, means *people*, or *nation*. Hence, *diut-isc* is to *diut*, as *popularis* is to *populus*. This adjective was first applied to the *language;*

and served to distinguish the *popular*, *national*, *native*, or *vulgar* tongue of the populations to which it belonged from the Latin. It first appears in documents of the ninth century:—"Ut quilibet episcopus homilias apertè transferre studeat in rusticam Romanam linguam aut *theotiscam*, quo tandem cuncti possint intelligere quæ dicantur."—Synodus Turonensis, A.D. 813. Quod in lingua *Thiudisca* scaftlegi, id est armorum depositio, vocatur.—*Capit. Wormatiense.* De collectis quas *Theudisca* lingua heriszuph appellat.—*Conventus Silvacensis.* Si, *barbara*, quam *Teutiscam* dicunt, lingua loqueretur.—Vita Adalhardi, &c.—D.G., i. p. 14, *Introduction.*

As to the different forms in which either the root or the adjective appears, the most important of them are as follows:—

1. In Mœso-Gothic, *þiudiskô* = ἐθνικῶς—Galatians ii. 14; a form which implies the substantive *þiuda* = ἔθνος.

2. In Old High-German, *diot* = *populus*, gives the adjective *diutisc* = *popul-aris.*

3. In Anglo-Saxon we have *þeód* and *þeódisc.*

Sometimes this adjective means *heathen*; in which case it applies to religion and is opposed to *Christian.*

Oftener it means *intelligible*, or *vernacular*, and applies to language; in which case it is opposed to *Latin.*

The particular Gothic dialect to which it was first applied was the German of the Middle Rhine. Here the forms are various:—*theodisca, thiudisca, theudisca, teudisca, teutisca.* When we reach parts less in contact with the Latin language of Rome, its use is rarer. Even the Germans of the Rhine frequently use the equivalent term *Alemannic*, and *Francic*; whilst the Saxons and Scandinavians never seem to have recognised the word at all.

Hence it is only the Germans of *Germany* that are *Theotisci*, or *Deut-sche.*

We of England, on the other hand, apply it only to the *Dut-ch* of Holland.

Up to a certain time in its earlier history the term *Dutch* (*Teutisca, Theodisca, &c.*) is, to a certain degree, one of disparagement; meaning *non-Roman*, or *vulgar.* It soon, however, changes its character; and in an Old High-German gloss —*uncadiuti* (*ungideuti*) = *un-dutch* is translated *barbarus.*

The standard has changed. Barbarism now means a departure from what is Dutch. Nevertheless, originally *Deutsche* = *vulgar*.

Like *high* as opposed to *low*, *rich* to *poor*, &c., the word *Deut-sch* was originally a *correlative* term—*i.e.* it denoted something which was *popular*, *vulgar*, *national*, *unlearned*—to something which was not. Hence, it could have had no existence until the relations between the learned and lettered language of Rome, and the comparatively unlearned and unlettered *vulgar tongue* of the Franks and Alemanni had developed some notable points of contrast. *Deut-sche*, as a name for *Germans*, in the sense in which it occurs in the *ninth* century, was an impossibility in the *first*, or *second*. This is not sufficiently considered. Many believe that the *Teut-*, in *Teutones*, is the *deut-*, in *deut-sch*. To be this *exactly* is impossible. Any German tribe that called itself *þeuda*, *Diot* or *Þeoð* in the first century must have given a different meaning to the word; and, so doing, have called themselves *homines*, *heroes*, or by some term equally complimentary.

The present national sense of the word is wholly secondary and derivative. Originally it was no more the name of a people or a language than the word *Vulgate* in the expression *the Vulgate translation of the Scriptures* is the name of a people or a language.

§ 171. *Teutonic*.—The history of this word is closely connected with that of the preceding; inasmuch as both have the same combination of letters for their first syllable, viz. T. E. U. T. On the other hand, the final syllables are different. Are the two words the same? The common element TEUT is in favour of their being so.

Again,—about the tenth century the Latin writers upon German affairs began to use not only the words *Theotiscus* and *Theotiscé*, but also the words *Teutonicus* and *Teutonicé*. Upon this Grimm remarks that the latter term sounded more learned; since *Teutonicus* was a classical word, an adjective derived from the Gentile name of the Teutones conquered by Marius. This is likely enough. At any rate, no fact is more certain than that, about the time in question, the Germans were called, indifferently, either *Theot-isci*, or *Teut-onici*.

What does this prove? That the word *Teutonicus* (= *Theotiscus*) came from the classical term *Teutones* is admitted; though this is by no means certain, inasmuch as the word may have been formed after the analogy of *Romanice*.

Admitting this, I by no means believe that, *on the strength of their name*, the *Teutonici* (= *Theotisci*) were of the same stock with the classical Teutones; neither does the similarity prove that they were. I doubt whether it even *implies* so much—*i. e.* when taken alone. Its application, however, at the time in question, to populations unequivocally German, and its use as a synonym with *Dutch* (*Theotiscus*) do more than the name itself. The name itself proves no more than is proved by the presence of the root *L-t*, in the words *Læti*, and *Latini*, names from which no one has argued that the *Latins* and *Læti* were the same.

Of far greater importance than the use of the word *Teutonicus* in the tenth century is its use in the first and second —its use by the classical writers. Did they use it as equivalent to German? Some did—Velleius Paterculus most especially. Nevertheless, the usual meaning of the word *Teutones* in the classical writers is to denote a population identical with, or similar to, the *Teutones* conquered by Marius. This it meant, and nothing more. In like manner the adjective *Teutonicus* meant *after the fashion of the Teutones*. I imagine that if a poet of the times in question were asked what he meant by the epithet, such would be his answer. That he would say that *Teutonicus* was only another word for *Germanicus*, and that the *Teutones* were *Germans*, I do *not* imagine, admitting, however, that a geographer or historian might do so. The probable reason for this will soon appear. At present, the classical rendering of *Teutones* and *Teutonici* is *like the men whom Marius conquered*—whoever they were. Of course, this term connoted something else. It was applied to the colour and texture of the hair; so that we read of *Teutonici capilli*. It was applied to the manner of throwing javelins, so that we hear of men who were—

> *Teutonico* ritu soliti torquere cateias.
>
> *Æneid*, lib. vii. l. 741.

It was applied to several other characteristics besides. Now, even if we admit all these to be common to the Teutones and Germans, we get no evidence as to the two words bearing the same meaning. All that we get is the fact that *Teutonicus* meant *like the men conquered by Marius*, and that these had certain points in common with the Germans.

Hence—the question as to the German origin of the *Teutones* must be discussed chiefly on its own merits, and, to a great extent, independently of the fact of the words *Teutonic* and *Dutch* having been used as synonyms; for it has already been remarked that it was quite impossible for the *Teut-* in the classical word *Teut-ones*, and the *Teut-* in the medieval form *Teut-iscus*, to be one and the same word, with one and the same meaning. The *Teut-* in *Teut-*iscus could have no existence until the contrast between the Latin as a learned, and the German as an unlearned, language had become prominent and familiar to both Germans and Latins. On the other hand, the *Teut-* in *Teut-ones* appears far too early for anything of the sort.

Again—the syllables *Vulg-*, and *Belg-*, are quite as much alike as *Teuton-*, and *Deut-sch;* yet how unreasonable it would be for an Englishman to argue that he was a descendant of the *Belgæ* because he spoke the *Vulgar* Tongue.

Mutatis mutandis, however, this is the argument of many of the German writers—though not of all. Are we then to say that it is only *some* of the German writers who identify the *Deut-*sch and the *Teut-*ons on the strength of the name? We can scarcely do this. As far as my own reading and experience go, I can safely say that I have never yet met a German, who, in some way or other, either consciously or unconsciously, did not argue from the similarity of name to the descent of his countrymen from the men who fought against Marius. He has done this even though he has not been guilty of the error just indicated. Nor has he done it upon unreasonable, though (in my mind) insufficient grounds.

Though the *Teut-* in *Teut-*ones is not the *Teut-* in *Teut-*iscus in its secondary sense of *vulgar*, or *popular*, as opposed to *learned* and *cultivated*, it may still be the same word with its primary meaning of *people*. It is by no means unlikely

for an invading nation to call themselves *the nation, the nations, the people,* &c. Neither, if a German tribe had done so, would the word employed be very unlike *Teuton-es*. Although the word *þiud-a* = *nation* or *people,* is generally strong in its declension (so making the plural *þiud-ôs*), it is found also in a weak form with its plural *thiot-ûn* = *Teuton-*. See *Deutsche Grammatik*, i. 630.

Again—we have the *Saltus Teut-o-bergius* mentioned by Tacitus (*Annal.* lib. i. p. 60). Whatever may be the power of the *Teut-* in *Teutones*, it is highly probable that here it means *people*, in other words, that it is the *Teut-* in *Dut-ch*, and that in its primary sense *populus* rather than *vulgus*. It means either *the hill of the people*, or *the city of the people;* according as the syllable *-berg-* is derived from *báirgs* = *a hill*, or from *baúrgs* = *a city*. In either case the compound is allowable, *e. g.* diot-*wëc*, *public way*, Old High-German; thiod-*scatho*, *robber of the people*, Old-Saxon; þëód-*cyning*, þeod-*mearc*, *boundary of the nation*, Anglo-Saxon; þiód-*land*, þiód-*vëgr*, *people's way*, Icelandic.

The evidence, then, is reduced to the mere fact of the first syllable in *Teut*-ones, probably, meaning *people;* whilst (if so) it was a German gloss.

That *people*, however, was actually its meaning is only a probability. There is not a tittle of external evidence on the point.

But, supposing that there were, it would by no means follow that because it was a German word it was *exclusively* so. The root *p-lk* (*v-lg*) is equally Slavonic and Latin—*pulk* = *vulg-*us, as well as the German *folk*.

Such are the reasons against too much stress on the root *Teut-*, in *Teut*-ones. Let us now take the rest of the evidence. Velleius Paterculus has been noticed.

Tacitus makes no mention of the Teutones at all.

Ptolemy mentions both *Teut*-onarii and *Teut*-ones. The former looks like a German word; it being probable that the *-arii* = *wære*. If so, *Teuton-* is the name of a place. The localities of both these populations are other than German rather than German. Again—admitting *Teutonarii* to be a German word, it is by no means certain that it applies to a German population.

The remaining evidence in favour of the Teutones having been German lies in their connection with the Cimbri. What is the proof of these having been German? In nine cases out of ten the discreditable answer is "their connection with the evidently *Dutch Teutones*"—an answer that shows that the reasoning is in a vicious circle.

The doctrine to which the present writer has long committed himself is as follows:—for certain reasons, the knowledge of the precise origin and locality of the nations conquered by Marius was, at an early period, confused and indefinite. New countries were made known without giving any further information. Hence, the locality of the Cimbri was always pushed forwards beyond the limits of the geographical areas accurately ascertained. Finally, their supposed locality retrograded continually northwards, until it fixed in the districts of Sleswick and Jutland, where the barrier of the sea, and the increase of geographical knowledge (with one exception) prevented it from getting further.

This view arises out of the examination of the language of the historians and geographers as examined in order, from Sallust to Ptolemy.

a. b. Of Sallust and Cicero, the language points to Gaul as the home of the nation in question; and that without the least intimation of its being any particularly distant portion of that country.

c. Cæsar, whose evidence ought to be conclusive, fixes them to the south of the Marne and Seine. This we learn, not from the direct text, but from inference: "Gallos—a Belgis Matrona et Sequana dividit."—*Bell. Gall.* i. 1. "Belgas—solos esse qui, patrum nostrorum memoria, omni Gallia vexata, Teutones Cimbrosque intra fines suos ingredi prohibuerint."—*Bell. Gall.* ii. 4. Now if the Teutones and Cimbri had moved from north to south, they would have clashed with the Belgæ first, and with the other Gauls afterwards. The converse, however, was the fact.

d. Diodorus Siculus, without defining their locality, deals throughout with the Cimbri as a Gallic tribe. Besides this, he gives us one of the elements of the assumed indistinctness of ideas in regard to their origin, viz. their hypothetical con-

nection with the Cimmerii. In this recognition of what might have been called the *Cimmerian theory*, he is followed by Strabo and Plutarch.—*Diod. Sicul.* v. 32. *Strabo*, vii. *Plutarch, Vit. Marii.*

e. The next writer who mentions them is Strabo. In confirmation of the view taken above, this author places the Cimbri on the northernmost limit of the area geographically known to him, viz. *beyond* Gaul and *in* Germany, between the Rhine and the Elbe:—*Τῶν δὲ Γερμάνων, ὡς εἶπον, οἱ μὲν προσάρκτιοι παρηκοῦσι τῷ Ὠκεανῷ. Γνωρίζονται δ' ἀπὸ τῶν ἐκβολῶν τοῦ Ῥήνου λάβοντες τὴν ἀρχὴν μέχρι τοῦ Ἄλβιος. Τούτων δὲ εἰσὶ γνωριμώτατοι Σούγαμβροί τε καὶ Κίμβροι. Τὰ δὲ πέραν τοῦ Ἄλβιος τὰ πρὸς τῷ Ὠκεανῷ παντάπασιν ἄγνωστα ἡμῖν ἐστίν.*—Lib. iv. Further proof that this was the frontier of the Roman world we get from the statement which soon follows, viz. that "thus much was known to the Romans from their successful wars, and that more would have been known had it not been for the injunction of Augustus forbidding his generals to cross the Elbe."—Lib. iv.

f. Velleius Paterculus agrees with his contemporary Strabo. He places them beyond the Rhine, and deals with them as Germans:—"Tum Cimbri et Teutoni transcendere Rhenum, multis mox nostris suisque cladibus nobiles."—ii. 8. "Effusa —immanis vis Germanarum gentium quibus nomen Cimbris ac Teutonis erat."—Ibid. 12.

g. The author who most mentions in detail the tribes beyond the Elbe is also the author who most pushes back the Cimbri towards the north. This is Ptolemy. Coincident with his improved information as to the parts southward, he places them at the extremity of the area known to him:—*Καῦχοι οἱ μείζονες μέχρι ξοῦ Ἄλβιος ποταμοῦ· ἐφεξῆς δὲ ἐπὶ αὔχενα τῆς Κιμβρικῆς Χερσονήσου Σάξονες· πάντων δὲ ἀρκτικώτεροι Κίμβροι.*—*Ptolemæi Germania.*

Such is the evidence of those writers, Greek or Roman, who deal with the local habitation of the Cimbri rather than with the general history of that tribe. As a measure of the indefinitude of their ideas, we have the confusion, already noticed, between the Cimbri and Cimmerii, on the parts of Diodorus, Strabo, and Plutarch. A better measure occurs in the following extract from Pliny, who not only fixes the Cimbri in three

places at once, but also (as far as we can find any meaning in his language) removes them so far northward as Norway:—"Alterum genus Ingævones; quorum pars Cimbri, Teutoni, ac Chaucorum gentes. Proximi Rheno Istævones; quorum pars Cimbri mediterranei."—iv. 28. "Promontorium Cimbrorum excurrens in maria longe peninsulam efficit, quæ Cartris appellatur."—Ibid. 27. "Sevo Mons" (the mountain-chains of Norway) "immanem ad Cimbrorum usque promontorium efficit sinum, qui Codanus vocatur, refertus insulis, quarum clarissima, Scandinavia est, incompertæ magnitudinis."—Ibid. Upon confusion like this it is safe to say that there must be a misconception somewhere.

To say the least, then, it is doubtful whether the word *Teuton* is properly applied to a German population; however, German the word *Teut*-iscus (=*Deut*-sch) may be. From this we get the Italian form *Tedesco*, and a French form *Tudesque*, formed after the fashion of *grotesque*.

§ 172. *Anglo-Saxon.*—The *Lingua-Anglorum* of Beda is translated by Alfred *on Englisce*. So old is the word *English*. This is the commoner term. At the same time the word *Saxon* is in use—*fures quos* Saxonice *dicimus* vergeld-þeovas. (See D. G. *Introduction to third edition*, p. 2.)

Why do we call the older stages of the English Language Anglo-Saxon, when they are so clearly English? This question is ably urged by a writer in the *Gentleman's Magazine* for April and May, 1852, who would replace the ordinary nomenclature in the following manner:—

1. A.D. 550—1150 *Old-English* (Anglo-Saxon).
2. — 1150—1350 *Early-English* (Semi-Saxon).
3. — 1350—1550 *Middle-English* (First-English*).
4. — 1550—1852 *New-English* (Later-English).

§ 173. *Icelandic, Old Norse.*—Although Icelandic is the usual name for the mother-tongue of the Danish, Swedish, and Norwegian, the Norwegian philologists generally prefer the term *Old Norse*.

In favour of this view is the fact that Norway was the

* Who uses this term?

mother-country, Iceland the colony, and that some portions of what is called Old Icelandic was composed in Norway.

Still the reason is insufficient; since the present term *Icelandic* is given to the language not because Iceland *was* the country that *produced*, but because it *is* the country that has *preserved* it.

Suppose that, whilst the Latin of Virgil and Cicero in Italy had been changing into the modern Italian, in some old Roman colony (say Sardinia) it had remained either wholly unaltered, or else, altered so little as for the modern *Sardinian*—provided he could read at all—to be able to read the authors of the Augustan age, just like those of the era of Charles Albert; no other portion of the old Roman territory—not even Rome itself—having any tongue more like to that of the Classical writers than the most antiquated dialect of the present Italian. Suppose, too, that the term *Latin* had become obsolete, would it be imperative upon us to call the language of the Classics *Old Italian*, *Old Roman*, or at least *Old Latin*, when no modern native of Rome, Latium, or Italy could read them? Would it be wrong to call it *Sardinian*, when every Sard *could* read them? I think not. *Mutatis mutandis*, this is the case with Iceland and Norway.

§ 174. *The question of convenience.*—The chief subject in connection with the names that have just passed under review has been the theoretic propriety, or impropriety, of them. It is, however, nearly certain that this will have but little to do with their adoption and currency. The practical facts of most importance in this way are (1), the extent to which a given form is actually in use, and (2), its convenience or inconvenience.

Gothic.—The word *Gothic* is more current than convenient. At the same time, it is chiefly inconvenient to the general philologue, to the systematic ethnologist, and to the special investigator of history of the *Sarmatian* stock. For the comparatively limited field of German philology, it is well nigh unexceptionable. For this reason it is likely to keep its place longer than it deserves. The present writer is more vexed by it, than, perhaps, any one else; yet he must take it as he finds it, however desirous of replacing it by the term *German*.

Dutch.—The English and continental powers of the word are difficult to reconcile. In English it means the language of Holland, as opposed to that of Germany. In Germany it means *German.* Then there are the further complications arising out of the term *Hoch-Deutsch* (*High-Dutch*), and *Platt-Deutsch.* It is doubtful whether these difficulties would be met by returning to the original *English* power of the word, which was (*to a certain extent*) identical with the modern German. It was so to *a certain extent,* inasmuch as in the fifteenth and sixteenth centuries *High-Dutch* meant the present literary German, *Low-Dutch* meaning the Dutch of Holland—the Dutch of *Holland* rather the *Platt-Deutsch* dialects of Germany Proper.

The simple form *Dutch* is an inconvenient name for the language of Holland.

The compound *Low-Dutch* is also inconvenient.

The most correct name, the name current both in Germany Proper and Holland, is *Netherlandish ;* but this is a compound which is unpleasing to the English ear, sounding too like the dystogistic term *outlandish.*

Netherlandic is hybrid—*i. e.* English in respect to its first three syllables, Greek in respect to its last.

Flemish, if the Dutch of Holland would consent to use it, would, perhaps, prove a useful term, for it must be remembered that, *in philology,* when we talk of the Dutch (of Holland) we also mean the Flemish (of Belgium). Both must be denoted by the same word.

The name that, individually, I find most convenient for the Dutch of Holland and of Belgium, as opposed to the *High-German* and *Platt-Deutsch* of Germany is *Batavian.*

The two other words (*High-German* and *Platt-Deutsch*) are also convenient—though objections of no small weight lie against them. In the first place—

1. They are more or less correlative terms. Nevertheless, the difference of form disguises this correlation.

2. Secondly.—*Platt-Deutsch* is an absolutely foreign word, a foreign word, too, which is nearly sure to be mispronounced.

Be it so. The words are, still, convenient. We may learn this by trying to mend them.

Say *High-German* and *Low-German.*—This means too

much; since *Low-German* is used as a generic term, including the Platt-Deutsch dialects, and a great deal more, viz. the English, and the Dutch of Holland. Or—

Say, *High-Dutch* and *Low-Dutch*.—The word Low-Dutch suggests the Dutch of Holland (the *Batavian*). Or—

Say, *Hoch-Deutsch* and *Platt-Deutsch*.—We get two foreign words instead of one.

Upon the whole, the three best names seem to be (1), *High-German*, (2) *Platt-Deutsch* (*Plattoitsh*, or *Pladdoitsch*),* and (3), *Batavian*.

Teutonic.—As opposed to *Norse* or *Scandinavian*, the word is useful. In this case it denotes the languages of Germany Proper, Holland, and England as opposed to the Danish, Swedish, &c. In short, it is a convenient name for the primary division of the so-called Gothic (German) stock.

Saxon — Anglo-Saxon — Angle, English, &c.—Theoretically, the views of the author already referred to are strictly correct, and they are, of course, strengthened by the doctrine (if sound) of the present writer.

As to the foreign origin of the word *Saxon*, the only objections that lie against it are practical. Even if the terms *Anglo*-Saxon and *Semi*-Saxon be got rid of, there is the *Old*-Saxon to be dealt with. When an unexceptionable term for this has become current, the word *Saxon* may safely be ejected from German Philology.

Scandinavian, Norse, &c.—The first of these terms would be unnecessary if it were not for the tendency of the other to occasionally engender a certain false notion.

Scandinavian means the languages of the northern branch of the Gothic (or German) stock, as contrasted with the *Teutonic*. So doing, it means the Danish as well as the Swedish, and the Swedish as well as the Norwegian — also the Feroic and the Icelandic.

Now *Norse* may mean this also; but it may also mean *Norwegian* as opposed to Swedish, *Norwegian* as opposed to Danish, *Norwegian* as opposed to Icelandic.

On the other hand, *Scandinavian* is inconvenient. Its power in Philology is different from its power in Geography.

* Or *Platteitch* (*Pladdeitch*).

In Philology it includes Denmark. No one would hesitate in saying that the Danish was one of the Scandinavian languages. In Geography (generally at least) it excludes Denmark. Few would say that in visiting Copenhagen they were visiting Scandinavia. Scandinavia, in *geography*, means Sweden and Norway.

If the nomenclature for the northern branch of the Gothic (or German) stock were likely to be settled in England, rather than between the Danes, Swedes, Norwegians, and Icelanders, the question would be a simple one. *Scandinavian* might be eliminated altogether, *Norse* might replace it, and *Norwegian* denote the Norse of Norway, just as *Danish*, *Swedish*, and *Icelandic* would denote that of Denmark, Sweden, and Iceland.

But this is not likely to be the case. Meanwhile the Norwegian philologues eschew the word *Icelandic*, and use *Old Norse* instead; the Danes demurring to the substitution.

Of the literature thus designated some portion was undoubtedly Norwegian rather than Icelandic.

Another portion was undoubtedly Icelandic rather than Norwegian.

A third is of uncertain origin.

This third portion the English philologue most conveniently calls Old *Norse* (or simply *Norse*).

The second he conveniently calls Old *Icelandic*.

The first he conveniently calls Old *Norwegian*.

What the scholars, however, of the countries most interested in the matter will do is uncertain. It is only certain that by calling everything Old *Norse* the nomenclature for the special and proper Old *Norwegian* is impaired.

Now this is by no means a matter of indifference. On the contrary, certain peculiarities of the special and proper Norse of Norway (the Old Norwegian) require notice. One of them is the important form *-sc* instead of *-st*, as the sign of the so-called passive voice—a form of pre-eminent value, inasmuch as it points to the origin of a passive voice in a middle, of a middle in a reflective, and of a reflective in the combination of the verb and pronoun.

The present chapter, along with the one which preceded it, has been written for the sake of indicating the extent to which both the classification and the nomenclature of the German stock of language are matters that we should reconsider rather than acquiesce in. There is much to be done even in the arrangement of our subject-matter and the naming of our tools —more than the generality of writers admit.

CHAPTER XXVII.

THE RELATION OF THE ENGLISH TO THE ANGLO-SAXON, AND THE STAGES OF THE ENGLISH LANGUAGE.

§ 175. If the present English of the nineteenth century be compared with the Anglo-Saxon of the tenth, the following points of difference will be observed:—

1. The Anglo-Saxon language contained words that are either wanting in the present English, or, if found, used in a different sense.

A. S.	English.	A. S.	English.
lyft	*air*	swithe	*very*
lichoma	*body*	sáre	*very*
stefn	*voice*	sith	*late*
theód	*people*	reccan	*care about*
ece	*everlasting*	ongitan	*understand*
hwæt	*sharp*	*sweltan*	*die*, &c.

These words, which are very numerous, although lost (or changed as to meaning) in the current English, are often preserved in the provincial dialects.

2. The present English contains words that were either wanting in the Anglo-Saxon, or, if found, used in a different sense—*voice*, *people*, *conjugal*, *philosophy*, *alchemist*, *very*, *survey*, *shawl*, and other words, to the amount of some hundreds. These have been introduced since the time of the Anglo-Saxons, from the Latin, Greek, French, Arabic, and other languages.

3. Words found in both Anglo-Saxon and English appear in different forms in the different languages.

A. S.	English.	A. S.	English.
án	*one*	gærs	*grass*
eahta	*eight*	ic	*I*
nygon	*nine*	spræc	*speech*
endlufon	*eleven*	eáge	*eye*, &c.

More important, however, than the differences between word and word are those between inflection and inflection. Thus—

4. The Anglo-Saxon contained grammatical forms that are wanting in the present English.

A. S.	English.	A. S.	English.
tung-*ena*	*tongues*	god-*ra*	*good*
word-*a*	*words*	wi-*t*	*we two*
treow-*u*	*tree-s*	gi-*t*	*ye two*
sun-*a*	*son-s*	hwo-*ne*	*who-m*
god-*an*	*good*	we luf-*iath*	*we love*
god-*re*	*good*	we luf-*odon*	*we loved*
god-*ne*	*good*	to luf-*ianne*	*to love.*
god-*es*	*good*		

5. The present English contains grammatical forms that were wanting in Anglo-Saxon. The words *ours*, *yours*, *theirs*, *hers*, were unknown in Anglo-Saxon.

6. Grammatical forms found both in the Anglo-Saxon and the English appear with different forms in the different languages.

A. S.	English	A. S.	English
smith-*es*	*smith's*	hvá-*m*	*who-m*
smith-*as*	*smith-s*	blets-*ode*	*bless-ed*, &c.
hir-*e*	*her*		

§ 176. In detail—

Nouns.—*Gender.*—In Anglo-Saxon there are three genders, the masculine, the feminine, and the neuter. With *adjectives* each gender has its peculiar declension; with *substantives* there are also appropriate terminations, but only to a certain degree; *e.g.* of words ending in *-a* (*nama*, a name; *cuma*, a guest), it may be stated that they are always masculine; of words in *-u* (*sunu*, a son; *gifu*, a gift), that

they are never neuter; in other words, that they are either masculine or feminine.

The definite article varies with the gender of its substantive; *þæt eage*, the eye; *se steorra*, the star; *seo tunge*, the tongue.

Of Number.—The plural form in *-en* (as in *oxen*), rare in English, was common in Anglo-Saxon. It was the regular termination of a whole declension; *e.g. eágan*, eyes; *steorran*, stars; *tungan*, tongues. Besides this, the Anglo-Saxons had forms in *-u* and *-a*, as *ricu*, kingdoms; *gifa*, gifts. The termination *-s* current in the present English was confined to a single gender and to a single declension, as *endas*, ends; *dagas*, days; *smiðas*, smiths.

Of Case.—Of these the Saxons had, for their substantives, at least three; viz. the nominative, dative, genitive. With the pronouns and adjectives there was a true accusative form; and with a few especial words an ablative or instrumental one. *Smið*, a smith; *smiðe*, to a smith; *smiðes*, of a smith. Plural, *smiðas*, smiths; *smiðum*, to smiths; *smiða*, of smiths: *he*, he; *hine*, him; *him*, to him; *his*, his: *se*, the; *þa*, the; *þy*, with the; *þam*, to the; *þæs*, of the.

Of the dative in *-um*, the world *whilom* (*at times, at whiles*) is a still extant and an almost isolated specimen.

Of Declension.—In *Anglo-Saxon* it is necessary to determine the termination of a substantive. There is the weak, or simple declension for words ending in a vowel (as *eage, steorra, tunga*), and the strong, or complex declension for words ending in a consonant (*smið, spræc, leáf*). The letters *i* and *u* are dealt with as semivowels, semivowels being dealt with as consonants; so that words like *sunu* and *gifu* belong to the same declension as *smið* and *spræc*.

That the form of adjectives varies with their definitude or indefinitude, has already been seen: definitive adjectives following the inflection of the simple; indefinite ones that of the complex declension.

The chief details of the Anglo-Saxon declension have, also, been shown.

The Anglo-Saxon inflection of the participles present is remarkable. With the exception of the form for the genitive plural definite (which, instead of *-ena*, is *-ra*,) they follow the

declension of the adjectives. From the masculine substantives formed from them, and denoting the agent, they may be distinguished by a difference of inflection.

	Participle.	*Substantive.*
	Wegferende = *Wayfaring.*	Wegferend = *Wayfarer.*
Sing. Nom.	Wegferende	Wegferend.
Acc.	Wegferendne	Wegferend.
Abl.	Wegferende	Wegferende.
Dat.	Wegferendum	Wegferende.
Gen.	Wegferendes	Wegferendes.
Plur. Nom.	Wegferende	Wegferendas.
Dat.	Wegferendum	Wegferendum.
Gen.	Wegferendra	Wegferenda.

PRONOUNS.—*Personal.*—Of the pronominal inflection in Saxon, the character may be gathered from the chapter upon pronouns. At present, it may be stated that, like the Mœso-Gothic, and the Icelandic, the Anglo-Saxon language possessed for the first two persons a *dual* number; inflected as follows:—

	1*st Person.*		2*nd Person.*	
Nom.	Wit	*We two.*	Git	*Ye two.*
Acc.	Unc	*Us two.*	Inc	*You two.*
Gen.	Uncer	*Of us two.*	Incer	*Of you two.*

Besides this, the demonstrative, possessive, and relative pronouns, as well as the numerals *twa* and *þreo*, had a fuller declension than they have at present.

VERBS. — *Mood.* — The subjunctive mood, that in the present English (with the exception of the conjugation of the verb substantive) differs from the indicative only in the third person singular, was in Anglo-Saxon inflected as follows:—

Indicative Mood.

Pres. Sing.	1.	Lufige.	*Plur.*	1. 2. 3.	Lufiaþ.
	2.	Lufast.			
	3.	Lufaþ.			

Subjunctive Mood.

Pres. Sing.	1. 2. 3.	Lufige.	*Plur.*	1. 2. 3.	Lufion.

The Saxon infinitive ended in *-an* (*lufian*), and besides this there was a so-called gerundial form, *to lufigenne*.

Tense.—In regard to tense, the Anglo-Saxon coincided with the English. The present language has two tenses, the present and the past; the Saxon had no more. This past tense the modern English forms either by addition (*love, loved*), or by change (*fall, fell*). So did the Anglo-Saxons.

Number and Person.—In the present English the termination *-eth* (*moveth*) is antiquated. In Anglo-Saxon it was the only form recognised. In English the plural number (indicative as well as subjunctive) has no distinguishing inflection. It was not so in Anglo-Saxon. There, although the *persons* were identical in form, the *numbers* were distinguished by the termination *-aþ* for the indicative, and *-n* for the subjunctive. (*See above.*)

Such are the chief points in the declension of nouns and the conjugation of verbs that give a difference of character between the ancient Anglo-Saxon and the modern English.

§ 177. The English language stands to the Anglo-Saxon in the relation of a derived language to a mother tongue, or (changing the expression) the English may be called the Anglo-Saxon in its *most modern* form; whilst the Anglo-Saxon may, with equal propriety, be called the English in its *most ancient* form. However, it is not so important to settle the particular mode of expressing the nature of this relation, as to become familiar with certain facts connected with recent languages as compared with the older ones from which they originate; facts which chiefly arise out of the tenses of the verbs, and the cases of the nouns.

The Middle English has inflections which are wanting in the Modern; and the Early English has inflections which are wanting in the Middle.

The Middle Frisian has inflections which are wanting in the Modern; and the Early Frisian has inflections which are wanting in the Middle.

The earlier the stage of the Dutch language, the more numerous the inflections.

The earlier the stage of the High-German, the more numerous the inflections.

The inflection of the Mœso-Gothic is fuller than that of any of the allied languages.

The earlier the stage of the Danish, the more numerous the inflections.

The earlier the stage of the Swedish, the more numerous the inflections.

The earlier the stage of the Icelandic, the more numerous the inflections.

So much for the comparison between the different stages of one and the same language. It shows that the earlier the stage, the fuller the inflection; the later the stage, the scantier the inflection; in other words, it shows that as languages become modern, they lose their inflections.

There is another method of proving this rule; and that is by the comparison of allied languages that change with different degrees of rapidity.

The Danish language has changed more rapidly than the Swedish, and, consequently, has fewer of its original inflections.

The Swedish language has changed more rapidly than the Feroic, and, consequently, has fewer of its original inflections.

The Feroic has changed more rapidly than the Icelandic, and, consequently, has fewer of its original inflections.

The Icelandic has changed so slowly, that it retains almost all the original inflections of the Old Norse.

In all the languages allied to the English, the earlier the stage, the more numerous are the inflections, and *vice versâ*.

Smiðum the dative plural of the Anglo-Saxon *smið*, is equivalent in meaning to the English *to smiths*, or to the Latin *fabris*. *Smiðum*, however, is a single Anglo-Saxon word (a substantive, and nothing more); whilst its English equivalent is two words (*i. e.* a substantive with the addition of a preposition). The letter *s*, in *smiths*, shows that the word is plural. The *-um*, in *smiðum*, does this and something more. It is the sign of the *dative case* plural. The *-um*, in *smiðum*, is the part of a word. The preposition *to* is a separate word with an independent existence. *Smiðum* is the radical syllable *smið*, *plus* the subordinate inflectional syllable *-um*, the sign of the dative case. *To smiths* is the substantive *smiths*, *plus* the preposition *to*, equivalent in power to the sign of a dative case,

but different from it in form. As far, then, as the word just quoted is concerned, the Anglo-Saxon differs from the English thus. It expresses a given idea by a modification of the form of the root, whereas the modern English denotes the same idea by the addition of a preposition. The Saxon inflection is superseded by a combination of words.

The part that is played by the preposition with nouns, is played by the auxiliaries (*have*, *be*, &c.) with verbs.

The sentences in italics are mere variations of the same general statement.

1. *The earlier the stage of a given language, the greater the amount of its inflectional forms, and the later the stage of a given language, the smaller the amount of them.*

2. *As languages become modern, they substitute prepositions and auxiliary verbs for cases and tenses.*

3. *The amount of inflection is in the inverse proportion to the amount of prepositions and auxiliary verbs.*

4. *In the course of time, languages drop their inflection and substitute in its stead circumlocutions by means of prepositions, &c. The reverse never takes place.*

5. *Given two modes of expression, the one inflectional* (smiðum), *the other circumlocutional* (to smiths), *we can state that the first belongs to an early, the second to a late, stage of language.*

The present chapter, then, showing the relation of the English to the Anglo-Saxon, shows something more. It exhibits the *general* relation of a modern to an ancient language. As the English is to the Anglo-Saxon, so are the Danish, Swedish, and Norwegian, to the Old Norse; so also the Modern High-German to the Mœso-Gothic; so the Modern Dutch of Holland to the Old Frisian; so, moreover, amongst the languages of a different stock, are the French, Italian, Spanish, Portuguese, Romanese, and Wallachian to the Latin, and the Romaic to the Ancient Greek.

How far two languages pass with equal rapidity from their ancient to their modern, from their inflected to their uninflected state (in other words, how far all languages alter at the same rate), is another question that will be noticed elsewhere.

Akin to this is a second, viz.: how far the rate of change in

a given language can be accelerated by external circumstances? This second question bears immediately upon the history of the English language. The grammar of the current idiom compared with the grammar of the Anglo-Saxon is simplified. How far was this simplification of the grammar promoted by the Norman Conquest? The current views exaggerate the influence of the Norman Conquest and of French connections. The remark of Mr. Price in his Preface to Warton, acceded to by Mr. Hallam in his *Introduction to the Literature of Europe*, is, that every one of the other Low Germanic languages (affected by nothing corresponding to the Norman Conquest) displays the same simplification of grammar as the Anglo-Saxon (affected by the Norman Conquest) displays. Confirmatory of this remark, it may be added, that, compared with the Icelandic, the Danish and Swedish do the same. Derogatory to it is the comparatively complex grammar of the *New* German, compared, not only with the Old High-German, but with the Mœso-Gothic.

An extract from Mr. Hallam shall close the present section, and introduce the next.

"Nothing can be more difficult, except by an arbitrary line, than to determine the commencement of the English language: not so much, as in those on the Continent, because we are in want of materials, but rather from an opposite reason, the possibility of showing a very gradual succession of verbal changes that ended in a change of denomination. We should probably experience a similar difficulty, if we knew equally well the current idiom of France or Italy in the seventh and eighth centuries. For when we compare the earliest English of the thirteenth century with the Anglo-Saxon of the twelfth, it seems hard to pronounce why it should pass for a separate language, rather than a modification or simplification of the former. We must conform, however, to usage, and say that the Anglo-Saxon was converted into English:—1. By contracting and otherwise modifying the pronunciation and orthography of words. 2. By omitting many inflections, especially of the noun, and consequently making more use of articles and auxiliaries. 3. By the introduction of French derivatives. 4. By using less inversion and ellipsis, especially in poetry. Of these, the second alone, I think, can be considered as sufficient to describe a

new form of language; and this was brought about so gradually, that we are not relieved from much of our difficulty, as to whether some compositions shall pass for the latest offspring of the mother, or the earlier fruits of the daughter's fertility. It is a proof of this difficulty that the best masters of our ancient language have lately introduced the word Semi-Saxon, which is to cover everything from A.D. 1150 to A.D. 1250."—Chapter i. 47.

§ 178. At a given period, then, the Anglo-Saxon of the standard, and (if the expression may be used) classical authors, such as Cædmon, Alfred, Ælfric, &c., had undergone such a change as to induce the scholars of the present age to denominate it, not Saxon, but *Semi*-Saxon. It had ceased to be genuine Saxon, but had not yet become English. In certain parts of the kingdom, where the mode of speech changed more rapidly than elsewhere, the Semi-Saxon stage of our language came earlier. It was, as it were, precipitated.

The History of King Leir and his Daughters is found in two forms. Between these there is a difference either of dialect or of date, and possibly of both. Each, however, is Semi-Saxon. The extracts are made from *Thorpe's Analecta Anglo-Saxonica.*

Bladud hafde ene sune,	Bladud hadde one sone,
Leir was ihaten;	Leir was ihote,
Efter his fader daie,	After his fader he held þis lond,
He heold þis drihlice lond,	In his owene hond,
Somed an his live,	Ilaste his lif-dages,
Sixti winter.	Sixti winter.
He makade ane riche burh,	He makede on riche borh,
þurh radfulle his crafte,	þorh wisemenne reade,
And he heo lette nemnen,	And hine lette nemni,
Efter him seolvan;	After him seolve;
Kaer-Leir hehte þe burh.	Kair-Leir hehte þe borh.
Leof heo wes þan kinge,	Leof he was þan kinge;
þa we, an ure leod-quide,	þe we, on ure speche,
Leir-chestre clepiad,	Leþ-chestre cleopieþ,
Geare a þan holde dawon.	In þan eolde daiye.

Translation literal.

Bladud had a son,	Bladud had a son,
Lear was hight;	Lear was hight
After his father's days	After his father he held the land
He held his liege land	In his own hand
Together on (through) his life,	Through his life-days
Sixty winters.	Sixty winters.
He made a rich borough	He made a rich borough
Through his wise craft,	Through wise men's counsel,
And he it let name	And he let it name
After himself.	After himself.
Caer Lear hight the burgh.	Caer Lear hight the borough.
Dear was it to the king.	Dear was it to the king.
Which we on our language	Which we, on our speech,
Leicester call	Leicester call
Of yore on the old days.	In the old days.

The Grave, a poetical fragment, the latter part of the Saxon Chronicle, a Homily for St. Edmund's Day (given in the *Analecta*), and, above all, the printed extracts of the poem of *Layamon*, are the more accessible specimens of the Semi-Saxon. The *Ormulum*, although in many points English rather than Saxon, retains the dual number of the Anglo-Saxon pronouns. However, lest too much stress be laid upon this circumstance, the epistolary character of the *Ormulum* must be borne in mind.

It is very evident that if, even in the present day, there were spoken in some remote district the language of Alfred and Ælfric, such a mode of speech would be called, not Modern English, but Anglo-Saxon. This teaches us that the stage of language is to be measured, not by its date, but by its structure. Hence Saxon ends and Semi-Saxon begins, not at a given year, A.D., but at that time (whenever it be) when certain grammatical inflections disappear, and certain characters of a more advanced stage are introduced.

Some, amongst others, of the earlier changes of the standard Anglo-Saxon are—

1. The substitution of *-an* for *-as*, in the plural of substan-

tives, *munucan* for *munucas* (monks); and, conversely, the substitution of *-s* for *-n*, as *steorres* for *steorran* (stars). The use of *-s*, as the sign of the plural, without respect to gender or declension, may be one of those changes that the Norman Conquest forwarded; *-s* being the sign of the plural in Anglo-Norman.

2. The ejection or shortening of final vowels, *þæt ylc* for *þæt ylce; sone* for *sunu; name* for *nama; dages* for *dagas.*

3. The substitution of *-n* for *-m* in the dative case, *hwilon* for *hwilum.*

4. The ejection of the *-n* of the infinitive mood, *cumme* for *cuman* (*to come*), *nemne* for *nemnen* (*to name*).

5. The ejection of *-en* in the participle passive, *I-hote* for *gehaten* (*called, hight*).

6. The gerundial termination *-enne,* superseded by the infinitive termination *-en;* as *to lufian* for *to lufienne,* or *lufigenne.*

7. The substitution of *-en* for *-aþ* in the persons plural of verbs; *hi clepen* (*they call*) for *hi clypiaþ*, &c.

The preponderance (not the occasional occurrence) of forms like those above constitute Semi-Saxon in contradistinction to standard Saxon, classical Saxon, or Anglo-Saxon proper.

§ 179. *Early English Stage.* — Further changes convert Semi-Saxon into Early English. Some, amongst others, are the following:—

1. The ejection of the dative plural termination *-um,* and the substitution of the preposition *to* and the plural sign *-s;* as *to smiths* for *smiþum.* Of the dative singular the *-e* is retained (*ende, worde*); but it is by no means certain that, although recognised in writing, it was recognised in pronunciation also.

2. The ejection of *-es* in the genitive singular whenever the preposition *of* came before it; *Godes love* (*God's love*), but the *love of God,* and not the *love of Godes.*

3. The syllables *-es* as a sign of the genitive case extended to all genders and to all declensions; *heart's* for *heortan; sun's* for *sunnan.*

4. The same in respect to the plural number; *sterres* for *steorran; sons* for *suna.*

5. The ejection of *-na* in the genitive plural; as *of tunges'* for *tungena*.

6. The use of the word *the*, as an article, instead of *se*, &c.

The preponderance of the forms above (and not their occasional occurrence) constitutes Old English in contradistinction to Semi-Saxon.

The following extract from *Henry's History* (vol. viii. append. iv.) is the proclamation of Henry III. to the people of Huntingdonshire, A.D. 1258. It currently passes for the earliest specimen of English:—

"Henry, thurg Godes fultome, King on Engleneloande, lhoaurd on Yrloand, Duke on Normand, on Acquitain, Eorl on Anjou, send I greting, to alle hise holde, ilærde & ilewerde on Huntingdonschiere.

"That witen ge well alle, thæt we willen & unnen (grant) thæt ure rædesmen alle other, the moare del of heom, thæ beoth ichosen thurg us and thurg thæt loandes-folk on ure Kuneriche, habbith idon, and schullen don, in the worthnes of God, and ure threowthe, for the freme of the loande, thurg the besigte of than toforen iseide rædesmen, beo stedfæst and ilestinde in alle thinge abutan ænde, and we heaten alle ure treowe, in the treowthe thæt heo us ogen, thet heo stede-feslliche healden & weren to healden & to swerien the isetnesses thet beon makede and beo to makien, thurg than toforen iseide rædesmen, other thurg the moare del of heom alswo, alse hit is before iseide. And thet æhcother helpe thet for to done bitham ilche other, aganes alle men in alle thet heo ogt for to done, and to foangen. And noan ne of mine loande, ne of egetewhere, thurg this besigte, muge beon ilet other iwersed on oniewise. And gif oni ether onie cumen her ongenes, we willen & heaten, thæt alle ure treowe heom healden deadlichistan. And for thæt we willen thæt this beo stædfast and lestinde, we senden gew this writ open, iseined with ure seel, to halden amanges gew ine hord Witnes usselven æt Lundæn, thæne egetetenthe day on the monthe of Octobr, in the two and fowertigthe geare of ure crunning."

In Modern English.

Henry, through God's support, King of England, Lord of Ireland, Duke of Normandy, of Acquitain, Earl of Anjou, sends greeting, to all his subjects, learned and unlearned (*i. e.* clergy and laity) of Huntingdonshire. This know ye well all, that we will and

grant, what our counsellors all or the more part of them, that be chosen through us and through the land-folk of our kingdom, have done, and shall do, to the honour of God, and our allegiance, for the good of the land, through the determination of those before-said counsellors, be stedfast and permanent in all things without end, and we enjoin all our lieges, by the allegiance that they us owe, that they stedfastly hold and swear to hold and to maintain the ordinances that be made, and be to be made through the before-said counsellors, or through the more part of them also, as it is before said, and that each other help that for to do by them each other, against all men, in all that they ought for to do, and to promote. And none either of my land nor of elsewhere, through this business, may be impeded or damaged in any way. And if any man or any woman cometh them against, we will and enjoin that all our lieges them hold deadly foes. And for that we will that this be stedfast and lasting, we send you this writ open, sealed with our seal, to keep amongst you in store. Witness ourself at London, the eighteenth day of the month of October, in the two and fortieth year of our crowning.

Some of the *Political Verses* (published by the Camden Society), *Havelok the Dane*, *William and the Werwolf*, *the Gestes of Alisaundre*, *King Horn*, *Ipomedon*, and *the King of Tars;* and, amongst the longer works, Robert of Gloucester's Chronicle, and the poems of Robert of Bourn (Brunn), are (amongst others) Old English. Broadly speaking, the *Old* English may be said to begin with the reign of Henry III., and to end with that of Edward III.

In the Old English the following forms predominate.

1. A fuller inflection of the demonstrative pronoun, or definite article; *þan*, *þenne*, *þære*, *þam;*—in contradistinction to the Middle English.

2. The presence of the dative singular in *-e; ende*, *smithe;* —*ditto*.

3. The existence of a genitive plural in *-r* or *-ra; heora*, theirs; *aller*, of all;—*ditto*. This with substantives and adjectives is less common.

4. The substitution of *heo* for *they*, of *heora* for *their*, of *hem* for *them;*—in contradistinction to the latter stages of English, and in contradistinction to Old Lowland *Scotch*.

5. A more frequent use of *min* and *thin*, for *my* and *thy;* —in contradistinction to Middle and Modern English.

6. The use of *heo* for *she;*—in contradistinction to Middle and Modern English and Old Lowland *Scotch*.

7. The use of broader vowels; as in *iclepud* or *iclepod* (for *icleped* or *yclept*); *geongost*, youngest; *ascode*, asked; *eldore*, elder.

8. The use of the strong preterits (*see* the chapter on the tenses of verbs), where in the present English the weak form is found; *wex*, *wop*, *dalf*, for *waxed*, *wept*, *delved*.

9. The omission not only of the gerundial termination *-enne*, but also of the infinitive sign *-en* after *to; to honte, to speke;*—in contradistinction to Semi-Saxon.

10. The substitution of *-en* for *-eþ* or *-eð*, in the first and second persons plural of verbs; *we wollen*, we will: *heo schullen*, they should;—*ditto*.

11. The comparative absence of the articles *se* and *seo;*—*ditto*.

12. The substitution of *ben* and *beeth*, for *synd* and *syndon* =*we, ye, they are;*—in contradistinction to Semi-Saxon.

§ 180. The degree to which the Anglo-Saxon was actually influenced by the Anglo-Norman has been noticed. The degree wherein the two languages came in contact is, plainly, another consideration. The first is the question, How far one of two languages influenced the other? The second asks, How far one of two languages had the opportunity of influencing the other? Concerning the extent to which the Anglo-Norman was used, I retail the following statements and quotations.

1. "Letters even of a private nature were written in Latin till the beginning of the reign of Edward I., soon after 1270, when a sudden change brought in the use of French."—*Mr. Hallam, communicated by Mr. Stevenson* (*Literature of Europe*, i. 52, *and note*).

2. Conversation between the Members of the Universities was ordered to be carried on either in Latin or French:—"*Si qua inter se proferant, colloquio Latino vel saltem Gallico perfruantur.*"—*Statutes of Oriel College, Oxford.*—*Hallam, ibid.* from Warton.

3. "The Minutes of the Corporation of London, recorded in

the Town Clerk's Office, were in French, as well as the Proceedings in Parliament, and in the Courts of Justice."—*Ibid.*

4. "In Grammar Schools, boys were made to construe their Latin into French."—*Ibid.* "*Pueri in scholis, contra morem cæterarum nationum, et Normannorum adventu, derelicto proprio vulgari, construere Gallice compelluntur. Item quod filii nobilium ab ipsis cunabulorum crepundiis ad Gallicum idioma informantur. Quibus profecto rurales homines assimulari volentes, ut per hoc spectabiliores videantur, Francigenari satagunt omni nisu.*"—*Higden* (*Ed. Gale*, p. 210).

That there was French in England before the battle of Hastings, appears on the authority of Camden:—

"Herein is a notable argument of our ancestors' steadfastness in esteeming and retaining their own tongue. For, as *before the Conquest*, they misliked nothing more in King Edward the Confessor, than that he was Frenchified, and accounted the desire of a foreign language then to be a foretoken of the bringing in of foreign powers, which indeed happened."—*Remains*, p. 30.

Edward III.—This is the reign when the *re-action* of the original English against the Norman-French began; and the time from which it steadily and progressively increased. The father of English poetry, Geoffrey Chaucer, wrote under Edward III.; so did his contemporary Wycliffe, and others of almost equal importance; their predecessors, who had written in English at all, having written either in the Old English, or the Semi-Saxon.

Edward IV.—The reign in which printing was introduced into England by William Caxton.—By this time, the Anglo-Norman language had become almost wholly superseded by the English, remaining only as the language of a few of the Courts of Law. The English, however, as may be expected, has changed from the English of Chaucer, and is approaching the character of the English of the writers under Henry VIII. In South Britain no poetical successor worthy of comparison with Chaucer has appeared. In Scotland, however, there is the dawning of a bright period—the reign of James IV.

Henry VIII.—The establishment of the Protestant Religion, and the revival of Classical Learning, are the two great influ-

ences in the reign of Henry VIII.; the effects of both upon the style of our writers and the language itself being beneficial. The works of Sir Thomas More, and the earliest translations of the Bible, are the chief instances of the now rapidly-increasing English literature.

Elizabeth.—During the long reign of Queen Elizabeth the language underwent considerable change, and the early Elizabethan writers are much less like the writers of the present century than the later ones. Indeed, what is called the age of Queen Elizabeth comprises the reign of James the First, and part of that of Charles the First. This is the age of Shakspeare and his contemporary dramatists. It is also the time when the present translation of the Bible was made. The extent to which the English of the time in question is marked by peculiar indications of antiquity is generally known; so that the present general sketch of the history of the English language ends with the death of James I.

§ 181. The *present* tendencies of the English may be determined by observation; and as most of them will be noticed in the Etymological part of this volume, the few here indicated must be looked upon as illustrations only.

1. The distinction between the Subjunctive and Indicative Mood is likely to pass away. We verify this by the very general tendency to say *If it is*, and *If he speaks*, for *If it be*, and *If he speak*.

2. The distinction (as far as it goes) between the Participle Passive and the Past Tense is likely to pass away. We verify this by the tendency to say *It is broke*, and *He is smote*, for *It is broken*, and *He is smitten*.

3. Of the double forms, *Sung* and *Sang*, *Drank* and *Drunk*, &c., one only will be the permanent.

As stated above, these tendencies are a few out of a number, and have been adduced in order to indicate the subject rather than to exhaust it.

§ 182. What the present language of England would have been had the Norman Conquest never taken place, the analogy of Holland, Denmark, and of many other countries enables us to determine. It would have been much as it is at present. What it would have been had the *Saxon* Con-

quest never taken place, is a question wherein there is far more speculation. Of France, of Italy, of Wallachia, and of the Spanish Peninsula, the analogies all point the same way. They indicate that the original Celtic would have been superseded by the Latin of the Conquerors, and consequently that our language in its later stages would have been neither British nor Gaelic, but Roman. Upon these analogies, however, we may refine. Italy was, from the beginning, Roman; the Spanish Peninsula was invaded full early; no ocean divided Gaul from Rome; and the war against the ancestors of the Wallachians was a war of extermination.

CHAPTER XXVIII.

THE KELTIC STOCK OF LANGUAGES, AND THEIR RELATIONS TO THE ENGLISH.

§ 183. The languages of Great Britain at the invasion of Julius Cæsar were of the Keltic Stock.

Of the Keltic Stock there are two Branches.

1. The British or Cambrian Branch, represented by the present Welsh, and containing, besides, the Cornish of Cornwall (lately extinct), and the Armorican of the French province of Brittany. It is almost certain that the old British, and the ancient language of Gaul, belonged to this branch.

2. The Gaelic or Erse Branch, represented by the present Irish Gaelic, and containing, besides, the Gaelic of the Highlands of Scotland and the Manks of the Isle of Man.

2. A réir mar a ta e scrìobhta anns na fàidhibh, Feuch, cuiream mo theachdair e roimh do ghnùis, a dh'ulluicheas do shlighe romhad.

3. Guth an ti a'dh'éigheas anns an fhàsach, Ulluichibh slighe an Tighearna, deanaibh a cheumanna dìreach.

4. Bha Eoin a' baisteadh anns an fhàsach, agus a' searmonachadh baistidh an aithreachais, chum maitheanais pheacanna.

5. Agus chaidh a mach d'a ionnsuidh tìr Iudea uile, agus luchd-àiteachaidh Ierusaleim agus bhaisteadh leis iad uile ann an amhuinn Iordain, ag aideachadh am peacanna.

6. Agus bha Eoin air eudachadh le fionna chàmhal, agus crios leathair m'a leasruidh: agus bu bhiadh dha locuist agus mil fhiadhuich.

7. Agus shearmonaich e, ag radh, A ta neach a' teachd a'm' dhéigh a's cumhachdaiche na mise, neach nach airidh mise air cromadh sìos agus barr-iall a bhròg fhuasgladh.

8. Bhaist mise gu dearbh sibh le h-uisge: ach baistidh esan sibh leis an Spiorad Naomha.

Luke xv. 11–19.

11. Bha aig duine àraidh dithis mhac:

12. Agus thubhairt am *mac* a b'òige dhiubh r'*a* athair, Athair,

thoir dhomhsa a' chuid roinn a thig *orm* do *d'* mhaoin. Agus roinn e eatorra a bheathachadh.

13. Agus an déigh beagain do làithibh, chruinnich am mac a b'òige a chuid uile, agus ghabh e a thurus do dhùthaich fad air astar; agus an sin chaith e a mhaoin le beatha struidheasaich.

14. Agus an uair a chaith e *a chuid* uile, dh'éirich gorta ro mhòr san tìr sin; agus thòisich e ri bhi ann an uireasbhuidh.

15. Agus chaidh e agus cheangail se e féin ri aon do shaor-dhaoinibh na dùcha sin: agus chuir e d'a fhearann e, a bhiadhadh mhuc.

16. Agus bu mhiann leis a bhrù a lìonadh do na plaosgaibh a bha na mucan ag itheadh; oir cha d'thug neach air bith dha.

17. Agus an uair a thainig e chuige féin, thubhairt e, Cia lìon do luchd tuarasdail m'atharsa aig am bheil aran gu leoir agus r'a sheachnadh, 'nuair a ta mise a' bàsachadh le gorta?

18. Eiridh mi, agus théid mi dh'ionnsuidh m'athar, agus their mi ris, Athair, pheacaich mi 'n aghaidh fhlaitheanais, agus a'd' là-thairsa.

19. Agus cha 'n fhiu mi tuilleadh gu'n goirte do mhac-sa dhiom: dean mi mar aon do d' luchd tuarasdail.

§ 189.

In all these samples allow for differences of orthography, which conceal a certain amount of likeness.

§ 190. Taken altogether the Keltic tongues form a very remarkable class. As compared with those of the Gothic stock they are marked by the following characteristics:—

The scantiness of the declension of Keltic nouns.—In Irish there is a peculiar form for the dative plural, as *cos* = *foot*, *cos-aibh* = *to feet* (ped-*ibus*); and beyond this there is nothing else whatever in the way of *case*, as found in the German, Latin, Greek, and other tongues. Even the isolated form in question is not found in the Welsh and Breton. Hence the Keltic tongues are pre-eminently uninflected in the way of *declension*.

§ 191.—2. *The agglutinate character of their verbal inflections.*—In Welsh the pronouns for *we*, *ye*, and *they*, are *ni*, *chwyi*, and *hwynt* respectively. In Welsh also the root = *love* is *car*. As conjugated in the plural number this is—

car-*wn* = am-*amus*.
car-*ych* = am-*atis*.
car-*ant* = am-*ant*.

Now the *-wn*, *-ych*, and *-ant*, of the persons of the verbs are the personal pronouns, so that the inflection is really a verb and a pronoun in a state of *agglutination; i. e.* in a state where the original separate existence of the two sorts of words is still manifest. This is probably the case with languages in general. The Keltic, however, has the peculiarity of exhibiting it in an unmistakable manner; showing, as it were, an inflexion in the process of formation, and (as such) exhibiting an early stage of language.

§ 192. *The system of initial mutations.*—The Keltic, as has been seen, is deficient in the ordinary means of expressing case. How does it make up for this? Even thus. The noun changes its initial letter according to its relation to the other words of the sentence. Of course this is subject to rule. As, however, I am only writing for the sake of illustrating in a general way the peculiarities of the Keltic tongues, the following table, from *Prichard's Eastern Origin of the Keltic Nations*, is sufficient.

Câr, *a kinsman.*
1. *form*, Câr agos, *a near kinsman.*
2. Ei gâr, *his kinsman.*
3. Ei châr, *her kinsman.*
4. Vy nghâr, *my kinsman*

Tâd, *a father.*
1. *form*, Tâd y plentyn, *the child's father.*
2. Ei dâd, *his father.*
3. Ei thâd, *her father.*
4. Vy nhâd, *my father.*

Pen, *a head.*
1. *form*, Pen gŵr, *the head of a man.*
2. Ei ben, *his head.*
3. Ei phen, *her head.*
4. Vy mhen, *my head.*

Gwâs, *a servant.*
1. *form*, Gwâs fydhlon, *a faithful servant.*
2. *form.* Ei wâs, *his servant*
3. Vy ngwas, *my servant.*

Duw, *a god*
1. *form*, Duw trugarog, *a merciful god.*
2. Ei dhuw, *his god.*
3. Vy nuw, *my god*

Bara, *bread.*
1. *form*, Bara cann, *white bread.*
2. Ei vara, *his bread.*
3. Vy mara, *my bread.*

Lhaw, *a hand.*
1. *form*, Lhaw wenn, *a white hand.*
2. Ei law, *his hand.*

Mam, *a mother.*
1. *form*, Mam dirion, *a tender mother.*
2. Eivam, *his mother.*

Rhwyd, *a net.*	Súil, *an eye.*
1. *form*, Rhwyd lawn, *a full net.*	1. *form*, Súil.
2. Ei rwyd, *his net.*	2. A húil, *his eye.*
From the Erse.	Sláinte, *health.*
	2. *form*, Do hláinte, *your health.*

§ 193. *The ancient language of Gaul* Cambrian.*—The evidence in favour of the ancient language of Gaul being Cambrian rather than Gaelic, lies in the following facts:—

The old Gallic glosses are more Welsh than Gaelic.

a. Petorritum = *a four-wheeled carriage*, from the Welsh, *peaer* = *four* and *rhod* = *a wheel.* The Gaelic for *four* is *ceathair*, and the Gaelic compound would have been different.

b. Pempedula, the *cinque-foil*, from the Welsh *pump* = *five*, and *dalen* = *a leaf.* The Gaelic for *five* is *cuig*, and the Gaelic compound would have been different.

c. Candetum = a measure of 100 feet, from the Welsh *cant* = 100. The Gaelic for *a hundred* is *cead*, and the Gaelic compound would have been different.

d. Epona = *the goddess of horses.* In the Old Armorican the root *ep* = *horse.* The Gaelic for a horse is *each.*

e. The evidence from the names of geographical localities in Gaul, both ancient and modern, goes the same way: *Nantuates*, *Nantouin*, *Nanteuil*, are derived from the Welsh *nant* = *a valley*, a word unknown in Gaelic.

f. The evidence of certain French provincial words, which are Welsh and Armorican rather than Erse or Gaelic.

g. (?) An inscription on an ancient Keltic (?) tablet found at Paris, A.D. 1711, and representing a bull and three birds (cranes), is TARWOS TRI GARĆANOS. Now, for the first two names, the Gaelic affords as good an explanation as the Welsh; the third, however, is best explained by the Welsh.

Bull = *tarw*, Welsh; *tarbh*, Gaelic.
Three = *tri*, Welsh; *tre*, Gaelic.
Crane = *garan*, Welsh; *corr*, Gaelic.

* From a Paper of the late Mr. Garnett's in the *Transactions of the Philological Society.*

CHAPTER XXIX.

THE LANGUAGES OF THE CLASSICAL STOCK—THE ANGLO-NORMAN.

§ 194. THE Greek and Latin languages are members of the same class.

Of these, the former is only of secondary importance in English Philology.

The latter requires special notice. This is because the Norman Conquest introduced the Norman-French, and the Norman-French is of Latin origin.

From Italy, its original seat, the Latin was extended in the following chronological order;—

1. To the Spanish Peninsula.
2. To Gaul or France, and to Helvetia or Switzerland.
3. To Dacia, *i.e.* Moldavia, and Wallachia.

§ 195.

SPECIMENS.

Italian.

MARK i. 1–8.

1. Principio del Vangelo di Gesù Cristo Figliuolo di Dio.

2. Siccome sta scritto nel profeta Isaia: Ecco che io spedisco innanzi a te il mio Angelo, il quale preparerà la tua via dinanzi a te.

3. Voce d' uno, che grida nel deserto: Preparate la via del Signore, addirizzate i suoi sentieri.

4. Fu Giovanni nel deserto a battezzare, e predicare il battesimo della penitenza per la remissione de' peccati.

5. E tutto il paese della Giudea, e tutto il popolo di Gerusalemme andava a trovarlo, e confessando i loro peccati eran battezzati da lui nel fiume Giordano.

6. E Giovanni era vestito di pelo di camello, e aveva ai fianchi

una cintola di cuoio, e mangiava locuste, e miele selvatico. E predicava, dicendo:

7. Viene dietro di me chi è più forte di me: cui non son io degno di sciogliere prostrato a terra la coreggia delle scarpe.

8. Io vi ho battezzato con acqua; ma egli vi battezzerà con lo Spirito santo.

LUKE xv. 11–19.

11. Un uomo aveva due figliuoli,

12. E il minore di essi disse a suo padre: Padre, dammi la parte de' beni, che mi tocca. Ed egli fece tra loro le parti delle facoltà.

13. E di lì a pochi giorni, messo il tutto insieme, il figliuolo minore se ne andò in lontano paese, e ivi dissipò tutto il suo in bagordi.

14. E dato che ebbe fondo a ogni cosa, fu gran carestía in quel paese, ed egli principiò a mancare del necessario.

15. E andò, e si insinuò presso di uno de' cittadini di quel paese; il quale lo mandò alla sua villa a fare il guardiano de' porci.

16. E bramava di empire il ventre delle ghiande, che mangiavano i porci: e nissuno gliene dava.

17. Ma rientrato in se stesso, disse: Quanti mercenarj in casa di mio padre hanno del pane in abbondanza; e io qui mi muojo di fame!

18. Mi alzerò, e anderò da mio padre, e dirò a lui: Padre, ho peccato contro del cielo, e contro di te:

19. Non sono omai degno di esser chiamato tuo figlio: trattami come uno de' tuoi mercenarj.

§ 196.

Piedmontese.

MARK i. 1–8.

1. 'L prinsipi dë l' evangeli dë Gesu-Crist, Fieul d'Iddiou;

2. Secound ch'a l è scrit ënt i proufeta: Eccou, i mandou 'l mè inviato dënans a toua faccia, 'l qual a të prountërà la stra.

3. La vouss dë coul ch'ha crià ënt 'l dësert *a l è:* Prepare la stra dë Nossëgnour, spiane i so vieui.

4. Giouan a batësava ënt 'l dësert, e a predicava 'l batesim dël pentiment, për *outëni* la remissioun d'i pëcà.

5. E tut 'l pais dë la Giudea, e i abitant dë Gerusalem andasiou da chiel, e a l erou tutti batësà da chiel ënt 'l fium dël Giourdan, counfessand i so pëcà.

6. Giouan a l era vësti dë pei dë gamel, e *a l avia* una sentura

dë couram ëntourn a i so ren, e a mangiava dë crave d'ï pra e d'amel sarvage.

7. E a predicava, disand: A i n'a ven un dop dë mi, ch'a l è pi poutent che mi, a 'l qual i soun nen degn dë dësgroupé, chinandë-me giù, la staca dë le scarpe.

8. *Për* mi, i l' heu batësà d'acqua; ma chiel a vë batesërà dël Spirit Sant.

LUKE xv. 11–19.

11. Un om a l avia doui fieui;

12. E 'l pi giouvou a l ha fà-ie a so pare: Mè pare, da-me la part dël patrimoni ch'a l è mia: e chiel a l ha dividù-ie i so beni.

13. E pochi dì dop, quand 'l fieul pi giouvou a l ha avù rabastà tut, a s'è ëndà-ssëne fora ënt un pais lountan; e lì a l ha counsumà so ben vivand ënt la dësbaucia.

14. E dop ch'a l ha avù spendù tut, a i è arrivà-ie una gran carëstia ënt coul pais; e a l ha coumensà a essi ënt la miseria.

15. Anloura a s'è ëndà-ssëne via, e a s'è buttà-sse al sërvissi d'un d'ï abitant dël pais, ch'a l'ha mandà-lou ënt soue terre ën pastura d'ï animai.

16. E a l avria voulsù-sse lëvé la fam coun le pëleuie ch'ï animai a mangiavou; ma nëssun a i n'a dasia.

17. Oura essend tournà ënt se stess, a l ha dit: Quanti mercenari i è-lou ënt la ca dë mè pare, ch'a l han dë pan in abboundansa, e mi i meuirou dë fam?

18. I m'aussëreu, e i ëndareu da mè pare, e i direu: Mè pare, i heu pëcà countra 'l ciel e dënans a ti;

19. E i soun pi nen degn d'essi ciamà to fieul; tratë-me parei d'un d'ï to mercenari.

§ 197.

Spanish.

MARK i. 1–8.

1. Principio del Evangelio de Jesu-Christo, Hijo de Dios.

2. Así como está escrito en Isaías el Propheta: He aquí yo envio á mi angel delante de tu faz, que preparará tu camino delante de tí.

3. Voz del que clama en el desierto: Aparejad el camino del Señor: haced derechas sus sendas.

4. Estaba Juan en el desierto bautizando, y predicando el bautismo de penitencia para remision de pecados.

5. Y salia á él toda la tierra de Judéa, y todos los de Jerusalém, y eran bautizados por él en el rio Jordán, confesando sus pecados.

6. Y Juan andaba vestido de pelos de camello, y trahia un ceñidor de piel al rededor de sus lomos, y comia langostas y miel silvestre. Y predicaba, diciendo:

7. En pos de mí viene el que es mas fuerte que yo, ante el qual no soy digno de postrarme para desatar la correa de sus zapatos.

8. Yo os he bautizado en agua, mas él os bautizará en Espíritu Santo.

LUKE xv. 11–19.

11. Un hombre tuvo dos hijos.

12. Y dixo el menor de ellos á su padre: Padre, dame la parte de la hacienda, que me toca. Y él les repartió la hacienda.

13. Y no muchos dias despues, juntando todo lo suyo el hijo menor, se fué léjos á un pais muy distante, y allí malrotó todo su haber, viviendo disolutamente.

14. Y quando todo lo hubo gastado, vino una grande hambre en aquella tierra, y él comenzó á padecer necesidad.

15. Y fué, y se arrimó á uno de los ciudadanos de aquella tierra: el qual lo envió á su cortijo á guardar puercos.

16. Y deseaba henchir su vientre de las mondaduras, que los puercos comian: y ninguno se las daba.

17. Mas volviendo sobre sí, dixo: ¡Quántos jornaleros en la casa de mi padre tienen el pan de sobra, y yo me estoy aquí muriendo de hambre!

18. Me levantaré, é iré á mi padre, y le diré: Padre, pequé contra el cielo, y delante de tí:

19. Ya no soy digno de ser llamado hijo tuyo: hazme como á uno de tus jornaleros.

§ 198.

Catalonian.

MARK i. 1–8.

1. Principi del Evangeli de Jesu Christ, Fill de Deu:

2. Axí com está escrit en los Profetas: Veus aquí, jo envío mon ángel devant ton rostro, lo qual aparellará ton camí devant de tu.

3. Veu del que clama en lo desert: Aparellau lo camí del Senyor; feu drets sos camins.

4. Estava Joan en lo desert batejant, y predicant lo baptisme d'arrepentiment, pera remissió dels pecats.

5. Y exía envers ell tota la terra de Judea, y tots los de Jerusalem, y eran batejats per ell en lo riu Jordá, confessant sos pecats.

6. Anava Joan vestit de pel de camell, y portava un cenyidor de

cuyro al entorn de sos lloms, y menjava llagostas y mel silvestre. Y predicava, dihent:

7. Detrás de mi ve un ques mes fort que jo, devant del qual jo no so digne de postrarme pera desferli la corretja de las sandalias.

8. Jous he batejat ab aygua; mes ell vos batejará en Esperit Sant.

LUKE xv. 11–19.

11. Un home tenía dos fills:

12. Yl mes petit digué á *son* pare: Pare, donaume la part quem toca de vostres bens. Y ell los repartí los bens.

13. Y al cap de pochs dias, juntant lo fill menor tot lo que era seu, sen aná lluny á un país estrany, y allí dissipá tots sos bens vivint dissolutament.

14. Y quant ho hagué gastat, vingué una gran fam en aquella terra, y comensá á patir miseria.

15. Llavors sen aná, y s'arrimá á un dels ciutadans d'aquella terra, qui l'enviá á sa granja á guardar porchs.

16. Y desitjava umplir son ventre de las triaduras de quels porchs menjavan, y ningú las hi donava.

17. Emperó tornant en si, digué: ¡Quants jornalers en casa de mon pare tenen lo pa de sobras, y jo aquí m'estich morint de fam!

18. M'alsaré, y aniré á mon pare, y li diré: Pare, he pecat contral cel y contra vos;

19. Ja no so digne de ser anomenat fill vostre: tractaume com à un de vostres jornalers.

§ 199.

Portuguese.

MARK i. 1–8.

1. Principio do Evangelho de Jesu Christo Filho de Deos.

2. Conforme está escrito no Profeta Isaias: Eis ahi envio eu o meu Anjo ante a tua face, o qual irá adiante de ti preparar-te o caminho.

3. Voz do que clama no Deserto: Preparai o caminho do Senhor, endireitai as suas varédas.

4. Estava João baptizando no Deserto, e prégando o baptismo de penitencia para remissão de peccados.

5. E sahia concorrendo a elle toda a terra de Judéa, e todos os de Jerusalem, e erão baptizados por elle no rio Jordão, confessando os seus peccados.

6. E João andava vestido de pelles de camelo, e trazia huma

cinta de couro á roda de seus lombos, e comia gafanhotos e mel silvestre. E prégava, dizendo:

7. Após de mim vem outro mais forte do que eu: onte o qual não sou digno de me prostrar para lhe desatar a corrêa dos çapatos.

8. Eu tenho-vos baptizado em agua, porém elle baptizar-vos-ha no Espirito Santo.

LUKE xv. 11–19.

11. Hum homem teve dous filhos:

12. E disse o mais moço delles a seu pai: Pai, dá-me a parte da fazenda, que me toca. E elle repartio entre ambos a fazenda.

13. E passados não muitos dias, entrouxando tudo o que era seu, partio o filho mais moço para huma terra muito distante n'hum paiz estranho, e lá dissipou toda a sua fazenda vivendo dissolutamente.

14. E depois de ter consumido tudo, succedeo haver naquelle paiz huma grande fome, e elle começou a necessitar.

15. Retirou-se pois dalli, e accommodou-se com hum dos Cidadãos da tal terra. Este porém o mandou para hum casal seu a guardar os pórcos.

16. Aqui desejava elle encher a sua barriga de landes, das que comião os pórcos: mas ninguem lhas dava.

17. Até que tendo entrado em si, disse: Quantos jornaleiros ha em casa de meu pai, que tem pão em abundancia, e eu aqui pereço á fomé!

18. Levantar-me-hei, e irei buscar a meu pai, e dir-lhe-hei: Pai, pequei contra o Ceo, e diante de ti:

19. Ja não sou digno de ser chamado teu filho: faze de mim, como de hum dos teus jornaleiros.

§ 200.

French.

MARK i. 1–8.

1. Le commencement de l'évangile de Jésus-Christ, Fils de Dieu.

2. Conformément à ce qui est écrit dans les Prophètes: Voici, j'envoie mon méssager devant ta face, qui préparera le chemin devant toi.

3. La voix de celui qui crie dans le désert *est:* Préparez le chemin du Seigneur, applanissez ses sentiers.

4. Jean baptisoit dans le désert, et prêchoit le baptême de repentance pour la rémission des péchés.

5. Et toute la Judée, et ceux de Jérusalem alloient à lui, et ils étoient tous baptisés par lui, dans le fleuve du Jourdain, en confessant leurs péchés.

6. Jean étoit vêtu de poil de chameau ; il *avoit* une ceinture de cuir autour de ses reins, et il se nourrissoit de sauterelles et de miel sauvage.

7. Et il prêchoit, en disant : Il en vient un après moi, *qui est* plus puissant que moi ; et dont je ne suis pas digne, en me baissant, de délier la courroie des souliers.

8. *Il est* vrai *que* je vous ai baptisés d'eau ; mais il vous baptisera du Saint-Esprit.

LUKE xv. 11–19.

11. Un homme avoit deux fils ;

12. Et le plus jeune dit à son père : Mon père, donne-moi la part du bien qui m'appartient. Et il leur partagea ses biens.

13. Et peu de jours après, quand le plus jeune fils eut tout ramassé, il s'en alla dehors dans un pays éloigné ; et là il dissipa son bien en vivant dans la débauche.

14. Et après qu'il eut tout depensé, une grande famine survint en ce pays-là ; et il commença d'être dans la disette.

15. Alors il s'en alla, et se mit au service d'un des habitans du pays, qui l'envoya dans ses possessions pour paître les pourceaux.

16. Et il désiroit de se rassasier des gousses que les pourceaux mangeoient ; mais personne ne lui en donnoit.

17. Or étant revenu à lui-même, il dit : Combien y a-t-il de mercenaires dans la maison de mon père, qui ont du pain en abondance, et moi je meurs de faim !

18. Je me leverai, et je m'en irai vers mon père, et je lui dirai : Mon père, j'ai péché contre le ciel et devant toi ;

19. Et je ne suis plus digne d'être appelé ton fils ; traite-moi comme l'un de tes mercenaires.

§ 201.

2. Sco ei stat scrit ent ils Prophets: Mire, jou tarmet mieu Mess avont tia Vista, ilg qual ven a paregiar tia Via avont tei.

3. La vusch dad ün ca clomma ent ilg dasiert: Pineit la Via d'ilg Senger, figeit sias Sendas plaunas.

4. Johannes battegiava ent ilg dasiert, a pardagava ilg Battem d'ilg milgiurament t'ilg pardunament d'ils puccaus.

5. A tut la terra da Judea mav'ora tiers el, a quels da Jerusalem; a tuts vangivan battiai dad el, ent ilg fluss d'ilg Jordan, a cunfessavan lur puccaus.

6. Mo Johannes era vastcheus cun palingia d'Camel, a cun ünna tschinta d'Curom anturn sia Vaicha, a mangiava Salips, a Mel salvadi.

7. A pardagava, a scheva: Suenter mei ven ün ch'ei pli ferms ca jou, alg qual jou sunt bucca vangonts da mi anclinar, a snuvar ora la Coregia da sês Calzêrs.

8. Jou vus hai bein battiau cun Aua; mo el ven a battiar vus cu'lg Spirit Soing.

LUKE xv. 11–19.

11. Ün Hum veva dus Filgs:

12. Ad ilg juven da quels schet alg Bab: Bab, mi dai la Part da la Rauba c'aud' à mi: ad el parchè or ad els la Rauba.

13. A bucca bears Gis suenter, cur ilg Filg juven vet tut mess ansemel, scha tilà'l navent en ünna Terra dalunsch; a lou sfiget el tut sia Rauba cun viver senza sparng.

14. A cur el vet tut sfaig, scha vangit ei en quella Terra ün grond Fumaz: ad el antschavet a ver basengs.

15. Ad el mà, a sa plidè cun ün Burgeis da quella Tetra: a quel ilg tarmatet or sin sês Beins a parchirar ils Porcs.

16. Ad el grigiava dad amplanir sieu Venter cun las Criscas ch'ils Porcs malgiavan; mo nagin lgi deva.

17. Mo el mà en sasez a schet: Quonts Fumelgs da mieu Bab han budonza da Paun, a jou mier d'fom?

18. Jou vi lavar si, ad ir tier mieu Bab, a vi gir a lgi: Bab, jou hai faig puccau ancunter ilg Tschiel ad avont tei:

19. A sunt bucca pli vangonts da vangir numnaus tieu Filg: fai mei esser sco ün da tes Fumelgs.

§ 203.

Enghadin.

MARK i. 1–8.

1. Il principi dal Evangeli da Jesu Christo, Filg da Dieu,

2. Segund chi'l ais scrit n'ils profets: Mêra, eug tramet meis Anguel avaunt tia fatscha, il qual vain à drizar tia via avaunt tai.

3. *Qua ais* üna vusch d'ün chi bragia n'il desert: Chiœnschà la via dal Segner, fat sias semdas plaunas.

4. Joannes battizava n'il desert, è predgiav' il battaisem dalla pœnitenza in remissiun dals puchiads.

5. E tuot il pajais dalla Judea, è quels da Jerusalem, giaivan oura pro el, è gnivan tuots battizads da d'el n'il flüm Jordan, confessand lur puchiads.

6. Mo Joannes eira vestì cun peus d'chamêl, et *haveiv'* üna tschinta d'chüram intuorn ils flanchs, è mangiava salips, è meil sulvadi.

7. E predgiava, dschant: Davo mai vain quel ch'ais plü ferm co eug, dal qual eug nun sun deng, m'inclinand, da slargiar la curaja dallas scarpas.

8. Eug s'ha battizads cun agua; mo quel s'battizarà cu'l Spirt sanct.

LUKE xv. 11–19.

11. Un crastian haveiva duos filgs.

12. E'l plü juven d'els diss al bap: Bap, da'm la part dalla raba ch'im tocca. E'*l bap* partit ad els la raba.

13. E pauc dids davo, il filg plü juven, haviand miss insemmel ogni chiaussa, giet el inavaunt seis viadi in pajais luntaun; è qua dissipet el sias facultads, vivand dissolutamaing.

14. E dapo ch'el havet spais ogni chiaussa, venn üna greiva charestia in quel pajais; tal ch'el cumanzet ad havair bsœng.

15. E giet, è s'matet cun ün dals havdaduors da quella contrada, il qual il tramatet sün seis bains, à perchürar ils porcs.

16. Et el desiderava da s'implir il corp cun las grüscas chia'ls porcs magliavan; mo ingün nu'l dava.

17. Mo siand turnâ in sai svess, diss el: Quants mercenaris da meis bap haun paun largiamaing, et eug mour d'famm!

18. Eug vœlg star sü, è vœlg ir pro meis bap, è'l vœlg dir: Bap, eug nhai pecchiâ contr' al tschel ed avaunt tai.

19. E nun sun plü deng d'esser clamâ teis filg; fa'm sco ün da teis mercenaris.

In all these the alphabet as well as the language is of Roman origin.

§ 204. In the Danubian Principalities, however, the alphabet is of Greek origin—being based on the Slavonic of Servia.

Transliterated into the Roman character, the Wallachian, or *Rumango*, as it is properly called, runs thus:—

LUKE xv. 11–19.

11. Un om avea doĭ fec′orĭ.

12. Shi a zis c′el maĭ tinr din eĭ tatluĭ su: tat, dmĭ partea c′e mi se kade de avucie: shi de a imprcit lor avuciea.

13. Shi nu dup multe zile, adunint toate fec′orul c′el maĭ tinr, s'a dus intr 'o car departe, shi akolo a rsipit toat avuciea ca, viecuind intr dezmĭerdrĭ.

14. Shi keltuind el toate, c'a fkut foamete mare intr' ac′ea car; shi el a inc′eput a se lipsi.

15. Shi mergina c'a lipit de unul din lkuitorĭ crĭ ac′eia; si 'l a trimis pre el la carinide sale c pask porc′ĭ.

16. Shi doria c 'shĭ sature pintec′ele sŭ de roshkobele c′e minka porc′ĭ; shi niminĭ nu ĭ da luĭ.

17. Iar viind intru sine, a zis: kicĭ argacĭ aĭ tatluĭ mieu sint indestulacĭ de pĭne, iar eŭ pĭeiŭ de foame.

18. Skula-m-voiŭ, shi m' voiŭ duc′e la tata mieŭ, shi voiŭ zic′e lui:

19. Tat, greshit-am la c′er shi inaintea ta, shi nu mai sint vrednik a m kema fiul tŭ: fm ka pre unul din argacĭ tĭ.

Such is a general view of the Languages derived from the Latin.

§ 205. Of these the French requires to be more minutely exhibited.

Between the provincial French of the north and the provincial French of the south, there is a difference, at the present day, at least of dialect, and perhaps of language. This is shown by the following specimens: the first from the canton of Arras, on the confines of Flanders; the second from the department of Var, in Provence.

LUKE xv. 11–14.

11. Ain homme avoüait deeux garchéons.

12. L'pus jone dit a sain père, " Main père, baillé m'chou qui doüo me 'r'v'nir ed vous bien," et leu père leu partit sain bien.

13. Ain n'sais yur, tro, quate, chéon jours après l'pus tiò d'cnés déeux éféans oyant r'cuéllé tout s'n' héritt'main, s'ot' ainvoye dains nâin pahis gramain loüon, dú qu'il échilla tout s'n' argint ain fageant l'braingand dains chés cabarets.

14. Abord qu'il o eu tout bu, tout mié et tout drélé, il o v'nu adonc dains ch' pahis lo ainn' famaine cruüelle, et i c'mainchouait d'avoir fon-ye d' pon-ye.

THE SAME.

11. Un homé avié dous enfans.

12. Lou plus pichoun diguét a son päiré, " Moun päiré, dounas mi ce què mi reven de vouastré ben;" lou pairé faguet lou partagé de tout ce que poussédavo.

13. Paou de jours après, lou pichoun vendét tout se què soun päiré il avié desamparat, et s'en anét dins un päis fourco luench, ounté dissipét tout soun ben en debaucho.

14. Quand aguét tou arcaba, uno grosso famino arribet dins aqueou päis et, leou, si veguét reduech à la derniero misèro.

§ 206. Practically speaking, although in the central parts of France the Northern and Southern dialects melt each into the other, the Loire may be considered as a line of demarcation between two languages; the term Language being employed because, in the Middle Ages, whatever may be their real difference, the Northern Tongue and the Southern Tongue were dealt with not as separate dialects, but as distinct Languages —the Southern being called Provençal, the Northern Norman-French.

Of these two Languages (for so they will in the following pages be called, for the sake of convenience) the Southern or

Provençal approaches the dialects of Spain; the Valencian of Spain and the Catalonian of Spain being Provençal rather than standard Spanish or Castilian.

The Southern French is sometimes called the Langue d'Oc, and sometimes the Limousin.

It is in the Southern French (Provençal, Langue d'Oc, or Limousin) that we have the following specimen; viz. the Oath of Ludwig, sworn A.D. 842.

The Oath of the King.

Pro Deo amur et pro Xristian poblo et nostro commun salvament, d' ist di en avant, in quant Deus savir et podir me dunat, si salvarai eo cist meon fradre Karlo, et in ajudha et in cadhuna cosa, si cum om per dreit son fradra salvar dist, in o quid il mi altresi fazet: et ab Ludher nul plaid nunquam prindrai uui, meon vol, cist meon fradre Karl in damno sit.

The Oath of the People.

Si Loduuigs sagrament, que son fradre Karlo jurat, conservat; et Karlus, meos sendra, de suo part non lo stanit; si io returnar non l'int pois, ne io, ne neuls cui eo returnar int pois, in nulla ajudha contra Lodhuwig nun li iver.

The same in Modern French.

Pour de Dieu l'amour et pour du Chrêtien peuple et le notre commun salut, de ce jour en avant, en quant que Dieu savoir et pouvoir me donne, assurément sauverai moi ce mon frère Charles, et en aide, et en chacune chose, ainsi comme homme par droit son frère sauver doit, en cela que lui à moi pareillement fera: et avec Lothaire nul traité ne onques prendrai qui, à mon vouloir, à ce mien frère Charles en dommage soit.

* * * * * * *

Si Louis le serment, qu'à son frère Charles il jure, conserve; Charles, mon seigneur, de sa part ne le maintient; si je détourner ne l'en puis, ni moi, ne nul que je détourner en puis, en nulle aide contre Louis ne lui irai.

§ 207. The Norman-French, spoken from the Loire to the confines of Flanders, and called also the Langue d'Oyl, differed from the Provençal in (amongst others) the following circumstances.

1st. It was of later origin; the southern parts of Gaul having been colonised at an early period by the Romans.

2nd. It was in geographical contact, not with the allied languages of Spain, but with the Gothic tongues of Germany and Holland.

It is the Norman-French that most especially bears upon the history of the English language.

The proportion of the original Keltic in the present languages of France has still to be determined. It may, however, be safely asserted, that, at a certain epoch between the first and fifth centuries, the language of Gaul was more Roman and less Keltic than that of Britain.

SPECIMEN.

From the Anglo-Norman Poem of Charlemagne.

Un jur fu Karléun al Seint-Denis muster,
Reout prise sa corune, en croiz seignat sun chef,
E ad ceinte sa espée: li pons fud d'or mer.
Dux i out e demeines e baruns e chevalers.
Li emperères reguardet la reine sa muillers.
Ele fut ben corunée al plus bel e as meuz.
Il la prist par le poin desuz un oliver,
De sa pleine parole la prist à reisuner:
"Dame, véistes unkes hume nul de desuz ceil
Tant ben séist espée ne la corone el chef?
Uncore cunquerrei-jo citez ot mun espeez."
Cele ne fud pas sage, folement respondeit:
"Emperere," dist-ele, trop vus poez preiser.
"Uncore en sa-jo un ki plus se fait leger,
Quant il porte corune entre ses chevalers;
Kaunt il met sur sa teste, plus belement lui set"

Literal Translation.

1.

LATIN.

Unum diurnum fuit Carolus, ad illud Sancti Dionysii monasterium,

Re-habebat prehensam suam coronam, in cruce signatum suum caput,

Et habebat cinctam suam spadam; ille pugnus fuit de auro mero,
Duces ibi habebat, et dominos, et barones, et caballarios.
Ille imperator contemplatus est illam reginam suam mulierem;
Illa fuit bene coronata ad plus bellum et ad melius.
Ille illam prehendit per illum pugnum de sub unam olivam,
De sua plena parabola illam prehendit ad ratiocinari,
Domina, vidisti unquam hominem nullum de sub cœlum;
Jam bene sedet spada nec illa corona illud caput;
Ad usque horam conqueram ego civitates ad meam spadam.
Illa ne fuit passum sagax,—stulte respondet.
" Imperator," dixit illa, " nimis vos potestis vos pretiare;"
Ad-usque-horam sapio-ego unum qui plus se facit levem,
Quando ille portat coronam inter suos caballeros,
Quando ille mittit super suam testam plus belle ille sedet.

2.

ENGLISH.

One day was Charlemagne at St. Denis' minster,
Had taken his crown, in-cross marked (*signed*) his head
And had girt his sword; the hilt was of gold pure (*mere*),
Dukes there he had, and lords (*domines* or *dons*) and barons, and cavaliers,
The emperor looked-at (*regarded*) the queen his wife;
She was well crowned, at the most beautiful and at the best.
He her took by the fist under an olive-tree;
Of his full word (*parole*), he took to converse (*reason with*).
" Dame, saw you ever man none below the heaven
So well sits sword nor crown his head.
Yet will I conquer cities with my sword."
She was not wise foolishly answered:
" Emperor," said she, " too much you may praise yourself;
Yet know I one who makes himself more light
When he carries crown amongst chevaliers;
When he places on his head more beautifully him sits."

§ 208. In the Northern French we must recognise not only a Keltic and a Classical, but also a Gothic element: since Clovis and Charlemagne were no Frenchmen, but Germans.

In the Northern French of *Normandy* there is a second

Gothic element, viz. a Scandinavian element. By this the proper Northern French underwent a further modification.

Until the time of the Scandinavians or Northmen, the present province of Normandy was called Neustria. Three generations before the Norman Conquest, a Norwegian captain, named in his own country *Rolf*, and in France *Rollo*, or *Rou*, settled upon the coast of Normandy. What Hengist and the Germans were in Britain, Rollo and his Scandinavians were in France. The province took from them its name of Normandy. The *Norwegian* element in the Norman-French has yet to be determined. Respecting it, however, the following statements may, even in the present state of the question, be made:—

1st. That a Norse dialect was spoken in Normandy at Bayeux, some time after the battle of Hastings.

2nd. That William the Conqueror understood the Norse language.

3rd. That the names Jersey, Guernsey, and Alderney are as truly Norse names as Orkney and Shetland.

The *Southern* division of the French cannot be compared with the Northern for its influence on the English. In the reign, however, of Henry II. the marriage with Eleanor of Aquitaine encouraged it.

CHAPTER XXX.

HISTORICAL AND LOGICAL ELEMENTS OF THE ENGLISH LANGUAGE.

§ 209. THE Keltic elements of the present English fall into five classes.

1. Those that are of late introduction, and cannot be called original and constituent parts of the language. Such are (amongst others) the words *flannel*, *crowd* (a fiddle), from the British; and *kerne* an Irish foot-soldier), *galore* (enough), *tartan*, *plaid*, &c., from the Gaelic branch.

2. Those that (according to the current opinions) are common to both the Keltic and Gothic stocks, and are Indo-European rather than either Welsh, or Gaelic, or Saxon. Such (amongst others) are *brother*, *mother*, in Keltic *brathair*, *mathair;* the numerals, &c.

3. Those that have come to us from the Keltic, but have come to us through the medium of another language. Such are *druid* and *bard*, whose *immediate* source is not the Keltic but the Latin.

4. Keltic elements of the Anglo-Norman, introduced into England after the Conquest, and occurring in that language as remains of the original Keltic of Gaul.

5. Those that have been retained from the original Keltic of the island, and which form genuine constituents of our language. These fall into three subdivisions.

a. Proper names—generally of geographical localities; as *the Thames*, *Kent*, &c.

b. Common names retained in the provincial dialects of England, but not retained in the current language; as *gwet-hall* = *household stuff*, and *gwlanen* = *flannel* in Herefordshire.

c. Common names retained in the current language.—The following list is Mr. Garnett's:—

Welsh.	*English.*
Basgawd	*Basket.*
Berfa	*Barrow*
Botwm	*Button.*
Bràn	*Bran.*
Clwt	*Clout, Rag.*
Crochan	*Crock, Crockery.*
Crog	*Crook, Hook.*
Cwch	*Cock*, in *Cock-boat.*
Cwysed	*Gusset.*
Cyl, Cyln	*Kiln* (*Kill*, provinc.)
Dantaeth	*Dainty.*
Darn	*Darn.*
Deentur	*Tenter*, in *Tenter-hook.*
Fflaim	*Fleam, Cattle-lancet.*
Fflaw	*Flaw.*
Ffynnell (air-hole)	*Funnel.*
Gefyn (fetter)	*Gyve.*
Greidell	*Grid*, in *Gridiron.*
Grual	*Gruel.*
Gwald (hem, border)	*Welt.*
Gwiced (little door)	*Wicket.*
Gwn	*Gown.*
Gwyfr	*Wire.*
Masg (stitch in netting)	*Mesh.*
Mattog	*Mattock.*
Mop	*Mop.*
Rhail (fence)	*Rail.*
Rhasg (slice)	*Rasher.*
Rhuwch	*Rug.*
Sawduriaw	*Solder:*
Syth (glue)	*Size.*
Tacl	*Tackle.*

§ 210. *Latin of the First Period.*—Of the Latin introduced by Cæsar and his successors, the few words remaining are those that relate to military affairs; viz. *street* (*strata*); *coln* (as in *Lincoln* = *Lindi colonia*); *cest* (as in *Gloucester* = *glevæ castra*) from *castra*. The Latin words introduced between the time of Cæsar and Hengist may be called the *Latin of the first period*, or *the Latin of the Keltic period.*

§ 211. *The Anglo-Saxon.*—This is not noticed here, because from being the staple of the present language it is more or less the subject of the book throughout.

§ 212. *The Danish*, or *Norse.*—The pirates that pillaged Britain, under the name of Danes, were not exclusively the inhabitants of Denmark. Of the three Scandinavian nations,

the Swedes took the least share, the Norwegians the greatest in these invasions. Not that the Swedes were less piratical, but that they robbed elsewhere,—in Russia, for instance, and in Finland.

The language of the three nations was the same; the differences being differences of dialect. It was that which is now spoken in Iceland, having been once common to Scandinavia and Denmark. Whether this was aboriginal in *Denmark* is uncertain. In *Scandinavia* it was imported; the tongue that it supplanted having been, in all probability, the mother-tongue of the present Laplandic.

The Danish that became incorporated with our language, under the reign of Canute and his sons, may be called the direct Danish (Norse or Scandinavian) element, in contradistinction to the indirect Danish of § 214.

The determination of the amount of Danish in English is difficult. It is not difficult to prove a word *Scandinavian*. We must also show that it is not German. A few years back the current opinion was against the doctrine that there was much Danish in England. At present, the tendency is rather the other way. The following facts are from Mr. Garnett.—*Phil. Trans.* vol. i.

1. The Saxon name of the present town of *Whitby* in Yorkshire was *Streoneshalch*. The present name *Whitby*, *Hvitby*, or *White-town*, is Danish.

2. The Saxon name of the capital of Derbyshire was *Northweortheg*. The present name is Danish.

3. The termination *-by* = *town* is Norse.

4. On a monument in Aldburg Church, Holdernesse, in the East Riding of Yorkshire, referred to the age of Edward the Confessor, is found the following inscription:—

Ulf het aræran cyrice *for hanum* and for Gunthara saula.
"Ulf bid rear the church for him and for the soul of Gunthar."

Now, in this inscription, *Ulf*, in opposition to the Anglo-Saxon *wulf*, is a Norse form; whilst *hanum* is a Norse dative, and by no means an Anglo-Saxon one.—Old Norse *hanum*, Swedish *honom*.

5. The use of *at* for *to* as the sign of the infinitive mood is Norse, not Saxon. It is the regular prefix in Icelandic, Danish, Swedish, and Feroic. It is also found in the northern dialects of the Old English, and in the particular dialect of Westmoreland at the present day.

6. The use of *sum* for *as ; e.g. swa sum*, we forgive oure detturs.

7. Isolated words in the northern dialects are Norse rather than Saxon.

Provincial.	*Common Dialect.*	*Norse.*
Braid	*Resemble*	Bråas, *Swed.*
Eldin	*Firing*	Eld, *Dan.*
Force	*Waterfall*	Fors, *D. Swed.*
Gar	*Make*	Göra, *Swed.*
Gill	*Ravine*	Gil, *Iceland.*
Greet	*Weep*	Grata, *Iceland.*
Ket	*Carrion*	Kiöd = flesh, *Dan.*
Lait	*Seek*	Lede, *Dan.*
Lathe	*Barn*	Lade, *Dan.*
Lile	*Little*	Lille, *Dan.*

§ 213. *Roman of the Second Period.*—Of the Latin introduced under the Christianised Saxon sovereigns, many words are extant. They relate chiefly to ecclesiastical matters, just as the Latin of the Keltic period bore upon military affairs.—*Mynster*, a minster, *monasterium ; portic*, a porch, *porticus ; cluster*, a cloister, *claustrum ; munuc*, a monk, *monachus ; bisceop*, a bishop, *episcopus ; arcebisceop*, archbishop, *archiepiscopus ; sanct*, a saint, *sanctus ; profost*, a provost, *propositus ; pall*, a pall, *pallium ; calic*, a chalice, *calix ; candel*, a candle, *candela ; psalter*, a psalter, *psalterium ; mæsse*, a mass, *missa ; pistel*, an epistle, *epistola ; prædic-ian*, to preach, *prædicare ; prof-ian*, to prove, *probare.*

The following are the names of foreign plants and animals:—*camell*, a camel, *camelus ; ylp*, elephant, *elephas ; fic-beam*, fig-tree, *ficus ; feferfuge*, feverfew, *febrifuga ; peterselige*, parsley, *petroselinum.*

Others are the names of articles of foreign origin, as *pipor*,

pepper, *piper*; *purpur*, purple, *purpura*; *pumicstan*, pumice-stone, *pumex*.

The above-given list is from Guest's *English Rhythms* (b. iii. c. 3). It constitutes that portion of the elements of our language which may be called the Latin of the second, or Saxon period.

§ 214. *The Anglo-Norman element.*—For practical purposes we may say that the French or Anglo-Norman element appeared in our language after the battle of Hastings, A.D. 1066.

Previous, however, to that period we find notices of intercourse between the two countries.

1. The residence in England of Louis Outremer.

2. Ethelred II. married Emma, daughter of Richard Duke of Normandy, and the two children were sent to Normandy for education.

3. Edward the Confessor is particularly stated to have encouraged French manners and the French language in England.

4. Ingulphus of Croydon speaks of his own knowledge of French.

5. Harold passed some time in Normandy.

6. The French article *la*, in the term *la Drove*, occurs in a deed of A.D. 975.—See Ranouard, *Journal des Savans*, 1830.

The chief Anglo-Norman elements of our language are the terms connected with the feudal system, the terms relating to war and chivalry, and a great portion of the law terms—*duke, count, baron, villain, service, chivalry, warrant, esquire, challenge, domain*, &c.

When we remember that the word *Norman* means *man of the north*, that it is a *Scandinavian*, and *not a French* word, that it originated in the invasions of the followers of Rollo and other *Norwegians*, and that just as part of England was overrun by Pagan buccaneers called *Danes*, part of France was occupied by similar *Northmen*, we see the likelihood of certain Norse words finding their way into the French language, where they would be superadded to its original Keltic and Roman elements.

The extent to which this is actually the case has only been partially investigated. It is certain, however, that some French words are Norse or Scandinavian. Such, for instance, are several *names of geographical localities* either near the sea, or the rīver Seine; in other words, within that tract which was most especially occupied by the invaders. As is to be expected from the genius of the French language, these words are considerably altered in form. Thus—

NORSE.	ENGLISH.	FRENCH.
Toft	Toft	Tot
Beck	Beck	Bec
Flöt	Fleet*	Fleur, &c.

and in these shapes they appear in the Norman names *Yvetot*, *Caudebec*, and *Harfleur*, &c.

Now any words thus introduced from the Norse of Scandinavia into the French of Normandy might, by the Norman Conquest of England, be carried further, and so find their way into the English.

In such a case, they would constitute its *indirect* Scandinavian element.

A list of these words has not been made; indeed the question requires far more investigation than it has met with. The names, however, of the islands *Guerns-ey*, *Jers-ey*, and *Aldern-ey*, are certainly of the kind in question—since the *-ey*, meaning *island*, is the same as the *-ey* in *Orkn-ey*, and is the Norse rather than the Saxon form.

Latin of the third period.—This means the Latin which was introduced between the battle of Hastings and the revival of Literature. It chiefly originated in the cloister, in the universities, and, to a certain extent, in the courts of law. It must be distinguished from the *indirect* Latin introduced as part and parcel of the Anglo-Norman. It has yet to be accurately analysed.

§ 215. *Latin of the Fourth Period.*—This means the Latin which has been introduced between the revival of literature and the present time. It has originated in the writings of

* Meaning *ditch*.

learned men in general, and is distinguished from that of the previous periods by—

1. Being less altered in form:

2. Preserving, with substantives, in many cases its original inflections; *axis, axes; basis, bases:*

3. Relating to objects and ideas for which the increase of the range of science in general has required a nomenclature.

§ 216. *Greek.*—Words derived *directly* from the Greek are in the same predicament as the Latin of the third period—*phænomenon, phænomena; criterion, criteria,* &c.; words which are only *indirectly* of Greek origin, being considered to belong to the language from which they were immediately introduced into the English. Such are *deacon, priest,* &c., introduced through the Latin. Hence a word like *church* proves no more in regard to a Greek element in English, than the word *abbot* proves in respect to a Syrian one.

The Latin of the fourth period and the Greek agree in retaining, in many cases, original inflexions rather than adopting the English ones; in other words, they agree in being but *imperfectly incorporated.* The phænomenon of imperfect incorporation is reducible to the following rules:—

1. That it has a direct ratio to the date of the introduction, *i. e.* the more recent the word the more likely it is to retain its original inflexion.

2. That it has a relation to the number of meanings belonging to the words: thus, when a single word has two meanings, the original inflexion expresses one, the English inflexion another—*genius, genii,* (*spirits*), *geniuses* (*men of genius*).

3. That it occurs with substantives only, and that only in the expression of number. Thus, although the plural of substantives like *axis* and *genius* are Latin, the possessive cases are English. So also are the degrees of comparison for adjectives like *circular,* and the tenses, &c., for verbs like *perambulate.*

§ 217. The following is a list of the chief Latin substantives introduced during the latter part of the fourth period, and preserving the *Latin* plural forms—

FIRST CLASS.

Words wherein the Latin Plural is the same as the Latin Singular.

(*a*) *Sing.*	*Plur.*	(*b*) *Sing.*	*Plur.*
Apparatus	apparat*us*	Caries	cari*es*
Hiatus	hiat*us*	Congeries	congeri*es*
Impetus	impet*us*	Series	seri*es*
		Species	speci*es*
		Superficies	superfici*es*.

SECOND CLASS.

Words wherein the Latin Plural is formed from the Latin Singular by changing the last Syllable.

(*a*).—*Where the Singular termination* -a *is changed in the Plural into* -æ :—

Sing.	*Plur.*	*Sing.*	*Plur.*
Formul*a*	formul*æ*	Nebul*a*	nebul*æ*
Lamin*a*	lamin*æ*	Scori*a*	scori*æ*.
Larv*a*	larv*æ*		

(*b*.)—*Where the Singular termination* -us *is changed in the Plural into* -i :—

Sing.	*Plur.*	*Sing.*	*Plur.*
Calcul*us*	calcul*i*	Polyp*us*	polyp*i*

Cris*is*	cris*es*	Synthes*is*	synthes*es*
Diæres*is*	diæres*es*	Thes*is*	thes*es*.

THIRD CLASS.

Words wherein the Plural is formed by inserting -e *between the last two sounds of the Singular, so that the former number always contains a Syllable more than the latter* :—

Sing.			*Plur.*
Apex	*sounded*	apec-*s*	apic*es*
Appendix	—	appendic-*s*	appendic*es*
Calix	—	calic-*s*	calic*es*
Cicatrix	—	cicatric-*s*	cicatric*es*
Helix	—	helic-*s*	helic*es*
Index	—	indec-*s*	indic*es*
Radix	—	radic-*s*	radic*es*
Vertex	—	vertec-*s*	vertic*es*
Vortex	—	vortec-*s*	vortic*es*.

In all these words the *c* of the singular number is sounded as *k*, of the plural as *s*.

§ 218. The following is a list of the chief Greek substantives lately introduced, and preserving the *Greek* plural forms:—

FIRST CLASS.

Words where the Singular termination -on *is changed in the Plural into* -a :—

Sing.	*Plur.*	*Sing.*	*Plur.*
Aphelio*n*	aphelio*a*	Criterio*n*	criteri*a*
Perihelio*n*	perihelio*a*	Ephemero*n*	ephemer*a*
Automato*n*	automato*a*	Phænomeno*n*	phænomen*a*.

SECOND CLASS.

Words where the Plural is formed by adding either -es *or* -a, *but where the Singular either rejects or changes the last letter of the original root.*

Plurals in -es :—

Original root.	*Plur.*	*Sing.*
Apsid-	apsid*es*	apsis
Cantharid-	cantharid*es*	cantharis
Chrysalid-	chrysalid*es*	chrysalis
Ephemerid-	ephemerid*es*	ephemeris
Tripod-	tripod*es*	tripos.

Plurals in -a :—

Original root.	*Plur.*	*Sing.*
Dogmat-	dogmat*a*	dogma
Lemmat-	lemmat*a*	lemma
Miasmat-	miasmat*a*	miasma.*

§ 219. *Miscellaneous elements.*—Of miscellaneous elements we have two sorts; those that are incorporated in our language, and are currently understood (*e.g.* the Spanish word *sherry*, the Arabic word *alkali*, and the Persian word *turban*), and those that, even amongst the educated, are considered strangers. Of this latter kind (amongst many others) are the Oriental words *hummum*, *kaftan*, *gul*, &c.

Of the currently understood miscellaneous elements of the English language, the most important are from the French;

* This list is taken from Smart's valuable and logical English Grammar.

some of which agree with those of the Latin of the fourth period, and the Greek in preserving the *French* plural forms —as *beau, beaux, billet-doux.*

Italian.—Some words of Italian origin do the same: as *virtuoso, virtuosi.*

Hebrew.—The Hebrew words, *cherub* and *seraph* do the same; the form *cherub-im,* and *seraph-im,* being not only plurals, but Hebrew plurals.

Beyond the words derived from these five languages, none form their plurals other than after the English method, *i. e.* in *-s*: as *waltzes*, from the *German* word *waltz.*

§ 220. The extent to which a language, which, like the English, at one and the same time requires names for many objects, comes in contact with the tongues of half the world, and has, moreover, a great power of incorporating foreign elements, derives fresh words from varied sources, may be seen, from the following incomplete notice of the languages which have, in different degrees, supplied it with new terms.

Arabic.—Admiral, alchemist, alchemy, alcohol, alcove, alembic, algebra, alkali, assassin, from a paper of Mr. Crawford, read at the British Association, 1849.

Persian.—Turban, caravan, dervise, &c.—*Ditto.*

Turkish.—Coffee, bashaw, divan, scimitar, janisary, &c.—*Ditto.*

Hindu languages.—Calico, chintz, cowrie, curry, lac, muslin, toddy, &c.—*Ditto.*

Chinese.—Tea, bohea, congou, hyson, soy, nankin, &c.—*Ditto.*

Malay.—Bantam (fowl), gamboge, rattan, sago, shaddock. —*Ditto.*

Polynesian.—Taboo, tattoo.—*Ditto.*

Tungusian, or some similar Siberian language.—Mammoth, the bones of which are chiefly from the banks of the Lena.

North-American Indian.—Squaw, wigwam, pemmican.

Peruvian.—Charki = prepared meat; whence *jerked* beef.

Caribbean.—Hammock.

Ancient Carian.—Mausoleum.

§ 221. A distinction has been drawn between the *direct*

and *indirect* elements of a language, the latter leading to the *ultimate origin* of words.

Thus a word borrowed into the English from the French, might have been borrowed into the French from the Latin, into the Latin from the Greek, into the Greek from the Persian, &c., and so *ad infinitum*.

The investigation of this is a matter of literary curiosity rather than any important branch of philology.

The ultimate known origin of many common words sometimes goes back to a great date, and points to extinct languages:—

Ancient Nubian (?)—Barbarous.
Ancient Egyptian.—Ammonia.
Ancient Syrian.—Cyder.
Ancient Lydian.—Mæander.
Ancient Persian.—Paradise.

§ 222. Again, a word from a given language may be introduced by more lines than one, or it may be introduced twice over; once at an earlier, and again at a later period. In such a case its form will, most probably, vary; and, what is more, its meaning as well. Words of this sort may be called *di-morphic*, their *di-morphism* having originated in one of two reasons—a difference of channel, or a difference of date. Instances of the first are, *syrup*, *sherbet*, and *shrub*, all originally from the *Arabic*, *srb*; but introduced differently, viz. the first through the Latin, the second through the Persian, and the third through the Hindoo. Instances of the second are words like *minster* introduced during the Anglo-Saxon, as contrasted with *monastery* introduced during the Anglo-Norman, period. By the proper application of these processes, we account for words so different in their present forms, yet so identical in origin, as *priest* and *presbyter*, *episcopal* and *bishop*, *&c.*

§ 223. *Distinction*.—The history of the languages that have been spoken in a particular country is a different subject from the history of a particular language. The history of the languages that have been spoken in the United States of America is the history of certain *Indian* languages. The history of the

languages of the United States is the history of a German language.

§ 224. *Words of foreign simulating a vernacular origin.*—These may occur in any mixed language whatever; they occur, however, oftener in the English than in any other.

Let a word be introduced from a foreign language—let it have some resemblance in sound to a real English one: lastly, let the meanings of the two words be not absolutely incompatible. We may then have a word of foreign origin taking the appearance of an English one. Such, amongst others, are *beef-eater*, from *bœuffetier; sparrow-grass, asparagus; Shotover, Chateau vert;* Jerusalem, Girasole;† Spanish beef-eater, spina bifida; periwig, peruke; runagate, renegade; lutestring, lustrino;‡ Oyes, O yez! ancient, ensign.§*

Dog-cheap.—This has nothing to do with *dogs*. The first syllable is *god = good* transposed, and the second the *ch-p* in *chapman* (*= merchant*) *cheap*, and *East-cheap*. In Sir J. Mandeville, we find *god-kepe = good bargain*.

Sky-larking.—Nothing to do with *larks* of any sort; still less the particular species, *alauda arvensis*. The word improperly spelt *l-a-r-k*, and banished to the slang regions of the English language, is the Anglo-Saxon *lác = game*, or *sport;* wherein the *a* is sounded as in *father* (not as in *farther*). *Lek = game*, in the present Scandinavian languages.

Zachary Macaulay = Zumalacarregui; Billy Ruffian = Bellerophon; Sir Roger Dowlass = Surajah Dowlah, although so limited to the common soldiers, and sailors who first used them, as to be exploded vulgarisms rather than integral parts of the language, are examples of the same tendency towards the irregular accommodation of misunderstood foreign terms.

Birdbolt.—An incorrect name for the *gadus lota*, or *eel-pout*, and a transformation of *barbote*.

Whistle-fish.—The same for *gadus mustela*, or *weazel-cod*.

Liquorice = glycyrrhiza.

* As in *Shotover Hill*, near Oxford.
† As in *Jerusalem artichoke*.
‡ A sort of silk.
§ *Ancient Cassio*—"Othello."

Wormwood = weremuth, is an instance of a word from the same language, in an antiquated shape, being equally transformed with a word of really foreign origin.

§ 225. Sometimes the transformation of the *name* has engendered a change in the object to which it applies, or, at least, has evolved new ideas in connection with it. How easy for a person who used the words *beef-eater*, *sparrow-grass*, or *Jerusalem*, to believe that the officers designated by the former either eat or used to eat more beef than other people; that the second word was the name for a *grass* or herb of which *sparrows* were fond; and that *Jerusalem* artichokes came from Palestine.

I have heard that Little John *shot over* Shotover Hill. Here the confusion originates a fiction.

Sometimes a false spirit of accommodation affects the *spelling*. Hence, *frontispiece*, *sovereign*, *colleague*, *lanthorn*, from *frontispicium*, *sovrano*, *collega*, *lanterna*.

Language is affected by false etymologies as well as by true ones.

§ 226. The *logical* analysis of a language is one thing, the historical analysis another.

Let the present language of England (for illustration's sake only) consist of 40,000 words. Of these let 30,000 be Anglo-Saxon, 5,000 Anglo-Norman, 100 Keltic, 10 Latin of the first, 20 Latin of the second, and 30 Latin of the third period, 50 Scandinavian, and the rest miscellaneous. In this case the language is considered according to the historical origin of the words that compose it, and the analysis (or, if the process be reversed, the synthesis) is an historical analysis.

But it is very evident that the English, or any other language, is capable of being contemplated in another view, and that the same number of words may be very differently classified. Instead of arranging them according to the languages whence they are derived, let them be disposed according to the meanings that they convey. Let it be said, for instance; that out of 40,000 words, 10,000 are the names of natural objects, that 1000 denote abstract ideas, that 1000 relate to warfare, 1000 to church matters, 500 to points of chivalry, 1000 to

agriculture, and so on through the whole. In this case the analysis (or, if the process be reversed, the synthesis) is not historical but logical; the words being classed not according to their origin, but according to their meaning.

Now the logical and historical analyses of a language generally in some degree coincide, as may be seen by noticing the kind of words introduced from the Anglo-Norman, or the Arabic. The former are chiefly legal, the latter chemical and astronomical.

CHAPTER XXXI.

ARE THERE SARMATIAN ELEMENTS IN ENGLISH?

§ 227. *Sarmatian* is a generic name for the *Lithuanic* and *Slavonic* languages collectively.

Did any members of either of these divisions either accompany the Angles, or effect independent settlements?

They may easily have done so, inasmuch as we have seen that Mecklenburg, Lauenburg, and parts of Holstein were Slavonic, to say nothing of other parts of Germany.

The actual Slavonic names we meet with, over and above that of the *Werini*, of whom so much has already been said, are the following:—

1. *The Polabi.*—From *po = on*, and *Labe = the Elbe.* Name Slavonic. Germanised by the addition of the termination *-ing*, and so become *Po-lab-ing-i*; just as in *Kent* we find the *Kent-ing-s.*—Conterminous with the Nordalbingian *Stormarii*, from whom they are divided by the river *Bille*, a small confluent of the Elbe. Capital Ratzeburg.—D. N.

2. *The Wagrians.*—North of the Polabi, and divided from the Danes by the Eyder, from the Non-Danish Nordalbingians by the Trave—Capital Oldenburg. The Isle of Femern was Wagrian.

3. *The Obotriti*, written also *Obotritæ*, *Abotriti*, *Abotridi*; *Apodritæ*, *Abatareni*, *Apdrede*, *Afdrege*, and, for the sake of distinction from a people of the same name, *Nort-Obtrezi*, occupants of the western part of Mecklenburg, and extended as far east as the Warnow, as far south as Schwerin.—The Obotrites were allies of the Franks against the Saxons, and after the defeat and partial removal of the latter, were transplanted to some of their localities.—"Saxones transtulit" (*i. e.* Charle-

magne) "in Franciam, et pagos transalbianos Abodritis dedit. —*Eginhart Ann.* A. D. 804.—D. N.

4. *The Lini.*—Slavonians on the left bank of the Elbe, and the first met with on that side of the river—occupants of Danneburg, Luchow and Wustrow, in Luneburg. The *Smeldengi* and the *Bethenici* are mentioned along with the Lini (or Linones). Of this Slavonic a Paternoster may be seen in the Mithridates representing the dialect of the neighbourhood in Luchow in A. D. 1691. It is much mixed with the German. About the middle of the last century this (Cis-Albian Slavonic) dialect became extinct.—D. N.

5. *The Morizani.*—The district round the Muritz Lake.—D. N.

6. *The Doxani.*—Locality; the valley of the Dosse.—D. N.

7. *The Hevelli.*—Locality; the valley of the Hevel. These are the Slavonians of Brandenburg and Mittelmark.—D. N.

Again,—the original *Lithuanic* area extended as far as the frontier between East Prussia and Pomerania. Hence, members of the Lithuanic division may have joined the Angles.

Nor is this all. A case can be made in favour of a large portion of Scandinavia having been Lithuanic before it was German. If so, the Norse element of the English may have contained Sarmatian words.

This question is too new and too complicated to be gone into in any detail. I only raise it,—adding that, amongst other words, I believe *Ale*, *Woman*, Old *Scratch* and *Bogy* (as names of the Devil), to be, in their remote origin, Sarmatian.

CHAPTER XXXII.

ARE THERE UGRIAN ELEMENTS IN ENGLISH?

§ 228. ARE there Ugrian elements in English?

Yugoria is the name of a tract of land which may be found in many of the older maps, applied to the western part of Siberia, or to parts beyond the North-eastern frontier of Russia in Europe.

The tracts thus denominated are chiefly occupied by populations more or less allied to the Finlanders of the Duchy of Finland. There are some others, but the majority are Fin.

Now the adjective Ugrian has grown out of the substantive Ugoria, or Ugria, and the adjective Ugrian has been applied to the tribes of the district in question. More than this, it has been extended to the whole family to which they belong, and as this family contains the Finlanders of Finland, the Laplanders, the Esthonians of Esthonia, the Zirianians and Permians of the Government of Perm, the Magyars of Hungary, and several minor populations on the rivers Obi and Volga besides, the term is one of considerable importance and generality. A work by Müller, upon the ethnology of the tribes in question, and upon the geography of the country they occupy, is denominated "The Ugrian Family" (*Der Ugrische Folkstamme*), and as this is a book of value and authority, it has done much to fix the term. It should be added, however, that there are other names besides, and that good authorities have used them.

The doctrine that Ugrian elements may be found in the English language, rests on two foundations.

The first of these is called the *Fin Hypothesis*. This means that just as a Keltic population preceded the German, so did a Ugrian population precede the Keltic. All Europe,

according to this view, was once Ugrian or Fin—all Europe and much of Asia.

The second source whence we may get Ugrian elements is Norway. Those who put no faith in the Fin, or Ugrian hypothesis, consider that all the parts north of the Baltic were once Lap, even as Lap-land is. If so, Lap words may have been taken up by the Norwegian, and, through it, introduced into England.

This is a question raised rather than solved.

That Lap words are by no means scarce, even in the southern dialects of Norway, is certain.

CHAPTER XXXIII.

THE PICTS—WHO WERE THEY?

§ 229. The opinion to which the author committed himself in his last edition was that of the late Mr. Garnett, and, probably, the majority of investigators. This was to the effect of the Picts being Kelts of the British branch—Kelts rather than Germans, and British Kelts rather than Gaelic Kelts.

The evidence lay in the following facts:—

a. When St. Columba, whose mother-tongue was the Irish Gaelic, preached to the Picts, he used an interpreter—*Adamnanus* apud *Colganum*, 1, 11, c. 32. This is a point of external evidence, and shows the *difference* between the Pict and Gaelic. What follows are points of internal evidence, and show the affinity between the Pict and Welsh.

b. A manuscript in the Colbertine Library contains a list of Pict kings from the fifth century downwards. These names are not only more Keltic than Gothic, but more Welsh than Gaelic. *Taran* = *thunder* in Welsh. *Uven* is the Welsh *Owen*. The first syllable in *Talorg* (= *forehead*) is the *tal* in *Talhaiarn* = *iron forehead*, *Taliessin* = *splendid forehead*, Welsh names. *Wrgust* is nearer to the Welsh *Gwrgust* than to the Irish *Fergus*. Finally, *Drust*, *Drostan*, *Wrad*, *Necton*, closely resemble the Welsh *Trwst*, *Trwstan Gwriad*, *Nwython*, whilst *Cineod*, and *Domhnall* (*Kenneth* and *Donnell*) are the only true Erse forms in the list.

c. The only Pict common name extant is the well-known compound *pen val*, which is in the oldest MS. of Beda *peann fahel*. This means *caput valli*, and is the name for the eastern termination of the Vallum of Antoninus. Herein *pen* is unequivocally Welsh, meaning *head*. It is an impossible form in Gaelic. *Fal*, on the other hand, is apparently Gaelic,

the Welsh for a *rampart* being *gwall*. *Fal*, however, occurs in Welsh also, and means *inclosure*. "Incepit autem duorum ferme millium spatii à monasterio Æburcurnig ad occidentem, in loco qui sermone Pictorum *Peanfahel*, lingua autem Anglorum *Penneltun* appellatur; et tendens contra occidentem terminatur juxta Urbem Alcluith."—*Hist. Ecc.* i. 12.

The evidence just indicated is rendered nearly conclusive by an interpolation, apparently of the twelfth century, of the Durham MS. of Nennius, whereby it is stated that the spot in question was called in Gaelic *Cenail*. Now Cenail is the modern name *Kinneil*, and it is also a Gaelic translation of the Pict *pen val*, since *cean* is the Gaelic for *head*, and *fhail* for *rampart* or *wall*. If the older form were Gaelic, the substitution, or translation, would have been superfluous.

d. The name of the *Ochil Hills* in Perthshire is better explained from the Pict *uchel* = *high*, than from the Gaelic *uasal*.

e. Bryneich, the British form of the province of Bernicia, is better explained by the Welsh *byrn* = *ridge* (*hilly country*), than by any word in Gaelic.—*Garnett, in Transactions of Philological Society*.

§ 230. It must be admitted that the evidence in favour of the Picts being not only Kelts, but Kelts of the British branch, is satisfactory—perhaps, when taken by itself, sufficient. At the same time it is anything but conclusive.

Claudian often mentions the Picts. That he mentions them in company with the *Saxons* is a point of no great importance. He mentions them, however, as the occupants of a northern locality—a locality, at least, as far north as the Orkneys.

> "Quid rigor æternus cœli; quid sidera prosunt
> Ignotumque fretum? maduerunt Saxone fuso
> Orcades; incaluit *Pictórum* sanguine *Thule*,
> Scotorum cumulos flevit glacialis Ierne."
>
> *De quart. Consul. Hon.* 30–34.

Due importance must be given to this extract, and to the word *Thule* contained in it. It points towards Scandinavia.

So does the evidence of Nennius:—"Post intervallum annorum multorum, non minus DCCC., Picti venerunt et occupaverunt

insulas quæ *Orcades* vocantur; et postea ex insulis affinitimis vastaverunt non modicas et multas regiones, *occupaverunt que eas in sinistrali plaga* Britanniæ; *et manent usque in hodiernum diem. Ibi tertiam partem Britanniæ tenuerunt et tenent usque nunc.*"—*Nenn.* CV.

The eight hundred years is calculated from the event last noticed, which was to the effect that when Brito the grandson of Æneas was ruling in Britain, his brother Posthumus was king of the Latins, and Eli was judge over Israel. No weight attaches itself to this piece of chronology. On the other hand the geography is valuable. The islands on the *left* of Britain were the Hebrides, and (perhaps) the Isle of Man.

Now the two portions of Britain where the local traditions say most about the Picts are the Orkney Isles and the Scottish Border—the *Vallum* being called the *Picts* Wall.

The following extracts from Nennius point in the same direction, though not more to the parts between the Tyne and Solway than to those between the Forth and Clyde.

"CAP. XII. *Ut Brittones a Scottis vastati Pictisque Romanorum auxilia quæsierint, qui secundo venientes, murum trans insulam fecerint; sed hoc confestim a præfatis hostibus interrupto, majore sint calamitate depressi.*

"Exin Brittania in parte Brittonum, omni armato milite, militaribus copiis universis, tota floridæ juventutis alacritate spoliata, quæ tyrannorum temeritate abducta nusquam ultra domum rediit, prædæ tantum patuit, utpote omnis bellici usus prorsus ignara: denique subito duabus gentibus *transmarinis* vehementer sævis, Scottorum a Circio, *Pictorum ab Aquilone*, multos stupet gemitque per annos. Transmarinas autem dicimus has gentes, non quod extra Brittaniam essent positæ; sed quia a parte Brittonum erant remotæ, duobus sinibus maris interjacentibus, quorum unus ab Orientali mari, alter ab Occidentali, Brittaniæ terras longe lateque inrumpit, quamvis ad se invicem pertingere non possint. Orientalis habet in medio sui urbem Giudi, Occidentalis supra se, hoc est, ad dexteram sui habet urbem Alcluith, quod lingua eorum significat 'petram cluith;' est enim juxta fluvium nominis illius.

"Et cum plurimam insulæ partem, incipientis ab austro, possedissent, contigit gentem Pictorum de *Scythia*, ut perhibent,

longis navibus non multis oceanum ingressam, circumagente flatu ventorum, extra fines omnes Brittaniæ *Hiberniam* pervenisse, ejusque septentrionales oras intrasse, atque inventa ibi gente Scottorum, sibi quoque in partibus illius sedes petisse, nec impetrare potuisse. Ad hanc ergo usque pervenientes navigio Picti ut diximus, petierunt in ea sibi quoque sedes et habitationem donari. Respondebant Scotti, quia non ambos eos caperet insula: 'Sed possumus,' inquiunt, 'salubre vobis dare consilium quid agere valeatis. Novimus insulam aliam esse non procul a nostra, contra ortum solis, quam sæpe lucidioribus diebus de longe aspicere solemus. Hanc adire si vultis, habitabilem vobis facere valetis: vel si qui restiterit, nobis auxiliariis utimini.' Itaque patentes Brittaniam Picti, habitare per septentrionales insulæ partes coeperunt; nam Austrina Brittones occupaverant. *Cumque uxores Picti non habentes peterent a Scottis*, ea solum conditione dare consenserunt, ut ubi res perveniret in dubium, *magis de feminea regum prosapia*, quam de masculina regem sibi eligerent: *quod usque hodie apud Pictos constat esse servatum.*"

In these extracts a *third* of Britain is given to the Picts. Now a third is the portion which is afterwards given to the Scandinavians.

The fact of the royal blood running in the *female* line invalidates the inference drawn from the British character of the names of the Pict kings.

The distribution of the Picts over Orkney, the Hebrides, Ireland, and the south of Scotland is exactly that of the Scandinavians, and (in the present state of our knowledge) of no one else.

§ 231. Take a series of names from some of the more English parts of Wales; *e. g.* the parts about Swansea. They will be Welsh, but they will not be the language of all, or even of the majority of the population. *Mutatis mutandis* this is the view that may be taken of the Picto-Brittannic glosses one and all; it being considered that they belonged to the *country* rather than to the *people*. Neither is this exception gratuitous. The geographical distribution of the Picts, and the extent to which it is also Scandinavian must, by no means, be overlooked.

§ 232. The following extract first requires to be construed, then to be criticised.

"Procedente autem tempore, Britannia post Brittones et Pictos, tertiam Scottorum nationem in Pictorum parte recepit, *qui* duce *Reuda* de Hibernia progressi, vel amicitia vel ferro sibimet inter eos sedes quas hactenus habent, vindicarunt: a quo videlicet duce usque hodie. *Dalreudini* vocantur, nam lingua eorum '*daal*' partem significat."

First, as regards the construction.—But one view has been taken of this, viz. that *qui* refers to the word *Scottorum*, so that it was the *Scots* who came from Ireland, the *Scots* whom Reuda led, the *Scots* in whose language *daal* meant part. Nevertheless, the true antecedent *may* be the word *Pictorum*.

Without pressing this point further, let us examine the *matter* of the extract. Herein *daal* is *not a Scotch*, and *is a Scandinavian* word.

Upon the whole, then, it can scarcely be considered safe to take the Keltic origin of the Picts as a settled question. The Scandinavian hypothesis, often adopted and often abandoned, is still tenable.

CHAPTER XXXIV.

AFFINITIES OF THE ENGLISH AND ITS ALLIED LANGUAGES TO CERTAIN OTHER TONGUES.

§ 233. THE *closest* affinities of the English are with the languages of Germany: but it by no means follows that the range of the English affinities is thus limited.

The English language has clear and definite affinities with both the Latin and the Greek.

Nevertheless, the Latin and the Greek do not belong to the same division of the same class with the English and German.

On the contrary, the tongues allied to the German form a definite group, or division, in a class of considerable magnitude and importance.

And the Latin and Greek form a similar definite group, or division, in that same class.

1. The names of several natural objects, &c., are common to these two groups—viz. the group containing the English and its allied languages, on the one side, and the group containing the Latin and Greek, on the other.

Instances like those which have just been under notice are instances of *glossarial* affinity, because the likeness consists in the likeness between individual words (γλώσσαι).

What follow are instances of what is called *grammatical* affinity, because the likeness consists in the likeness between *the inflections*.

The *-s* in the English genitive singular (*father's*) is the *-s* in patr-*is*, lapid-*is*, &c., which is the -ς in σώματ-ος, τίταν-ος, &c.

2. The *-s* in the English nominative plural (*fathers*) is the *-s* in *lapid-es*, τιτᾶν-ες.

3. The *-er* in the English Comparative degree (*wiser*) is probably, the *-er* in words like *inf-er-us*, *sup-er-us*.

4. The *-st* in the English Superlative (*wis-est*) is the -ιστ in words like οἴκτ-ιστ-ος.

5. The *-m* in *for-m-er* is the *-m* in *pri-m-us*.

6. The *-t* in *tha t* and *wha-t* is the *-d* in *i-d*, and the -τ in ὅ-τ-ι.

* Meaning *know*, as in *I wist not—Middlesex to wit.*

7. The *-th* in words like *four-th fif-th* is the *-t* in *quar-t-us*, and *quin-t-us*, τέταρ-τ-ος, πέμπ-τ-ος.

8. The *-m* in *a-m*, is the *-m* in *sum*, and εἰ-μ-ί.

9. The *-s* in *call-es-t* is the *-s* in *am-as*, and τύπτ-εις. The *-t* is of a late origin. It was unknown in the Mœso-Gothic, and in the Old-Saxon, where the termination is simply *-s*.

10. The *-th* in *speak-eth* is the *-t* in *am-at*.

11. The *-ing* in *speaking*, is the *-nd* of the Latin Gerunds, *ama-nd-i, ama-nd-o, ama-nd-um*. The older form of the English participle was *-nd*. In Anglo-Saxon *luf-i-and* was the participle. This termination has since been softened down into *-ing*.

12. The first *d* in *did* is believed on good grounds to be as true a reduplication as the τ in τέ-τυφα, and the *m* in *mo-mordi*.

13. The *-d* in the participle *moved* is probably the *-t* in *voc-at-us*, and the *-θ* in τυφ-θ-είς.

Now all this gives us the following fact, viz.: that every one of the ordinary English inflections, as we find them in the ordinary grammars, are not only German, as they are shown to be in the body of the present work, but Latin and Greek as well.

Add to this that the list of *glossarial* affinitities can be greatly enlarged.

Add also that § 299 shows us a certain amount of regularity in the interchange of articulate sounds between the English, Latin, and Greek.

Assuredly, then, there is, in philology, some large and comprehensive class, of which the languages akin to the Latin and Greek form one division, the languages akin to the English and German another.

§ 234. Are these the only divisions? No. All the forms of speech akin to the Russian, Servian, Polish, and Bohemian, belong to this same class. So do the forms of speech akin to the Let of Courland and Livonia, and the Lithuanian of Lithuania. So does the language of the ancient literature of India.

It is only because such languages as the Russian, the Servian, the Bohemian, the Polish, the Old Slavonic, the Let, the

Old Prussian, the Lithuanian, and the Sanskrit are less studied than the Latin and Greek that they are less called in to the explanation of the English. The light they shed upon our own language is of the same kind as that given by the classical tongues; and their affinity is, there or thereabouts, the same.

The Keltic is related; but less nearly.

The current, but by no means satisfactory name for the general class containing this alliance of tongues is Indo-European. It is used as rarely as possible in the present work.

CHAPTER XXXV.

HYBRIDISM AND THE INTRODUCTION OF NEW WORDS.

§ 235. In *lambkin* and *lancet*, the final syllables (*-kin* and *-et*) have the same power. They both express the idea of smallness or diminutiveness. These words are but two out of a multitude, the one (*lamb*) being of Saxon, the other (*lance*) of Norman origin. The same is the case with the superadded syllables: *-kin* is Saxon; *-et* Norman. Now to add a Saxon termination to a Norman word, or *vice versâ*, is to corrupt the English language.

This leads to some observations respecting the—

Introduction of new words—Hybridism.—Hybridism is a term derived from *hybrid-a, a mongrel;* a Latin word *of Greek extraction.*

The terminations *-ize* (as in *criticize*), *-ism* (as in *criticism*), *-ic* (as in *comic*), along with others, are Greek terminations. To add them to words of other than of Greek origin is to be guilty of hybridism.

The terminations *-ble* (as in *penetrable*), *-bility* (as in *penetrability*), *-al* (as in *parental*)—these, amongst many others, are Latin terminations. To add them to words of other than of Latin origin is to be guilty of hybridism.

Hybridism is the commonest fault that accompanies the introduction of new words. The hybrid additions to the English language are most numerous in works on science.

It must not, however, be concealed that several well-established words are hybrid; and that, even in the writings of the classical Roman authors, there is hybridism between the Latin and the Greek.

The etymological view of every word of foreign origin is, not

that it is put together in England, but that it is brought whole from the language to which it is vernacular. Now no derived word can be brought whole from a language unless, in that language, all its parts exist. The word *penetrability* is not derived from the English word *penetrable*, by the addition of *-ty*. It is the Latin word *penetrabilitas* imported.

In derived words all the parts must belong to one and the same language, or, changing the expression, *every derived word must have a possible form in the language from which it is taken.* Such is the rule against Hybridism.

A true word sometimes takes the appearance of a hybrid without really being so. The *-icle*, in *icicle*, is apparently the same as the *-icle* in *radicle*. Now, as *ice* is Gothic, and *-icle* classical, hybridism is simulated. *Icicle*, however, is not a derivative but a compound; its parts being *is* and *gicel*, both Anglo-Saxon words.

§ 236. *On Incompletion of the Radical.*—Let there be in a given language a series of roots ending in *-t*, as *sæmat*. Let a euphonic influence eject the *-t*, as often as the word occurs in the nominative case. Let the nominative case be erroneously considered to represent the root, or radical, of the word. Let a derivative word be formed accordingly, *i. e.* on the notion that the nominative form and the radical form coincide. Such a derivative will exhibit only a part of the root; in other words, the radical will be incomplete.

Now all this is what actually takes place in words like *hæmo-ptysis* (*spitting of blood*) *sema-phore* (*a sort of tele-graph*). The Greek imparisyllabics eject a part of the root in the nominative case; the radical forms being *hæmat-* and *sæmat-*, not *hæm-* and *sæm-*.

Incompletion of the radical is one of the commonest causes of words being coined faultily. It must not, however, be concealed that, even in the classical writers, we have, in words like δίστομος, examples of incompletion of the radical.

PART II.

DIALECTS.

CHAPTER I.

GENERAL VIEW OF THE DIFFUSION OF THE ENGLISH LANGUAGE.

§ 237. *Distribution of the English Language within the British Isles.*—The English Language is spoken in all the counties of England.

It is spoken in Wales, *partially;* that is, in the Principality of Wales there are two languages, viz. the English, and the Welsh as well.

It is also spoken in Scotland, *partially;* that is, in the Northern and Western counties of Scotland there are two languages, the English, and a language called the *Scotch* Gaelic as well.

It is also spoken in Ireland, *partially;* that is, in Ireland there are two languages, the English, and a language called the *Irish* Gaelic as well.

It is also spoken in the Isle of Man, *partially;* that is, in the Isle of Man there are two languages, the English, and a language called the Manx as well.

§ 238. *Diffusion of the English Language* beyond *the British Isles.*—It is spoken in the United States of America, in Canada, in Australia, and, more or less in all the English colonies and dependencies.

The extension of the English language *beyond* the British

Isles is a recent event when compared with its extension *over* the British Isles in the early periods of our history. Indeed, he former has taken place almost entirely since the reign of Queen Elizabeth. It was then that the first English colony, that of Virginia, was planted in North America; and it was only natural that the emigrants who left England should take their language with them. Upon the shores of America it came in contact and collision with the numerous dialects of the native Indians; and upon these it encroached just as, a thousand years before, it had encroached upon the original British of Britain. Certain languages then became entirely lost, and, at the same time, the tribes that spoke them. Sometimes they were wholly exterminated; sometimes they were driven far into the interior of the land. In a short time populous cities stood upon the hunting-grounds of the expelled tribes, and the language of the mother-country became naturalised in a New World. The subsequent settlement of Maryland, Georgia, and the remaining States of America completed the preponderance of the English language from the boundaries of Canada to the Gulf of Mexico.

During the Protectorate of Cromwell, the island of Jamaica was taken from the Spaniards, and from that time forwards the English has been the language of a greater part of the West-Indian Islands.

In Canada, it first took root after the taking of Quebec in the reign of George the Second. As Canada, however, had been previously a French colony, the European language that was first spoken there was not the English but the French. Hence, when Quebec was taken, the language of the country fell into two divisions. There were the different dialects of the original Indians, and there was the French of the first European colonists. At the present moment, both these languages maintain their ground; so that the English is spoken only partially in Canada, the French and the Indian existing by the side of it.

At the Cape of Good Hope the English is spoken in a similar manner; that is, it is spoken partially. The original inhabitants were the Caffre and Hottentot tribes of Africa, and the earliest European colonists were the Dutch. For these

reasons Dutch and English, conjointly with the Hottentot and Caffrarian dialects, form the language of the Cape of Good Hope. In Guiana, too, in South America, English and Dutch are spoken in the neighbourhood of each other, for the same reason as at the Cape.

In Asia the English language is spoken in India; but there the original languages of the country are spoken to a far greater extent than is the case in either America or Africa.

Australia and New Zealand are exclusively English colonies, and, consequently, in Australia and New Zealand English is the only *European* language that is spoken. In each of these settlements it encroaches upon the native dialects.

Malta, Gibraltar, Heligoland, Guernsey, and Jersey, and many other localities of less note, are isolated spots, which, being portions of the English dominions, use the English language.

The English Language was diffused over the English colonies and dependencies from Great Britain.

The English Language was diffused over Great Britain from Germany.

Mutatis mutandis, the history of the two diffusions is the same.

Different portions of one country, at different times, supplied different portions of other countries with a population speaking a certain language.

The particular form of this language varied with the particular locality from which it was introduced.

Also—with the date of its introduction.

Lastly, it was liable to a further modification from the particular languages of the new countries with which it came in contact. Between them, there would be a certain amount of action and reaction.

§ 239. By putting these facts together we shall find that there are two methods of classifying dialects—the *ethnological* and the *structural*.

According to the former, we place in the same class those dialects which were introduced by the same section of immigrants. Thus, a body of Germans, starting from the same part of Germany, and belonging to the same section of the

German population, even if, whilst at sea, it separated into two, three, or more divisions, and landed upon widely-separated portions of Great Britain, would introduce dialects which were allied *ethnologically;* even though, by one of them changing rapidly, and the others not changing at all, they might, in their external characters, differ from each other, and agree with dialects of a different origin. Hence, the ethnological principle is essentially historical; and it is based upon the idea of *affiliation* or affinity in the way of descent.

The *structural* principle is different. Two dialects introduced by different sections of an immigrant population may suffer similar changes; *e. g.* they may lose the same inflections, adopt similar euphonic processes, or incorporate the same words. In this case, their external characters become mutually alike. Hence, if we take two such dialects, and place them in the same class, we do so simply because they are *alike in certain characters*, not because they are affiliated.

§ 240. Such are the two chief principles of classification. Generally, they more or less coincide; in other words, similarity of external character is *primâ facie* evidence of affinity in the way of affiliation, identity of origin being the safest assumption in the way of cause; whilst identity of origin is generally a sufficient ground for calculating upon similarity of external form; such being, *à priori*, its probable effect.

Still, the evidence of one in favour of the other is only *primâ facie* evidence. Dialects of the same origin may grow unlike; dialects of different origins alike.

§ 241. The causes, then, which determine those minute differences of language, which go by the name of *dialects* are twofold.—1. Original difference; 2. Subsequent change.

The original difference between the two sections of an immigrant population are referable to either—1. Difference of locality in respect to the portion of the country from which they originated; or, 2. Difference in the date of the invasion.

Two bodies of immigrants, one from the Eyder, and the other from the Scheldt, even if they left their respective localities on the same day of the same month, would most probably differ from one another; and that in the same way that a Yorkshireman differs from a Hampshire man.

On the other hand, two bodies of immigrants, each leaving the very same locality, but one in 200 A.D., and the other in 500 A.D., would also, most probably, differ; and that as a Yorkshireman of 1850 A.D. differs from one of 1550 A.D.

§ 242. The subsequent changes which may affect the dialect of an immigrant population are chiefly referable to either influences exerted by the dialects of the aborigines of the invaded country or influences of simple growth, or development. A dialect introduced from Germany to a portion of Great Britain, where the aborigines spoke Gaelic, would be differently affected from a dialect similarly circumstanced in a British, Welsh, and Cambrian district.

A language which changes *rapidly*, will, at the end of a certain period, wear a different aspect from one which changes *slowly*.

CHAPTER II.

CHIEF CHARACTERISTICS OF ENGLISH DIALECTS.

§ 243. THE philological criticism of a provincial dialect is the philological criticism of a language, except that it is more minute.

Glossarial peculiarities—grammatical peculiarities—phonetic differences—these are the chief heads to which the phenomena of dialects equally with those of languages are referable.

The details of the first of these three divisions belong to lexicography rather than grammar.

§ 244. In the way of inflection we find in the present provincial dialects of Great Britain (amongst others) the following forms.

1. A plural in *-en*, as, We call-*en*, ye call-*en*, they call-*en*.

2. The use of Anglo-Saxon inflections of *he*.

In Lancashire and elsewhere, *hoo* (= A. S. *heo* = *she*).

3. The participial form in *-and*; as *goand, slepand*,—Northumberland, &c.

4. The common use of the termination *-th* in the third person present; *goeth, hath, speaketh*,—Devonshire, &c.

5. Plural forms in *-en*; as *housen*,—Leicestershire and elsewhere.

6. Old preterite and participial forms of certain verbs; as—

Clom,	from	*climb*,	Hereford and elsewhere.
Hove,	—	*heave*,	ditto.
Puck,	—	*pick*,	ditto.
Shuck,	—	*shook*,	ditto.
Squoze,	—	*squeeze*,	ditto.
Sew,	—	*sow*,	Essex.
Rep,	—	*reap*,	ditto.
Mew,	—	*mow*,	ditto, &c.

§ 245. The following changes (a few out of many) are matters not of grammar, but of pronunciation :—

ui for *oo*—*cuil, bluid,* for, *cool, blood,*—Cumberland, Scotland.

oy for *i*—*foyne, twoyne,* for *fine, twine,*—Cheshire, Cambridgeshire, Suffolk.

oy for *oo*—*foyt* for *foot,*—Halifax.

oy for *o*—*noite, foil, coil, hoil,* for *note, foal, coal, hole,*—Halifax.

oy for *a*—*loyne* for *lane,*—Halifax.

ooy for *oo*—*nooin, gooise, fooil, tooil,* for *noon, goose, fool, tool,*—Halifax.

w inserted (with or without a modification)—as *spwort, scworn, whoam,* for *sport, scorn, home,*—Cumberland, West Yorkshire, Somerset, Gloster, &c.

ew for *oo,* or *yoo*—*tewn* for *tune,*—Suffolk, Westmoreland, &c.

iv for *oo,* or *yoo* when a vowel follows—as *Samivel* for *Samuel; Emmanivel* for *Emmanuel.* In all these we have seen a tendency to *diphthongal* sounds.

In several of the following instances the practice is reversed, and instead of the vowel being made a diphthong, the diphthong becomes a vowel, as—

o for *oy*—*boh* for *boy,*—Suffolk, &c.

oo for *ow*—*broon* for *brown,*—Bilsdale, &c.

ee for *i*—*neet* for *night,*—Cheshire, &c.

o for *ou*—*bawn'* for *bound,*—Westmoreland, &c.

ēē for *a*—*theere* for *there,*—Cumberland, &c.

ēē for *ĕ*—*reed, seeven,* for *read, seven,*—Cumberland, Craven.

ā for *ō*—*sair, mair, baith,* for *sore, more, both,*—Cumberland, Scotland, &c.

ă for *ŏ*—*saft* for *soft,*—Cheshire, &c.

o for *ă*—*mon* for *man,*—Cheshire, &c.

y inserted before a vowel—*styake, ryape,* for *stake, rope,*—Borrowdale; especially after *g, gyarden, gyown,* for *garden, gown,*—Warwickshire, &c.; and at the beginning of a word, as *yat, yan,* for *ate, one* (*ane*),—Westmoreland, Bilsdale, &c.

h inserted — *hafter*, *hoppen*, for *after*, *open*, — Westmoreland, &c.

h omitted—*at*, *ard*, for *hat*, *hard*,—*Passim*.

§ 246. *Transition of Consonants.*

b for *v*—*Whitehebbon* for *Whitehaven*,—Borrowdale, &c.

p for *b*—*poat* for *boat*.—Welsh pronunciation of many English words.

v for *f*—*vind* for *find*,—characteristic of Devonshire, Kent, &c.

t for *d* (final)—*deet* for *deed*,—Borrowdale, &c.

t for *ch* (*tsh*)—*fet* for *fetch*,—Devonshire, &c.

d for *j* (*dzh*)—*sled* for *sledge*,—Hereford, &c.

d for *th* (þ)—*wid* = *with*; *tudder* = *the other*,—Borrowdale, Westmoreland. Initial (especially before a consonant)—*drash*, *droo* = *thrash*, *through*,—Devonshire, Wilts, &c.

k for *ch* (*tsh*)—*thack*, *pick*, for *thatch*, *pitch*,—Westmoreland, Lincolnshire, Halifax, &c.

g for *j* (*dzh*)—*brig* for *bridge*,—Lincolnshire, Hereford, &c.

g preserved from the Anglo-Saxon—*lig*, *lie*. Anglo-Saxon, *licgan*,—Lincolnshire, North of England, &c.

z for *s*—*zee* for *see*, Devonshire, &c.

s for *sh*—*sall* for *shall*,—Craven, Scotland, &c.

y for *g*—*yet* for *gate*,—Yorkshire, Scotland, &c.

w for *v*—*wiew* for *view*,—Essex, London, &c.

n for *ng*—*bleedin* for *bleeding*,—Cumberland, Scotland, &c.

sk for *sh*—*busk* for *bush*,—Halifax, &c.

§ 247. *Ejection of Letters.*

k before *s*, the preceding vowel being lengthened by way of compensation—*neist* for *next*, *seist* for *sixth*,—Halifax.

d and *v* after a consonant—*gol* for *gold*, *siller* for *silver*,—Suffolk. The ejection of *f* is rarer; *mysel* for *myself*, however, occurs in most dialects.

l final, after a short vowel,—in which case the vowel is lengthened—*poo* for *pull*,—Cheshire, Scotland.

al changed to *a* open—*hawf* for *half*, *saumon* for *salmon*,—Cumberland, Scotland.

§ 248. *Transposition.*—Transpositions of the liquid *r* are common in all our provincial dialects; as *gars*, *brid*, *perty*, for *grass*, *bird*, *pretty*. Here the provincial forms are the

oldest, *gærs*, *brid*, &c., being the Anglo-Saxon forms. Again; *acsian*, Anglo-Saxon = *ask*, English.

§ 249. *Double meaning of the word old.*—The word *old*, as applied to language, has a double meaning.

The language of the United States was imported from England into America in the reign of Queen Elizabeth. The language of South Australia has been introduced within the present generation. In one sense, the American English is older than the Australian. It was earlier separated from the mother-tongue.

The language, however, of America may, in the course of time, become the least old of the two; the word *old* being taken in another sense. It may change with greater rapidity. It may lose its inflections. It may depart more from the structure of the mother-tongue, and preserve fewer of its *old* elements. In this sense the Australian (provided that it has altered least, and that it retain the greatest number of the *old* inflections) will be the older tongue of the two.

Now what may be said of the language of two countries, may be said of the dialects of two districts. The one dialect may run its changes apace; the other alter but by degrees. Hence, of two works in two such dialects, the one would appear older than the other, although in reality the two were contemporary.

Hence, also, it is a lax expression to say that it is the old forms (the archaisms) that the provincial dialects retain. The provincial forms are archaic only when the current language changes more rapidly than the local idiom. When the local idiom changes fastest, the archaic forms belong to the standard mode of speech.

The provincial forms, *goand*, *slepand*, for *going* and *sleeping*, are archaic. Here the archaism is with the provincial form.

The forms *almost*, *horses*, *nought but*, contrasted with the provincialisms, *ommost*, *hosses*, *nobbot*, are archaic. They have not been changed so much as they will be. Here the archaism (that is, the nearer approach to the older form) is with the standard idiom. A sequestered locality is preservative of old forms. But writing and education are preservatives of them also.

CHAPTER III.

OLD SPECIMENS OF DIFFERENCE OF DIALECT—DIALECTS OF THE ANGLO-SAXON PERIOD.

§ 250. "In speaking," writes Mr. Kemble, "of the Anglo-Saxon language, scholars universally intend that particular form of speech in which all the principal monuments of our most ancient literature are composed, and which, with slight variations is found in Beowulf and Cædmon, in the Exeter and Vercelli Codices, in the translation of the Gospel and Homilies, and in the works of Ælfred the Great. For all general purposes this nomenclature is sufficiently exact; and in this point of view, the prevalent dialect, which contains the greatest number of literary remains, may be fairly called the Anglo-Saxon language, of which all varying forms were dialects. It is, however, obvious that this is in fact an erroneous way of considering the subject; the utmost that can be asserted is, that Ælfred wrote his own language, viz. that which was current in Wessex; and that this, having partly through the devastations of heathen enemies in other parts of the island, partly through the preponderance of the West Saxon power and extinction of the other royal families, become the language of the one supreme court, soon became that of literature and the pulpit also."—*Phil. Trans.*, No. 35.

§ 251. If this be the case, any extant specimen of the Anglo-Saxon representative of any form of speech beyond the Kingdom of Wessex presents itself to us under the *primâ facie* aspect of a dialect.

§ 252. In the *Analecta Anglo-Saxonica*, a Homily on the *Natale Sancti Edmundi* is in this predicament; the form of speech for the parts about Bury St. Edmunds, in Suffolk, being the form of speech represented.

§ 253. Of the two texts of the so-called Saxon Chronicle, one is considered to represent the language of the northern part of Northamptonshire, *i.e.* the parts about Medemstead (or Peterborough). If so, it is Mercian rather than West-Saxon.

§ 254. The chief deviations, however, from the ordinary Anglo-Saxon of the classical Anglo-Saxons, are from the parts north of the Trent.

Wanley's Fragment of Cædmon.—The north-east of Yorkshire was the birth-place of the Anglo-Saxon monk Cædmon. Nevertheless, the form in which his poems in full have come down to us is that of a West-Saxon composition. This indicates the probability of the original work having first been re-cast, and afterwards lost. Be this as it may, the following short fragment has been printed by Wanley, from an ancient MS., and by Hickes from Beda, *Hist. Eccl.*, 4, 24, and it is considered, in the first form, to approach, or, perhaps, to represent, the Northumbrian of the original poem.

1.	2.
Wanley.	*Hickes.*
Nu scylun hergan	Nú we sceolan herigean
Hefaen-ricaes uard,	Heofon-ríces weard,
Metudes mæcti,	Metodes mihte,
End his modgethanc.	And his módgethanc.
Uerc uuldur fadur,	Weorc wuldor-fæder,
Sue he uundra gihuaes,	Sva he wundra gewæs,
Eci drictin,	Ecé driten,
Ord stelidæ.	Ord onstealde.
He ærist scopa,	Ne æ′rest scóp,
Elda barnum,	Eorðan bearnum,

Haleg scepen:	Hálig scyppend:
Tha mittungeard,	Dá middangeard,
Moncynnæs uard,	Moncynnes weard,
Eci drictin,	Ece drihten,
Æfter tiaðæ,	Æfter teóde,
Firum foldu,	Firum foldan,
Frea allmectig.	Freá almihtig.

Translation.

Now we should praise
The heaven-kingdom's preserver,
The might of the Creator,
And his mood-thought.
The glory-father of works,
As he, of wonders, each
Eternal Lord,
Originally established.
He erst shaped,
For earth's bairns,
Heaven to roof;
Holy shaper;
Then mid-earth,
Mankind's home,
Eternal Lord,
After formed,
For the homes of men,
Lord Almighty.

§ 255. *The Death-bed Verses of Bede.*

Fore the neidfaerae,
Naenig uuiurthit
Thoc-snotturra
Than him tharf sie
To ymbhycganne,
Aer his hionongae,
Huaet, his gastae,
Godaes aeththa yflaes,
Æfter deothdaege,
Doemid uuieorthae.

Before the necessary journey,
No one is
Wiser of thought
Than he hath need
To consider,
Before his departure,
What, for his spirit,
Of good or evil,
After the death-day,
Shall be doomed.

From a MS. at St. Gallen; quoted by Mr. Kemble, *Archæologia*, vol. xxviii.

§ 256. *The Ruthwell Runes.*—The inscription in Anglo-Saxon Runic letters, on the Ruthwell Cross, is thus deciphered and translated by Mr. Kemble:—

. . . . . mik.
Riiknæ kyningk
Hifunæs hlafard,
Hælda ic ne dærstæ.
Bismerede ungket men,
Bâ ætgæd[r]e,
Ik (n)iðbædi bist(e)me(d)

. . . . . me.
The powerful King,
The Lord of Heaven,
I dared not hold.
They reviled us two,
Both together,
I stained with the pledge of crime.

. . . . . , ...

"The dialect of these lines is that of Northumberland in the seventh, eighth, and even ninth centuries. The first peculiarity is in the *æ* for *e* in the oblique cases, and which I have observed in the contemporary MS. of Cuðberht's letter at St. Gallen. This, which is strictly organic, and represents the uncorrupted Gothic genitive in *-as*, and dative in *a*, as well as the Old-Saxon forms of the substantive, is evidence of great antiquity. But that which is, perhaps, the most characteristic of the Northumbrian dialect is the formation of the infinitive in *-a* and *æ*, instead of *-an* (*hældæ*, *gistiga*). The Durham Book has, I believe, throughout but one single verb, which makes the infinitive in *-an*, and that is the anomalous word *bean = to be;* even *wosa* and *wiortha* following the common rule. The word *ungket* is another incontrovertible proof of extreme antiquity, having, to the best of my knowledge, never been found but in this passage. It is the dual of the first personal pronoun *Ic*, and corresponds to the very rare dual of the second personal pronoun *incit*, which occurs twice in Cædmon." *

* J. M. Kemble, "On Anglo-Saxon Runes," *Archæologia*, vol. xxviii.

§ 257. *The Cotton Psalter.*—This is a Latin Psalter in the Cotton collection, accompanied by an Anglo-Saxon interlineation. Place uncertain. Time, ninth century or earlier. The following points of difference between this and the West-Saxon are indicated by Mr. Garnett, *Phil. Soc.* No. 27.

COTTON PSALTER.	WEST-SAXON.
Boen, *prayer*	Bén.
Boec, *books*	Béc.
Coelan, *cool*	Célan.
Doeman, *judge*	Déman.
Foedan, *feed*	Fédan.
Spoed, *fortune*	Spéd.
Swoet, *sweet*	Swét.
Woenan, *think, ween*	Wénan.

§ 258. *The Durham Gospels—Quatuor Evangelia Latine, ex translatione B. Hieronymi, cum glossâ interlineatâ Saxonicâ.*—Nero, D. 4.

§ 259. *The Rituale Ecclesiæ Dunhelmensis.*—Edited for the Surteęs Society by Mr. Stevenson. Place: neighbourhood of Durham. Time: A.D. 970. Differences between the Psalter and Ritual:—

a. The form for the first person is in the Psalter generally *-u.* In the Ritual it is generally *-o.* In West Saxon, *-e.*

PSALTER.—*Getreow-u,* I believe; *cleopi-u,* I call; *sell-u,* I give; *ondred-u,* I fear; *agęld-u,* I pay; *getimbr-u,* I build. Forms in *-o; sitt-o,* I sit; *drinc-o,* I drink.

RITUAL.—*Feht-o,* I fight; *wuldrig-o,* I glory. The ending in *-u* is rarer.

b. In the West Saxon the plural present of verbs ends in *-að: We lufi-að, ge lufi-að, hi lufi-að.* The Psalter also exhibits this West-Saxon form. But the plurals of the Ritual end in *-s:* as, *bidd-as = we pray; giwoed-es = put on; wyrc-as = do.*

c. The infinitives of verbs end in the West Saxon in *-an* as *cwed-an = to say.* So they do in the Psalter. But in the Ritual the *-n* is omitted, and the infinitive ends simply in *-a: cuoetha = to say; inngeonga = to enter.*

d. The oblique cases and plurals of substantives in West Saxon end in *-an:* as *heortan = heart's; heortan = hearts.* So they do in the Psalter. But in the Ritual the *-n* is omitted, and the word ends simply in *-a* or *-e;* as *nome = of a name* (West Saxon *nam-an*); *hearta = hearts.*

§ 260. *The Rushworth Gospels.* — Place, Harewood in Wharfdale, Yorkshire. Time, according to Wanley, the end of the ninth century.

Here observe—

1. That the Ruthwell inscription gives us a sample of the so-called Northumbrian Anglo-Saxon, and that as it is spoken in Scotland, *i. e.* in Galloway.

2. That the Rushworth Gospels take us as far south as the West Riding of Yorkshire.

3. That there are no specimens from any Cumberland, Westmoreland, or North Lancashire localities, these being, most probably, exclusively Keltic.

The most general statements concerning this great section of the Anglo-Saxon, is that it prefers—

1. The sounds of *k* and *s*, to those of *ch* and *sh*.

2. The forms without the prefix *ge-*, to those with them. Nevertheless the form *ge-cenned* (= *natus*) occurs in the first line of the extract from the Durham Gospels.

"The most important peculiarity in which the Durham Evangeles and Ritual differ from the Psalter is the form of the infinitive mood in verbs. This in the Durham books is, with the exception of one verb, beán, *esse*, invariably formed in *-a*, not in *-an*, the usual form in all the other Anglo-Saxon dialects. Now this is also a peculiarity of the Frisic, and of the Old Norse, and is found in no other Germanic tongue; it is then an interesting inquiry whether the one or the other of these tongues is the origin of this peculiarity; whether, in short, it belongs to the Old, the original Frisic form which prevailed in the fifth, sixth, and seventh centuries, or whether it is owing to Norse influence, acting in the ninth and tenth, through the establishment of Danish invaders and a Danish dynasty in the countries north of the Humber."—*Kemble, Phil. Trans.* No. 35.

The Wessex and Northumbrian forms of the Anglo-Saxon are strongly contrasted. That the language of the Midland parts of England was intermediate to the two is a reasonable supposition. We may, if we choose, call this *Mercian*, as many do. If so, the primary division of the Anglo-Saxon dialects is (1) West-Saxon, (2) Mercian, (3) Northumbrian. So little, however, is known of the Mercian, that an arrangement thus systematic is, in the present state of our knowledge, scarcely safe.

§ 261. The study of the dialects of the *Old* and *Middle English* is complicated by a distinction, of some importance, between *simple transcription* and *transcription with accommodation*.

The locality of the authorship of a composition is one thing. The locality of a MS. is another.

Thus — the composition of a Devonshire poet may find readers in Northumberland, and his work be transcribed by a Northumbrian copyist. Now this Northumbrian copyist may do one of two things: he may transcribe the Devonian production *verbatim et literatim*; in which case his country-

men read the MS. just as a Londoner reads Burns, *i. e.* in the dialect of the writer, and not in the dialect of the reader. On the other hand, he may *accommodate* as well as transcribe, *i. e.* he may change the *non*-Northumbrian into Northumbrian expressions, in which case his countrymen read the MS. in their own rather than the writer's dialect.

Now it is clear, that in a literature where transcription *combined with accommodation* is as common as *simple* transcription, we are never sure of knowing the dialect of an author unless we also know the dialect of his transcriber. In no literature is there more of this *semi*-translation than in the Anglo-Saxon and the early English; a fact which sometimes raises difficulties, by disconnecting the evidence of authorship with the otherwise natural inferences as to the dialect employed; whilst, at others, it smoothes them away by supplying as many specimens of fresh dialects, as there are extant MSS. of an often-copied composition.

Inquiring whether certain peculiarities of dialect in Layamon's Brut, really emanated from the author, a writer in the *Quarterly Review* (No. clxiv.) remarks, that to decide this it "would be necessary to have access either to the priest's autograph, or to a more faithful copy of it than it was the practice to make either in his age or the succeeding ones. A transcriber of an early English composition followed his own ideas of language, grammar, and orthography; and if he did not entirely obliterate the characteristic peculiarities of his original, he was pretty sure, like the Conde de Olivares, 'd'y meter beaucour du sein.' The practical proof of this is to be found in the existing copies of those works, almost every one of which exhibits some peculiarity of features. We have *Trevisa* and *Robert of Gloucester* in two distinct forms—*Pier's Ploughman* in at least three, and *Hampole's Pricke of Conscience* in half a dozen, without any absolute certainty which approximates most to what the authors wrote. With regard to Layamon, it might be supposed that the older copy is the more likely to represent the original; but we have internal evidence that it is not the priest's autograph; and it is impossible to know what altera-

tions it may have undergone in the course of one or more transcriptions."

Again, in noticing the orthography of the *Ormulum* (alluded to in the present work*), he writes: "It is true that in this instance we have the rare advantage of possessing the author's autograph, a circumstance which cannot with confidence be predicated of any other considerable work of the same period. The author was, moreover, as Mr. Thorpe observes, a kind of critic in his own language; and we therefore find in his work, a regularity of orthography, grammar, and metre, hardly to be paralleled in the same age. All this might, in a great measure, disappear in the very next copy; for fidelity of transcription was no virtue of the thirteenth or the fourteenth century; at least with respect to vernacular works. It becomes, therefore, in many cases a problem of no small complication, to decide with certainty respecting the original metre, or language, of a given mediæval composition, with such data as we now possess."

From all this it follows, that the inquirer must talk of *copies* rather than of *authors*.

§ 262. Again—differences of spelling do not always imply differences of pronunciation, though perhaps they may be *primâ facie* of such. Still, it is uncritical to be over-hasty in separating, as specimens of *dialect*, works, which, perhaps, only differ in being specimens of separate *orthographies*.

Again—the accommodation of a transcribed work is susceptible of *degrees*. It may go so far as absolutely to replace one dialect by another, or it may go no further than the omission of the more unintelligible expressions, and the substitution of others more familiar. I again quote the *Quarterly Review*:—"There are very few matters more difficult than to determine, *à priori*, in what precise form a vernacular composition of the thirteenth century might be written, or what form it might assume in a very short period. Among the Anglo-Saxon charters of the eleventh and twelfth centuries, many are modelled upon the literary Anglo-Saxon, with a few slight changes of orthography and inflection; while

* Vol. ii. p. 116.

others abound with dialectical peculiarities of various sorts. Those peculiarities may generally be accounted for from local causes. An East-Anglian scribe does not employ broad western forms, nor a West of England man East-Anglian ones; though each might keep his provincial peculiarities out of sight, and produce something not materially different from the language of Ælfric."

In the Reeve's Tale, Chaucer puts into the mouth of one of his north-country clerks, a native of Strother, in the north-west part of the deanery of Craven, where the Northumbrian dialect rather preponderates over the Anglian, certain Yorkshire glosses. "Chaucer* undoubtedly copied the language of some native; and the general accuracy with which he gives it shows that he was an attentive observer of all that passed around him.

"We subjoin an extract from the poem, in order to give our readers an opportunity of comparing southern and northern English, as they co-existed in the fifteenth century. It is from a MS. that has never been collated; but which we believe to be well worthy the attention of any future editor of the Canterbury Tales. The italics denote variations from the printed text:—

"John highte that oon and Aleyn highte that other:
Of *oo* toun were thei born that highte Strother,
Ffer in the north I can not tellen where.
This Aleyn maketh redy al his gere—
And on an hors the sak he caste anoon.
Fforth goth Aleyn the clerk and also John.
With good swerde and bokeler by his side.
John knewe the weye—hym nedes no gide;
And atte melle the sak a down he layth.
Aleyn spak first: Al heyle, Symond—in fayth—
How fares thi fayre daughter and thy wyf?
Aleyn welcome—quod Symkyn—be my lyf—
And John also—how now, what do ye here?
By God, quod John—Symond, nede has *na* pere.
Hym bihoves *to* serve him self that has na swayn;
Or *ellis* he is a fool as clerkes sayn.

* From the *Quarterly Review*, No. cx.

Oure maunciple I hope he wil be ded—
Swa *werkes hym* ay the wanges in his heed.
And therefore is I come and eek Aleyn—
To grynde oure corn, and carye it *ham* agayne.
I pray yow *spedes* * us *hethen* that ye may.
It shal be done, quod Symkyn, by my fay!
What wol ye done while it is in hande?
By God, right by the hoper wol I stande,
Quod John, and see *how gates* the corn gas inne;
Yit saugh I never, by my fader kynne,
How that the hoper wagges til and fra!
Aleyn answerde—John wil *ye* swa?
Than wil I be bynethe, by my crown,
And se *how gates* the mele falles down
In til the trough—that sal be my disport.
Quod John—In faith, I is of youre sort—
I is as ille a meller as *are* ye.

* * * *

And when the mele is sakked and ybounde,
This John goth out and fynt his hors away—
And gan to crie, harow, and wele away!—
Our hors is lost—Aleyn, for Godde's banes,
Stepe on thi feet—come of man attanes!
Allas, oure wardeyn has his palfrey lorn!
This Aleyn al forgat bothe mele and corn—
Al was out of his mynde, his housbonderie.
What—whilke way is he goon? he gan to crie.
The wyf come lepynge *in* at a ren;
She saide—Allas, youre hors goth to the fen
With wylde mares, as faste as he may go.
Unthank come on this hand that *band* him so—
And he that *bet* sholde have knet the reyne.
Alas! quod John, Alayn, for Christe's peyne,
Lay down thi swerde, and I *wil* myn alswa;
I is ful *swift*—God wat—as is a ra—
By Goddes *herte* he sal nought scape us bathe.
Why ne hadde thou put the capel in the lathe?
Il hayl, by God, Aleyn, thou *is* fonne."

"Excepting the obsolete forms *hethen* (hence), *swa*, *lorn*, *whilke*, *alswa*, *capel*—all the above provincialisms are still,

* Apparently a *lapsus calami* for *spede*.

more or less, current in the north-west part of Yorkshire. *Na, ham*(e), *fra, banes, attanes, ra, bathe*, are pure Northumbrian. *Wang* (cheek or temple) is seldom heard, except in the phrase *wang tooth, dens molaris. Ill*, adj., for *bad—lathe* (barn)—and *fond* (foolish)—are most frequently and familiarly used in the West Riding, or its immediate borders."

Now this indicates a class of writings which, in the critical history of our local dialects, must be used with great caution and address. An imitation of dialect may be so lax as to let its only merit consist in a deviation from the standard idiom.

Edgar in *King Lear*, when assuming madness, speaks after the fashion of a clown, and (so doing) speaks provincially. The particular dialect which he uses is uncertain. The locality in which it is used is Kent. But is the form Kentish? Many hold that there was a conventional dialect for the stage, that this was that of the West Country, inasmuch as the words put into the mouth of the character under notice, as well as many others, are most like those of Somerset and Devon—from which the *present* Kentish differs notably. On the other hand, a well-known Kentish specimen of the thirteenth century is full of West-country forms. If so, the dialect has altered—certainly since the time of the work in question, possibly since that of Shakspere.

In Ben Jonson's *Tale of a Tub*, one (and more than one of the characters) speaks thus; his residence being the neighbourhood of London.

> Is it no sand? nor buttermilk? if 't be,
> Ich 'am no *z*ive, or watering-pot, to draw
> Knots in your 'casions. If you trust me, *z*o—
> If not, *pra*forme 't your *z*elves. 'Cham no man's wife,
> But resolute Hilts: you 'll *v*ind me in the buttry.
>
> *Act* I. *Scene* 1.

This is certainly Western, rather than South-Eastern, *at the present time at least.*

Not so, however, with the provincialisms of another of Ben Jonson's plays, the *Sad Shepherd:*

> ——shew your sell
> Tu all the sheepards, bauldly; gaing amang hem.

Be mickle in their eye, frequent and fugeand.
And, gif they ask ye of Eiarine,
Or of these claithes; say that I ga' hem ye,
And say no more. I ha' that wark in hand,
That web upon the luime, sall gar em thinke.

Act II. *Scene* 3.

Here the forms are Northern, the scene of the play being Sherwood Forest.

Is this the present dialect of Nottinghamshire? Not much. Was it the dialect of Nottinghamshire in Jonson's time? It was either that or something conventional; or, possibly, it was the dialect best known to the author.

Sufficient has been said to show the caution required in connecting the older with the present provincialisms. The extent to which this has been done will appear towards the conclusion of our next chapter.

CHAPTER IV.

PROVINCIAL FORMS OF SPEECH AT PRESENT EXISTING.

§ 263. That the distinction between the Angle and the Saxon portions of England has no real existence, is a doctrine for which the reasons have been given in Part I.

From this it follows that the ordinary division into the Angle and the Saxon dialects of England is invalid.

The extent to which philological elements derived from the *Jutes* of *Jut*-land are *not* to be sought for in either Kent or Hants has been investigated.

So has the extent to which philological elements derived from the Goths of Gaul, and the Franks of Gaul *may* be sought for.

The points where the English and British frontiers meet are supplied by the ordinary maps—the localities wherein the original British held its ground the longest being indicated in the ordinary histories.

The Danish, Norse, or Scandinavian areas will be considered in a separate chapter—a chapter which also contains some remarks upon the Frisians.

In ignoring the ordinary distinctions between the Angles and the Saxons the present writer deviates widely from his predecessors. Nevertheless, he, by no means denies that the application of the two terms to different parts of England may be a fact, which, if rightly interpreted, is of considerable importance. That the words Sus-*sex*, Es-*sex*, Middle-*sex*, and Wes-*sex*, mean *something* in the way of *Saxon*-hood is transparently evident. It is only doubtful in what this *Saxon*-hood consisted. Now if it did not consist in a *real* difference between the Saxons and the Angles, it consisted in a difference of the conditions under which the two names were imposed.

The details of the difference I imagine to have been as follows:—

In the Saxon parts of England the influence of the populations who called the *Angles* by the name of *Saxon* was sufficient to give currency to the latter term, as opposed to the former; whereas, in the Angle parts of England this influence was insufficient to affect the currency and predominance of the native names.

Now the populations who called the Angles by the name of Saxon were three—(1) the original Britons, (2) the Romans, and (3) the Franks—supposing these latter to have been (as they are by hypothesis) early occupants of Kent.

The value of each of these influences in determining the name *Saxon* has yet to be investigated—if, indeed, it lies within the field of investigation. So have the questions depending on the Gothic hypothesis.

The *real* fact, then, indicated by the term *Saxon* (a term which the currency of the names Es-*sex*, Sus-*sex*, Middle-*sex*, and Wes-*sex* makes convenient) is, the prevalence of some element, either Roman or British, either Frank or Gothic, either Romano-Britannic or Franco-Gothic, &c., &c., in the parts south of the Orwell and the Thames, of sufficient influence to determine the preponderance of a British, Roman, or Frank name over a German one, even in the case of a German population.

The term *Saxon* as applied to our dialects is *convenient;* its convenience making the use of it excusable; and—

The division of our dialects called *Saxon* is, to a certain extent, *natural*—though not on account of the reasons usually exhibited.

§ 264. The extent to which the standard or classical Anglo-Saxon was Saxon rather than Angle has already been noticed. It may be added that it was *West*-Saxon rather than either *South*-Saxon, or *East*-Saxon, *Middle*-Saxon or Kentish.

Now, it by no means follows that because the *West*-Saxon was the form of speech most under cultivation in the times anterior to the Norman Conquest, it should also be the form of speech in which the English writers most especially expressed themselves. On the contrary, the literary develop-

ment of the southern dialects may have ceased with the Saxon line of kings, whereas the reaction against the Anglo-Norman may have begun with some other dialect—Northern, Eastern, Western, or Midland, as the case may have been.

§ 265. In the present state of our knowledge we should neither wholly eliminate from the study of the modern dialects such terms as Saxon, Mercian, and Northumbrian, on the one side, nor yet, on the other, force our groups into an absolute agreement with the old political divisions of the Anglo-Saxon period.

Let—

Saxon = *Southern*
Northumbrian = *Northern*
East Anglian = *Eastern*,
Mercian = *Midland*,

and we get a convenient and not very inaccurate nomenclature — a nomenclature, however, which is merely provisional. Should it lead to any undue identifications between the political and philological divisions, it should be abandoned.

§ 266. *The Midland (Mercian?) Group of Dialects.*— I think that it was Mr. Guest who first diverted the attention of scholars from the consideration of the West-Saxon of the chief Anglo-Saxon writers as the mother-dialect of the present English to the Mercian; so turning their attention from the south to the centre of England.

The primary reason for this view lies in the fact of the Midland Dialects making the nearest approach to the literary English. This is only another way of saying that the literary English more especially represents the Midland dialects. That the peasants and country people of these parts partake of the nature of literary men more than those elsewhere, and that they speak more purely on the strength of a better education, is an untenable position. The truer view is, that the English of our standard authors originated in the Midland counties. Hence, it is the literature that resembles the dialects rather than the dialects that emulate the literature.

The particular district where the difference between the language of the educated portion of the community and the masses is at its *minimum*, I believe, to be the parts between

St. Neots in Huntingdonshire and Stamford on the borders of Lincoln, Rutland, and Northamptonshire. This gives the county of Huntingdon as a centre. The same—though in a less degree—applies to the southern, eastern, and south-eastern parts of Lincolnshire, Rutland, the north and north-western parts of Cambridge, the western parts of Essex, Herts, Beds, Northamptonshire, and part of Bucks. In Warwickshire, and Oxfordshire, a similar representation of the literary English prevails—though a change from the typical forms of Huntingdon and Bedford is apparent.

In the quarters I know best—*i.e.* the southern parts of Lincolnshire, Gay's song of—

Our Polly is a sad slut, &c.

would run as follows :—

Our Polly is a sad sloot,* nor heeds what we hev taught her,
I woonder any man on eerth should ivver rare a daughter ;
For she mun hev both hoods and gowns and hoops to swell her pride,
And scarves, and stays, and gloovs, and laĕce, and she 'll hev men beside ;
And when she 's dressed with carr and cost, so temptin, foyne, and gay,
As men should sarve a cowcumber, she flings hersen away.

I do not say that this gives us the *minimum* deviation from the literary English. I only say that it approaches it.

With dialects even more than with separate substantive languages must we classify after types, rather than by definitions.

For this reason the parts about Huntingdon or Bedford have been chosen as a centre for the Midland, or Mercian forms of speech. For—

§ 267. *The Southern—Saxon—group of Dialects,* we conveniently begin with Somersetshire. The dialect of this county—especially the western parts of it—stands in strong contrast to the Huntingdon.

* Sounded as the *u* in *full.*

§ 268. SPECIMENS.

*Mr. Guy and the Robbers.**

1.
Mr. Guy war a gennelman
O' Huntsfull, well knawn
As a grazier, a hirch one,
Wi' lons o' hiz awn.

2.
A oten went ta Lunnun
He's cattle ver ta zill;
All the hosses that a rawd
Niver minded hadge or hill.

3.
A war afeard o' naw one;
A niver made his will;
Like wither vawk, avaur a went
He's cattle vor ta zill.

4.
One time a'd bin to Lunnun,
An zawld iz cattle well;
A brought awa a power o' gawld,
As I 've a hired tell.

5.
As late at night a rawd along,
All droo a unket ood,
A ooman rauze vrom off tha groun,
An right avaur en stood.

6.
She look'd za pitis Mr. Guy
At once hiz hoss's pace
Stapt short, a wonderin how, at night,
She com'd in jitch a place.

7.
A little trunk war in her hon;
She zim'd vur gwon wi chile,
She ax'd en nif a'd take er up
An cor er a veo mile.

8.
Mr. Guy, a man o' veelin
Vor a ooman in distress,
Than took er up behind en;
A cood'n do na less.

9.
A corr'd er trunk avaur en,
And by hiz belt o' leather
A bid her hawld vast; on tha rawd,
Athout much tak, together.

10.
Not vur tha went avaur she gid
A whissle loud an long,
Which Mr. Guy thawt very strange,
Er voice too zim'd za strong;

11.
She'd lost er dog, she zed; an than
Another whizzle blaw'd,
That stortled Mr. Guy; a stapt
His hoss upon the rawd.

12.
Goo on, zed she; bit Mr. Guy
Zum rig beginn'd ta fear;
Vor voices rauze upon tha wine,
An zim'd a comin near.

13.
Again tha rawd along; again
She whissled, Mr. Guy
Whipt out his knife an cut tha belt,
Than push'd er off; vor why:

14.
Tha ooman he took up behine,
Begummers, war a man;
Tha rubbers zaw ad lad ther plots
Our grazier to trepan.

* From Halliwell's *Archaic and Provincial Dictionary.*

15.

I sholl not stap ta tell what zed
Tha man in ooman's clawze,
Bit he an all o'm jist behine
War what you mid suppauze—

16.

Tha cust, tha swaur, tha dreaten'd too,
An ater Mr. Guy
Tha gallop'd all; twar niver tha near,
Hiz hoss along did vly.

17.

Auver downs, droo dales, awa a went,
Twar da-light now amawst,
Till at an inn a stapt, at last,
Ta thenk what he'd a lost.

18.

A lost! why nothin—but hiz belt
A zummet moor ad gain'd;
Thic little trunk a corr'd awa,
It gawld galore contain'd.

19.

Nif Mr. Guy war hirch avaur,
A now war hircher still,
Tha plunder o' tha highwamen
Hiz coffers went ta vill.

20.

In safety Mr. Guy rawd whim,
A o'ten tawld the story;
Ta meet wi' jitch a rig myzel,
I shood'n soce be zorry.

The Devonshire forms are more extreme still.

EXTRACT.*

Rab. Zo, Bet, how is't? How de try?—Where hast a'be thicka way? Where dost come from?

Bet. Gracious, Rab! you gush'd me. I've a' be up to vicarige, to vet a book vor dame, and was looking to zee if there be any shows in en, when you wisk'd over the stile, and galled me.

Rab. And dost thee look so like a double-rose, when thee art a' galled, Bet? What dost thee gook thee head vor: look up, wo't?

Bet. Be quiet: let 'lone my hat, wol ye?

Rab. What art tozing over the book vor?

Bet. Turning out the dog's ears.

Rab. 'Ot is it—a story book?

Bet. I wish 'twas, I love story books dearly; many nearts I've a' zit up when all the volks have a' be a-bed, and a' rede till es have had a crick in the niddick, or a' burn'd my cep.

Rab. And dost love to rede stories about spirits and witches?

Bet. I'll tell thee. I was wan neart reding a story book about spirits, that com'd and draw'd back the curtains at the bed's voot

* *A Devonshire Dialogue, in Four Parts*, &c. Edited by Mrs. Gwatkin. London and Plymouth, 1839.

(and there was the ghastly pictures o' em). The clock had beat wan, when an owl screech'd 'pon the top o' the chimley, and made my blood rin cold. I zim'd the cat zeed zum 'ot: the door creaked, and the wind hulder'd in the chimley like thunder. I prick'd up my ears, and presently, zum 'ot, very hurrisome, went dump! dump! dump! I would a' geed my life vor a varden. Up I sprung, drow'd down my candle, and douted en; and hadn't a blunk o' fire to teen en again. What could es do? I was afear'd to budge. At last I took heart, and went up stears backward, that nort mert catch me by the heels. I didn't unray mysel vor the neart, nor teen'd my eyes, but healed up my head in the quilt, and my heart bumpt zo, ye could hear en; and zo I lied panking till peep o' day.

RAB. Poor Bet! why if a vlea had hopp'd into thy ear thee wot a' swoon'd.

BET. You may well enew laugh at me, but I can't help et, nor vorbear reding the books when I come athort 'em. But I'll tell thee: I've a' thort pon't zince, that the dump! dump! dump! that galled me zo, was nort else but our great dog diggin out his vleas against the dresser.

RAB. Like enew: I marvel that you, who ha' zo much indel and oudel work to do, can vend time vor reding; but then, it zeems, you rede when you ought to zleep.

BET. Why, you must know, Dame dosn't like I shu'd rede zich books; it be other lucker books us ha' vrom the Pason; and when us ha' done up our chewers, and 'tis candle-teeming, Measter takes hiszell to the alehouse, I take up my knitting, and Dame redes to me. Good now: es may ha' as many books vrom the Pason as us wol, he ne'er zaith her nay, and he hath a power o' em, that a' hath.

In Cornwall the general character is Devonian—in Cornwall, however, we must remember that the Cornubian form of the British was in existence during the last century.

The Gloucestershire dialect belongs to the same class with the Somerset; with which (as with the Wilts) it agrees more than with the Herefordshire.

SPECIMEN.

*George Ridler's Oven.**

1.

The stowns that built George Ridler's Oven,
And thauy qeum from the Bleakeney's quar;
And George he wur a jolly old mon,
And his yead it graw'd above his yare.

2.

One thing of George Ridler I must commend,
And that wur not a notable theng;
He mead his brags avoore he died,
We any dree brothers his zons z'hou'd zeng.

3.

There's Dick the treble and John the mean,
Let every mon zing in his auwn pleace;
And George he wur the elder brother,
And therevoore he would zing the beass.

4.

Mine hostess's moid (and her neaum 'twur Nell),
A pretty wench, and I lov'd her well;
I lov'd her well, good reauzon why;
Because zhe lov'd my dog and I.

5.

My dog is good to catch a hen,
A duck or goose is vood for men;
And where good company I spy,
O thether gwoes my dog and I.

6.

My mwother told I when I wur young,
If I did vollow the strong beer pwoot,
That drenk would pruv my auverdrow,
And meauk me wear a thread-bare cwoat.

7.

My dog has gotten zitch a trick,
To visit moids when thauy be zick:
When thauy be zick and like to die,
O thether gwoes my dog and I.

* From Halliwell's *Archaic and Provincial Dictionary*

8.

When I have dree zispences under my thumb,
O then I be welcome wherever I come;
But when I have none, O then I pass by,
'Tis poverty pearts good company.

9.

If I should die, as it may hap,
My greauve shall be under the good yeal tap:
In vouled earms there wool us lie,
Cheek by jowl my dog and I.

The Western Somerset graduates into the Devonshire; the Eastern into the Wiltshire and Dorsetshire forms of speech, these latter being still strongly marked by provincial peculiarities—more so than that of Berks, which theoretically is the special representative of the Anglo-Saxon of Wessex:—

SPECIMEN.

1.

*A Letter from a parish Clerk in Dorsetshire to an absent Vicar, in the Dialect of the County. From "Poems on Several Occasions," formerly written by John Free, D.D. 8vo., London, 1757.**

Measter, an't please you, I do send,
Theaz letter to you as a vriend,
Hoping you'll pardon the inditing,
Becaz I am not us'd to writing,
And that you will not take unkind
A word or zo from poor George Hind.
For I am always in the way,
And needs must hear what people zay.
First of the house they make a joke,
And zay the chimnies never smoak.
Now the occasion of these jests,
As I do think, were swallows nests;
That chanc'd the other day to vaal,
Into the parlour, zut and aal.
Bezide the people not a few,
Begin to murmur much at you,

* From Halliwell's *Archaic and Provincial Dictionary.*

For leaving of them in the lurch,
And letting straingers zerve the church,
Who are in haste to go agen;
Zo, we ha'nt zang the Lord knows when.
And for their preaching, I do know,
As well as moost, 'tis but zo, zo.
Zure if the call you had were right,
You ne'er could thus your neighbours slight;
But I do fear you've zet your aim on
Naught in the world but vilthy mammon, &c.

2

From Akerman's "Wiltshire Tales."

Everybody kneows old Barnzo, as wears his yead o' one zide. One night a was coming whoame vrom market, and vell off's hos into the road, a was *zo* drunk. Some chaps coming by picked un up, and zeein' his yead was al o' one zide, they thought 'twas out 'o jint, and began to pull 't into 'ts pleace agen, when the owld bwoy roar'd out, "Barn zo (born so), I tell 'e!" Zo a' was allus called owld Barnzo ever a'terwards.

Whilst Kent, Surrey, and Sussex, like Berkshire, are poor in dialectical characteristics, Hants, like Dorset (for which Barnes' poems are the classical work), preserves a good deal of the old language, its dialects belonging, evidently, to the Dorset and Wilts division.

SPECIMEN.*

Isle of Wight Dialect.

JAN. What's got there you?

WILL. A blastnashun straddlebob craalun about in the nammut bag.

JAN. Straddlebob! Where ded'st leyarn to caal'n by that neyam?

WILL. Why what shoud e caal'n? tes the right neyam, esn ut?

JAN. Right neyam, no! why ye gurt zote vool casn't zee tes a Dumbledore?

WILL. I knows tes, but vur aal that Straddlebob's zo right a neyam vorn as Dumbledore ez.

* From Halliwell's *Archaic and Provincial Dictionary.*

JAN. Come, I'll be deyand if I doant laay thee a quart o'that.

WILL. Done! and I'll ax meyastur to night when I goos whooam, beet how't wool. (Accordingly meyastur was applied to by Will, who made his decision known to Jan. the next morning.)

WILL. I zay, Jan! I axed meyastur about that are last night.

JAN. Well! what did 'ur zay?

WILL. Why a zed one neyam ez jest zo vittum vorn as tother, and he louz a ben caald Straddlebob ever zunce the island was vust meyad.

JAN. The devvul a hav! if that's the keeas I spooas I lost the quart.

WILL. That thee has't lucky! and we'll goo down to Arverton to the Red Lion and drink un ater we done work.

§ 269. *The Northern—Northumbrian—Group of Dialects.*—It is safe to say that a line drawn from Warrington to Chesterfield, and from Chesterfield to Goole, gives us a limit concerning which we may predicate that everything to the north, and something to the south of it, is *Northumbrian*. Able writers indeed, make the southern part of Yorkshire, and South Lancashire Mercian. I think, however, that they have allowed themselves to be misled by the *political* value of the term.

The extent to which certain important districts *south* of this line are also Northumbrian is another question.

The more prominent dialects of this class scarcely yield to the Exmoor and West Somerset forms of speech in their departure from the ordinary English.

The divisions and sub-divisions of this group are numerous, and, in some cases, well-defined. Nevertheless, they graduate into each other.

The South Lancashire is well-known from the specimens of Collier (Tim Bobbin). Rochdale, Oldham, and Bury are (I believe) the *towns* nearest this standard.

SPECIMEN.*

TUM. Theaws no peshunce, Meary; boh howd te tung on theawst hear in o snift: for theaw mun know, ot tis some cunstable wur os preawd ot id tean poor Tum prisner, or if theaw'd tean o hare on had hur eh the appern meet neaw; boh th' gobbin ne'er considert

* From *Tim Bobbin*—the spelling somewhat exaggerated.

o' honging would naw be cawd good spooart be ony body eh ther senses, on wer enough fort' edge o finer mon's teeth in mine. Heawe'er he knock os bowdly ot justice's dur, os if id ha dung it deawn. This fotcht o preaw'd gruff felly eawt, whooa put us int' a pleck we as money books an papers os a cart wou'd howd. To this mon (whooa I soon perceiv't wur th' clark) th' cunstable tow'd meh wofoo kese; an eh truth, Meary, I'r os gawmless os o goose, on began o whackering os if I'd stown o how draight o horses. Then this felly went eawt o bit, on with him coom the justice, whooa I glendurt sooar, an thowt he favort owd John o' Dobs, whooa theaw knows awlus wears a breawnish white wig, ot hongs on his shilders like keaw-teals. "Well, Mr. Cunstable," sed justice, "whot han ye brought me neaw?" "Why, pleeos yer worship, ween meet neaw tean o horse-steyler, whooa wur meying off with tit os hard os he cou'd." Od, thought I't meh seln, "neaw or never" Tum! speyke for the sell, or theawrt throttlt ot tis very beawt; so I speek up, an sed, "that's naw true, Mr. Justice: for I'r boh gooink ofoot's pese." "Umph," said th' justice, "there's naw mitch difference as to that point. Heawe'er, howd teaw the tung, yung mon, and speyk when the'rt spokk'n too. Well, theaw mon ith breawn cooat, theeaw!" sed th' justice, "whot has theaw to sey ogen this felly here? Is this tit thy tit, seys to?" "It is, sur." "Here clark, bring's that book, on lets swear him." Here th' justice sed o nominy to 'im, on towd 'im he munt tey kere o whot eh sed, or he moot as helt be foresworn, or ong that yeawth there. "Well, on theaw seys ot tis tit's thy tit, is it?" "It is, pleeos yer worship." "On where had teaw him, seys to?" "I bred im, sur." "E whot country?" "Cown-edge, sur." "On when wur he stown, seys to?" "Last dey boh yusterday, abeawt three o' clock ith oandurth: for eawr Yem saigh 'im abeawt two, on we mist 'im obeawt four o'clock." "On fro Cown-edge, theaw seys?" "Yus, sur." Then the justice turn'd im to me, on sed, "Is aw tis true ot this man seys, hears to meh?" "It is," sed I, "part on't; on part on't is naw: for I did naw steyl this tit: nor ist oboon two eawrs sin furst time ot eh brad meh e'n on im." "Heaw coom theaw't be riding owey wi' im then, if theaw did naw steyl im?" "Why, o good deed, sur; os I'r goink toart whom to dey, o felly weh o little reawnd hat, on o scrunt wig, cullur o yoars, welly, boh shorter, o'ertook meh; he wur riding o one tit on lad another. Neaw this mon seeink I'r toyart, becose I went wigglety-wagglety ith' lone, he offer't meh his lad tit t' ride on. I'r fene oth' proffer, beleemy, on geet on: boh he ride off, whip on spur, tho he cou'd hardly mey th' tit keawnter, on wou'd

stey on meh ot on eleheawse ith' road. Naw, measter justice, I'd naw gon three-quarters on o mile boh theese fok o'ertean meh; towd meh I'd stown th' tit, on neaw han brought meh hither, os in I'r o 'Yorshar horse-steyler.' On this is aw true, master justice, or mey I ne'er gut' on ill pleck when eh dee."

*The Oldham Weaver.**

1.

Oi'm a poor cotton-weyver, as mony a one knoowas,
Oi've nowt for teh yeat, an oi've woorn eawt my clooas,
Yo'ad hardly gi' tuppence for aw as oi've on,
My clogs are boath brosten, and stuckins oi've none,
Yo'd think it wur hard,
To be browt into th' warld,
To be—clemmed, an do th' best as yo con.

2.

Owd Dicky o' Billy 's kept telling me lung,
Wee s'd ha' better toimes if I'd but howd my tung,
Oi've howden my tung, till oi've near stopped my breath,
Oi think i' my heeart oi'se soon clem to deeath,
Owd Dicky 's weel crammed,
He never wur clemmed,
An' he ne'er picked ower i' his loife.

3.

We tow'rt on six week—thinking aitch day wur th' last,
We shifted, an' shifted, till neaw we're quoite fast;
We lived upo' nettles, whoile nettles wur good,
An' Waterloo porridge the best o' eawr food,
Oi'm tellin' yo' true,
Oi can find folk enow,
As wur livin' na better nor me.

4.

Owd Billy o' Dans sent th' baileys one day,
Fur a shop deebt oi eawd him, as oi could na pay,
But he wur too lat, fur owd Billy o' th' Bent,
Had sowed th' tit an' cart, an' ta'en goods fur th' rent,
We'd neawt left bo' th' owd stoo',
That wur seeats fur two,
An' on it ceawred Marget an' me.

* From *Mary Barton*, vol. i. pp. 51, 52.

5.

Then t' baileys leuked reawnd un as sloy as a meawse,
When they seed as aw t' goods were ta'en eawt o' t' heawse,
Says one chap to th' tother, "Aws gone, theaw may see;"
Says oi, "Ne'er freet, mon, yeaur welcome ta' me."
They made no moor ado
But whopped up th' eawd stoo',
An' we booath leet, whack—upo' t' flags!

6.

Then oi said to eawr Marget, as we lay upo' t' floor,
"We's never be lower i' this warld, oi'm sure,
If ever things awtern, oi'm sure they mun mend,
For oi think i' my heart we're booath at t' far eend;
For meeat we ha' none;
Nor looms teh weyve on,—
Edad! they're as good lost as fund."

7.

Eawr Marget declares had hoo clooas to put on,
Hoo'd goo up to Lunnon an' talk to th' greet mon;
An' if things were na awtered when there hoo had been,
Hoo's fully resolved t' sew up meawth an' eend;
Hoo's neawt to say again t' king,
But hoo loikes a fair thing,
An' hoo says hoo can tell when hoo's hurt.

The Westmoreland dialect is closely allied to the Cumberland (both being Scotch rather than English), represented by the following

EXTRACT.

The Impatient Lassie.

Deuce tek the clock! click-clackin' sae
Ay in a body's ear;
It tells and tells the teyme is past
When Jwohnny sud been here.
Deuce tek the wheel! 'twill nit rin roun,
Nae mair to-neet I'll spin,
But count each minute wid a seegh
Till Jwohnny he steals in.

How neyce the spunky fire it burns
For twee to sit beseyde,
And theer's the seat where Jwhonny sits—
And I forget to cheyde;
My fadder, tui, how sweet he snwores,
My mudder's fast asleep—
He promis'd oft, but, oh! I fear
His word he wunnet keep.

What can it be keeps him frae me?
The ways are nit sae lang,
And sleet and snow are nought at aw
If yen were fain to gang:
Some udder lass, wi' bonnier feace,
Has catch'd his wicked ee,
And I'll be pointed at at kurk—
Nay, suiner let me dee!

O durst we lasses nobbet gang
And sweetheart them we leyke,
I'd run to thee, my Jwohnny, lad,
Nor stop at bog or deyke:
But custom's sec a silly thing—
Thur men mun hae their way,
And monie a bonny lassie sit
And wish frae day to day.

I yence hed sweethearts monie a yen
They'd weade thro' muck and mire,
And when our fwok wer deed asleep
Com' tremlin' up to t' fire.
At Carel market lads wad stare,
And talk, and follow me;
Wi' feyne shwort keakes, ay frae the fair,
Baith pockets cramm'd wad be.

O dear! what changes women pruive
In less than seeben year,
I walk the lonnins, owre the muir,
But de'il a chap comes near!
And Jwohnny I nee mair can trust,
He's just like aw the lave;
I fin' this sairy heart 'll brust!
I'll suin lig i' my grave!

But, whisht!—I hear my Jwohnny's fit—
  Aye, that's his varra clog!
He steeks the faul yeat softly tui—
  Oh, hang that cwoley dog!
Now hey for seeghs and suggar words,
  Wi' kisses nit a few—
This warl's a parfe't paradeyse
  When lovers they pruive true!

The Durham forms of speech closely approach the Northumberland.

SPECIMEN.*

In a town near Newcassel, a pitman did dwell,
Wiv his wife named Peg, a tom-cat, and himsel;
A dog called Cappy, he doated upon,
Because he was left by his great uncle Tom.
  Weel bred Cappy, famous au'd Cappy;
  Cappy's the dog, Talliho, Talliho!

His tail pitcher-handled, his colour jet black;
Just a foot and a half was the length of his back;
His legs seven inches frer shoulders to paws,
And his lugs like twe dockins, hung owre his jaws.
  Weel bred Cappy, famous au'd Cappy,
  Cappy's the dog, Talliho, Talliho!

For huntin' of varmin reet cliver was he,
And the house frer a' robbers his bark wad keep free.
Could baith fetch and carry; could sit on a stool,
Or, when frisky, wad hunt water-rats in a pool.
  Weel bred Cappy, &c.

As Ralphy to market one morn did repair,
In his hatband a pipe, and weel combed was his hair;
Ower his arm hung a basket—thus onwards he speels,
And enter'd Newcassel wi' Cap at his heels.
  Weel bred Cappy, &c.

He hadn't got further than foot of the side,
Afore he fell in with the dog-killin' tribe;
When a highwayman fellow slipp'd round in a crack,
And a thump o' the skull laid him flat on his back!
  Down went Cappy, &c.

* *Handley Cross*, vol. ii. pp. 76-78.

Now Ralphy, extonish'd, Cap's fate did repine,
While its eyes like twee little pearl buttons did shine;
He then spat on his hands, in a fury he grew,
Cries, "'Gad smash! but ar'l hev settisfaction o' thou,
For knockin' down Cappy," &c.

Then this grim-luiken fellow his bludgeon he raised,
When Ralphy eyed Cappy, and then stood amazed;
But fearin' aside him he might be laid down,
Threw him into the basket, and bang'd out o' town.
Away went Cappy, &c.

He breethless gat hyem, and when liftin' the sneck,
His wife exclaim'd, "Ralphy! thou's suin gettin' back;"
"Getten back!" replied Ralphy, "ar wish ar'd ne'er gyen,
In Newcassel, they're fellin' dogs, lasses, and men.
They've knocked down Cappy, &c.

"If aw gan to Newcassel, when comes wor pay week,
Ar' liken him again by the patch on his cheek;
Or if ever he enters wor toon wiv his stick,
We'll thump him about till he's black as au'd Nick,
For killin' au'd Cappy," &c.

Wiv tears in her een, Peggy heard his sad tale,
And Ralph wiv confusion and terror grew pale;
While Cappy's transactions with grief they talk'd o'er,
He creeps out o' the basket quite brisk on the floor!
Weel done, Cappy! &c.

In Yorkshire, the Cleveland dialect is allied to the Durham. In the southern parts of the East Riding it is modified by the literary English, losing some of its broader characteristics.

In Holderness our Lincolnshire specimen runs as follows:—

Our Polly is a sad Slut, &c.

Oor Polly is a sad slŏot, sheh eeds not wat we 've towt er,
Ah wŏondher ony man on ath should ivver rear a dowter,
Fo sheh mun ev boath oods an goons, an oops te swell er praide,
An scahfs, an staas, angleaves, an leace, an she 'll hae men besaide;
An wen she 's dhriss'd wi' care an cost se temtin faine an gay,
As men should sahve a coōc̣ŏmer, sheh flings hersen away.

The following is an extreme sample of the dialect about Roseberry Topping.

This is te gie nōătice, Jamz Pickersgill yats his yune te morn t'morn, te morn t' nēăn, an te morn t' neet an ne'er langer, se lang as storm hoāds, coz he caen't get eldin = This is to give notice, James Pickersgill heats his oven to-morrow at morn, to-morrow at noon, and to-morrow at night, and not longer, so long as the bad weather lasts, because he can't get fuel.

*Sheffield Dialect.**

Cum all yo cutlin heroes, where'ersome'er yo be,
All yo wot works at flat-backs, cum lissen unto me;
A baskitful for a shillin,
To mak em we are willin,
Or swap em for red herrins, ahr bellies tubbe fillin,
Or swap em for red herrins, ahr bellies tubbe fillin.

A baskit full o' flat-backs o'm shure we'l mak, or mooar,
To ger reit into't gallara, whear we can rant an rooar,
Thro' flat-backs, stooans, an sticks;
Red herrins, booans, an bricks;
If they dooant play Nansa's fansa, or onna tune we fix,
We'l do the best at e'er we can to braik sum ore ther necks.

Hey, Jont, lad, is that thee, where are ta waddlin too?
Dusta work at flat-backs yit, as thahs been used to do?
Hah, cum an tha'st gooa wimma,
An a sample o will gi'tha;
It 's won at o've just fooaged uppa Jeffra's bran new stidda;
Look at it well, it duz excel all't flat-backs e ahr smitha.

Let's send for a pitcher a' ale, lad, for o'm gerrin varra droi;
O'm ommast chooakt we smitha sleck, the woind it is so hoi.
Ge Rafe and Jer a drop,
They sen they cannot stop,
They're e sich a moita hurra to get to 't penny hop.
They're e sich a moita hurra to get to 't penny hop.

Here's Steeam at lives at Heela, he 'l soon be here, o kno.
He's larnt a new Makkarona step, the best yo ivver saw;

* *Sheffield Dialect.*—By A. Bywater. 1839.

He has it sooa compleat,
He troies up ivvera street,
An ommast braiks all't pavors we swattin dahn his feet.
An Anak troies to beat him whenivver they dun meet.

We'l raise a tail be Sunda, Steeam; o kno whoa 's won to sell;
We'l tee a hammer heead at end, to mak it balance well.
It 's a reit new Lunnon tail;
We 'l ware it kail for kail;
Ahr Anak browt it we him, that neet he cum bi 't mail.
We'l drink success unto it—hey! Jont, lad, teem aht t 'ale.

From Hallamshire the dialect changes but little in the direction of (a) Derby and Nottingham, where the speech again graduates into the (b) Cheshire and (c) Staffordshire.

(*a.*)

*A Dialogue between Farmer Bennet and Tummus Lide.**

Farmer Bennet. Tummus, why dunnur yo mend meh shoon?

Tummus Lide. Becoz, mester, 'tis zo cood, I connor work wee the tachin at aw, I 've brockn it ten times I 'm shur to do. It freezes zo hard. Why Hester hung out a smock frock to dry, an in three minits it wor frozzen as stiff as a poker, and I conner afford to keep a good fire; I wish I cud, I 'd soon mend yore shoon, an uthers tow. I 'd soon yarn sum munney, I warrant ye. Conner yo find some work for m', mester, these hard times? I 'll doo onnythink to addle a penny. I con thresh—I con split wood—I con mak spars—I con thack, I con skower a dike, an I con trench tow, hut it freezes so hard. I con winner—I con fother, or milk. If there be need on 't, I woodner mind drivin plow or onnythink.

Farmer B. I hanner got nothin for ye to doo, Tummus; but Mester Boord towd me jist now that they wor gooin to winner, an that they shud want sumbody to help 'em.

Tummus L. O, I 'm glad on 't, I 'll run oor an zee whether I con help 'em, bur I hanner bin weein the threshold ov Mester Boord's doer for a nation time, becoz I thoot misses didner use Hester well; bur I dunner bear malice, an zo I 'll goo.

Farmer B. What did misses Boord za or doo to Hester then?

* From Bosworth's *Anglo-Saxon Dictionary*, Introduction, p. 31, quoted in Halliwell.

Tummus L. Why, Hester may be wor summut to blame too; for her wor one on 'em, de ye zee, that jaw'd Skimmerton,—the mak gam that frunted zum o' the gentlefook. They said t' wor time to dun wee sick litter, or sich stuff, or I dunner know what they caw'd it, but they wor frunted wee Hester bout it; an I said, If they wor frunted wee Hester, they mid bee frunted wee me. This set misses's back up, an Hester hanner bin a charrin there sin. But 'tis no use to bear malice; zo I 'll goo oor, and zee which we the winde blows.

(*b.*)

Farmer Dobbin.

A Day wi' the Cheshur Fox Dugs.

"Thear 's slutch upo' thoi coat, mon, thear 's blood upon thoi chin,
It 's welly toim for milkin, now where ever 'ast 'ee bin?"
"Oiv bin to see the gentlefolk o' Cheshur roid a run,
Owd wench! oiv bin a hunting, an oiv seen some rattling fun."

Th' owd mare was in the smithy when the huntsman, he trots through,
Black Bill agate o' ammering the last nail in her shoe;
The cuvver laid so wheam loik, and so jovial foin the day,
Says I, "Owd mare, we 'll take a fling and see 'em go away."

When up an oi'd got shut ov aw the hackney pads an traps,
Orse dealers an orse jockey lads, an such loik swaggering chaps,
Then what a power o' gentlefolk did oi set oies upon!
A reining in their hunters, aw blood orses every one!

They 'd aw got bookskin leathers on, a fitten 'em so toight,
As roind an plump as turmits be, an just about as whoit;
Their spurs wor maid o' siller, an their buttons maid o' brass,
Their coats wor red as carrots an their collurs green as grass.

A varmeut looking gemman on a woiry tit I seed,
An another close besoid him, sitting noble on his steed;
They ca' them both owd codgers, but as fresh as paint they look,
John Glegg, Esquoir, o' Withington, an bowd Sir Richard Brooke.

I seed Squoir Geffrey Shakerley, the best un o' that breed,
His smoiling face tould plainly how the sport wi' him agreed;
I seed the 'Arl ov Grosvenor, a loikly lad to roid,
I seed a soight worth aw the rest, his farently young broid.

Zur Umferry de Trafford, an the Squoir ov Arley Haw,
His pocket full o' rigmarole, a rhoiming on 'em aw;
Two Members for the Cointy, both aloik ca'd Egerton,
Squoir Henry Brooks and Tummus Brooks, they 'd aw green collurs on.

Eh! what a mon be Dixon John, ov Astle Haw, Esquoir,
You wudna foind, an measure him, his marrow in the shoir;
Squoir Wilbraham o' the Forest, death an danger he defois,
When his coat be toightly buttoned up, an shut be both his oies.

The Honerable Lazzles, who from forrin parts be cum,
An a chip of owd Lord Delamere, the Honerable Tum;
Squoir Fox an Booth an Worthington, Squoir Massey an Squoir Harne,
An many more big sportsmen, but their neames I didna larn.

I seed that great commander in the saddle, Captain Whoit,
An the pack as thrung'd about him was indeed a gradely soight;
The dugs look'd foin as satin, an himsel look'd hard as nails,
An he giv the swells a caution not to roid upo' their tails.

Says he, "Yung men o' Monchester an Livverpoo, cum near,
Oiv just a word, a warning word, to whisper in your ear,
When, starting from the cuvver soid, ye see bowd Reynard burst,
We canna 'ave no 'untin if the gemmen go it first."

Tom Rance has got a single oie wurth many another's two,
He held his cap abuv his yed to shew he'd had a view;
Tom's voice was loik th' owd raven's when he skroik'd out "Tally ho!"
For when the fox had seen Tom's feace he thought it toim to go.

Eh moy! a pratty jingle then went ringing through the skoy,
Furst Victory, then Villager begun the merry croy,
Then every maith was open from the oud'un to the pup,
An aw the pack together took the swelling chorus up.

Eh moy! a pretty skouver then was kick'd up in the vale,
They skim'd across the running brook, they topp'd the post an rail,
They didna stop for razzur cop, but play'd at touch an go,
An them as miss'd a footin there, lay doubled up below.

I seed the 'ounds a crossin Farmer Flareup's boundary loin,
Whose daughter plays the peany and drinks whoit sherry woin,
Gowd rings upon her finger and silk stockings on her feet;
Says I, "It won't do him no harm to roid across his wheat."

So, toightly houdin on by'th yed, I hits th' owd mare a whop,
Hoo plumps into the middle o' the wheatfield neck an crop;
An when hoo floinder'd out on it I catch'd another spin,
An, missis, that 's the cagion o' the blood upo' my chin.

I never oss'd another lep, but kep the lane, and then
In twenty minutes' toim about they turn'd toart me agen;
The fox was foinly daggled, an the tits aw out o' breath,
When they kilt him in the open, an owd Dobbin seed the death.

Loik dangling of a babby, then the Huntsman hove him up,
The dugs a bayin roind him, while the gemmen croid, Whoo-hup!
Then clane an quick, as doesome cawves lick fleetins from the pail,
They worried every inch ov 'im, except his yed and tail.

What 's up wi' them rich gentlefolk and lords as was na there?
There was noither Marquis Chumley, nor the Voiscount Combermere;
Noither Legh, nor France o' Bostock, nor the Squoir o' Peckforton—
How cums it they can stop awhom, such sport a goin on?

Now, missis, sin the markets be a doin moderate well,
Oiv welly maid my moind up just to buoy a nag mysel;
For to keep a farmer's spirits up 'gen things be gettin low,
Theer 's nothin loik Fox-huntin and a rattling Tally-ho!

(*c.*)

*Conversation between a Staffordshire Canal Boatman and his Wife.**

LADY. Dun yo know Solden mouth Summy?

GENT. Eees: an' a' neation good feller he is tew.

LADY. A desput quoiet mon! But he loves a sup o' drink. Dun you know his woif?

GENT. Know her, ay. Her 's† the very devil when her spirit 's up.

* Halliwell's *Archaic and Provincial Dictionary.*

† This should probably be *hoo*, Anglo-Saxon *heo*;—and so elsewhere.

LADY. Her is. Her uses that mon sheamful; her rags him every neet of her loif.

GENT. Her does. Oive known her come into the public, and call him all the names her could lay her tongue tew afore all the company. Her oughts to stay till her 's got him i' the boat, and then her mit say wha her 'd a moind. But her taks aiter her feyther.

LADY. Hew was her feyther?

GENT. Whoy singing Jemmy.

LADY. Oi don't think as how Oi ever know'd singing Jemmy. Was he ode Soaker's brother?

GENT. Eees, he was. He lived a top o' Hell Bouk. He was the wickedest, swearnist mon as ever I know'd. I should think as how he was the wickedest mon i' the wold, and they say he had the rheumatiz so bad.

§ 270. *Extreme and intermediate Dialects.*—As dialects graduate into each other, it is the extreme forms that best illustrate their respective groups, whereas when the confines of another division are approached, forms grow equivocal. That the Northern and Southern dialects form such definite groups as they do, arises, to a great degree, from the negative—or non-pronounced—character of the interjacent midland forms—Mercian in some sense, though not accurately coinciding with the political boundaries of Mercia. This Mercian group is simple. So is the Saxon. The Northumbrian, on the other hand, may have, as our knowledge advances, to be divided and sub-divided, and that into sections, each of which may be equivalent to either of the other two classes. And on these grounds good writers have considered the southern Northumbrian as Mercian. Possibly, it may not be Northumbrian. But the most convenient test of the Mercian is its approach to the literary English.

What are the dialects of Worcester and Hereford? The current statement concerning them, viz. that they agree with those of the midland counties rather than Gloucestershire, makes them Mercian—as they probably are. But whether the Salopian is most like the Cheshire or the Hereford form of speech I cannot say. A line dividing (more or less irregularly) the counties of Lincoln, Nottingham, Leicester, Stafford, and Shrop-

shire, would give us the debatable frontier between the Mercian and the Northumbrian—its outline being sinuous and irregular.

§ 271. *Eastern Counties.*—As contrasted with the Northumbrian dialects those of Norfolk and Suffolk are Mercian; but whether they should be subordinated to the Mercian, as outlying forms, or placed as a separate section by themselves under the name of *East Anglian*, is uncertain. Essex has certain Kentish forms; and, perhaps, it is Kentish, Southern, or Saxon, rather than East Anglian. Middlesex is in the same category as Essex. The confusion between the *v* and *w*, so common with the native Londoner, is an Essex and Middlesex characteristic. The Londoner interchanges them not because he is a cockney, but because his town is a part of Middlesex.

§ 272. *Affiliation of Dialects.*—Compare the present chapter with the one which preceded it, and the question as to the relations of the modern dialects of the one to the ancient ones of the other will present itself—all the more forcibly for our remarks upon the difference between *simple transcription and transcription with accommodation;* all the more forcibly, too, for our cautions respecting the value of theatrical and other imitations of provincial forms of speech. As far, however, as I can form an opinion upon a point which has engaged less of my special study than almost any part of our literature or language, the results are by no means commensurate to the preliminary criticism. They appertain to the history of the written language rather than to that of our special provincialisms. They tell us that, in certain cases, certain MSS. were written in parts of the country different from those wherein the original works were composed. They tell us that, in certain cases, the authorship is referable to a different part of the country from that of the authorship of the standard works in Anglo-Saxon. They tell us that, in many cases, either external or internal evidence will teach us what those parts of the country were, and in the cases of two, or more, MSS. of a single work, account for *variæ lectiones* in the text. But they nowhere, or very rarely, give what we most want, viz.

the equivalent to such samples as those that have lately been laid before the reader in the dialects of their respective localities (say) seven, six, five, four, or (even) three centuries ago. The reason for this seems to be in the fact of the earlier copyists and writers, however much the dialect of the parts wherein they either transcribed or composed might deviate from the literary or cultivated English, having rarely adopted those deviations to anything like their full extent. What they wrote was the ordinary English with certain local characteristics. The difference between an imperfectly-educated North-Briton writing English without being very nice as to his Scotticisms, and Burns composing in his own native Doric, illustrates what I hold to be the difference between a copyist in (say) Gloucestershire, and a writer in the Gloucester dialect, *i.e.* after the manner in which Burns was one in the Ayrshire.

For the more northern forms of the Northumbrian the standard may have been Scotch rather than English.

The doctrine that MSS., however provincial in respect to their locality, are only imperfectly provincial in respect to their form of speech, is as much an inference from the language of our archæological critics as it is from the study of the case itself. An editor, with the text of his author before his eyes, and with that text as the main object of his attention, finds discrepancies between his MSS. which he considers extraordinary. He accounts for them by supposing a difference of either time or place in their transcription—in the instances before us, of place. He fixes this place by the means of certain peculiarities—pronouncing it to lie in Hants, Gloucester, or Yorkshire, as the case may be. Here his function ends. He has discovered certain facts connected with the history of his text, and has explained them as far as was necessary for his subject. The special investigator of our provincial dialects, however, looks upon the MSS. from a different point of view, *his* business being with the history of the particular form of speech before him—his business being to compare the old with the new, and to ascertain the connection between them. In doing this, he finds that what the editors, looking to the standard English, consider to have been provincial, he, looking to what is probably some extreme form of provincialism, treats as English—English

tinctured with a certain amount of rusticity, or archaism, as the case may be, but nothing more.

Let the following extract from Halliwell's *Dictionary of Provincialisms and Archaisms* illustrate this.

The *Romance of Octavian*, according to Mr. Disraeli, is in the Hampshire dialect, nearly as it is spoken now.

Although somewhat doubtful as to the literal correctness of this opinion, an extract from it may be compared with a modern specimen of the dialect.*

1.

The kuy3tys logh yn the halle,
The mantellys they yeve menstrales alle;
Lavor and basyn they gon calle
To wassche and aryse,
And syth to daunce on the walle
Of Parys.

2.

Whan the soudan thys tydyng herde,
For vie as he wer wod he ferd;
He ran with a drawe swerde
To hys mamentrye,
And alle hys goodys ther he amerrede
With greet envye.

3.

Asterob, Jopyn, and Mahoun
He alle to-hew with hys fachoun,
And Jubiter he drew adoun
Of hys autere;
He seyde, hy nere worth a scalounc
Alle y-fere.

4.

Tho he hadde hys goddys y-bete,
He was abated of alle hys hete.
To sende hys sendys nolde he na3t lete,
Tho anoonry3t,
To Babylonye after lordes grete
To help hym fy3t.

* For this see the Isle of Wight specimen, p. 406.

So much for the difference between specimens of a given dialect in its earlier stages and specimens of the literary English as modified by provincial copyists.

The former are rare; the latter, as may be seen from the work last referred to, common.

CHAPTER V.

ISOLATED DIALECTS.

§ 273. *English Dialects not in continuity with the mother-tongue.*—Of these the most remarkable are those of—

1. *Little England beyond Wales.*—In Pembrokeshire, and a part of Glamorganshire, the language is English rather than Welsh. The following extracts from Higden have effected the belief that this is the result of a Flemish colony. "*Sed et Flandrenses, tempore Regis Henrici Primi in magna copia juxta Mailros ad orientalem Angliæ plagam habitationem pro tempore accipientes, septimam in insula gentem fecerunt: jubente tamen eodem rege, ad occidentalem Walliæ partem, apud Haverford, sunt translati. Sicque Britannia ——his——nationibus habitatur in præsenti——Flandrensibus in West Wallia.*"

A little below, however, we learn that these Flemings are distinguished by their origin only, and not by their language: —"*Flandrenses vero qui in Occidua Walliæ incolunt, dimissa jam barbarie, Saxonice satis loquuntur.*"—Higden, edit. Gale, p. 210.

The following vocabulary collected by the Rev. J. Collins,* in the little peninsula of Gower, contains no exclusively Flemish elements.

Angletouch, n. s. *worm.*

Bumbagus, n. s. *bittern.*

Brandis, n. s. *iron stand for a pot or kettle.*

Caffle, adj. *entangled.*

Cammet, adj. *crooked.*

Cloam, n. s. *earthenware.*

Charnel, n. s. *place raised in the roof for hanging bacon.*

* First published in the *Transactions of the Philological Society.* No. 93.

Clit, v. *to stick together.*

Deal, n. s. *litter, of pigs.*
Dotted, adj. *giddy, of a sheep.*
Dome, adj. *damp.*
Dreshel, n. s. *a flail.*

Eddish, n. s. *wheat-stubble.*
Evil, n. s. *a three-pronged fork for dung,* &c.

Firmy, v. *to clean out, of a stable,* &c.
Fleet, adj. *exposed in situation, bleak.*
Flott, n. s. *aftergrass.*
Flamiring, s. *an eruption of the nature of erysipelas.*
Fraith, adj. *free-spoken, talkative.*
Frithing, n. s. *a fence made of thorns wattled.*
Foust, v. act. *to tumble.*
Flathin, n. s. *a dish made of curds, eggs, and milk.*

Gloy, n. s. *refuse straw after the reed has been taken out.*
Gloice, n. s. *a sharp pang of pain.*

Heavgar, adj. *heavier* (so also *near-ger, far-ger*).
Hamrach, n. s. *harness collar made of straw.*
Hay, n. s. *a small plot of ground attached to a dwelliny.*

Kittybags, n. s. *gaiters.*

Lipe, n. s. *matted basket of peculiar shape.*
Letto, n. s. *a lout, a foolish fellow.*

Main, adj. *strong, fine* (*of growing crops*).

Nesseltrip, n. s. *the small pig in a litter.*
Nommet, n. s. *a luncheon of bread, cheese,* &c.—*not a regular meal.*
Noppet, } adj. *lively – convales-*
Nipperty, } *cent.*

Ovice, n. s. *eaves of a building.*

Plym, v. *to fill, to plump up.*
Plym, adj. *full.*
Planche, v. *to make a boarded floor.*
Peert, adj. *lively, brisk.*
Purty, v. n. *to turn sulky.*

Quat, v. act. *to press down, flatten.*
Quapp, v. n. *to throb.*

Rathe, adj. *early, of crops.*
Reremouse, n. s. *bat.*
Ryle, v. *to angle in the sea.*
Riff, n. s. *an instrument for sharpening scythes.*

Seggy, v. act. *to tease, to provoke.*
Semmat, n. s. *sieve made of skin for winnowing.*
Shoat, n. s. *small wheaten loaf.*
Showy, v. n. to *clear* (*of weather*); (*show, with termination* y, *common*).

Soul, n. s. *cheese, butter,* &c. (*as eaten with bread*)
Snead, n. s. *handle of a scythe.*
Songalls, n. s. *gleanings*—to gather *songall, is* to glean.
Sull, *or* Zull, n. s. *a wooden plough.*
Stiping, n. s. *a mode of fastening a sheep's foreleg to its head by a band of straw, or withy.*
Susan, n. s. *a brown earthenware pitcher.*
Sump, n. s. *any bulk that is carried.*
Suant, part. *regular in order.*
Slade, n. s. *ground sloping towards the sea.*
Tite, v. *to tumble over.*
Toit, n. s. *a small seat or stool made of straw.*
'Toit, adj. *frisky, wanton.*
Vair, n. s. *weasel* or *stoat.*
Want, n. s. *a mole.*
Wirg, n. s. *a willow.*
Wimble, v. *to winnow.*
Weest, adj. *lonely, desolate.*
Wash-dish, n. s. *the titmouse.*

2. *The baronies of Forth and Bargie in the County Wexford.*—The barony of Forth "lies south of the city of Wexford, and is bounded by the sea to the south and east, and by the barony of Bargie to the west. It is said to have been colonized by the Welshmen who accompanied Strongbow in his invasion of Ireland; but by the term Welshmen, as here used, we must no doubt understand the English settlers of Gower and Pembroke. Vallancey published a specimen of their language. Some of the grammatical forms can hardly fail to interest the English scholar, and we may venture more particularly to call his attention to the verbal ending *th.* In no other of our spoken dialects do we find the *th* still lingering as an inflection of the *plural* verb."

Address in the Barony of Forth Language.

Presented in August, 1836, *to the Marquis of Normanby, then Earl of Mulgrave, and Lord Lieutenant of Ireland; with a Translation of the Address in English.*

To's Excllencie Consantine Harrie Phipps, Earle Mulgrave, 'Lord Lieutenant-General, and General Governor of Ireland;' Ye soumissive spakeen

To His Excellency Constantine Henry Phipps, Earl Mulgrave, Lord Lieutenant-General and General Governor of Ireland: The humble Address of

o' ouz Dwellers o' Baronie Forthe, Weisforthe.

Mai't be plesaunt to th' Excellencie,

Wee, Vassales o' 'His Most Gracious Majesty' Wilyame ee 4th an az wee verilie chote na coshe an loyale Dwellers na Baronie Forth, crave na dicke luckie acte t'uck necher th' Excellencie, an na plaine garbe o' oure yola talke, wi' vengem o' core t'gie oure zense o'ye grades wilke be ee dighte wi' yer name, and whilke wee canna zie, albeit o' Governere Statesman an alike. Yn ercha an ol o' whilke yt beeth wi' gleezom o'core th' oure eene dwitheth apan ye vigere o'dicke zovereine, Wilyame ee Vourthe unnere fose fatherlie zwae oure deis be ee spant, az avare ye trad dicke lone ver name was ee kent var ee *Vriene o' Levertie*, an *He fo brack ge neckers o' zlaves*—Mang ourzels —var wee dwitheth an Irelone az oure general haime—y'ast bie' ractzom home delt tous ye lass ee mate var ercha vassale, ne'er dwith ee na dicke wai n'ar dicka. Wee dewithe ye ane fose deis bee gien var ee gudevare o' ee lone ye zwae, t'avance pace an levertie, an wi'out vlinch ee garde o' general riochts an poplare vartue.—Ye pace—yea wee ma' zei ye vaste pace whilke be ee stent o'er ye lone zince th' ast ee cam, prooth, y'at we alane needed ye giftes o' general riochts, az be

the Inhabitants of Barony Forth, Wexford.

May it please your Excellency,

We, the subjects of His Most Gracious Majesty William IV., and as we truly believe both faithful and loyal inhabitants of the Barony Forth, beg leave, at this favourable opportunity to approach Your Excellency, and in the simple garb of our old dialect to pour forth from the strength (or fulness) of our hearts, our strength (or admiration) of the qualities which characterise your name, and for which we have no words but of Governor, Statesman, &c. Sir, each and every condition, it is with joy of heart that our eyes rest upon the representative of that Sovereign, William IV., under whose paternal rule our days are spent; for before your foot pressed the soil, your name was known to us as the *Friend of Liberty*, and *He who broke the fetters of the slave*. Unto ourselves—for we look on Ireland to be our common country—you have with impartiality (of hand) ministered the laws made for every subject, without regard to this party or that. We behold you, one whose days devoted to the welfare of the land you govern, to promote peace and liberty—the uncompromising guardian of common rights and public virtue. The peace, yes, we may say the profound peace, which overspreads

displayte bie ee factes o' thie governmente. Ye state na dicke die o'ye lone, na whilke be ne'er fash n'ar moil, albeit "Constitutional Agitation," ye wake o'hopes ee blighte, stampe na per zwae ee be rare an lightzom. Yer name var zetch avanct avare y'e, e'en a dicke var hie, arent whilke ye brine o' zea, an ee crags o'noghanes cazed nae balk. Na oure glades ana whilke we dellte wi' mattoc, an zing t'oure caules wi plou, we hert ee zough o'ye colure o' pace na name o' 'Mulgrave.' Wi 'Irishmen' oure general hopes be ee bond, az 'Irishmen,' an az dwellers na coshe an loyale o' Baronie Forthe, w'oul dei an ercha dei, oure maunes an aure gurles, prie var lang an happie zins, horne o'leurnagh an ee vilt wi benizons, an yersel an oure zoverine 'till ee zin o'oure deis be var ay be ee go t'glade.

the land since your arrival, proves that we alone stood in need of the enjoyment of common privileges, as is demonstrated by the results of your government. The condition, this day, of the country, in which is neither tumult nor confusion, but that constitutional agitation, the consequence of disappointed hopes, confirm your rule to be rare and enlightened. Your fame for such came before you, even into this retired spot, to which neither the waters of the sea yonder, nor the mountains above, caused any impediment. In our valleys, where we were digging with the spade, or as we whistled to our horses in the plough, we heard in the word 'Mulgrave,' the sound of the wings of the dove of peace. With Irishmen our common hopes are inseparably wound up; as Irishmen, and as inhabitants, faithful and loyal, of the Barony Forth, we will daily, and every day, our wives and our children, implore long and happy days, free from melancholy and full of blessings, for yourself and good Sovereign, until the sun of our lives be for ever gone down the dark valley of death.*

§ 274 (*a*). *Americanisms.*—These, which may be studied in the excellent dictionary of J. R. Bartlett, are chiefly referable to five causes—

1. Influence of the aboriginal Indian languages.
2. Influence of the languages introduced from Europe an-

* *Philological Transactions.* No. 84.

terior to the predominance of English; viz. French in Louisiana, Spanish in Florida, Swedish in Pennsylvania and Delaware, and Dutch in New York.

3. Influence, &c., subsequent to the predominance of the English; viz. German in Pennsylvania, and Gaelic and Welsh generally.

4. Influence of the original difference of dialect between the different portions of the English population.

5. Influence of the preponderance of the Anglo-Saxon over the Anglo-Norman element in the American population in general.

b. Few words from the Gypsey language have mixed themselves with our standard (or even our provincial) dialects.

c. Thieves' language, or that dialect for which there is no name, but one from its own vocabulary, viz. *slang*, is of greater value in philology than in commerce. It serves to show that in speech nothing is arbitrary. Its compound phrases are either periphrastic or metaphorical; its simple monosyllables are generally those of the current language in an older form. The thieves of London are conservators of Anglo-Saxonisms. In this dialect I know of no specimens earlier than the reign of Queen Elizabeth. In the dramatic literature of that age they are rife and common. The Roaring Girl, the Jolly Beggars, amongst the plays, and Deckar's Bellman amongst the tracts, preserve us a copious vocabulary, similar to what we have now, and similar to what it was in Gay's time. Of this the greater part is Saxon. Here and there appears a word of Latin origin, e. g. *pannum*, bread; *cassons*, cheese.

CHAPTER VI.

THE NORSE DISTRICTS.

§ 275. If we study the local names of Germany and Scandinavia, we shall find that when we get North of the Eyder a change takes place. In Sleswick the compound names of places begin to end in *-gaard*, *-skov*, and *-by;* in *-by* most especially, as Oster-*by*, Wis-*by*, Gammel-*by*, Nor-*by*, &c. In Jutland the forms in *-by* attain their *maximum*. They prevail in the islands. They prevail in Sweden. They are rare (a fact of great importance) in Norway. In Germany they are either non-existent or accidental. In respect to its meaning, *by* = *town*, *village*, *settlement;* and *By-en* = *the town*, is a term by which Christiania or Copenhagen—the metropolis of Norway and Denmark—is designated. Such forms as Kir-*ton*, Nor-*ton*, and New-*ton* in German, would in Danish, be Kir-*by*, Nor-*by*, New-*by*.

Now the distribution of the forms in *-by* over the British Isles has the same import as its distribution in Germany and Scandinavia. It indicates a Danish as opposed to a German occupancy. Again—the Anglo-Saxon forms are *Church* and *Ship*, as in Dun-*church* and *Ship*-ton; whereas the Danish are *Kirk* and *Skip*, as in Orms-*kirk* and *Skip*-ton. The distribution of these forms over the British Isles closely coincides with that of the compounds in *-by*.

With these preliminaries we will follow the lines which are marked out by the occurrence of the places in *-by;* beginning at a point on the coast of Lincolnshire, about half-way between the entrance to the Wash and the mouth of the Humber; the direction being south and south-west. Ander-*by* Creek, Willoug-*by* Hills, Mum-*by*, Or-*by*, Ir-*by*, Firs-*by*, Reves-*by*,

Conings-*by*, Ewer-*by*, Asgar-*by*,* Span-*by*, Dows-*by*, Duns-*by*, Hacon-*by*,* Thurl-*by*, Carl-*by** take us into Rutlandshire, where we find only Gran-*by* and Hoo-*by*. Neither are they numerous in Northamptonshire; Canons' Ash-*by*, Cates-*by*, and Bad-*by* giving us the outline of the South-eastern parts of their area. For Huntingdon, Cambridge, and Beds, nothing ends in -*by*, whilst the other forms are in *sh*, and *ch*—as *Charlton*, *Shelton*, *Chesterton* rather than *Carlton*, *Skelton*, *Casterton*. Leicestershire is full of these forms, as may be seen by looking at the parts about Melton, along the valleys of the Wreak and Soar; but as we approach Warwickshire they decrease, and there is none south of Rug-*by*. More than this, the form changes suddenly, and three miles below the last-named town we have Dun-*church* and Coa*ch*-*batch*. Tradition, too, indicates the existence of an old March or Debateable Land; for south of Rug-*by* begins the scene of the deeds of Guy Earl of Warwick, the slayer of the *Dun* Cow. Probably, too, the Bevis of Hampton was a similar† *North*-amptonshire hero, notwithstanding the claim of the town of *South*-ampton.

The line now takes a direction northwards and passes through Bretby (on the Trent) to Derby, Leicestershire being wholly included. And here the frontier of the forest which originally covered the coal-district seems to have been the western limit to the Danish encroachments, Rotheram, Sheffield, and Leeds lying beyond, but with the greater part of Nottinghamshire and a large part of Derby within it. In Yorkshire the East Riding is Danish, and the North to a great extent; indeed the western feeders of the Ouse seem to have been followed up to their head-waters, and the watershed of England to have been crossed. This gives the numerous -*bys* in Cumberland and Westmoreland—Kirk-*by*, Apple-*by*, &c.

So much for the very irregular and remarkable outline of the area of the forms in -*by* on its southern and western sides. In the north-east it nearly coincides with the valley of the Tees—

* These are Danish forms throughout—*Asgar-*, *Hacon-*, and *Carl-* being as little Anglo-Saxon as -*by*. *Carl-by* in Anglo-Saxon would be *Charlton*.

† North-avon-ton-shire.

nearly but not quite; since, in Durham, we have Ra-*by*, Sela-*by*, and Rum-*by*. The derivatives of *castra*, on the other hand, are in *-ch-*; *e.g.* Eb-*ch*ester, *Ch*ester-le-street, Lan*ch*ester (Lan-*c*aster). In Northumberland there are none.

I look upon this as the main Danish area of Great Britain, its occupants having been deduced from a series of primary settlements on the Humber. It coincides chiefly with the water-system of the Trent, makes Lincolnshire and the East Riding of Yorkshire the mother-countries, and suggests the notions that, as compared with the Humber, the rivers of the Wash, and the river Tees were unimportant. The oldest and most thoroughly Danish town was Grimsby. The settlements were generally small. I infer this from the extent to which the names are compounded of *-by* and a noun in the genitive case *singular* (Candel-*s*-*by*, Grim-*s*-*by*, &c.). Danish names such as Thorold, Thurkill, Orm, &c., are eminently common in Lincolnshire; and, at Grimsby, a vestige of the famous Danish hero Havelok is still preserved in *Havelok-street*. On the other hand, the number of Danish idioms in the provincial dialects is by no means proportionate to the preponderance of the forms in *-by*. In Lincolnshire it is but small, though larger in Yorkshire and Cumberland.

The extent to which the rivers which fall in the Wash are *not* characterized by the presence of forms in *-by* is remarkable. The Witham and Welland alone (and they but partially) have *bys* on their banks. Again—

Just above Yarmouth, between the Yare, the North River and the sea, is a remarkable congregation of forms in *-by*. These are more numerous in this little tract than the rest of Norfolk, Suffolk, and Essex together — Mault-*by*, Orms-*by*,* Hemes-*by*, &c. This may indicate either a settlement direct from Scandinavia, or a secondary settlement from Lincolnshire.

However doubtful this may be, it is safe to attribute the *-bys* on the West of England, to the Danes of Cumberland and Westmoreland, the Danes of the Valley of the Eden. These spread—

* Doubly Danish: the Anglo-Saxon form of *Orm* being *Worm*.

A. Northwards, following either the coast of Galloway or the water-system of the Annan, Locker-*bie*, &c.—

B. Westwards into the Isle of Man—

C. Southwards into—

a. Cheshire, Lancashire, and Carnarvonshire (*Orms*-head), always, however, within a moderate distance of the sea—Horn-*by*, Orms-*kirk*,* Whit-*by*, Ire-*by*, Hels-*by*, &c.—

b. Pembrokeshire; where in Haver-*ford* and Mil-*ford* the element *ford* is equivalent to the Danish *Fiord*, and the Scotch *Firth*, and equals the Latin word *sinus* — not *vadum*. *Guard*- in Fish-*guard* is Danish also; as are Ten-*by* and *Harold*-stone.

Such is the distribution of one branch of the Scandinavians, viz. those from Jutland, the Danish Isles, and (perhaps) the South of Sweden. That of the Norwegians of Norway is different. Shetland, the Orkneys, Caithness, and Sutherland, the Hebrides, and Ireland, form the line of invasion here. In Man the two branches meet—the Danish from the east, and the Norwegian from the north and east.

The numerous details respecting the Scandinavians in Britain are to be found in Mr. Worsaae's *Danes and Northmen*; and, besides this, the proof of the distinction just drawn between the Danes of South Britain and the Norwegians of Scotland, the Hebrides and Ireland. It lies in the phænomena connected with the form -*by*.

a. Common as they are in Denmark and Sweden, they are rare in Norway.

b. Common as are other Scandinavian elements, the forms in -*by* are almost wholly wanting in Scotland and Ireland.

Hence—*Northman* or *Scandinavian* means a *Dane* in South Britain, a *Norwegian* in Scotland and Ireland, and a Dane *or* Norwegian, as the particular case may be, in the Isle of Man, Northumberland and Durham. This is well shown, and that for the first time, in the valuable work referred to.

* Doubly Scandinavian: the Anglo-Saxon form would be *Worm-church*. *Generally* in compounds of this kind the Danish form *Kirk* is a prefix, the Anglo-Saxon *church* an affix; *e. g.* *Kirk*-by, Off-*church*. The Carnarvonshire promontories are *Orms*-heads; the Glamorganshire promontory is *Worms*-head.

Can this analysis be carried further? Probably it can. Over and above the consideration of the Frisians of Friesland, there is that of the North-Frisians. Some of these may easily have formed part of the Scandinavian invasion. The nearest approach to absolute evidence on this point is to be found in the East Riding of Yorkshire; where in Holdernesse we have the Frisian forms News-*om*, Holl-*ym*, Arr-*am*, and the compound Fris-*marsh*. The Leicestershire Fris-*by* is more evidently *North*-Frisian.

In Sussex the division into *Rapes* is more Norse than German. It is, however, the only sign of Norse occupancy south of the Thames. Perhaps, it came from Normandy.

As a proof of the sharpness of the line of demarcation between the Danes and Saxons, the two *castra* that formed, or belonged to the Roman station *Durobrivis* deserves notice. On the Huntingdon, or Angle, side of the Neve the present form is *Chesterton;* on the Northampton, or Danish, *Caistor*. We have, probably, here traces of a bilingual town.

CHAPTER VII.

THE LOWLAND SCOTCH.

§ 276. THE term *Lowland* is used to distinguish the Scotch of the South-east from the Scotch of the Highlands. The former is English in its immediate affinities, and German in origin; the latter is nearly the same language with the Gaelic of Ireland, and is, consequently, Keltic.

The question as to whether the Lowland Scotch is a dialect of the English, or a separate and independent language, is a verbal rather than a real one.

Reasons for considering the Scotch and English as *dialects* of one and the same language lie in the fact of their contiguous dialects being mutually intelligible.

Reasons for calling one a dialect of the other depend upon causes other than philological, *e.g.* political preponderance, literary development, and the like.

Reasons for treating the Scotch as a separate substantive language lie in the extent to which it has the qualities of a regular cultivated tongue, and a separate substantive literature —partially separate and substantive at the present time, wholly separate and substantive in the times anterior to the union of the crowns, and in the hands of Wyntoun, Blind Harry, Dunbar, and Lindsay.

Reasons for making the *philological* distinction between the English and Scotch dialects exactly coincide with the geographical and political boundaries between the two kingdoms are not so easily given. It is not likely that the Tweed and Solway should divide modes of speech as accurately as they divide laws and customs; that broad and trenchant lines of demarcation should separate the Scotch from the English exactly along the line of the Border; and that there should

be no Scotch elements in Northumberland, and no Northumbrian ones in Scotland. Neither is such the case. Hence, in speaking of the Lowland Scotch, it means the language in its typical rather than in its transitional forms; indeed, it means the *literary* Lowland Scotch, which, under the first five Stuarts, was as truly an independent language as compared with the English, as Swedish is to Danish, Portuguese to Spanish, or *vice versâ*.

These (viz. those of the Swedish to the Danish, the Portuguese to the Spanish, or *vice versâ*) are the true relations between the Lowland Scotch and the English. At the same time, the early history (the *origines*) is the same for both forms of speech. So are the ethnological relations. For this reason a specimen of the Scotch of the fifteenth century is all that will be laid before the reader, the further details of its special history, as well as those of its grammatical structure, being recommended to the learning and acumen of the native North-British philologues.

Wallace, xi. 230-262.

A lord off court, quhen he approchyt thar,
Wnwisytly sperd, withoutyn prouision;
"Wallace, dar ye go fecht on our lioun?"
And he said; "Ya, so the Kyng suffyr me;
Or on your selff, gyff ye ocht bettyr be."
Quhat will ye mar? this thing amittyt was,
That Wallace suld on to the lioun pas.
The King thaim chargyt to bring him gud harnas:
Then he said; "Nay, God scheild me fra sic cass.
I wald tak weid, suld I fecht with a man,
But (for) a dog, that nocht off armes can,
I will haiff nayn, bot synglar as I ga."
A gret manteill about his hand can ta,
And his gud suerd; with him he tuk na mar;
Abandounly in barrace entryt thar.
Gret chenys was wrocht in the yet with a gyn,
And pulld it to quhen Wallace was tharin.
The wod lyoun, on Wallace quhar he stud,
Rampand he braid, for he desyryt blud;

With his rude pollis in the mantill rocht sa.
Aukwart the bak than Wallace can him ta,
With his gud suerd, that was off burnest steill,
His body in twa it thruschyt euirilkdeill.
Syn to the King he raykyt in gret ire,
And said on lowd; "Was this all your desyr,
To wayr a Scot thus lychtly in to wayn?
Is thar mar doggis at ye wald yeit haiff slayne?
Go, bryng thaim furth, sen I mon doggis qwell,
To do byddyng, quhill that with thee duell.
It gaynd full weill I graithit me to Scotland;
For grettar deidis thair men has apon hand,
Than with a dog in battaill to escheiff—
At you in France for euir I tak my leiff."

THE

ENGLISH LANGUAGE.

PART III.

PHÔNÊSIS.

CHAPTER I.

ELEMENTARY SOUNDS OF THE ENGLISH LANGUAGE.—LETTERS.—ALPHABET.—PECULIARITIES OF THE ENGLISH SOUND-SYSTEM.

§ 277. THE elementary sounds of the English language are forty; of these, thirty-four are simple and six compound.

SIMPLE.

Vowels (12).
1. The sound of the letter *a* in *father*.
2. . . . *a* in *fate*.
3. . . . *a* in *fat*.
4. . . . *e* in *bed*.
5. . . letters *ee* in *feet*.
6. . . letter *i* in *tin*.
7. . . . . letters *oo* in *cool*.
8. . . . . letter *u* in *full*.
9. . . . . letters *aw* in *bawl*.
10. . . letter *o* in *note*.
11. . . . *o* in *not*.
12. . . . *u* in *but*.

Semi-Vowels (2).
13. . . . *w* in *well*.

14. The sound of the letter **y* in *yet*.

Mutes (14).
15. . . . *p* in *pain*.
16. . . . *b* in *bane*.
17. . . . *f* in *fane*.
18. . . . *v* in *vain*.
19. . . . *t* in *tin*.
20. . . . *d* in *din*.
21. . . letters *th* in *thin*.
22. . . . *th* in *thine*.
23. . . letter *k* in *kill*.
24. . . . *g* in *gun*.
25. . . . *s* in *seal*.
26. . . . *z* in *zeal*.
27. . . letters *sh* in *shine*.
28. . . letter *z* in *azure*.

Nasal (1).
29. . . letters *ng* in *king*.

Aspirate (1).
30. . . letter *h* in *hot*.

Liquids (4).
31. . . . *l* in *low*.
32. . . . *m* in *mow*.
33. . . . *n* in *no*.
34. . . . *r* in *row*.

COMPOUND.

Diphthongs (4).
35. The sound of the letters *ou* in *house*.
36. . . . *ew* in *new*.
37. . . letter *i* in *pine*.
38. . . letters *oi* in *voice*.

Compound Sibilants (2).
39. . . . *ch* in *chest* (or of *tsh*).
40. . . . *j* in *jest* (or of *dzh*).

These two compound sounds are formed by combining the sound of *t* with that of *sh*, and the sound of *d* with that of *zh*, respectively. Hence the real sound of the *ch* in *chest*, is that of *tsh*, or nearly so. Thus:

Church might be spelt *tshurtsh*.
Chide . . . *tshide*.
Chirp . . . *tshirp*.
Chin . . . *tshin*, &c.

* The letter *y* has sometimes the power of a vowel, as in *merry*; sometimes of a semi-vowel, as in *yet*. Sometimes, too, it is sounded as the *i* in *pine*, in which case it is a *Diphthong*.

And the real sound of the *j* in *jest* is that of *dzh*, or nearly so. Thus:

Join might be spelt *dzhoin*.
Jump . . *dzhump*.
Jet . . *dzhet*.
John . . *Dzhon*, &c.

The arrangement of sounds, as far as we have hitherto gone, is a *natural* arrangement; that is, vowels are arranged with vowels, consonants with consonants, mutes with mutes, liquids with liquids, and cognate sounds with cognate sounds. It will soon be seen that, besides the *natural* arrangement of the sounds of a language, there is an *artificial* arrangement as well; *or if not artificial, one which at the first view appears to be so.*

Sounds are capable of being expressed in writing by signs. These signs are *seen* by the *eye*, whilst *sounds* are heard by the *ear*.

Figures like *b*, *h*, *f*, that represent sounds, are called *letters*.

The *figures* of the letters are as follows:—

5 Vowels—a, e, i, o, u.
2 Semi-vowels—y, w.
10 Mutes—p, b, f, v, t, d, k, g, s, z.
1 Aspirate—h.
4 Liquids—l, m, n, r.
1 Double sound—j.
3 Superfluous letters—c, q, x.

Words like *bee, eff, aitch*, &c., are the *names* of letters.

The *names* of the letters are as follows:—

5 Vowels—a, e, i, o, you, wy.
2 Semi-vowels—double-you, wy.
10 Mutes—bee, dee, eff, gee, kay, pee, ess, tee, vee, zed (or izzard).
4 Liquids—el, em, en, err.
1 Aspirate—aitch.
1 Double letter—jay (*dzhay*).
3 Superfluous letters—see, cue, eks.

§ 278. The letters of the English language are twenty-six in number, their form, order, and names being as follows:—

Roman.		*Italic.*		*Name.*
A	a	*A*	*a*	*a*
B	b	*B*	*b*	*bee*
C	c	*C*	*c*	*see* (*cee*)
D	d	*D*	*d*	*dee*
E	e	*E*	*e*	*e*
F	f	*F*	*f*	*eff*
G	g	*G*	*g*	*jee*
H	h	*H*	*h*	*aitch*
I	i	*I*	*i*	*i*, or *eye*
J	j	*J*	*j*	*j* consonant, or *jay*
K	k	*K*	*k*	*kay*
L	l	*L*	*l*	*el*
M	m	*M*	*m*	*em*
N	n	*N*	*n*	*en*
O	o	*O*	*o*	*o*
P	p	*P*	*p*	*pee*
Q	q	*Q*	*q*	*cue*
R	r	*R*	*r*	*ar*
S	s	*S*	*s*	*ess*
T	t	*T*	*t*	*tee*
U	u	*U*	*u*	*u*, or *you*
V	v	*V*	*v*	*v*, consonant, or *vee*
W	w	*W*	*w*	double *u*
X	x	*X*	*x*	*eks*
Y	y	*Y*	*y*	*wy*
Z	z	*Z*	*z*	*zed*, or *izzard*

The English letters were originally reckoned at twenty-four, because, anciently, *i* and *j*, as well as *u* and *v*, were expressed by the same character.

The *order* of the letters is called the *Alphabet;* because, in the Greek language, the names of the first two letters were *alpha* and *beta* respectively; that is, *alpha* was the name of the letter which we call *a*, and *beta* of *b*.

Apparently this order is *artificial*—only, however, apparently. The extent to which it has a character of regularity will be seen hereafter.

§ 279. *Remarks on the English Phonesis.*—Sounds 1, 2, 3. The *a* in *father*. This sound, so common in French, Italian, Spanish, German, and most other languages, is compara-

tively rare in English—rare, at least, as a *proper* power of *a*.

Hence, the ordinary power of this letter (*i.e.* the sound of the *a* in *fate*) is an English peculiarity. In nine languages out of ten, its sound is that of the *a* in *father*. For further remarks, see 34 (R).

Neither is the true sound of the *a* in *fat* very common out of England. The ordinary continental vowel, is that of the *a* in *father*, pronounced short—not the *a* in *fate* so pronounced.

4. The sound which is to the *e* in *bed* as the *a* in *father* is to the *a* in *fat* and *fate*, and the *aw* in *bawl* to the *o* in *note* and *not*, is not found in English as a proper power of *e*. Like the *a* in *father*, however, it is found as an *improper* power of something else. See 34 (R).

5, 6. The spelling here disguises the real affinities. The *ee* in *feet* is to the *i* in *tin*, as the *a* in *fat* is to the *a* in *fate*, and the *o* in *note* to the *o* in *not*.

Between the *ee* in *feet* and the *a* in *fate*, the Italian, and many other languages have an intermediate sound—the *é fermé* of the French. See Prel. Diss. II. Hence, there is a break in the English vowel system here.

7, 8. The real affinity is again disguised here—the *u* in *full* being to the *oo* in *cool* as the *i* in *tin* to the *ee* in *feet*.

Between the *ee* in *feet* and the *oo* in *cool*, the Italian, and many other languages, have an intermediate sound. See Prel. Diss. II.

9, 10, 11. The spelling again disguises the affinity: the *aw* in *bawl* being to the *o* in *note* and *not*, as the *a* in *father* to the *a* in *fat* and *fate*.

Between the *oo* in *cool* and the *o* in *note*, the Italian, and many other languages, have an intermediate sound. See Prel. Diss. II.

12. The *u* in *but* is somewhat rare beyond the pale of the English Language. It is commonest in the languages of India. It is a sound into which *certain short vowels, when unaccented, have a tendency to pass*. An extract from Walker may illustrate this:—

"If the accent be kept strongly on the first syllable of the word *tolerable*, as it always ought to be, we find scarcely any distinguishable

difference to the ear if we substitute *u* or *o* instead of *a* in the penultimate syllable; thus—*tolerable*, *toleroble*, or *toleruble*, are exactly the same word to the ear, if pronounced without premeditation or transposing the accent. Thus, the word *man*, when not under the accent, might be written *mun* in *nobleman*, *husbandman*, *woman*, and *tertian* and *quartan*, as *tertiun*, *quartun*, &c. The same observation will hold good in almost every final syllable where *a* is not accented—as *medal*, *dial*, *giant*, *bias*, &c., *defiance*, *temperance*, &c. But when the final syllable ends in *age*, *ate*, or *ace*, the *a* goes into a somewhat different sound."

This "somewhat different sound" is the *i* in *pin* (or nearly so), as in *cabbage*, &c., pronounced *cabbidge*, &c.

13. The true *w*, with its proper semi-vowel sound, is far from common. Foreigners sound it as *v*.

15, 16, 17, 18. The Quaternion here is complete—*p*, *b*, *f*, *v*.

19, 20, 21, 22. So it is here; though imperfectly expressed in spelling—*t*, *d*, þ, ð (*th*, *dh*). The last two are somewhat scarce sounds out of England.

23, 24. The Quaternion here is incomplete—*k* and *g* (see Prel. Diss. II.) being wanting. Both sounds are rare.

25, 26, 27, 28. Quaternion complete.

29. *Ng*. This is the only nasal we have. Common in the French, Portuguese, and several African Languages.

§ 280. 34. *R* at the *beginning* of a syllable is sounded over the whole area of the English Language; and that distinctly —*run*, *right*, &c.

So it is when *medial*, or divided between two syllables (see Prel. Diss. II.), so as to be *initial* as well as final.

At the *end*, however, of a syllable, this distinctness and universality of the sound of *r* is by no means the case.

At the end of a syllable *r* never follows a consonant, inasmuch as such combinations as *abr*, *apr*, *afr*, *avr*, *atr*, &c., are unpronounceable. A vowel, however, it may easily follow. What takes place when it does? I doubt whether, in the ordinary *English* pronunciation, the *r* is sounded at all. It *ought* to be; and, perhaps, it is sometimes.

At the same time (and this may serve to illustrate the fact under notice), there is a large percentage of educated speakers

who make no difference between the sound of the *a* in *father*, and the *a* in *farther*; who, if you tell them to pronounce such a word as *cago* after the manner of a Frenchman or an Italian, will utter it just as they do their own English word *cargo*; or (rather) they pronounce their own English word *cargo* just as they would *cago* of French or Italian.

The same make no distinction between *aw* (as in *bawl*) and *or*; indeed, such a name as *Bor*lase they pronounce *Bawlace*.

In the case of *ar* and *or*, and their assimilation to *ah* and *oh* (*a* French, and *aw*), the question may be settled by the reader appealing to his own pronunciation. If he do not confuse the sounds himself, he will assuredly know some one who does.

With *e* (as in *fer*-ment) the examination is somewhat more difficult—the reason being as follows:—

The sound which is to the *e* in *fen*, as the *a* of the Italians is to the *a* in *fate*, and the *aw* in *bawl* to the *o* in *note*, is not expressed by any separate combination of letters, nor yet indicated in the ordinary works on pronunciation. Still it exists. Indeed it is the sound in question, *i. e.* the sound of *e*, *u*, and *i* when short and followed by *r*—the *r* not being sounded.

The rule then stands thus—that when a vowel is followed by *r*, the *r* is often dropped altogether, and the vowel made *open* (see Prel. Diss. II.).

With the *a* in *fat*, the *o* in *not*, and the *e* in *fen*, this is easy, as all those vowels have an open as well as a close sound.

But the *a* in *fate*, the *o* in *note*, the *ee* in *feet*, the *oo* in *cool*, have no open sounds at all. What then is the sound of such words as *fare*, *ore*, *here*, in the mouth of one who thus slurs over his final *r*'s? A very short sound of the open *e* is added—a sound which we may, perhaps, spell thus—fa*ĕh*, o*ĕh*, he*ĕh*.

So much for the independent sounds. The dependent ones of the *i* in *fin*, the *u* in *but*, and *u* in *full*, all become that of the *e* in *ferment*. Thus, Walker writes that "*fir*, a tree, is perfectly similar to the first syllable of *ferment*. *Sir* and *stir* are exactly pronounced as if written *sur* and *stur*."

The etymological history of the word *near* illustrates this phenomenon rather curiously. At the present moment the word ends in *r*—to the eye if not to the ear also. It is also an adjective in the positive degree. Originally, however, it was

only the *comparative* which ended in *-r*; the positive being *neah* (i. e. *nigh*). So that the *r* is one of two things—either non-existent in the spoken language, being a mere matter of spelling, or (if pronounced) non-radical.

Sometimes this slurring of the *r* goes to a still greater length; and words wherein it is both final and initial at once, are pronounced as if it were non-existent. When a speaker pronounces *correct* as *caw-ect* he gives us an instance of this mispronunciation. Again—in *claret* the *e* is often elided; so that the word becomes *clart*. Carry (as many do) the change further still; sink the *r* and open the *a*, and you get *claht*—the *a* as in *father* and the *r* nowhere.

In the notices of *a*, *e*, and *o*, it has been stated that the *proper* powers of the *a* in *father*, &c., are rare. The meaning of the qualifying adjective is now seen. The sounds that we get at by the slurring of the *r* are *im*proper ones.

Hirrient is a convenient term for the investigation and illustration of the points connected with *r*. When it is truly and properly sounded with the tongue *vibrating against the palate* (though not in the exaggerated way which fine speakers often indulge in), we may say that the sound is *hirrient*. When slurred over (as in farther pronounced father) we may call it *otiose*.

Hirrient is a term used in certain grammars, and means *vibrating* or *vibrational*.

35. The proper elements of the *ou* in *house* are not *o* + *u* but *a* + *w*. The German orthography gives this the nearest where *haus* = *house*.

36. The proper elements of the *ew* in *new* are not *e* + *w* but *i* + *w*.

37. The proper elements of the *i* in *pine* are the *a* in *father* pronounced very short, + *y*.

38. The proper form of expression for the *oi* in *voice* is not *o* + *i* but *o* + *y*.

§ 281. 39, 40. The two compound sibilants may serve as text to a comment on one of the most important of our *unstable* combinations—important in most languages and doubly so in the English. Wherever we have the sound of *y*, preceded by either *s* or *z*, by *k* or *g*, by *t* or *d*, we may look out for

its operation. More than this, wherever we have a sound allied to that of *y* so preceded, we may look out for it. The sounds of the *i* in *fit*, and of the *ee* in *feet*, are in this predicament, and we know what influence they exert on a *g* or *k* that precedes them. They convert them (not always, though generally) into *j* (*dzh*) or *c* (*s*)—*gibbet, city* (pronounced *dzhibbet, sity*).

Let us begin with this latter sound, *i.e.* the vowel one, the one of *i* (or *ee*), and see what changes it both *undergoes and effects ;* for the sound of the letter *i* in words like *million*, not only becomes altered itself, but acts as a cause of alteration upon certain consonants preceding it.

When it follows a consonant and precedes a vowel it has a strong tendency to become a semi-vowel, and to take the sound of *y*, especially if the syllable preceding be accented—*míllion, pínion*, pronounced *míll-yon, pín-yon*.

This tendency is different with different consonants.

With *l* it effects important changes, though not in the English Language. Hence the consideration of the history of the combination *l* + *y* is a part of general, rather than special, philology. In French it is eminently important. There, there is a tendency for the latter element to obliterate and replace the former; so that combinations like *-eille* approach the sound of *-ey*—the *y* being sounded distinctly, and as a separate sound from the vowel preceding it.

With *m* and *n*, its combinations are also interesting (*my, ny*), though not to the special English scholar.

With *r* the vowel undergoes no change at all. Words like *vitreous* are pronounced as trisyllables—*vit-re-ous ;* since such a combination as *vitryous* would be unpronounceable.

With *s* its effects are remarkable. In the first place the change in question almost always takes place; *i. e.* the vowel becomes a semi-vowel, or *i* becomes *y*. Hence a combination which was originally *sia* becomes *sya*. The change, however, does not stop here. The sound of the combination *sy* almost always alters to that of *sh*, so that *sya* becomes *sha ; syee, shee ; syi, shy ; syo, sho ;* and *syu, shu*.

With *t*, preceding, the change goes further still. The vowel becomes a semi-vowel, so that *tia, tie, tio, tiu*, &c., become *tya,*

tye, tyo, tyu, &c. Then the sound of the combination *ty,* becomes that of *tsh.* Hence *tya* becomes *tsha; tye, tshee; tya, tshi; tyo, tsho; tyu, tshu.*

Thus the tendency of *i* to become *y* and of *y* to change the sound of certain consonants when they precede it, is the key to a series of apparent anomalies in the English spelling; and we may now see the principle in the pronunciation of certain words ending in *-ous.*

In words like *anxious,* the change was, first, from *an-si-ous* to *ang-syous,* and then from *ang-syous* to *ang-shous.*

In words like *precious,* the change was the same; since the *c* had the sound of *s,* and, consequently, was similarly affected—*pres-i-ous, pres-yous, preshous.*

The words like *station* the same; since the sound of *t* was the sound of *s,* &c.—*stas-i-on, sta-syon, sta-shon.*

In words like *righteous* we find the same; the series of changes being *right-e-ous, right-yous, righ-tshous.*

Caution.—It is only when *i* has the power of the *ee* in *feet,* that it thus changes itself, and effects changes in the sounds that precede. When sounded as the *i* in *pine* it always constitutes a separate syllable; *di-a-mond, di-al, vi-al,* &c. These never are likely to become *dyamond, dyal, vyal,* &c.

Hence the combination *-eou* is subject to the same rules with the combination *-iou.*

Where *s* becomes *sh, z* becomes as *zh.* This is why words like *gla-zi-er,* and *gra-zi-er,* are sounded *gla-zher,* and *gra-zher,* the process being *gla-zi-er, gla-zyer, gla-zher,* &c.

When *t* becomes *tsh, d* becomes *dzh.* This is why words like *hid-e-ous,* are pronounced like *hi-dzhous* (*hijjous*)—*hi-de-ous, hid-yous, hi-dzhous.*

Hence there are three ways of pronouncing a word like *tedious*—1, *te-di-ous; 2, te-dyous; 3, te-dzhous.*

Furthermore—the sound of the *ew* in *new* (or of the *ue* in *sue*) is connected with that of the unaccented *i;* since, by a series of changes, it often has the same effect upon a preceding consonant. It often becomes *yoo;* so that words like *new* and *sue* may be sounded as *nyoo,* and *syoo.* In this case the sound of *y* is developed, and this, when preceded by *s, z, t,* or *d,* has the same effects as a *y* produced by any other process; *i. e.* it

changes them into *sh*, *zh*, *tsh*, and *dzh*. This explains why *sugar* is sounded *shugar*; *nature*, *na-tsher*; *verdure*, *ver-dzhur*, &c.; the *u* having changed in sound, from *ew* to *yoo* (*na-tewr*, *na-tyoor*, *na-tshoor*, *na-tsher*).

Such is a sketch of one of the processes by which the pronunciation of the English Language has changed, still changes, and will continue to change. When we hear of the *jew* (*dzhew*) instead of the *dew* falling, we may possibly hear a vulgar form of utterance. Nevertheless, it is a vulgarity which lies in the very innermost parts of the mechanism of our language—of our language and of innumerable others besides.

Such, too, is a sketch of the changes which convert—

1. The combinations *ia*, *ie*, *io*, *iu*, into *ya*, *ye*, *yo*, *yu*—*i.e.* so many dissyllables into so many monosyllables; so many full and true vowels into so many *semi*-vowels (mill-*i*-*on*, mill-*yon*);

2. The combination -*iw* (*ew* in *new*) into *yu* (*yoo*); or *new* into *nyu* (*nyoo*). Replace the *n* by *s* or *z*, and you have *siw*, *syu*, and *ziw*, *zyu* (*sew*, *syoo*, *zew*, *zyoo*);

3. The combinations *syu* and *zyu* (*syoo* and *zyoo*) into *shu* and *zhu* (*shoo* and *zhoo*); and, finally,

4. The combinations *tyu* and *dyu* (*tyoo* and *dyoo*) into *tshu* and *dzhu* (*ch* and *j*).

This suggests some interesting considerations; inasmuch as we may speculate (and that legitimately) upon further changes. Thus—

a. A *sh* may become *zh*, and, *vice versâ*, *sure* (*shure*) becoming *zhure*, or *azure* (*a-zhure*) *ashure*.

b. A *tsh* may become *dzh*, and, *vice versâ*—*John* (*Dzhon*) becoming *Tshon* (*Chon*), or *chocolate* (*tshocolate*) becoming *jocolate* (*dzhocholate*).

c. A *sh* may become *tsh*, and (by a parity of reasoning) *zh* may become *dzh*.

d. Conversely, the compound sibilants *tsh* and *dzh* may become simple—*sh* and *zh*.

e. Finally, the aspirates so called may become lenes, and *sh*, *zh*, *tsh*, and *dzh*, become *s*, *z*, *ts*, *dz*.

So much for the consonants *s*, *z*, *t*, and *d*, and the changes that they may undergo when followed by the sound of *y*;

which sound of *y* may itself grow out of *iw*, as well as out of one of *i*.

Two important facts in what may be called *philological dynamics* (*i.e.* the processes by which changes are wrought in languages) arise out of them.

1. In the first place, *syllables originally different may become identical.*

I.	*a.*	*siu,*	*syu,*	*siw,*
	b.	*ziu,*	*zyu,*	*ziw,*
II.	*a.*	*tiu,*	*tyu,*	*tiw,*
	b.	*diu,*	*dyu,*	*diw,*

all exist at a certain stage of a certain language.

Let change set in; so that they become *shu, zhu, tshu,* and *dzhu.*

Let change go on; and let it be from the soft forms to the hard. In such a case *zhu* will become *shu,* and *dzhu* will become *tshu.*

Let it proceed; being from the compound to the simple sibilant. In such a case *tshu* will become *shu.*

Let the aspirate (so called) become lene, *shu* becoming *su.*

What is the result? That twelve originally different syllables have all come into the single form of *su.* But this is not all. Between the *s* and the *u,* a further change may insert an *i* or *y*; and the whole series of change may begin over and again; and, so on, *ad infinitum.* When once we get a truly unstable combination it is difficult to say where the phenomena of transition and alteration will stop.

I do not say that such an extreme case as the foregoing can be shown with our present philological materials. I give it, however, because the investigation of the possible changes of an unstable combination is so much exercise in the way of philological deduction. On the other hand, no fact, within certain limits, is more real, and of greater practical importance, than the tendency of *the interposition of the sound of* I *or* Y between S *or* Z, T *or* D, *and a vowel to develope an accumulation of aspirated sibilants.*

2. The second fact connected with this power of *y* which commands attention, is the following:—*It may evolve sounds*

which originally had no existence in the language to which they are developed.

Let there be a language without the sound of *s*; but let it have those of *y*, *t*, and the vowels. Let there be therein the combination *tya*.

Let *tya* become *tsh*.

Let *tsh* become *sh*.

Let *sh* become *s*.

We have, then, the development, evolution, or genesis of a simple articulate sound out of a complex one, the complex one being previously evolved, or developed, out of a pair of simple* ones.

Necdum finitus Orestes.—If we take a series of words from the modern English, beginning with *ch* in respect to their spelling, but with *tsh* in respect to their sound, and compare them with the Angle (or Anglo-Saxon), we shall find that the eye, at least, detects a difference. Thus, the words which are —

In English	are	*In Anglo-Saxon.*
*Ch*eek		*Ce*ac
*Ch*alk		*Ce*alc
*Ch*eap		*Ce*ap
*Ch*url		*Ce*orl
*Ch*oose		*Ce*osan, &c.

What is the explanation of this? Is the difference real or only literal? Did the Saxons want the sound of *tsh*; we having developed it since their time? Or had they it, and spelt it by means of *c* + *e*?

The specific answer to these questions is a point of pure and proper Anglo-Saxon philology as well as one of general phonesis.

There is no reason, *à priori*, why the Saxons should not have had the sound of *tsh*, and (so having it) spelt it by means of *c* + *e*.

Neither is there reason, *à priori*, why they should not have

* I have shown in the Appendix to M'Gillivray's "Voyage of the Rattlesnake," that this is partially the case with one of the North Australian dialects.

been without it, and (so being without it) have sounded the combination *c* + *e* according to its natural power.

We have it, it is true; but we may have evolved it during the interval between their time and ours.

Now, though the specific question as to the actual A. S. usage stands over, the more general phonetic problem as to the development, evolution, or genesis of the sound of *tsh* out of that of *k* + *y*, will be taken up; the best preliminary to which is the reconsideration of the phenomena presented by *t* + *y*.

The combination *t* + *y* became *t* + *sh*; in other words, *tya* became *tsha*.

Assuming the same instability for *k* + *y*, what ought that combination to become? Answer; *k* + *sh*. In other words, *kya* should become *ksha*.

But this is not the case. If it were so, *choose* would be sounded *kshoose*, which it is not. Its true sound (as aforesaid) is that of *tshoose*.

Nevertheless, *k* + *y* is an unstable combination, and *k* + *sh* is the combination into which it is expected to pass. This is a real sound. In certain languages it occurs as definitely and as prominently as the *tsh* (*ch*) in English. In such cases its nature is often explained to the Englishman by means of the word *election*; from which if we subtract the first three letters the sound of *-kshon* remains (ele-*ction*). Whether this be the best illustration of the compound sibilant whose elements are *k* + *sh*, is doubtful. I give it, however, in order to show the extent to which the combination itself has been recognised.

Now this *ksh* is, itself, an unstable combination; an unstable combination with a tendency to become *tsh*. No languages show this better than the Norse or Scandinavian. Therein *k* = *c*, and *j* = *e* of the Anglo-Saxons, so that—

The A. S. orthography would be,	*In Norse.*
*Ce*ac . . .	*kj*ak.
*Ce*alc . . .	*kj*alk.
*Ce*ap . . .	*kj*ap.
*Ce*orl . . .	*kj*orl.
*Ce*osan . . .	*kj*osan.

The combinations, then, *kj* and *ce* are equivalent to each

other, *i. e.* each element in each has the same power—the words in the second column being not absolutely Norse words, but A. S. words as they would appear if written according to the Norse orthography.

If we now ask how this *kj* is sounded in Scandinavia, we get a most instructive answer.

In Denmark it either retains its natural power of $k + y$, or else drops the sound of *y* and becomes a simple *k*.

In Norway it takes the sound of *ksh*.

In Sweden that of *tsh*.

The Norwegian form I believe to be transitional.

We may now go back again to $t + y$. Doing so, we shall raise a new question.

Mutatis mutandis, the history of $t + y$ was also the history of $d + y$; so that when one became *tsh* the other became *dzh*.

Assume that $g + y$ comports itself in the same way toward $k + y$, and, *mutatis mutandis*, the phenomena we have just investigated repeat themselves. Hence, when *kya* becomes *ksha* and *tsha*, *gya* becomes *gzha* and *dzha*. If so—

The A. S. *ge* should coincide with the English *j*;

The Norwegian *gj* should be sounded as *gzh*; and

The Swedish as *dzh* (the English *j*).

Yet such is not the case. The Norwegian and Swedish *gj* are often sounded alike, and that, not as either *gzh*, or *dzh*, but as the semi-vowel *y*—*gjöre* in Norwegian, *göra* in Swedish, being pronounced *yöre* and *yöra*.

Now take the Anglo-Saxon—

Gea	is in modern English		*Yea*	not	*Ja*.
Gealew	.	.	*Yellow*	.	*Jellow*.
Gear	.	.	*Year*	.	*Jear*.

and so on with the majority of examples of this combination.

This departure on the part of $g + y$ from the analogy of $d + y$, presenting itself as it does (to go no further) in three languages, is remarkable. It can, however, be explained; the close affinity between *g* and *y* (*ga* and *ya*) being the reason of it. It is this affinity which diverts (so to say) the line of change from the compound sibilants to the semi-vowel.

The evolution of the sound of *tsh* (for an *evolved* rather than

an original sound it seems to have been) has now been explained; as has, also, the reason why *gy* has not undergone, *mutatis mutandis*, the same series of changes as *ky*, and it may be added that our inquiry, as far as it has hitherto gone, has been to the effect that the sound of *dzh* should have no existence in English, except so far as it is either an original element of the A. S. phonesis, or a result of the combination *d* + *y* (ver-*dure*, ver-*dzhoor*). At any rate, it has not grown out of the process which gives us our *tsh*.

Nevertheless, it has not only an English existence independent of the combination *d* + *y*, but it cannot be shown to have been original to our tongue. The letter *j* spells it.

The letter *j*, however, was strange to the A. S. alphabet; and equally strange were any combinations that may reasonably be supposed to have represented it. It can not only, then, not be shown to have been original to our tongue, but good reasons may be given for denying its presence in our earliest sound-system.

It is an *evolved* sound of comparatively recent origin, and, if we look at the words in which it occurs, we shall easily get the history of its evolution. It is rare in words of Angle, common in words of French and Latin origin; words which are sometimes spelt with a *g* (followed by *e* or *i*) and sometimes with a *j*.

a. *G*entle, *g*eneral, *g*ender, *g*iant, *g*ibbet, &c.

b. *J*udge, *j*ust, *j*uggle, *j*est, &c. Now, with all these words the initial sound in the original French was that of *zh*.

Hence, whilst the *ch* in *choose* (*tsh*) has grown out of the A. S. *k* + *y*, it is out of the French *zh* that we have evolved our *j*, as in *j*est (*dzh*est), and our *g*, as in *g*ibbet (*dzh*ibbet).

Not that the histories of the two evolutions, though different, are unconnected. The existence of the previous *tsh* of A. S. origin, undoubtedly, promoted the change from *zh* to *dzh*.

Then there are the words in *ch* like *ch*ief, and *chase*, &c., &c., of French origin. The *ch* here originally represented the sound of *sh*. It now = *tsh*. The reason for this lies in the precedents and analogies of the A. S. *k* + *y* and its changes, and the French *j* (*zh*) with its conversion into *dzh*.

I conclude my observations on this long and complex ques-

tion with remarking that, different as are the histories of our *tsh* and *dzh* (*ch* and *j*), they still illustrate the same general fact—viz. the instability of the combinations *s*, *z*, *t*, *d*, *k*, or *g*+*y*, and their tendency to become sibilant.

With the *ch* and *g* (*sh* and *zh*) of the French, the very form of the combination suggests the history of the change. There was *once* a sound of *k* and *g* (as in *g*un). Otherwise the letters would never have been used as they are. With *j* the case is less clear. The name, however, of "Jupiter" (writes Professor Key) "was undoubtedly written originally Diupiter, so Janus was at first Dianus, just as the goddess Diana was called by the rustics Jana."—*Alphabet*, p. 71.

§ 282. The chief points wherein the English sound-system differs from that of the more important modern languages, are worth noting; a knowledge of them being useful in the study of foreign tongues.

The scarcity of *proper* open sounds contrasts the vowel part of the English sound-system with that of the Italian, French, and other languages. It is well known how common the sounds of both the *a* in *father* and the *aw* in *bawl* are there. In the French the *e* final is mute; so that the extent to which the open sound of the *e* in *bed* is wanting in English is not very manifest in the study of that language. Neither is in Italian, where no words end in *-er*. In German, however, and the Norse tongues, it requires some attention to discern the difference of sound between a final *-e* (as in mein*e*), and a final *-er* (as in mein*er*).

The absence of the *é* and *ó* fermé of the French and Italian, and other tongues, is another point to be remembered in the study of fresh languages. Thus the *o* in the Danish *Kone* runs great chance of being sounded by an Englishman as the *oo* in *cool*.

The *ü* of the Germans (*y* Danish and *u* French) is a wholly new sound to the Englishman.

So is the *ö* Danish and German, and the *eu* French.

As these two sounds are both absent in Italian, Spanish, and Portuguese, the vowel-system of these languages is *pro tanto* more English than the French and German, &c. On the other

hand, the *u* in *but* gives foreigners trouble, being (as has been already stated) rare in the European tongues, though common in the Asiatic.

In the simplicity of its nasal system (*i.e.* the sounds like the *ng* in *king*) the English agrees with the German, and is specially contrasted with the French and Portuguese.

W is English rather than continental. The best way for foreigners to learn it is to place an *u*- (*oo* in *cool*) before some syllable beginning with a vowel, and pronounce it as quickly as possible; *e.g.* on, *u*-on (*oo*-on); et, *u*-et (*oo-et*), &c. In this way the sound of *w* is soon obtained.

The mute-system in English is one of the fullest in the world. Out of the 4 quaternions 3 are full and perfect; so that 14 out of the 16 mutes belong to our language. The two that are wanting, the so-called aspirates of *k* and *g*, are the scarcest. Next to these come ð and þ, which we have.

But though full, the English mute-system is simple. Each sound has its normal and typical form; so that the *varieties* which go by the names of *guttural*, *cerebral*, &c., are wanting. Hence the *ch* German and many similar sounds are strange to us.

The question of simple single sounds is one thing; that of their *combinations* another.

The diphthongs in English are simple and few; though some languages (*e.g.* the Swedish) have fewer.

They are all, too, of one sort; *i.e.* that wherein the semi-vowel elements come *last*. Sounds like the French *oi* in *roi* we have none; nor yet (in the written language at least) any wherein *y* precedes its vowel. In the provincial dialects, however, they are by no means wanting.

The nasal *ng* is never initial. We say *song*, but not *ngos*. This limitation of the nasal to the final parts of syllables is common. The Germans, Italians, &c., avoid an initial *ng* as much as does the Englishman. In the Keltic, however, it occurs, as it also does in many Asiatic languages.

Though the English sibilants are *compound*, they are never *complex*. Thus, we say *sha* or *sho*. We also say *tsha* or *tsho*. But we never combine the two; never use the complex sound

shtsha or *shtsho;* never say *zhdzha* or *zhdzho*. Neither do the Italians, whose sibilant system is very like our own. The Slavonic population, on the other hand, *do;* and make no difficulty of such sounds as *shtshe,* or *shtshetsh*. This practice of using their compound sibilants in complex combinations, makes the Slavonic sound-system look much more unlike the English than it really is.

CHAPTER II.

POWERS OF CERTAIN LETTERS AND COMBINATIONS.

§ 283. *Single Vowels and Vowels followed by a Consonant and e Mute.*—(1.) *A* has six sounds,—1, that of the *a* in *fate*; 2, that of the *a* in *fat*; 3, the *a* in *father*; and 4, the *aw* in *bawl*; 5, the *o* in *not*; 6, the *e* in *bed*. The fourth and fifth are sounds of *o*.

The sound of the *a* in *fate* is the long, that of the *a* in *fat* the short, sound of *a*. They are the two most usual powers of the letter. The sixth power is exceptional, and is only found in the words *Thames*, *many*, and *any*; pronounced *Temz*, *menni*, *enni*.

When *a* precedes a single consonant followed by a mute *e*, it is always sounded as in *fate*. Except in the word *have*, which is pronounced *havv*.

The following words are also considered exceptions, though it is doubtful whether they are really so:—

Are—which is generally pronounced *arr*. *Are*, however, with the *a* as in *fate*, is equally correct.

Bade—the preterit tense of *bid*, generally pronounced *badd*. *Bade*, however, with the *a* as in *fate*, is used by good speakers.

Gape—This is sometimes pronounced with the *a* sounded as in *father*. It is a pronunciation for which no good reason can be given. It is, perhaps, commoner on the stage than elsewhere.

A is sounded as in *father*, when it precedes *lm*, as in *psalm*, *calm*. Also in the word *master*. Also in certain words ending in *lf*, or *lve*—as *calf*, *half*, *calve*, *salve*.

When followed by *th* (as in *thin*), *ns*, *nce*, *nt*, *nd*, *st*, *sk*, *sp*, it is sometimes pronounced as in *father*, sometimes as in *fat*.

In words like *bath*, *path*—*dance*, *glance*, *lance*, *France*, *prance*—*answer*—*grant*, *slant*—*slander*—*last*, *vast*—*basket*—*hasp*,

it may safely be said that, in the last century, the habit of pronouncing the *a* as in *father*, and that in a decided manner, was general. With equal safety it may be added, that the present tendency is to sound the *a* as in *fat*. Hence the pronunciation is in a transitional state; and, perhaps, the sound now given to the *a* is of an intermediate character—not so broad as in *father*, nor yet so slender as in *man*.

In words derived from the Latin *mando*, where the *and* is final, the sound is always *broad*—as *command*, *remand*, *demand*.

Extract from Walker.—"There are certain words from the Italian, and Spanish languages—such as *lumbago*, *bravado*, *tornado*, *farrago*, &c., which are sometimes heard with this sound of *a*; but, except in *bravo*, heard chiefly at the theatres, the English sound of *a* is preferable in all these words." See remarks on *i*.

A, when *long* and followed by *ll*, in an accented syllable, is pronounced as the *aw* in *bawl*. It is also so sounded when followed by a single *l* succeeded by any consonant but *p*, *b*, *f*, or *v*; as *salt*, *bald*, *false*, *falcon*.

Exceptions.—Words derived from the Arabic language, and beginning with *al*, as *alchemist*, *alcoran*, &c.

Exceptions.—*Most* words derived from the classical languages—as *calculate*.

Caution.—It is only in *accented* syllables that the *al* = *aw*. Hence, in words like *alte'rnate* the *a* is sounded as in *fat*, although *álter* is pronounced *a'wlter*. So it is in *bals'amic*; although balsam is sounded *ba'wlsom*, or *ba'wsom*.

Caution.—In words like *do'wnfall*, although the *all* be unaccented, it is still pronounced broad. The reason of this is, that the monosyllable *fall* preserves its sound even when, by composition, it loses its accent. So likewise it is with *also* and *almost*. Whether we sound them *álso* and *állmost*, or *alsó* and *allmóst*, the sound of *a* is the same (*i. e.* of *aw*).

Sometimes the *l* is omitted as well. Thus, *falcon* is pronounced *fawcon* and *fawlcon*.

Caution.—In words like *alley*, *valley*, the *a* is *short*. Hence they are excluded from the rule under consideration.

A is sounded as *aw* in the word *water* (*wawter*).

A when short and preceded by *w* is pronounced as the *o* in

not, except when followed by the sounds of *k*, *g*, or *ng*. Thus, *wan*, *want*, *was*, *what*, &c., but not *wax* (*waks*), *wag*, *twang*. This is the case even when *ll* follows; since we pronounce *wallow* and *swallow*, as *wollo* and *swollo*, rather than as *wawlo* and *swawlo*.

Observe.—As *q* is always followed by *u*, and as *qu* = *kw*, the rule for pronouncing words like *quantity* and *quality* is contained in the preceding one. These are sounded, *kwontity*, *kwollity*.

(2.) *E* has four sounds—1, that of the *e* in *bed*; 2, that of the *e* in *glebe*; 3, that of the *a* in *fat*; 4, that of the *i* in *pin*. The second is really the long sound of the *i* in *pin*. The last two are exceptional.

E is never mute at the end of words derived from the Greek and Latin—as *epitome*, *catastrophe*, *apostrophe*, *simile*.

When *e* precedes a single consonant, followed by an *e* mute, it has the sound of the *ee* in *feet*. Except in the words *where*, *there*, and *ere* = *before*.

Were, *therefore*.—Walker directs that the word *were*, as well as the *there* in *therefore*, should be sounded as *werr* and *therr*. It is doubtful whether this is called for in the present state of our language.

The exceptional sounds of *e* are those of the *a* in *fat*, and of the *i* in *pin*. It has the former of these in *clerk* and *sergeant*; the latter in *England* and *pretty*, pronounced *clark*, *sargeant*, *Ingland*, *pritty*.

Whether *Derby* be sounded as it is spelt, or as *Darby*, the oftener, is uncertain. The tendencies are towards the former pronunciation.

Whether *engine* be sounded as it is spelt, or as *ingine*, the oftener, is also uncertain. The tendencies are towards the latter pronunciation.

In the plural termination spelt *es*, the real sound is *iz*—*prais-es*, *praiz-iz*. With *e* before a final unaccented *l* or *n*, the vowel sound is often scarcely perceptible at all; words like *weazel* and *harden* being sounded *weaz'l*, *hard'n*.

(3.) *I* has three sounds—1, that of the *i* in *pin*; 2, that of the *i* in *pine*; 3, that of the *ee* in *feet*. Of these the second is no true prolongation of the first, but a diphthong. The third

is found only in words derived from the *modern* foreign languages.

When *i* precedes a single consonant followed by *e* mute, it has the sound of the *i* in *fine*, or the diphthongal sound; except in certain words derived from the *modern* foreign languages.

Shire.—In the last century the word was pronounced *sheer* by the best speakers. At present this usage is equivocal. Perhaps the best rule is to sound the *i* as in *pine*, when the syllable is accented, or out of composition, and as the *i* in *fir* when unaccented—Knight of the *shire*; York*sherr*.

Extract from Walker.—"The words that have preserved the foreign sound of *i* like *ee*, are the following:—*ambergris, verdegris, antique, becafico, bombasin, Brasil, capuchin, colbertine, caprice, chagrin, chevaux-de-frise, critique* (for criticism), *gabardine, haberdine, sardine, trephine, quarantine, routine, fascine, fatigue, intrigue, glacis, invalid, machine, magazine, marine, palanquin, pique, police, profile, recitative, mandarine, tambourine, tontine, transmarine, ultramarine.* In all these words, if, for the last *i*, we substitute *ee*, we shall have the true pronunciation. In *signior* the first *i* is thus pronounced. Mr. Sheridan pronounces *vertigo* and *serpigo* with the accent on the second syllable, and the *i* long, as in *tie* and *pie*. Dr. Kenrick gives these words the same accent, but sounds the *i* as *e* in *tea* and *pea*. The latter is, in my opinion, the general pronunciation." Now as *vertigo* and *serpigo*, according to the English pronunciation of the Latin language, would not be pronounced *verteego* and *serpeego*, even in reading a classic author, it is not reasonable that they should so be pronounced in English. Indeed, it is only in words derived from the *modern* tongues that *i* should ever be sounded as *ee*. To pronounce *initial* as if written *inéetial*, is to speak as if we mistook a word of Latin for one of French origin. The same reasoning applies to words where *a* has its foreign power.

When *i* is in an unaccented syllable followed by a *consonant*, it is difficult to determine whether it has the sound of *i* in *pine*, or that of *i* in *pin*. Thus, a word like *fidelity* may be either *fi-delity* or *fid-elity*. In the following cases it is *always* diphthongal:—

1. Compounds of *bi*, as *bi-capsular, bi-corporal, bi-pennate*, &c.
2. Compounds of *tri*, as *tri-corporal, tri-gintesimal*, &c.
3. Words beginning with *pri*, as *primeval, primordial*,—except *primer* and *primitive*.

In most—probably in all—other words either sound is allowable.

When *i* is in an unaccented syllable followed by a *vowel*, it is doubtful whether it has the sound of *i* in *pine*, or of the *ee* in *feet*. The former sound, however, is preferable—*di-urnal, di-ameter*, &c., not *de-urnal, de-amiter*.

(4.) *O* has five sounds: that of—1, the *o* in *note*; 2, the *o* in *not*; 3, the *o* in *prove*; 4, the *o* in *woman*; 5, the *o* in *love*. Of these the third and fourth are no true sounds of *o*, but of *u*. The fifth is a peculiar and unclassed sound, *i. e.* that of the *u* in *but*.

When *o* precedes a single consonant, followed by an *e* mute, it has the sound of the *o* in *note*.

Except in the words *prove, move, lose*, where it is sounded like the *oo* in *cool*, and in others like *love* and *glove*, where it is sounded as the *u* in *but*.

O is sounded as the *u* in *full* in the following words—*bosom, woman, wolf, wolsey, Wolverhampton*. In *worsted* and *Worcester* the *r* is generally silent, and the *o* takes this sound.

(5.) *U* has four sounds—1, that of the *ew* in *new*; 2, that of the *u* in *full*; 3, that of the *u* in *but*; 4, the sound of *yoo*. Two other sounds are exceptional—1, that of the *e* in *bed*; 2, that of the *i* in *pin*.

The usual short sound of *u* is that which it has in *but*. The only words where it is sounded as in *full* are—*bull, full, pull*, words compounded of *full*, as *wonderful, dreadful*, &c., *bullock, bully, bullet, bulwark, fuller, fullingmill, pulley, pullet, push, bush, bushel, pulpit, puss, butcher, cushion, cuckoo, pudding, sugar, huzzar*, and *put*.

Put is only pronounced in this way when it is a verb. The game of *put* and the village of *Putney* have the *u* sounded as in *but*. So has *putty*.

Bullion is placed by Walker in the foregoing list. The present writer would sound the *u* as in *but*.

In the word *bury* the *u* is sounded as the *e* in *bed*. In *busy*, as the *i* in *pin*.

§ 284. *Power of Y.*—The sounds of *y* fall into two divisions —its power as a semi-vowel, and its power as a vowel.

As a semi-vowel it has one sound only—that of the *y* in *yet*.

As a vowel it has three—1, that of the *ee* in *feet*; 2, that of the *i* in *pine*; 3, that of the *i* in *pin*.

When *y* precedes a single consonant followed by an *e* mute, it has the sound of the *i* in *fine*—as *rhyme, thyme*. However, in this position it occurs only in words of foreign (chiefly of Greek) origin.

It is only, too, in words of foreign (chiefly Greek) origin that *y* occurs with the sound of the *i* in *pin*—as *system, syntax*, pronounced *sistem, sintax*.

Of its two long sounds, *y* has that of the *i* in *pine*, when the syllable in which it occurs is accented; as *cyder, tyrant, reply*. It has that of the *ee* in *feet* when the syllable is *un*-accented; as—*liberty, fury, tenderly*. The only exception is in the case of verbs ending in *fy*, from the Latin *fi* = *to become*, such as *mólli-fy, fórti-fy*, where the *y*, although unaccented, is sounded as the *i* in *pine*.

§ 285. *Double Vowels.*—(1.) *AA. Double a* is found only in certain proper names, chiefly of Hebrew origin, as *Aaron, Baal*.

(2.) *EE. Double ee*, without an apostrophe, has only one sound, that of the *ee* in *feet*. In *e'er*, and *ne'er*, contracted from *ever* and *never*, and with an apostrophe to indicate the loss of the *v*, it is pronounced as the *a* in *fate*.

Exception.—In one word *ee* has the sound of the *i* in *pin*, *i. e.* in *breeches*, from *breech*, pronounced *britches*, from *britch*. *Chizcake* for *cheesecake* is exceptionable. *Beelzebub*, is more correctly sounded *Bëelzebub*, though *Belzebub* and *Beelzebub** are sufficiently English.

(3.) *OO.* The usual sound of *oo* is that of the *oo* in *cool*; which is, really, no modification of *o*, but the long sound of the *u* in *full*.

Besides this it has the following three—

* With the *ee* as in *feet*.

1. Of the *u* in *full;* as *wool, wood, good, foot, stood.*
2. Of the *u* in *but;* as *blood, flood, soot.*
3. Of the *o* in *grove;* as *door, floor.*

Moor = a black man, is sometimes sounded *more,* sometimes as it is spelt. *Soot,* also, is sometimes pronounced as it is spelt.

I, U, and *Y,* are never doubled.

§ 286. *Combinations of two Different Vowels.—AE* has the sound of the *e* in *bed;* as *Michael, Michaelmas.*

AI has the sound of the *a* in *fate;* as *hail, sail, tail, stain,* &c.

Exception 1.—The words *said, again,* and *against.* Here the *ai* is pronounced as *e.*

Exception 2.—The word *aisle.* This is sounded *ile.*

Walker draws a distinction between *said* as a tense, and *said* as a participle; stating that in the first case it rhymes to *bed,* in the second to *trade;* as, *he said* (*sed*), but *the said* (*sade*) *man.*

Plaid is pronounced two ways; either to rhyme with *mad* or with *made.*

When Walker wrote, *raillery* was considered as a rhyme to *salary.* So it was in Swift's time—

> "Where in eighteen-penny gallery
> Irish wits learn Irish raillery."

It is doubtful whether such is the case now; the general sound of the *ai* being more probably that of the *a* in *fate.* In which case it coincides with the spelling.

When Walker wrote, *raisin* was sounded as *reeson.* It is doubtful whether this be the present pronunciation.

AO is only found in the word *gaol,* the obsolete mode of spelling *jail.*

AU, unless followed by *n,* succeeded by a consonant (when the pronunciation is doubtful), is sounded as *aw,* as *taught, haul, Saul, caught,* &c.

Exception 1.—*Laugh, draught.* Here the *au* is sounded like the *a* in *father.*

Exception 2.—*Hautboy,* sounded *ho-boy.*

Exception 3.—*Cauliflower, laurel, laudanum,* sounded *colli-flower, lorrel, lodnum.*

Au followed by *n*, succeeded by a consonant, is sounded sometimes as the *a* in *father*, and sometimes as the *aw* in *bawl*.

1. As the *a* in *father*. The word in which this pronunciation is the most general and unequivocal is *aunt*.

2. As the *aw* in *bawl*. The words wherein this pronunciation is the most general and unequivocal are *vaunt*, and *avaunt*, *maunder* (to be querulous), *Maunday* (in Maunday Thursday), *daunt*, *paunch*, *gaunt*, *saunter*.

Between these, however, there is the following list wherein the pronunciation fluctuates.

Flaunt sometimes sounded	*flant*,* sometimes	*flawnt*.
Haunt . .	*hant* .	*hawnt*.
Gauntlet . .	*gantlet* .	*gawntlet*.
Jaunt . .	*jant* .	*jawnt*.
Jaundice . .	*jandice* .	*jawndice*.
Laundress . .	*landress* .	*lawndress*.
Laundry . .	*landry* .	*lawndry*.

Askant, *askance*, *hanch* (?), *lanch* (?), being more properly written without the *u*, do not come under this head. They more properly belong to that class of words where the simple *a* has the sound of *father*.

EA has the following sounds—

1. Of the *e* in *glebe* in *anneal*, *appeal*, *appear*, *appease*, *aread*, *arrears*, *beacon*, *beadle*, *beadroll*, *beads*, *beadsman*, *beagle*, *beak*, *beaker*, *beam*, *bean*, *beard*, *bearded*, *beast*, *beat*, *beaten*, *beaver*, *beleaguer*, *beneath*, *bequeath*, *bereave*, *besmear*, *bespeak*, *bleach*, *bleak*, *blear*, *bleat*, *bohea*, *breach*, *bream*, to *breathe*, *cease*, *cheap*, *cheat*, *clean*, *cleanly* (adverb), *clear*, *clearance*, *clean*, *cochineal*, *colleague*, *conceal*, *congeal*, *cream*, *creak*, *crease*, *creature*, *deacon*, *deal*, *dean*, *deanery*, *dear*, *decease*, *defeasance*, *defeasible*, *defeat*, *demean*, *demeanor*, *decrease*, *dream*, *drear*, *dreary*, *each*, *eager*, *eaten*, *eaves*, *entreat*, *endear*, *escheat*, *fear*, *fearful*, *feasible*, *feasibility*, *feast*, *feat*, *feature*, *flea*, *fleam*, *freak*, *gear*, *gleam*, *glean*, to *grease*, *grease*, *greaves*, *heal*, *heap*, *hear*, *heat*, *heath*, *heathen*, *heave*, *impeach*, *increase*, *interleave*, *knead*, *lea*, to *lead*, *leader*, *leaf*, *league*, *leak*, *lean*, *leash*, *leasing*, *least*, *leave*, *leaves*, *mead*, *meagre*, *meal*, *mean*, *meat*, *measles*, *neap*, *near*, *neat*, *pea*, *peace*, *peak*, *peal*, *pease*, *peat*, *plea*, *plead*, *please*, *reach*, to *read*, *ream*,

* Sounded throughout this column as in *father*.

reap, rear, rearward, reason, redstreak, release, repeal, repeat, retreat, reveal, screak, scream, seal, sea, seam, seamy, sear, sear-cloth, season, seat, shear, shears, sheath, sheathe, sheaf, sneak, sneaker, sneaking, speak, spear, steal, steam, streak, streamer, streamy, surcease, tea, teach, teague, teal, team, tear (substantive), *tease, teat, treacle, treason, treat, treatment, treaty, tweak, veal, underneath, uneasy, unreave, uprear, weak, weaken, weal, weald, wean, weanling, weariness, wearisome, weary, weasand, weasel, weave, wheal, wheat, wheaten, wreak, wreath, wreathe, wreathy, year, yearling, yearly, zeal.*

2. Of the *e* in *bed*—as *abreast, ahead,* &c., *already, bedstead, behead, bespread, bestead, bread, breadth, breakfast, breast, breath, cleanse, cleanly* (adjective), *cleanlily, dead, deadly, deaf, deafen, dearth, death, earl, earldom, early, earn, earnest, earth, earthen, earthly, endeavour, feather, head, heady, health, heard, hearse, heaven, heavy, jealous, instead, lead* (a metal), *leaden, learnt, learning, leather, leaven, meadow, meant, measure, pearl, peasant, pheasant, pleasant, pleasantry, pleasure, read* (past time and participle), *readily, readiness, ready, realm, rehearsal, rehearse, research, seamstress, search, spread, stead, steadfast, steady, stealth, stealthy, sweat, sweaty, thread, threader, threat, threaten, treachery, tread, treadle, treasure, wealth, wealthy, weapon, weather, yearn, zealot, zealous, zealously.*

3. Of the *a* in *fate,* as in *bear, pear, swear, tear, wear, break, steak.* These last two words, however, are often pronounced *breek,* and *steek.*

Read rhymes to *feed* in the present tense, to *fed* in the preterite and participle.

4. As the *a* in *father,* in *heart, hearth.*

EI has four sounds—

1. That of the *a* in *fate*—as *either* (?), *neither* (?), *leisure* (?), *deign, vein, rein, reign, feign, feint, veil, heinous, heir, heiress, inveigh, inveigle* (?), *neigh, skein, reins, their, theirs, eight, freight, weight, neighbour.*

2. That of the *e* in *glebe,* as *either* (?), *neither* (?), *leisure* (?), *ceiling, conceit, receipt, conceive, perceive, deceive, receive, inveigle* (?), *seize, seizen, seignior, seigniory, seine, plebeian.*

3. That of the *i* in *pine*—as *either* (?), *neither* (?), *height,* and *sleight.*

4. That of the *e* in *bed*—as *heifer*, *nonpareil*, pronounced *heffer*, *nonparell*.

It may be seen that *leisure* and *inveigle* occur in two of the preceding lists, and *either* and *neither* in three of them, accompanied by a note of interrogation. This means that the present writer will not take upon himself to determine between the different pronunciations.

EO has five sounds—

1. That of the *ee* in *feet*, as in *people*.

2. That of the *e* in *bed*; as *leopard*, *jeopardy*, *feoffee*, *feoffer*, and *feoffment*, which are sounded as if written *feffee*, *feffer*, *feffment*.

3. That of the *o* in *note*; as in *yeoman*.

4. That of the *oo* in *cool*, as in *galleon*, a Spanish ship, which is pronounced *galloon*.

5. When unaccented and at the end of syllables, it is sounded as the *u* in *but*—as *truncheon*, *courageous*, pronounced *trunshun*, *cou-rage-us*.

In *spelling*, the old orthographies *feod*, *feodal*, and *feodatory*, are superseded by *feud*, *feudal*, and *feudatory*.

In the word *Georgic*, the *e* is silent. It has the effect, however, of making the *g* sounded as *dzh*. Hence the word is sounded *jorgic* (*jorgic* or *dzhordzhic*).

EU is a very regular combination, and is always sounded like *ew*.

IA. In *carriage*, *marriage*, *parliament*, and *miniature*, the *i* is silent.

Diamond, accurately pronounced, is a trisyllable. Generally, however, it is sounded *dimond*.

IE. 1. Sounded as the *e* in *glebe*, in *grieve*, *thieve*, &c. This is its usual sound.

2. Sounded as the *i* in *pine*, in *die*, *pie*, *lie*, *tie*, *hie*.

3. Sounded as the *e* in *bed*, in *friend*.

In *orient* the *i* and *e* belong to different syllables. In *Spaniard* and *spaniel*, the sound is either *spa-ni-el*, or *span-yel*, *Span-i-ard*, or *Span-yard*. In *twentieth*, *thirtieth*, &c. the *i* should be sounded as a separate vowel, forming a syllable by itself.

IO. This either forms two separate syllables as in *vi-o-lent*,

vi-o-let, &c., or else the *i* is sounded as *y* (*million*—*mill-yon*);

Except in *marchioness* and *cushion*, where the *i* is silent.

OA is sounded as the *o* in *note*; as *oat*, *coal*, *loaf*. Except in the words *broad*, *abroad*, *groat*, which are sounded *brawd*, *abrawd*, *grawt*.

OE is sounded like the *o* in *note*, in *doe*, *foe*, *toe*, *sloe*, *throe*, and *hoe*. Like the *u* in *but*, in *does*, from *do*. Like the *oo* in *cool*, in *shoe* and *canoe*.

OI. Except in a few imperfectly-naturalised words, *oi* has but one power, *i. e.* its power in *voice*, *oil*, &c.

The word *choir* is often sounded as *quire*. In this case it is better to spell according to the pronunciation. This is generally done; since *quire* and *quirister* are both recognised forms of orthography.

In *tortoise* the *oi* is sounded as the *u* in *but*.

Avoirdupoise and *connoisseur* are sounded aver*d*upoise and conn*e*sseur.

OU has seven different sounds. Its first and most usual one is really a sound of *a*; since it is that of a diphthong formed by the *a* in *father*, and the *w* in *wall*.

This is heard in *abound*, *about*, *account*, *acoustics*, *aground*, *aloud*, *amount*, *around*, *arouse*, *astound*, *avouch*, *bough*, *bounce*, *bound*, *bounteous*, *bounty*, *bout*, *carouse*, *chouse*, *cloud*, *clout*, *compound*, *couch*, *couchant*, *crouch*, *deflour*, *devour*, *devout*, *doubt*, *doubtful*, *doughty*, *douse*, *drought*, *encounter*, *espouse*, *expound*, *flout*, *flounder*, *foul*, *founder*, *foundling*, *fountain*, *frousy*, *gout*, *ground*, *grouse*, *grout*, *hound*, *hour*, *house*, *impound*, *loud*, *lounge*, *louse*, *lout*, *mound*, *mountain*, *mountebank*, *mouse*, *mouth*, *noun*, *ounce*, *our*, *out*, *outer*, *outermost*, *paramount*, *plough*, *pouch*, *pounce*, *pound*, *pour* (?), *pout*, *profound*, *pronoun*, *pronounce*, *propound*, *proud*, *rebound*, *recount*, *redoubt*, *redoubted*, *redound*, *rencounter*, *round*, *roundelay*, *rouse*, *rout*, *scoundrel*, *scout*, *shout*, *shroud*, *slouch*, *spouse*, *spout*, *sprout*, *stout*, *surround*, *south*, *thou*, *thousand*, *touse*, *trounce*, *trousers*, *trout*, *wound* (did wind), *slough* (a miry place), *vouch*, *vouchsafe*, *without*, *scaramouch*.

2. The sound of the *u* in *but*. This is heard in *adjourn*, *journey*, *journal*, *country*, *cousin*, *couple*, *accouple*, *double*, *trouble*,

courteous, courtesy, courage, encourage, joust, housewife, flourish, nourish, enough, chough, rough, tough, slough (a cast skin), *scourge, southerly, southern, southernwood, southward, touch, touchy, young, younker* and *youngster;* but *southern, southerly,* and *southward* are sometimes pronounced regularly like *south.* This, however, is far from the prevailing pronunciation.

3. This is the sound of the *oo* in *cool,* and the words in which it occurs are chiefly of French origin—*croup, group, amour, paramour, cartouch, gout* (taste), *ragout, rendezvous, rouge, soup, sous, surtout, through, toupee* or *toupet, you, your, youth, tour, contour, tournay, tournament, pour* (?) and *route, accoutre, agouti, uncouth, wound, routine.*

4. This is the sound of the *o* in *note,* as *though, although, coulter, court, accourt, gourd, courtier, course, discourse, source, recourse, resource, bourne, dough, doughy, four, mould, mouldy, moult, mourn, shoulder, smoulder, soul, poultice, poult, poulterer, poultry, pour* (?), *troul, borough, thorough, furlough, fourteen, concourse, intercourse.*

5. The sound of the *aw* in *bawl—ought, bought, brought, sought, besought, fought, thought, methought, wrought.*

Nought is placed by some writers in this class, but its more proper spelling is *naught.*

6. The sound of the *u* in *full*—only found in *would, could, should.*

7. The sound of the *o* in *not;* as in *cough* and *trough,* pronounced *coff* and *troff,* sometimes *cawf* and *trawf.*

UA—Sounded as *wa;* as in *persuade, equal,* &c. In *guard, guardian, guarantee, piquant,* the *u* is silent. *Victuals, victualling, victualler,* are sounded *vittles, vittling, vittler.* In *mantua-maker* the *a* is omitted.

UE—Sounded as *we;* as in *consuetude.* In *conquer* and *conqueror* the *u* is silent; in *conquest* pronounced—*conker, conkeror, conkwest.*

In a final syllable, *when sounded at all,* it is sounded as the *ew* in *new,* with a tendency to change into *yoo* and *oo.* Except when preceded by *r,* in which case it cannot be sounded *yoo,* and is generally sounded *oo;* as in *true* (*troo*).

When *u* between *g* and *e* has no sound of its own, but

simply prevents the *g* from being sounded as *j*, it may be called the Protective *u*. Thus *plage*, which would most probably be sounded *plaij*, by being spelt *plague* retains the *g* with the sound in *gun*.

UI—Sounded as *wi*; as *languid, vanquish*.

In *guide, disguise, guile*, and *beguile*, the *u* is silent, and the *i* is sounded as in *pine*.

In *build, guilt, guinea*, and *guitar*, the *u* is also silent, but the *i* is sounded as in *pin*. The same is the case with *conduit*, pronounced *cundit* (or *condit*), and also with *biscuit* and *circuit*.

In *bruise, cruise, fruit, bruit, recruit*, the *ui* is sounded as *oo*. In *juice, sluice, suit*, and *pursuit*, it is sometimes sounded as *oo* (*i. e.* as the *o* in *prove*), sometimes as the *ew* in *new*.

In *Guildhall* the *u* is silent. The *i*, however, is variously pronounced; sometimes as the *i* in *pine*, sometimes as the *i* in *pin*.

UO—Sounded as *wo*; as in *quote, quotient*.

§ 287. *Vowels followed by a Semi-vowel.*—*AW*—always sounded as the *aw* in *bawl*.

EW—almost always sounded as in *new*. In *sew* and *shew* it is pronounced as *o* in *note*. In *Shrewsbury* and *strew* it is often so sounded. *Sewer*, a drain, is frequently pronounced *shore*.

OW.—This combination has three sounds—1, that of the *ou* in *house*; as in *prowl* (?), *cow, drown*, &c. 2. That of the *o* in *note*; as in *prowl* (?), *blow, slow, willow*, &c. 3. That of the *o* in *not*; as in the single word *knowledge*, when sounded *knol-ledge*, a pronunciation which is quite as common, though not so grammatical, as that whereby the word is sounded *kno-ledge*.

AY is sounded as the *a* in *fate*; as *say, lay, pay*, &c.

EY—Found almost exclusively at the end of words.

When accented, it is sounded like the *a* in *fate*; as *survéy, they, obey*. Except *key* and *ley*; here it is sounded as the *e* in *glebe*.

When unaccented, it is sounded as in *key* and *ley*; as *galley, valley, barley*. Except *súrvey* when used as a substantive, and consequently accented on the first syllable.

OY—Always sounded as the *oi* in *oil*, of which it is only another form. Chiefly reserved for the end of words—*alloy*, *destroy*.

UY.—Except as protective, to *g* or after *q*, this combination is found in one word only, viz. *buy*. Here it is sounded as the *i* in *pine*. When protective to *g* it is silent, as in *plaguy*. After *q* it sounds as *w*—*soliloquy*, *colloquy*, &c.

§ 288. *Combinations of three Vowels.*—*AYE*—Found only in two words, but with a different sound in each.

1. In the parliamentary expression, *The ayes have it*.—Here it is sounded as the *i* in *pine*.

2. In the almost antiquated expression *for aye*, meaning *for ever*.—Here the sound is essentially the same as the last, only broader, and exactly that of the *a* in *father*, followed by the *y* in *yet*; a sound which the *i* in *fine* only approaches.

EAU—Found in words of French origin only; in all which, except in the word *beauty*, which is sounded *bewty*, it has the power of the *o* in *note*.

EOU.—When preceded by the sound of *t*, *d*, or *s*, *eou* has the same effect as *iou*, *i. e.* it has a tendency to convert them into *tsh*, *dzh*, or *sh*, as *piteous*, *hideous*, which are often sounded *pitcheous*, *hidzheous* (*hijous*), &c.

When the preceding consonant cannot be so changed, but will admit of being followed by the sound of *y*, *e* becomes so sounded; as in *cutaneous* and *spontaneous*, pronounced *cuta-nyous* and *sponta-nyous*.

Lastly, when *y* would not be pronounceable, the *e* is sounded, and forms a separate syllable; as in *vit-re-ous*.

EYE—Found only in the word *eye*; where it is sounded as the *i* in *pine*.

EWE—Found only in the word *ewe*, which is sounded as *yoo*.

IOU—Sounded as *eou*.

IEU—In words of French origin only; as *adieu*, *lieu*, *pur-lieu*, where it is sounded as the *ew* in *new*. In *lieutenant* the first four letters are pronounced *lef*.

IEW—Found in one word only, *view*; where it is sounded like the *ew* in *new*.

UAY—Found only in the word *quay*, which is pronounced *kee*, and where the *u* belongs to the *q*.

UOI—Found only in *quoit*, where the *u* belongs to the *q*, and is silent. Pronounced *koit*.

UOY—Found only in *buoy*, and *buoyant*, where the *u* is silent.

§ 289. *Consonants.—P*, at the beginning of words, when followed by a mute, is silent; as *psalm*, *ptarmigan*. In *cupboard* it is sounded as *b*. In *receipt* and *corps* it is not pronounced at all. Between *m* and *t* it is either not sounded at all or sounded very lightly.

B.—When *b* follows *m* in the same syllable, it is silent; as in *lamb*, *climb*, *limb*. Except in the words *accumb* and *succumb*, where it is sounded.

When *b* precedes *t* in the same syllable, it is silent; as in *debt*, *doubt*. When any such words take an additional syllable, the *b* still remains without sound; as *redoubted*, *doubting*. The *b* in *subtle* is silent.

F.—In the preposition *of*, *f* is sounded as *v*; only, however, as long as the word is uncompounded. In the compound word *whereof* the *f* retains its usual sound.

V is always sounded as the *v* in *vane*.

T.—The combination *ti*, *without an accent* and followed by a vowel, is sounded as *sh* or *shy*; as *mótion*, *sátiate*, pronounced *móshun*, *sa-shyate*. In *satíety*, however, where the *i* is accented and sounded as in *pine*, the *t* preserves its original sound.

In all the terminations formed from verbs and adjectives ending in *ty*, the *t* preserves its original sound; as in *pities*, *mightier*, and *twentieth*, from *pity*, *mighty*, and *twenty*.

T is silent when preceded by *s* and followed by the abbreviated *l* or *-en*; as *hasten*, *nestle*, pronounced *ha-s'n*, *nessle*. In *often* and *soften* the *t* is silent. So it is in the French words *trait*, *goût*, *éclat*. So, also, in *Christmas*, *chestnut*, *mortgage*, *hostler*, *bankruptcy*, *mistletoe* (the first *t* only), *currant*.

K, before *n* in the same syllable, is always silent; as *knee*, *knight*, *know*.

G, before *a*, *o*, *u*, *l*, and *r*, is always sounded as in *gun*.

Before *e*, *i*, and *y* it is sometimes sounded as in *gun*, sometimes as in *oblige*.

The sound of the *g* in *gun* is generally found in words of Saxon; that of the *j* in *jest* (*dzh*) in words of Greek, Latin, and French origin.

G before *e* is sounded as in *gun*, in *gear, geck, geese, geld, gelt, gelding, get, gewgaw, shagged, snagged, ragged, cragged, scragged, dogged, rugged, dagger, pettifogger, tiger, anger, eager, meager, auger, finger, linger, conger, longer, stronger, younger, longest, strongest, youngest.*

G before *i* is sounded as in *gun*, in *gibbe, gibcat, gibberish, gibbous, giddy, gift, gig, giggle, gild, gill, gimlet, gimp, gird, girdle, girl, girth, gizzard, begin, give, forgive, biggin, piggin, noggin.*

G before *y* is sounded as in *gun*, in *gyve*, and in all adjectives ending in *y* and *ish* of Anglo-Saxon origin, and formed from substantives in *g*; as *waggish, hoggish, doggish, sluggish, digging, shaggy, jaggy, knaggy, snaggy, craggy, scraggy, quaggy, swaggy, draggy, spriggy, twiggy, boggy, foggy, cloggy, buggy.*

For the sound of *g* in words like *longer*, &c., see p. 42.

G is sounded as in *gun*, in *target*, although the word is of French origin, and *targe* is sounded *tarj* (*tardzh*).

G followed by *h* at the beginning of a syllable is sounded as in *gun.*

G followed by *h* at the end of a syllable is sounded as—

1. The *g* in *gun*; as *burg, burgher*. This is rare.

2. The *k* in *kin*. In the Irish word *lough.*

3. *F*—in *laugh, cough, chough, clough, slough* (a cast skin), *enough, rough, tough, trough.*

4. In *high, nigh, thigh, neigh, weigh, inveigh, bough, dough, though, although, clough, plough, furlough, slough, through, throughout, thorough, borough, usquebaugh, pugh,* it is silent.

N.B.—It is always silent when followed by *t*, except in the word *draught*, as *fight, bought, draft* (so pronounced).

By adding the varieties of the combination *gh* with those of *ou*, we find that the syllable *ough* has six different sounds—

Plough	pronounced	*plow.*
Cough	—	*coff.*
Through	—	*throo.*
Tough	—	*tuff.*
Though	—	*tho.*
Lough	—	*lock.*

G followed by *m* at the end of a syllable is silent; as *phlegm, diaphragm, apothegm.*

G before *n* is *always* silent in words of Anglo-Saxon origin; as in *gnaw, gnash, gnat.* In words of Greek origin it is sometimes sounded, as in *Gnostic;* sometimes omitted, as in *gnomon.*

G followed by *n,* at the end of a syllable, is silent, and the vowel that precedes is either lengthened or sounded as a diphthong; as *resign, reign, impugn,* pronounced *re-sine, rane, impewn.*

Caution.—The *n* must be in the same syllable as the *g,* otherwise the *g* is sounded; as *benignant.*

In *physiognomy* the *g* begins a syllable, and is, consequently, silent. In *cognizance* and *recognizance* it is generally silent. In *poignard, champignon,* and *seignior,* it has the French, in *bagnio, seraglio, intaglio,* the Italian sound. This is in both languages that of *ny,* or *ly—ponyard, seralyo.*

S has three sounds—1, that of the *s* in *seal;* 2, that of the *z* in *zeal;* 3, that of the *sh* in *shine.* It has the sound of *z* in the following situations:—In *as* and *whereas, these* and *those.* In *dissolve, possess, scissars, hussey,* and *hussár.* In words compounded with *dis,* when followed immediately by an accent, and *not* followed by a sharp consonant; as, *disáble, disáster, disórder, disbánd,* &c.

Caution.—If the syllable be *accented,* the *s* is sounded as in *seal—díssonant, díssolute.* So it is if the accent follow two syllables after, *i. e.* not immediately—*dis-agrée.* Hence we say *diss-abílity,* and *diz-áble;* with *s* in one case and *z* in the other.

Caution.—For this rule to apply, the *dis-* must be an element of composition. Hence, *dismal* is sounded *dizmal;* since the *dis-,* although accented, is no part of the original word.

In words ending in *sm;* as *prism, microcosm* (*prizm, microcozm*).

Before liquids; as *cosmetic, dismal,* &c.

In the termination *sy,* following an accented syllable, not ending in a sharp mute; as *easy, pansy, jersey,* &c. Except in the single word *pursy.*

In the termination *sible,* preceded by a vowel; as *visible,* &c.

In *rosary* and *misery.*

In the terminations *sal* and *sel,* when preceded by a vowel.

In the terminations *son, sen,* and *sin;* as *reason, cousin,* &c. Except *mason, bason, garrison, caparison, comparison, parson, person,* and *basin.*

In *presence, president, presume, presumptive,* and *presumption.*

In words compounded of *re,* where the *re* is inseparable; as *resemble, resent, resist.*

Caution.—When *re* can be separated from the syllables that follow it, and those syllables still constitute a perfect word, the *s* is sounded as in *seal—re-seat,* and *re-sign,* when it means *sign a second time.*

It is silent in *isle, island, aisle, demesne,* and at the end of certain French words; as *sous, vis-a-vis,* &c.

Z.—When *s* is pronounced as *sh, z* is sounded as *sh; glazier, grazier, azure.*

In the single word *rendez-vous,* the *z* is silent; such being the case in the French, from which language the word has been introduced.

In Italian the *z* is sounded as *ts.* Hence *mezzotinto* is pronounced *metsotinto.*

L is mute between *a* and *k* in the same syllable; as *chalk, talk.* Also between *a* and *m* in the same syllable; as *alms, balm.* Also in *would, could, should, almond, calf, half, folk, yolk, halser, malmsey, salmon.*

M has always the same sound; and is always pronounced, except in the word *comptroller.*

N, in an accented syllable, and before the sounds of the *g* in *gun,* or of *k,* is sounded as the *ng* in *king;* as *thank, concourse,* pronounced *thangk, congcourse.*

Caution.—If the syllable be unaccented, *n* is sounded as in *kin—concúrr.*

N at the end of a syllable after *l* or *m* is silent; as *kiln, hymn.*

R.—The sound of *r* is sometimes vocalized, sometimes transposed.

For the vocalized *r* see pp. 6, 7, 8.

The transposed *r* is of two kinds, *medial* and *final.* The first kind is the rarer of the two, and occurs only in the word *iron,* pronounced *iurn.*

The transposition of the final *r* occurs in unaccented syllables, ending in *re,* preceded by a consonant; as, *acre, lucre, sabre, fibre,* sounded *áker,* &c.

§ 290. *The superfluous letters.*—*C* is sounded as *k* before *a, o,* and *u,* as *s* before *e, i,* and *y*; as *card, cord, curd,* pronounced as *kard, kord, kurd—cement, city, cynic,* as *sement, sity, synic.*

C preceded by *s* and followed by *e, i,* or *y,* is not sounded at all. It is then equivalent to a second *s,* which would be unpronounceable, *e. g. scene, sceptre,* pronounced *sene, septre.*

Between *s* and *l, c* is silent; as in *muscle.*

In words derived from the Italian, and only imperfectly incorporated with the English, *c* is pronounced as *ch* (*tsh*) in situations where it would in English words be sounded *s—violoncello, vermicelli.*

In the titles of the Emperor and Empress of Russia, *c* precedes *z,* as *Czar, Czarina.* According to the spelling, these words should be sounded either *Ksar* and *Ksarina,* or *Gzar* and *Gzarina.* Generally, however, the sound of the *c* is wholly omitted, and the words are pronounced *Zar* and *Zarina.*

When *c* comes after an accent, and before the combinations *ea, ia, io,* and *eou,* it takes the sound of *sh*; as in *ocean, social, Phocian, saponaceous.* However, as the effects of *y* upon *c* sounded as *s* are precisely the same as if the *letter* were *s* as well as the *sound,* this has already been investigated.

Q is always pronounced as *kw.* It is also always followed, in spelling, by *u*; which is sounded as *w.* Except in certain words of French origin; in which case it is silent.

X has three sounds—1. that of *ks*—2. that of *gz*—3. that of *z.*

When *x* is the first letter of a word it is sounded as *z*; as *Xerxes, Xenophon*, pronounced *Zerxes, Zenophon*.

In words of Latin origin, compounded of the preposition *ex*, whenever the syllable that follows begins with any sound excepting that of a sharp mute, and is also accented, *x* is sounded as *gz—exért, exámple*, &c. is pronounced *egzert, egzample*, &c.

In the French words *billet-doux* and *beaux*, the *x* has the French pronunciation, *i. e.* in the first it is omitted altogether, in the second it is sounded as *z*.

§ 291. *Double Consonants.*—Double consonants are of two sorts.

a. Those that do not represent a really double sound, but which are doubled in writing, in order to signify that the vowel which goes before them is short; as *well, pitted, smitten*, &c.

b. Those which represent a really double sound; as *un-natural, soul-less*, &c. These only occur in those compound words wherein the first part *ends* in the same letter with which the other *begins*.

N.B.—Words like *book-case* are in this class, because the *c* is really sounded as a second *k*.

§ 292. *H and the combinations of h.*—*H* is silent at the beginning of the following words:—*heir, heiress, honest, honesty, honour, honourable, hour*. In *herb, herbage, hospital, humble*, and *hostler*, it is sometimes sounded, sometimes mute. In *humour*, and its compound, the *hu-* is sounded *yoo*.

H is silent after *r*; as *rhetoric, rheumatism, catarrh*.

H in combination has two sounds.

a. After *p, t, s*, and *c, when it occurs in the same syllable*, it gives to the combination the power of the *th* in *thin*, the *th* in *thine*, the *s* in *shine*, and the *ch* (*tsh*) in *chest* respectively. Here it has no sound of its own, but alters that of the preceding mute.

b. When it follows any letter whatever *in a different syllable*, it is *sounded*; as *hap-hazard, nut-hook, ink-horn, fool-hardy, Am-herst*, &c. This combination occurs only in compound words when the second part begins with *h*. In such cases care should be taken to sound it.

Ph, sounded as *f*, is applied to etymological purposes only.

It represents the Greek ϕ, and is used exclusively in words of real or supposed, direct or indirect, Greek origin.

In *nephew* and *Stephen* the *ph* is sounded as *v*.

In *diphthong* and *triphthong*, it is usual to sound the *p* only; as *dipthong, tripthong*. There is, however, no good reason for not sounding the words as *difthong, trifthong*. The same applies to *naphtha* and *ophthalmia*. In *apophthegm* both *p* and *h* are silent. In *sapphire* the pronunciation is *saffire*. *Phthisis* and *phthisical* are generally sounded *thisis* and *thisical*. Nevertheless, *fthisis* and *fthisical* are preferable.

Th has two sounds,—1. that of the *th* in *thin*,—2. that of the *th* in *thine*. At the *beginning* of words it has the first sound, as *thank, think*, &c. Except in *this, that, than, their, them, then, thence, there, these, they, thine, thither, those, thou, though, thus, thy*, and their compounds.

At the *end* of words it has generally the first sound when it is *quite* final; as in *death, breath*: and the second when it is followed by *e* mute; as *wreathe, bathe*.

Th between two vowels is sounded as in *thine* when the word is of Anglo-Saxon origin; as *father, feather, heathen, hither, thither, whither, whether, either, neither, weather, wether, wither, gather, together, mother*.

Th between two vowels is sounded as in *thin*, when the word is of Latin or Greek origin; as *apathy, sympathy, antipathy, Athens, atheist, authentic, author, authority, athirst, cathartic, cathedral, catholic, catheter, ether, ethics, lethargy, Lethe, leviathan, litharge, lithotomy, mathesis, mathematics, method, pathetic, plethora, polymathy, anathema, amethyst, theatre, amphitheatre, apothecary, apotheosis*.

In *Thomas, thyme, Thames*, and *asthma*, the *th* is sounded as *t*.

Sh has but one power, that of the *sh* in *shine*.

§ 293. *The Compound Sibilants.—J* is sounded as *dzh*, except in the single word *Hallelujah*, where it is pronounced as *y*.

Unless the word be of Greek or French origin, the combination *ch* has the sound of *tsh*; as in *child, chair, rich*. Except when preceded by *l* or *n*, when it is sounded as *sh*, as *bench*,

filch. It has this latter sound, too, in most words of French origin — *chaise, chagrin, machine*, &c.; but not in *charity* (*tsharity*).

In words derived from the Greek *ch* has the sound of *k*; as *chalcography, chalybeate, chamæleon, chamomile, chaos, character, chasm, Chersonese, chimera, chirography, chiromancy, chyle*, and its compounds; *cachexy, catechism, catechise, catechetical, catechumen, echo, echinus, epoch, epocha, echoes, machination, machinal, mechanic, mechanical, orchestra, technical, anarch, anarchy, conch, cochleary, distich, hemistich, eunuch, monarch, monarchical, hierarch, heresiarch, pentateuch, stomach, stomachic, scheme, school, scholar, schesis, mastich*, and in all words where it is followed by *l* or *r*; as *chlorosis, Christ, Christian, chronology, chronical*, &c.

Extract from Walker.—"When *arch* begins a word from the Greek language, and is followed by a vowel, it is always pronounced *ark*; as in *archangel, archipelago, architect, archetype, archiepiscopal, archidiaconal, archæology*. But when we prefix *arch* to a word of our own, and this word begins with a consonant, we pronounce it so as to rhyme with *march—archduke, archdeacon, archbishop*; and sometimes, when the following word begins with a vowel, if it is a composition of our own, and the word does not come to us compounded from the Greek or Latin, as *arch-enemy*."

Ache is in this class; although in Shakspeare it is sounded *aitsh*, and, on that account, is often so pronounced on the stage at present.

In *ostrich*, the *ch* is sounded like *dzh*; in *schedule*, as if the word was written *shedule*; in *yacht* and *drachm* it is silent; in *schism* the *sch* is sounded *s*.

In the Scotch word *loch*, the *ch* is also pronounced as *k*.

§ 294. *NG* has two sounds—1, that of the *ng* in *king*; 2, that of *ng-g*.

a. The former is found in adjectives in *y*, formed from substantives in *-ng*, as *spring-y*; in participles in *ing* from verbs in *-ng*; as *bring-ing*; and, lastly, in substantives in *er* from verbs in *-ng*; as *sing-er*.

b. The latter is found in all words not formed by the addition of any inflectional or derivational syllable; as *finger, anger,*

anguish, unguent, sounded *fing-ger, ang-ger, ung-guent:* and in the comparative and superlative inflections of adjectives in *ng;* as *long, longer, longest, young, younger, youngest*, sounded *long, long-ger, long-gest, young, young-ger, young-gest.* Thus, a person who longs after a thing is a *long-er*, but a measure of six feet is *long-ger* than one of five.

When the *g* following *n* is sounded as *j*, *n* is pronounced as in *kin;* as *stin-gy = stin-jy.*

CHAPTER III.

ACCENT.—EMPHASIS.—QUANTITY.—PERMUTATION AND TRANSITION OF SOUNDS.

§ 295. *Accent.*—In the word *tyrant* a certain amount of stress is laid upon the first syllable. In the word *presume* there is a stress on the second syllable. This stress is called *accent*. The circumstance of a syllable bearing an accent is sometimes expressed by a mark (′), in which case the word is said to be accentuated, *i. e.* to have the accent signified in writing.

Words accented on the last syllable—*Brigáde, preténce, harpoón, reliéve, detér, assúme, besoúght, beréft, befóre, abroád, abóde, abstrúse, intermíx, superádd, cavaliér.*

Words accented on the last syllable but one—*An′chor, ar′gue, hásten, fáther, fóxes, smíting, húsband, márket, vápour, bárefoot, archángel, bespátter, disáble, terrífic.*

Words accented on the last syllable but two—*Reg′ular, an′tidote, for′tify, suscéptible, incontrovértible.*

Words accented on the last syllable but three (rare)—*Récceptacle, régulating, tálkativeness, ábsolutely, lúminary, inévitable,* &c.

To understand still more clearly the nature of *accent*, the following sentences should be read aloud, and particular attention should be directed to the words in *italics*, as well as to the marks over them. If this be done, it will be observed that in each pair of sentences the same word occurs, twice; but it will also be noticed that there is a difference in the pronunciation. The first time that each word occurs, the accent is on the first syllable; the second time it occurs it is on the last. Furthermore, the word that is accented on the *first* syllable is a *noun*; the word that is accented on the *second* is a *verb*. Hence it is seen

that certain nouns may be converted into verbs simply by transposing the accent.

1. The *éxports* from London are very great; the *ímports* to London are very great also. 2. America *expórts* corn and *impórts* cloth.

1. Honey is an *éxtract* from flowers. 2. You cannot *extráct* honey from all flowers.

1. I have *fréquent* opportunities of visiting home. 2. I *frequént* the playground.

1. This is the *óbject*. 2. I hope you do not *objéct*.

1. *Pérfumes* are agreeable. 2. The flower *perfúmes* the air.

1. This is a *présent*. 2. I *presént* you with this.

1. This is *próduce* of the farm. 2. Few farms *produce* more.

1. I have a *próject* on my mind. 2. The walls *projéct*.

1. The *rébels* are in danger. 2. He is a bad man who *rebéls*.

1. Take a *súrvey* of the world at large. 2. *Survéy* the world at large.

1. I am in a state of *tórment*. 2. This *torménts* me.

1. He is an *ábsent* man. 2. He is going to *absént* himself.

1. I am going to a *cóncert*. 2. He is going to *concért* a plan with me.

1. This is bad *cónduct*. 2. I hope that I shall *condúct* myself well.

1. Berwick-upon-Tweed is upon the *cónfines* of England and Scotland. 2. He *confines* himself to his studies.

1. There is a *cóntract* between us. 2. All things *contráct* under the influence of cold.

To these instances add the following:—

Nouns.	*Verbs.*	*Nouns.*	*Verbs.*
ábstract	abstráct.	cómpress	compréss.
áccent	accént.	cóncrete	concréte.
áffix	affíx.	cónflict	conflíct.
áugment	augmént.	cónserve	consérve.
cólleague	colléague.	cónsort	consórt.
cómpact	compáct.	cóntrast	contrást.
cómpound	compoúnd.	cónverse	convérse.

Nouns.	*Verbs.*	*Nouns.*	*Verbs.*
cónvert	convért.	prémise	premíse.
désert	desért.	présage	preságe.
déscant	descánt.	présent	presént.
dígest	digést.	próduce	produce.
éssay	essáy.	próject	projéct.
éxtract	extráct.	prótest	protést.
férment	fermént.	rébel	rebél.
fréquent	frequént.	récord	recórd.
ímport	impórt.	réfuse	refúse.
íncense	incénse.	súbject	subjéct
ínsult	insúlt.	súrvey	survéy.
óbject	objéct.	tórment	tormént.
pérfume	perfúme.	tránsfer	transfér.
pérmit	permít.	tránsport	transpórt.
préfix	prefíx.		

Accents of this kind may be called *distinctive.*

§ 296. *Emphasis.*—In *ty'rant* and *presúme* we deal with single words: and in each *word* we determine which *syllable* is accented. Contrasted with the sort of accent that follows, this may be called a *verbal* accent.

In the line,

> Better for *us*, perhaps, it might appear,
> (Pope's "Essay on Man," I. 169.)

the pronoun *us* is strongly brought forward. An especial stress or emphasis is laid upon it, denoting that *there are other beings to whom it might not appear*, &c. This is collected from the context. Here there is a *logical* accent. "When one word in a sentence is distinguished by a stress, as more important than the rest, we may say that it is *emphatical*, or that an *emphasis* is laid upon it. When one syllable in a word is distinguished by a stress, and more audible than the rest, we say that it is accented, or that an accent is put upon it. Accent, therefore, is to syllables what emphasis is to sentences; it distinguishes one from the crowd, and brings it forward to observation."—Nares' "Orthoepy," part ii. chap. 1.

Accent is a verbal emphasis.

Emphasis, in the strict sense of the word, is a logical accent.

§ 297. *Quantity.*—The *a* in *fat*, the *i* in *fit*, the *u* in *but*, and the *o* in *not*, have the character of being uttered with rapidity, and they pass quickly in the enunciation, the voice not resting on them. This rapidity of utterance becomes more evident when we contrast with them the prolonged sounds of the *a* in *fate*, *ee* in *feet*, *oo* in *book*, or *o* in *note*; wherein the utterance is retarded, and wherein the voice rests, delays, or is prolonged. The *f* and *t* of *fate* are separated by a longer interval than the *f* and *t* of *fat*; and the same is the case with *fit*, *feet*, &c.

Let the *n* and the *t* of *not* be each as 1, the *o* also being as 1; then each letter, consonant or vowel, shall constitute $\frac{1}{3}$ of the whole word.

Let, however, the *n* and the *t* of *not* be each as 1, the *o* being as 2. Then, instead of each consonant constituting $\frac{1}{3}$ of the whole word, it shall constitute but $\frac{1}{4}$.

Upon the comparative extent to which the voice is prolonged, the division of vowels and syllables into *long* and *short* has been established: the *o* in *note* being long, the *o* in *not* being short. The longness or shortness of a vowel or syllable is said to be its *quantity*.

§ 298. *Permutation of Sounds.*—In the words *give* and *gave* we have a change of tense expressed by a change of vowel. In the words *price* and *prize* a change of meaning is expressed by a change of consonant. In *clothe* and *clad* there is a change both of a vowel and of a consonant. In the words *to use* and *a use* there is a similar change, although it is not expressed by the spelling. To the ear the verb *to use* ends in *z*, although not to the eye. The following are instances of the

Permutation of Vowels.

a	to	*ĕ*,	as	*man, men.*
a	to	*oo*,	as	*stand, stood.*
a	to	*u*,	as	*dare, durst.*
a	to	*ē*,	as	*was, were.*
ea	to	*o*,	as	*speak, spoken.*
ea=*ĕ*	to	*ea*=*ē*,	as	*breath, breathe.*
ee	to	*ĕ*,	as	*deep, depth.*
ea	to	*o*,	as	*bear, bore.*
i	to	*a*,	as	*spin, span.*

Permutation of Vowels.

i	to	*u*,	as	*spin, spun.*
ī=ei	to	*o*,	as	*smite, smote.*
ī=ei	to	*ĭ*,	as	*smite, smitten.*
i	to	*a*,	as	*give, gave.*
ī=ei	to	*a*,	as	*rise, raise.*
ĭ	to	*e*,	as	*sit, set.*
ow	to	*ew*,	as	*blow, blew.*
o	to	*e*,	as	*strong, strength.*
oo	to	*ee*,	as	*tooth, teeth.*
o	to	*i*,	as	*top, tip.*
o	to	*e*,	as	*old, elder; tell, told.*
ŏ	to	*e*,	as	*brother, brethren.*
ō=oo	to	*i*,	as	*do, did.*
ō=oo	to	*o=ŭ*,	as	*do, done.*
oo	to	*o*,	as	*choose, chose.*

Permutation of Consonants.

f	to	*v*,	*life, live; calf, calves.*
þ	to	*ð*,	*breath, to breathe.*
þ	to	*d*,	*seethe, sod; clothe, clad.*
d	to	*t*,	*build, built.*
s	to	*s*,	*use, to use.*
s	to	*r*,	*was, were; lose, forlorn.*

In *have* and *had* we have the *ejection* of a sound; in *work* and *wrought*, the *transposition* of one.

Permutation of Combinations.

ie=ī	to	*ow*,	as	*grind, ground.*
ow	to	*ī=ei*,	as	*mouse, mice; cow, kine.*
ink	to	*augh*,	as	*drink, draught.*
ing	to	*ough*,	as	*bring, brought.*
y (formerly *g*)	to	*ough*,	as	*buy, bought.*
igh=ei	to	*ough*,	as	*fight, fought.*
eek	to	*ough*,	as	*seek, sought.*

It must be noticed that the list above is far from being an exhaustive one. The expression too of the changes undergone has been rendered difficult on account of the imperfection of our orthography. The whole section has been

written in illustration of the meaning of the word *permutation*, rather than for any specific object in grammar.

In all the words above the change of sound has been brought about by the grammatical inflection of the word wherein it occurs. This is the case with the words *life* and *live*, and with all the rest. With the German word *leben*, compared with the corresponding word *live*, in English, the change is similar. It is brought about, however, not by a grammatical inflection, but by a difference of time, and by a difference of place; in fact, the words *life* and *leben* belong to different languages. This indicates the distinction between the *permutation* of letters and the *transition* of letters. In dealing with permutations, we compare different parts of speech; in dealing with transitions, we compare different languages, or different stages of a single language.

§ 299. The *Transition* of Letters is a part of Comparative Philology. Nevertheless, it is well to know how it differs from permutation. It is also well to note the phenomenon that the following lists of the same words in different languages, short as it is, is still sufficient to indicate. This is the *regularity* under which the modifications of the same words, with their similar, though different forms, exhibit themselves. The change which takes place with one word beginning with (say) *p*, takes place with others as well. Thus—between the Greek, the Latin, and the English—

1. *An initial* Π *or P, becomes F.*

Greek.	*Latin.*	*English.*
πατὴρ	pater	father
πλέος	pl-enus	full.

2. *An initial* Φ *or F, becomes B.*

Greek.	*Latin.*	*English.*
φέρ-ω	fer-o	bear
——	fruc-tus*	brook
——	freg-i†	break.

* The root of *fru-or*. The English word *brook*, as in expressions like *I could not brook such treatment*, means originally *to make the most of* or *use*. *Brauchen=use* in the present German.

† This is a simpler form than the present *frango*.

3. *An initial* K, *or C, becomes H.*

Greek.	*Latin.*	*English.*
κεφ-αλή	cap-ut	head *
καρδ-ία	cord-	heart.

4. *An initial* Γ, *or G, becomes K.*

Greek.	*Latin.*	*English.*
γνώ-ω	gno-sco	know
γέν-ος	gen-us	kin.

5. *An initial* Θ, *or TH, becomes D.*

This becomes *f* in Latin.

Greek.	*Latin.*	*English.*
θύρ-α	for-a	door
θυγάτηρ	——	daughter.

* In German *haup*-t.

CHAPTER IV.

ORTHÖEPY.

§ 300. *Orthöepy and Orthography.*—The term *Orthöepy* is a word derived from the Greek *ortho* (*upright*), and *epos* (*word*), signifying *right pronunciation.*

Ortho-graphy, from *ortho-* and *grafê* (*writing*), means *right spelling.*

It is well to take the explanation of these two words together.

Orthography teaches us to represent the words of the spoken language by means of letters; that is, by writing or printing. If we first pronounce a word (*e. g. man,* or *child*), then spell it and write it down, and, lastly, inquire whether the spelling be correct, we ask a question belonging to the province of *orthography.*

But there are a vast number of words of which the pronunciation is doubtful, being sounded differently by different persons. For instance, the word *neither* is pronounced in three ways: *neither, nayther,* and *neether.* To ascertain the proper pronunciation of words is the province of *orthöepy.* It teaches us to *speak* the words of our language accurately. If we first pronounce a word, and then ask whether we have pronounced it properly, we ask a question belonging to the province of orthöepy. Orthöepy deals with words as they are pronounced, or with language as it is sounded; orthography with words as they are spelt, or with language as it is written. The latter pre-supposes the former. Orthography is less essential to language than orthöepy, since all languages are spoken, whilst but a few languages are written. Orthography addresses itself to the eye, orthöepy to the ear. Orthöepy deals with the articulate sounds that constitute syllables and words;

orthography treats of the signs by which such articulate sounds are expressed in writing.

§ 301. *Errors.*—Of pronunciation there are two kinds, the conversational (or ordinary) and the rhetorical. In common conversation we pronounce the *i* in *wind,* like the *i* in *bit;* in rehearsing, or in declamation, however, we pronounce it like the *i* in *bite;* that is, we give it a diphthongal sound. In reading the Scriptures we say *blesséd;* in current speeech we say *blest.* It is the same with many words occurring in poetry.

Errors in pronunciation are referable to several heads. The man who pronounces the verb *to survéy,* as if it was *súrvey* (that is, with the accent on the wrong syllable), errs in respect to the *accentuation* of the word. To say *ōrātor* instead of *ŏrātor* is to err in respect to the *quantity* of the word. To pronounce the *a* in *father,* as it is pronounced in Yorkshire, or the *s* in *sound,* as it is pronounced in Devonshire (that is, as *z*), is to err in the matter of *articulation,* or the articulate sounds. To mispronounce a word because it is misspelt (to say, for instance, *Chemist* for *Chymist,* or *vice versâ;* for I give no opinion as to the proper mode of spelling), is only indirectly an error of orthöepy. It is an error, not so much of orthöepy as of orthography. To give a wrong inflection to a word is not bad pronunciation, but bad grammar. For practical purposes, however, many words that are really points of grammar and of orthography, may be dealt with as points of orthöepy.

Errors in the way of articulation generally arise from a source different from those of accent and of quantity. Errors in accent and quantity are generally referable to insufficient grammatical or etymological knowledge, whilst the errors of articulation betray a provincial dialect.

Misdivision of syllables.—The *misdivision of syllables* has, in the English, and in other languages, given rise to a peculiar class of words. There have been those who have written *a nambassador* for *an ambassador,* misdividing the syllables, and misdistributing the sound of the letter *n.* The double form (*a* and *an*) of the English indefinite article, encourages this misdivision. Now, in certain words an error of this kind has had a permanent influence. The English word *nag* is, in

Danish, *ög;* the *n,* in English, having originally belonged to the indefinite *an,* which preceded it. The words, instead of being divided thus, *an ag,* were divided thus, *a nag,* and the fault became perpetuated. That the Danish is the true form we collect, firstly, from the ease with which the English form is accounted for, and, secondly, from the Old-Saxon form *ehu,* Latin *equus.* In *adder* we have the process reversed. The true form is *nadder,* Old English, *natter,* German. Here the *n* is taken from the substantive and added to the article. In *newt* and *eft* we have each form. The list of words of this sort can be increased.

a. The fault of incompetent *enunciation.*—A person who says *sick* for *thick,* or *elebben* for *eleven,* does so, not because he knows no better, but because he cannot enounce the right sounds of *th* and *v.* He is *incompetent* to it. His error is not one of ignorance. It is an acoustic or a phonetic defect. As such it differs from—

b. The fault of erroneous *enunciation.*—This is the error of a person who talks of *jocholate* instead of *chocolate.* It is not that he *cannot* pronounce rightly, but that he mistakes the nature of the sound required. Still more the person who calls *a hedge an edge,* and *an edge a hedge.*

Incompetent enunciation and erroneous enunciation are, however, only the proximate and immediate causes of bad orthöepy. Amongst the remote causes (the immediate causes of *erroneous* enunciation) are the following.

a. Undefined notions as to the language to which a word belongs.—The flower called *anemone* is variously pronounced. Those who know Greek say *anemōne,* speaking as if the word was written *anemohny.* The mass say, *anemŏne,* speaking as if the word was written *anemmony.* Now, the doubt here is as to the language of the word. If it be Greek, it is *anemōne.*

Αἷμα ῥοδὸν τίκτει, τὰ δὲ δάκρυα τᾶν ἀνεμῶναν.

BION.

And if it be English, it is (on the score of analogy) as undoubtedly *anémmony.* The pronunciation of the word in point is determined when we have determined the language of it.

b. Mistakes as to fact, the language of a word being determined.—To know the word *anemōne* to be Greek, and to use it as a Greek word, but to call it *anemŏny*, is not to be undecided as to a matter of language, but to be ignorant as to a matter of quantity.

c. Neglect of analogy.—Each and all the following words, *orator, theatre, senator,* &c., are in the Latin language, from whence they are derived, accented on the second syllable; as *orátor, theátre, senátor*. In English, on the contrary, they are accented on the first; as *órator, théatre, scnator*. The same is the case with many other words similarly derived. They similarly suffer a change of accent. So many words do this, that it is the rule in English for words to throw their accent from the second syllable (counting from the end of the word) to the third. It was on the strength of this rule,—in other words, on the analogies of *orator*, &c., that the English pronunciation of the Greek word *ἀνεμώνη* was stated to be *anémmone*. Now, to take a word derived from the Latin, and to look to its original quantity only, without consulting the analogies of other words similarly derived, is to be neglectful of the analogies of our own language, and only attentive to the quantities of a foreign one.

These, amongst others, the immediate causes of erroneous enunciation, have been adduced not for the sake of exhausting, but for the sake of illustrating the subject.

§ 302. *Standards of Orthöepy.* — In matters of orthöepy it is the usual custom to appeal to one of the following standards.

a. The authority of scholars.—This is of value up to a certain point only. The fittest person for determining the classical pronunciation of a word like *anemone* is the classical scholar; but the mere classical scholar is far from being the fittest person to determine the analogies that such a word follows in English.

b. The usage of educated bodies, such as the bar, the pulpit, the senate, &c.—These are recommended by two circumstances: 1. The chances are that each member of them is sufficiently a scholar in foreign tongues to determine the original pronunciation of derived words, and sufficiently a critic in his own

language to be aware of the analogies that are in operation. 2. The quantity of imitators that, irrespective of the worth of his pronunciation, each individual can carry with him. On this latter ground the stage is a sort of standard.

c. The authority of societies constituted with the express purpose of taking cognizance of the language of the country.—These, although recognised in Italy and other parts of the Continent, have only been proposed in Great Britain. Their inefficacy arises from the inutility of attempting to fix that which, like language, is essentially fluctuating.

d. The authority of the written language.—The value of this may be collected from the chapter on orthography.

These, amongst others, the standards that have been appealed to, are adduced not for the sake of exhausting the subject, but to show the unsatisfactory nature of authority in matters of speech.

§ 303. *Orthöepic tests.*—For a person, on a point of pronunciation, to trust to his own judgment, he must be capable, with every word that he doubts about, of discussing three questions:—

a. The abstract or theoretical propriety of a certain pronunciation.—To determine this he must have a sufficient knowledge of foreign tongues and a sufficient knowledge of English analogies. He must also have some test by which he can determine to what language an equivocal word belongs. Of tests for this purpose, one, amongst others, is the following:—Let it be asked whether the word *lens* (in Optics) is English or Latin; whether it is be considered as a naturalised word or a strange one. The following fact will give an answer. There is of the word *lens* a plural number, and this plural number is the English form *lenses*, and not the Latin form *lentes*. The existence of an English inflection proves that the word to which it belongs is English, although its absence does not prove the contrary. That the word *anemone* is English (and consequently pronounced *anemŏne*) we know from the plural form, which is not *anemonæ*, but *anemones*.

b. The preference of one pronunciation over another on the score of utility.—The word *ascetic*, for certain orthographical

reasons, notwithstanding its origin from the Greek word *askeó*, is called *assetic*. From similar reasons there is a tendency to call the word *sceptic*, *septic*. Theoretical propriety (and, be it observed, the analogy of *ascetic* has not been overlooked) is in favour of the word being sounded *skeptic*. The tendency of language, however, is the other way. Now, the tendency of language and the theoretical propriety being equal, there is an advantage (a point of utility) in saying *skeptic*, which turns the scale. By sounding the *k* we distinguish the word *skeptic* from *septic*. By this the language gains a point in perspicuity, so that we can talk of the *anti-skeptic* writings of Bishop Warburton and of the *anti-septic* properties of charcoal.

c. The tendencies of language.—The combination *ew* is an Unstable Combination; that is, it has a tendency to become *yoo*, and the *y* in *yoo* has a tendency to change a *d* preceding into *j*; in other words, we see the reason why, by many persons, *dew* is pronounced *jew*.

It is generally an easier matter to say how a word will be sounded a hundred years hence, than to determine its present pronunciation. Theoretical propriety is in favour of *dew*, so also is the view in the way of utility. Notwithstanding this, posterity will say *jew*, for the tendencies of language are paramount to all other influences.

We may now judge of the relative value of the three lines of criticism exhibited above. Other things being equal, the language should have the advantage of the doubt, and the utility of a given pronunciation should prevail over its theoretical propriety. Where, however, the tendencies towards a given form are overwhelming, we can only choose whether, in doubtful words, we shall speak like our ancestors, or like our posterity.

CHAPTER V.

ORTHOGRAPHY.—ORTHOGRAPHICAL EXPEDIENTS.

§ 304. The difference between orthography and orthöepy has been explained.

A full and perfect system of *orthography* consists in two things:—1. The possession of a sufficient and consistent alphabet. 2. The right application of such an alphabet. This position may be illustrated more fully.

First, in respect to a full and perfect alphabet. Let there be in a certain language, simple single articulate sounds, to the number of forty, whilst the simple single signs, or letters, expressive of them, amount to no more than *thirty*. In this case the alphabet is insufficient. It is not full enough; since ten of the simple single articulate sounds have no corresponding signs whereby they may be expressed. In our own language, the sounds (amongst others) of *th* in *thin*, and of *th* in *thine*, are simple and single, whilst there is no sign equally simple and single to spell them with.

An alphabet, however, may be sufficient, and yet imperfect. It may err on the score of inconsistency. Let there be in a given language two simple single sounds, for instance, the *p* in *pate*, and the *f* in *fate*. Let these sounds stand in a given relation to each other. Let a given sign, for instance, פ (as is actually the case in Hebrew), stand for the *p* in *pate*; and let a second sign be required for the *f* in *fate*. Concerning the nature of this latter sign, two views may be taken. One framer of the alphabet, perceiving that the two sounds are mere modifications of each other, may argue that no new sign (or letter) is at all necessary, but that the sound of *f* in *fate* may be expressed by a mere modification of the sign (or letter) פ, and may be written thus פ, or thus פ׳, or פ᾽, &c.; upon the prin-

ciple that, like sounds should be expressed by like signs. The other framer of the alphabet, contemplating the difference between the two sounds, rather than the likeness, may propose, not a mere modification of the sign Ð, but a letter altogether new, such as *f*, or *ϕ*, &c., upon the principle that sounds of a given degree of dissimilitude should be expressed by signs of a different degree of dissimilitude.

Hitherto the expression of the sounds in point is a matter of convenience only. No question has been raised as to its consistency or inconsistency. This begins under conditions like the following:—Let there be in the language in point the sounds of the *t* in *tin*, and of the *th* in *thin*; which (it may be remembered) are precisely in the same relation to each other as the *p* in *pate* and the *f* in *fate*. Let each of these sounds have a sign (or letter) expressive of it. Upon the nature of these signs, or letters, will depend the nature of the sign or letter required for the *f* in *fate*. If the letter expressing the *th* in *thin* be a mere modification of the letter expressing the *t* in *tin*, then must the letter expressive of the *f* in *fate* be a mere modification of the letter expressing the *p* in *pate*, and *vice versâ*. If this be not the case, the alphabet is *inconsistent*.

In the English alphabet we have (amongst others) the folowing inconsistency:—The sound of the *f* in *fate*, in a certain relation to the sound of the *p* in *pate*, is expressed by a totally distinct sign; whereas, the sound of the *th* in *thin* (similarly related to the *t* in *tin*) is expressed by no new sign, but by a mere modification of *t*; viz. *th*.

A third element in the faultiness of an alphabet is the fault of erroneous representation. The best illustration of this we get from the Hebrew alphabet, where the sounds of ת and ט, mere *varieties* of each other, are represented by distinct and dissimilar signs, whilst ת and ת, sounds *specifically* distinct, are expressed by a mere modification of the same sign, or letter.

The right application of an alphabet.—An alphabet may be both sufficient and consistent, accurate in its representation of the alliances between articulate sounds, and in nowise redundant; and yet, withal, it may be so wrongly applied as to be

defective. Of defect in the use or application of the letters of an alphabet, the three main causes are the following :—

1. *Unsteadiness in the power of letters.*—Of this there are two kinds. In the first, there is one sound with two (or more) ways of expressing it. Such is the sound of the letter *f* in English. In words of Anglo-Saxon origin it is spelt with a single simple sign, as in *fill;* whilst in Greek words it is denoted by a combination, as in *Philip*. The reverse of this takes place with the letter *g*; here a single sign has a double power; in *gibbet* it is sounded as *j*, and in *gibberish* as *g* in *got*.

2. *The aim at secondary objects.*—The natural aim of orthography, of spelling, or of writing (for the three terms mean the same thing), is to express the *sounds* of a language. Syllables and words it takes as they meet the ear, it translates them by appropriate signs, and so paints them, as it were, to the eye. That this is the natural and primary object is self-evident; but beyond this natural and primary object there is, with the orthographic systems of most languages, a secondary one, viz. the attempt to combine with the representation of the sound of a given word the representation of its history and origin.

The sound of the *c* in *city*, is the sound that we naturally spell with the letter *s*, and if the expression of this sound was the *only* object of our orthographists, the word would be spelt accordingly (*sity*). The following facts, however, traverse this simple view of the matter. The word is a derived word; it is transplanted into our own language from the Latin, where it is spelt with a *c* (*civitas*); and to change this *c* into *s* conceals the origin and history of the word. For this reason the *c* is retained, although, as far as the mere expression of sounds (the primary object in orthography) is concerned, the letter is a superfluity. In cases like the one adduced the orthography is bent to a secondary end, and is traversed by the etymology.

3. *Obsoleteness.*—It is very evident that modes of spelling, which at one time may have been correct, may, by a change of pronunciation, become incorrect; so that orthography becomes obsolete whenever there takes place a change of speech without a correspondent change of spelling.

4. *Difference between the change of a sound and the original false expression of a sound.*—The letter *u* is a simple single sign. The sound of *ow*, in *town*, is a diphthongal, or a double sound. Now, in Anglo-Saxon, the modern word *town* is spelt *tún*. In this case one of two things must have taken place; either the word must have changed its sound, or the Anglo-Saxons must have expressed it falsely and improperly.

§ 305. Of a full and perfect alphabet and orthography, then, the chief conditions are as follows :—

1. That for every simple single sound, incapable of being represented by a combination of letters, there be a simple single sign.

2. That sounds within a determined degree of likeness be represented by signs within a determined degree of likeness; whilst sounds beyond a certain degree of likeness be represented by distinct and different signs, *and that uniformly*.

3. That no sound have more than one sign to express it.

4. That no sign express more than one sound.

5. That the primary aim of orthography be to express the sounds of words, and not their histories.

6. That changes of speech be followed by corresponding changes of spelling. Of all the points connected with the improvement of vicious modes of spelling, this requires the most careful and discreet handling.

The elementary articulate sounds of the English Language are to be found in § 277. To these some writers would add the additional sound of the *é fermé* of the French, believing that the vowel in words like *their* and *vein* has a different sound from the vowel in words like *there* and *vain*. For my own part I cannot detect such a difference either in my own speech or that of my neighbours; although I am far from denying that in certain *dialects* of our language such may have been the case. The following is an extract from the Danish grammar for Englishmen by Professor Rask, whose eye, in the matter in question, seems to have misled his ear: "The *é fermé*, or *close é*, is very frequent in Danish, but scarcely perceptible in English; unless in such words as *their, vein, veil*, which appear to sound a little different from *there, vain, vale*."

Now the vowels being *twelve*, the diphthongs *four*, and the

consonantal sounds *twenty-four*, we have altogether as many as *forty* sounds, some being so closely allied to each other as to be mere modifications, and others being combinations rather than simple sounds; all, however, agreeing in requiring to be expressed by letters or by combinations of letters, and to be distinguished from each other.

But, although every sound specifically distinct should be expressed by a distinct sign, it does not follow that mere modifications or varieties (especially if they be within certain limits) should be so expressed. In the Greek language sounds as like as the *o* in *not* and the *o* in *note* are expressed by signs as unlike as o and ω; that is, by the letters *omicron* and *omega* respectively; and so it is with ε and η. All that can be said in this case is, that it is the character of the Greek alphabet to represent a difference which the English neglects.

With respect to the diphthongs it is incorrect, uncommon, and inconvenient to represent them by simple single signs, rather than by combinations. In the English language the sounds of *ou, ew,* and *oi,* are properly spelt with two letters. Not so, however, of *i* in *bite.*

The compound sibilants may also be expressed not by single signs, but by the combinations *tsh* and *dzh.*

§ 306. With these views we may appreciate,

1. *The insufficiency of the English alphabet*—

a. In respect to the vowels.—Notwithstanding the fact that the sounds of the *a* in *father, fate,* and *fat,* and of the *o* and the *aw* in *note, not,* and *bawl,* are modifications of *a* and *o* respectively, we have still *six* vowel sounds specifically distinct, for which (*y* being a consonant rather than a vowel) we have but *five* signs. The *u* in *duck,* specifically distinct from the *u* in *bull,* has no specifically distinct sign to represent it.

b. In respect to the consonants.—The *th* in *thin,* the *th* in *thine,* the *sh* in *shine,* the *z* in *azure,* and the *ng* in *king,* five sounds specifically distinct, and five sounds perfectly simple, require corresponding signs, which they have not.

2. *Its inconsistency.*—The *f* in *fan,* and the *v* in *van,* sounds in a certain degree of relationship to *p* and *b,* are expressed by signs as unlike as *f* is unlike *p,* and as *v* is unlike *b.* The sound of the *th* in *thin,* the *th* in *thine,* the *sh* in *shine,* similarly

related to *t*, *d*, and *s*, are expressed by signs as like *t*, *d*, and *s*, respectively, as *th* and *sh*.

The compound sibilant sound of *j* in *jest* is spelt with the single sign *j*, whilst the compound sibilant sound in *chest* is spelt with the combination *ch*.

3. *Erroneousness*.—The sound of the *ee* in *feet* is considered the long (independent) sound of the *e* in *bed*; whereas it is the long (independent) sound of the *i* in *pit*.

The *i* in *bite* is considered as the long (independent) sound of the *i* in *pit*; whereas it is a diphthongal sound.

The *u* in *duck* is looked upon as a modification of the *u* in *bull*; whereas it is a specifically distinct sound.

The *ou* in *house* and the *oi* in *oil* are looked upon as the compounds of *o* and *i* and of *o* and *u* respectively; whereas the latter element of them is not *i* and *u*, but *y* and *w*.

The *th* in *thin* and the *th* in *thine* are dealt with as one and the same sound; whereas they are sounds specifically distinct.

The *ch* in *chest* is dealt with as a modification of *c* (either with the power of *k* or of *s*); whereas its elements are *t* and *sh*.

4. *Redundancy*.—As far as the representation of sounds is concerned the letter *c* is superfluous. In words like *citizen* it may be replaced by *s*; in words like *cat* by *k*. In *ch*, as in *chest*, it has no proper place. In *ch*, as in *mechanical*, it may be replaced by *k*.

Q is superfluous, *cw* or *kw* being its equivalent.

X also is superfluous, *ks*, *gz*, or *z*, being equivalent to it.

The diphthongal forms *æ* and *œ*, as in *Æneas* and *Crœsus*, except in the way of etymology, are superfluous and redundant.

5. *Unsteadiness*.—Here we have (amongst many other examples), 1. The consonant *c* with the double power of *s* and *k*; 2. *g* with its sound in *gun* and also with its sound in *gin*; 3. *x* with its sounds in *Alexander*, *apoplexy*, *Xenophon*.

In the foregoing examples a single sign has a double power; in the words *Philip* and *fillip*, &c. a single sound has a double sign.

In respect to the degree wherein the English orthography

is made subservient to etymology, it is sufficient to repeat the statement that the *c*, *æ*, and *œ* are retained in the alphabet for etymological purposes only.

The defects noticed in the preceding sections are *absolute* defects, and would exist, as they do at present, were there no language in the world except the English. This is not the case with those that are now about to be noticed; for them, indeed, the word *defect* is somewhat too strong a term. They may more properly be termed inconveniences.

Compared with the languages of the rest of the world the use of many letters in the English alphabet is *singular*. The letter *i* (when long or independent) is, with the exception of England, generally sounded as *ee*. With Englishmen it has a diphthongal power. The inconvenience of this is the necessity that it imposes upon us, in studying foreign languages, of unlearning the sound which we give it in our own, and of learning the sound which it bears in the language studied. So it is (amongst many others) with the letter *j*. In English this has the sound of *dzh*, in French of *zh*, and in German of *y*. From singularity in the use of letters arises inconvenience in the study of foreign tongues.

In using *j* as *dzh* there is a second objection. It is not only inconvenient, but it is theoretically incorrect. The letter *j* was originally a modification of the vowel *i*. The Germans, who use it as the semi-vowel *y*, have perverted it from its original power less than the English have done, who sound it *dzh*.

With these views we may appreciate, of the English alphabet and orthography—

1. *Its convenience or inconvenience in respect to learning foreign tongues.*—The sound given to the *a* in *fate* is singular. Other nations sound it as *a* in *father*.

The sound given to the *e*, long (or independent), is singular. Other nations sound it either as *a* in *fate*, or as *é fermé*.

The sound given to the *i* in *bite* is singular. Other nations sound it as *ee* in *feet*.

The sound given to the *oo* in *fool* is singular. Other nations sound it as the *o* in *note*, or as the *ó* in *chiuso*.

The sound given to the *u* in *duck* is singular. Other nations sound it as the *u* in *bull.*

The sound given to the *ou* in *house* is singular. Other nations, more correctly, represent it by *au* or *aw.*

The sound given to the *w* in *wet* is somewhat singular, but is also correct and convenient. With many nations it is not found at all, whilst with those where it occurs it has the sound (there or thereabouts) of *v.*

The sound given to *y* is somewhat singular. In Danish it has a vowel power. In German the semi-vowel sound is spelt with *j.*

The sound given to *z* is not the sound which it has in German and Italian; but its power in English is convenient and correct.

The sound given to *ch* in *chest* is singular. In other languages it has generally a guttural sound; in French that of *sh.* The English usage is more correct than the French, but less correct than the German.

The sound given to *j* (as said before) is singular.

2. *The historical propriety of certain letters.*—The use of *i* with a diphthongal power is not only singular and inconvenient, but also historically incorrect. The Greek *iota,* from whence it originates, has the sound of *i* and *ee,* as in *pit* and *feet.*

The *y,* sounded as in *yet,* is historically incorrect. It grew out of the Greek *υ,* a vowel, and no semi-vowel. The Danes still use it as such, that is, with the power of the German *ü.*

The use of *j* for *dzh* is historically incorrect.

The use of *c* for *k* in words derived from the Greek, as *ascetic,* &c. is historically incorrect. In remodelling alphabets the question of historical propriety should be recognised. Other reasons for the use of a particular letter in a particular sense being equal, the historical propriety should decide the question. The above examples are illustrative, not exhaustive.

§ 307. *On certain conventional modes of spelling.*—In the Greek language the sounds of *o* in *not* and of *o* in *note* (although allied) are expressed by the unlike signs or letters

o and *ω*, respectively. In most other languages the difference between the sounds is considered too slight to require for its expression signs so distinct and dissimilar. In some languages the difference is neglected altogether. In many, however, it is expressed, and that by some modification of the original letter.

Let the sign (¯) denote that the vowel over which it stands is long, or independent, whilst the sign (˘) indicates shortness, or dependence. In such a case, instead of writing *not* and *nωt*, like the Greeks, we may write *nŏt* and *nōt*, the sign serving for a fresh letter. Herein the expression of the nature of the sound is natural, because the natural use of (¯) and (˘) is to express length and shortness, dependence or independence. Now, supposing the broad sound of *o* to be already represented, it is very evident that, of the other two sounds of *o*, the one must be long (independent), and the other short (dependent); and as it is only necessary to express one of these conditions, we may, if we choose, use the sign (¯) alone; its presence denoting length, and its absence shortness (independence or dependence).

As signs of this kind, one mark is as good as another; and instead of (¯) we may, if we choose, substitute such a mark as (′) (and write *nót* = *nōt* = *nωt* = *nōte*); provided only that the sign (′) expresses no other condition or affection of a sound. This use of the mark (′), viz. as a sign that the vowel over which it is placed is long (independent), is common in many languages. But is this use of (′) natural? For a reason that the reader has anticipated, it is not natural, but conventional. It is used elsewhere not as the sign of *quantity*, but as the sign of *accent*; consequently being placed over a letter, and being interpreted according to its natural meaning, it gives the idea, not that the syllable is long, but that it is emphatic or accented. Its use as a sign of quantity is an orthographical expedient, or a conventional mode of spelling.

The English language abounds in orthographical expedients; the mode of expressing the quantity of the vowels being particularly numerous. To begin with these:—

The reduplication of a vowel where there is but one syllable (as in *feet, cool*), is an orthographic expedient. It merely means that the syllable is long (or independent).

The reduplication of a consonant after a vowel, as in *spotted, torrent,* is, in most cases, an orthographic expedient. It merely denotes that the preceding vowel is short (dependent).

The use of *th* with the power of the first consonantal sound in *thin* and *thine,* is an orthographic expedient. The combination must be dealt with as a single letter.

X, however, and *q* are not orthographic expedients. They are orthographic compendiums.

The mischief of orthographic expedients is this:—When a sign, or letter, is used in a *conventional,* it precludes us from using it (at least without further explanation) in its *natural* sense. Thus the double *o* in *mood* constitutes but one syllable. If, in a foreign language, we had, immediately succeeding each other, first the syllable *mó,* and next the syllable *od,* we should have to spell it *mo-od,* or *möod,* or *mo-ȯd,* &c. Again, it is only by our knowledge of the language that the *th* in *nuthook,* is not pronounced like the *th* in *burthen.* In the languages of India the true sound of *t* + *h* is common. This, however, we cannot spell naturally; because the combination *th* conveys to us another notion. Hence arise such combinations as *thh,* or *t*^{c}, &c., in writing Hindoo words.

A second mischief of orthographic conventionalities, is the wrong notions that they engender, the eye misleading the ear. That *th* is really *t* + *h,* no one would have believed had it not been for the spelling.

§ 308. *The e mute—the juxta-position of different vowels.*—Two important modes of spelling still stand over for notice.

(1.) By adding a second vowel, and so giving the appearance of a diphthong (*rĕd, reād*); and (2) by adding at the end of the word the letter *e,* which, from the circumstance of its not being sounded, is called the *e* mute (*băt, bāte*); we get, *for the present stage of the English language,* the same results that come from the reduplication of the vowel, as in *feet* and *cool; i. e.* we get a sign to the eye that the vowel is long or independent. Such, at least, is the general inference from these combinations. At

the same time it is doubtful whether either of these is a true orthographic expedient; inasmuch as it is highly probable that they once represented (or approached the representation of) a real sound; *e. g.* the *e* now called mute was once sounded.

Again, the provincial pronunciation of such a word as *wheat* is *whee-ŭt* (there or thereabouts). This, which is provincial now, may easily be *archaic, i. e.* belong to the written language in an older stage. If so, the second vowel is no true orthographic expedient. Whatever it may be now, it originally expressed a real sound; a real sound which has changed and simplified itself during the interval.

§ 309. Long as is the list of the different powers of the different letters of the English Language, the greater part of them finds an explanation in one of the above-mentioned principles.

The etymological principle explains much; for the English is a language which pre-eminently recognises it; and it is also a language which, from the complex character of its organisation, has a large field for its application.

Change between the first use of a given mode of spelling and the present time explains much also;

Orthographic expedients explain more;

Fourthly, the juxta-position of incompatible sounds explains much (see remarks on *d* and *s*).

B.—The *b* in *debtor, subtle, doubt,* agrees with the *b* in *lamb, dumb, thumb, womb,* in being mute. It differs, however, in another respect. The words *debtor, subtle, doubt,* are of classical, the words *lamb, dumb,* &c. are of Angle origin. In *debtor,* &c. the *b* was undoubtedly at one time pronounced, since it belonged to a different syllable; *debitor, subtilis, dubito,* being the original forms. I am far from being certain that, with the other words, *lamb,* &c. this was the case. With them the *b* belonged (if it belonged to the word at all) to the same syllable as the *m*. I think, however, that instead of this being the case, the *b,* in *speech,* never made a part of the word at all; that it belongs now, and that it always belonged, to the *written* language only; and that it was inserted in the spelling upon what may be called the principle of imitation.

D.—The reason for *d* being often sounded like *t*, is as follows:—

The words where it is so sounded are either the past tenses or the participles of verbs; as *plucked, tossed, stepped*, &c.

Now the letter *e* in the second syllable of these words is not sounded; whence the sounds of *k*, of *s*, and of *p*, come in immediate contact with the sound of the letter *d*.

But the sound of the letter *d* is flat, whilst those of *k*, *s*, and *p* are sharp; so that the combinations *kd*, *sd*, and *pd* are unpronounceable. Hence *d* is sounded as *t*.

In the older stages of the English Language the vowel *e* (or some other vowel equivalent to it) was actually sounded, and in those times *d* was sounded also.

Hence *d* is retained in spelling, although its sound is the sound of *t*.

K (*C*).—1. Before *e*, *i*, and *y*, the letter *c* is pronounced as *s*—*cetaceous, city, Cyprian*;

2. Before *a*, *o*, and *u*, it is sounded as *k*—*cat, cool, cut*;

3. Before a consonant it is so sounded—*craft*.

On the other hand—1. *K* rarely comes before *a*, *o*, or *u*—

2. But it *is* used before *e*, *i*, or *y*; because in that position *c* would run the chance of being sounded as *s*.

Hence at the end of words *k* is used in preference to *c*. We write *stick, lock*, rather than *stic, loc*, or *sticc, locc*.

And the reason is clear; the sound of *c* is *either* that of *k* or that of *s*.

Which of these sounds it shall represent is determined by what follows.

If followed by nothing, it has no fixed sound; but

At the end of words it *is* followed by nothing;

Whence it has, at the end of words, no fixed sound; and

Therefore, being inconvenient, has to be replaced by *k*.

But, besides this, *k* is rarely doubled. We write *stick* rather than *stikk*. This is because it is never used except where *c* would be pronounced as *s*; that is, before a small vowel. If *kid* were spelt *cid*, it would run the chance of being pronounced *sid*.

Now, the preference of *c* to *k* is another instance of the influence of the Latin language. The letter *k* was wanting in

Latin; and as such was eschewed by languages whose orthography was influenced by the Latin.

Hence arose in the eyes of the etymologist the propriety of retaining, in all words derived from the Latin (*crown, concave, concupiscence,* &c.), the letter *c* to the exclusion of *k*. Besides this, the Anglo-Saxon alphabet, being taken from the Roman, excluded *k*, so that *c* was written even before the small vowels, *a, e, i, y*; as *cyning*, or *cining, a king*. *C* then supplants *k* upon etymological grounds only. In some of the languages derived from the Latin this dislike to the use of *k* leads to several orthographical inconveniences. As the tendency of *c* before *e, i, y,* to be sounded as *s* (or as a sound allied to *s*), is the same in those languages as in others; and as, in those languages as in others, there frequently occur such sounds as *kit, ket, kin,* &c., a difficulty arises as to the spelling. If spelt *cit, cet,* &c. there is risk of their being sounded *sit, set*. To remedy this an *h* is interposed—*chit, chet,* &c. This, however, only substitutes one difficulty for another, since *ch* is, in all probability, already used with a different sound: *e.g.* that of *sh*, as in French; or that of *k* guttural, as in German. The Spanish orthography is thus hampered. Unwilling to spell the word *chimera* (pronounced *kimera*) with a *k*; unable to spell it with either *c* or *ch*, it writes the word *quimera*. This distaste for *k* is an orthographic prejudice. Even in the way of etymology it is but partially advantageous: since in the other Gothic languages, where the alphabet is less rigidly Latin, the words that in English are spelt with a *c*, are there written with *k*—*kam*, German; *komme*, Danish; *skrapa*, Swedish = *came, come, scrape*.

That the syllables *cit, cyt, cet,* were at one time pronounced *kit, kyt, ket,* we believe: 1. from the circumstance that if it were not so, they would have been spelt with an *s*; 2. from the comparison of the Greek and Latin languages, where the words *cete, circus, cystis,* Latin, are κητὴ, κίρκος, κύστις, Greek.

In the words *mechanical, choler,* &c. derived from the Greek, it must not be imagined that the *c* represents the Greek *kappa* or κ. The combination *c* + *h* is to be dealt with as a single letter. Thus it was that the Romans, who had in their language neither the sound of χ, nor the sign κ,

rendered the Greek *chi* (χ), just as by *th* they rendered θ, and by *ph*, ϕ.

The faulty representation of the Greek χ has given rise to a faulty representation of the Greek κ, as in *ascetic*, from ἀσκήτικος.

G.—Where *c* is sounded as *k*, *g* is sounded as in *gun*.

Where *c* is sounded as *s*, *g* is sounded as *j* (*dzh*)—not always, though generally.

This engenders the use of *u* as an orthographic expedient. In words like *prorogue*, &c. its effect is to separate the *g* from the *e*, and (so doing) to prevent it being sounded as *j* (*dzh*).

The letter S.—In a very large class of words the letter *s* is used in spelling where the real sound is that of the letter *z*. Words like *stags*, *balls*, *peas*, &c. are pronounced *stagz*, *ballz*, *peaz*. It is very important to be familiar with this orthographical substitution of *s* for *z*.

The reason for it is as follows:—

The words where it is so sounded are either possessive cases, or plural nominatives; as *stag's*, *stags*, *slab's*, *slabs*, &c.

Now in these words (and in words like them) the sounds of *g* (in *stag*) and of *b* (in *slab*) come in immediate contact with the sound of the letter *s*.

But the sound of the letter *s* is sharp, whilst those of *g* and *b* are flat, so that the combinations *gs*, *bs*, are unpronounceable. Hence *s* is sounded as *z*.

In the older stages of the English language a vowel was interposed between the last letter of the word and the letter *s*, and, when that vowel was sounded, *s* was sounded also.

Hence *s* is retained in spelling, although its sound is the sound of *z*.

This fact of the final *s* being so frequently sounded as *z* reduces the writer to a strait whenever he has to express the *true* sound of *s* at the end of a word. To write *s* on such an occasion would be to use a letter that would probably be mispronounced; that is, pronounced as *z*.

The first expedient he would hit upon would be to double the *s*, and write *ss*. But here he would meet with the following difficulty:—A double consonant expresses the shortness of

the vowel preceding, *tŏss*, *hĭss*, *ĕgg*, &c. Hence a double *s* (*ss*) might be misinterpreted.

This throws the grammarian upon the use of *c*, which, as stated above, has, in certain situations, the power of *s*. To write, however, simply *sinc*, or *onc*, would induce the risk of the words being sounded *sink*, *onk*. To obviate this, *e* is added, which has the double effect of not requiring to be sounded (being mute), and of showing that the *c* has the sound of *s* (being small).

"It is the peculiar quality," writes Johnson, "of *s* that it may be sounded before all consonants, except *x* and *z*, in which *s* is compound, being only *ks*, and *z* only a hard [flat] or gross *s*. It is therefore termed by grammarians *suæ potestatis litera*; the reason of which the learned Dr. Clarke erroneously supposed to be, that in some words it might be doubled at pleasure." A reference to the current Greek Grammars will indicate another reason for σ being called *suæ potestatis litera*. It will there be seen that, whilst π, β, φ—κ, γ, χ—τ, δ, θ—are grouped together, as *tenues*, *mediæ*, and *aspiratæ*, and as *inter se cognatæ*, σ stands by itself; ζ, its *media* (flat sound), being treated as a double letter, and *sh*, its so-called aspirate, being non-existent in the Greek language.

H.—The reason for *h* appearing in combination with *t* and *s*, in words like *thin* and *shine*, is as follows:—

The Greeks had in their language the sounds of both the *t* in *tin*, and of the *th* in *thin*.

These two sounds they viewed in a proper light; that is, they considered them both as simple single elementary sounds.

Accordingly, they expressed them by signs, or letters, equally simple, single, and elementary. The first they denoted by the sign, or letter, τ, the second by the sign, or letter, θ.

They observed also the difference in sound between these two sounds.

To this difference of sound they gave names. The sound of τ (*t*) was called *psilon* (a word meaning *bare*). The sound of θ (*th*) was called *dasy* (a word meaning *rough*).

In the Latin language, however, there was no such sound as that of the *th* in *thin*.

And, consequently, there was no simple single sign to represent it.

Notwithstanding this the Latins knew of the sound, and of its being in Greek; and, at times, when they wrote words of Greek extraction, they had occasion to represent it.

They also knew that the sound was called *dasy*, in opposition to the sound of *t* (τ), which was *psilon*.

Now the Latins conceived that the difference between a sound called *psilon*, and a sound called *dasy*, consisted in the latter being pronounced with a stronger breath, or breathing.

In the Latin language the word *aspiration* means *breathing*; so that, according to the views just stated, the Greek word *dasy* was translated by the Latin word *aspiratum* (*i. e. aspirated* or *accompanied by a breathing*).

In Latin the letter *h* was not called a sound, but merely a breathing* (*aspiratio*).

This being the case, the addition of the letter *h* was thought a fit way of expressing the difference between the sounds of the *t* in *tin* and the *th* in *thin*.

As the influence of the Latin language was great, this view of the nature of the sound of *th* (and of sounds like it) became common.

The Anglo-Saxons, like the Greeks, had a simple single sign for the simple single sound: *viz.* þ (for the *th* in *thin*), and ð (for the *th* in *thine*).

But their Norman conquerors had neither sound nor sign, and so they succeeded in superseding the Anglo-Saxon by the Latin mode of spelling.

Add to this, that they treated the two sounds of *th* (*thin* and *thine*) as one, and spelt them both alike.

* The fact of *asper* = *dasy* has, probably, had something to do with the evolution of this term. If so, it has effected a *catachresis*.

CHAPTER VI.

HISTORICAL SKETCH OF THE ENGLISH ALPHABET.

§ 310. The preceding chapters have exhibited the theory of a full and perfect alphabet; they have shown how far the English falls short of such a standard; and, besides this, they have exhibited some of the various conventional modes of spelling which the insufficiency of alphabets, combined with other causes, has engendered. The present chapter gives a *history* of our alphabet, whereby many of its defects are partially *accounted for*. These defects, it may be said, once for all, the English alphabet shares with those of the rest of the world; although, with the doubtful exception of the French, it possesses them in higher degree than any other.

With few, if any, exceptions, all the modes of writing in the world originate, directly or indirectly, from the Phœnician. This is easily accounted for when we call to mind, (1) the fact that the Greek, the Latin, and the Arabic alphabets, are all founded upon this; and (2) the great influence of the nations speaking those three languages. The present sketch, however, is given only for the sake of accounting for our chief defects and peculiarities.

§ 311. *Phœnician period.*—At a certain period the alphabet of Palestine, Phœnicia, and the neighbouring languages of the so-called Semitic tribes, consisted of *twenty-two* separate and distinct letters.

The chances are, that, let a language possess as few elementary articulate sounds as possible, an alphabet of only twenty-two letters will be insufficient. Now, in the pticuarlar case of the languages in point, the number of elementary sounds, as we infer from the present Arabic, was *above* the average. Hence,

it may safely be asserted, that the original Phœnician alphabet was *insufficient* for even the Phœnician language.

It was, moreover, *inconsistent;* since sounds as like as those of *teth* and *tau* (mere variations of each other) were expressed by signs as unlike as ט and ת; whilst sounds as unlike as those of *beth* with a point, and *beth* without a point (*b* and *v*), were expressed (if expressed at all) by signs as like as ב and בּ. This, however, was a subsequent change.

In its early state it was imported into Greece. Now, as it rarely happens that any two languages have precisely the same elementary articulate sounds, so it rarely happens that an alphabet can be transplanted from one tongue to another, and be found, at once, to coincide.

The Greeks had, in all probability, sounds which were wanting in Palestine and Phœnicia. In Palestine and Phœnicia it is certain that there were sounds wanting in Greece.

Of the twenty-two Phœnician letters, the Greeks appear to have taken but twenty-one. The eighteenth letter, *tsadi,* seems either never to have been introduced into Europe, or to have become obsolete immediately after its introduction.

§ 312. *Greek period.*—Compared with the Semitic, the *Old* Greek alphabet ran thus:—

	Hebrew.	*Greek.*		*Hebrew.*	*Greek.*
1.	א	A.	12.	ל	Λ.
2.	ב	B.	13.	מ	M.
3.	ג	Γ.	14.	נ	N.
4.	ד	Δ.	15.	ס	Ξ.
5.	ה	E.	16.	ע	O.
6.	ו	F.	17.	פ	Π.
7.	ז	Z.	18.	צ	—
8.	ח	H.	19.	ק	Q*
9.	ט	Θ.	20.	ר	P.
10.	י	I.	21.	ש	Σ.
11.	כ	K.	22.	ת	T.

In a work specially devoted to the history of alphabetic writing, the so-called Semitic letters should appear in their very oldest form. They do not, however, do so in the foregoing

* Or rather the letter out of which *Q* grew.

table. Indeed, although we are speaking of the *Phœnician* alphabet, the forms themselves of the letters are not Phœnician. They are (as may be seen from the heading of the columns) *Hebrew*. For the chief purposes of the present chapter this is sufficient. The older forms, however, may be studied in more works than one, *e. g.* in the Phœnicia of Gesenius, in Professor Key's Alphabet, &c.

The names of the letters are as follows:—

Hebrew.	*Greek.*	*Hebrew.*	*Greek.*
1. Alef	Alfa.	12. Lamed	Lambda.
2. Beth	Beta.	13. Mem	Mu.
3. Gimel	Gamma.	14. Nun	Nu.
4. Daleth	Delta.	15. Samekh	Sigma.
5. He	E.	16. Ayn	O.
6. Vaw	Digamma.	17. Pi	Pi
7. Zayn	Zeta.	18. Tsadi	——
8. Heth	Eta.	19. Kof	Koppa.
9. Teth	Theta.	20. Resh	Rho.
10. Yod	Iota.	21. Sin	San.
11. Kaf	Kappa.	22. Tau	Tau.

When this alphabet of twenty-two letters was transferred from Phœnicia to Greece, the following changes took place; changes of which the effects are to be found, more or less, in more than half the alphabets of the world, even at the present time:—

Letter 6 (*Vaw*) became obsolete.

Letters 5 and 8 (E *and* H). The Greeks, like the Phœnicians, &c. used them with similar, though different, powers. In the languages akin to the Phœnician, these were sounds of *h*—aspirates (so-called) or gutturals. In the Greek, this aspirate or guttural power grew obsolete, and the powers of the letters equivalent to the ה and ח became those of the vowels *e* and *ee*. Furthermore, the Greeks (probably, at some comparatively late period) added to the name E, the adjective *psilon* (=*bare*, or, in the technical language of the grammarian, *lene*); and, hence the name became E-*psilon*, *Epsilon*, or E*psilon*.

What the Greeks in aftertimes wrote X and Φ, the Greek during the first stage of the alphabet wrote ΚΗ and ΠΗ.

Letters 15 and 21 (*Samekh* and *Sin*). Of these, the latter took the Greek form, *San*, only in the earlier stages of the language. In the later this name became obsolete. When this had taken place, the name *Sigma* (which word for word = *Samekh*, just as word for word *San* = *Sin*) was transferred from the fifteenth letter to the twentieth.

Letter 16, *Ayn*. The history of this sign is nearly that of the sign ה (E). It came to denote the sound of *o*, having originally been something different. What this original sound was is uncertain. It is generally considered to have been a nasal, *i. e.* something akin to the *ng* in *king*. Such is the history of the change it underwent when becoming Greek as a *sign*.

Different from this is the history of the *name* by which it was known. This came to be O*mikron* (= *little o*), O-*mikron*, *Omikron*; this being, *mutatis mutandis*, the change that converted E into *Epsilon*. The history, however, of the two letters differs; inasmuch as the letter from which *Epsilon* was differentiated (viz. the sound of *Eta*), was already a part of the alphabet, whereas the sound from which *Omikron* was differentiated was an *addition*, a sound of comparatively late origin, of which the sign was Ω, and the name *O mega*, *O-mega*, *Omega*.

Letter 18, *Tsadi*. See below.

Letter 19, *Kof*, like *Vaw*, became obsolete—both as a name and as a letter; not simply, like *San*, where the name only got lost, whilst the letter remained, but wholly and absolutely, letter and name as well.

We have now seen that out of twenty-two Phœnician *letters*, and a like number of *names of letters*, the Greeks adopted as many as twenty-one, if we suppose that Tsadi *never* made any part of the Greek alphabet; but, *with* Tsadi, twenty-two. The doubts about this sign arise out of the fact of there having been an old Greek name *Sampi*. How came it? Word for word it seems to be *Tsadi*. Yet there is no proof that *Tsadi* was ever taken into the Greek alphabet. It occurs in no MS., in no inscription. Nevertheless, it may have once been Greek—having become obsolete at a very early period.

Hence, we may treat it as a letter lost at so early a period as, for practical purposes, to be ignored as a part of the Greek alphabet—which, then, (as aforesaid) consists of twenty-one letters out of twenty-two—*letters and names of letters*. Mark this difference, and—

Then, ask what principles regulated the adaptation of the Phœnician alphabet to the Greek language; the answers being—

Firstly, that letters expressive of sounds to which there were no precise equivalents in Greek, were used with other powers. This was the case with the letters.

Figured.		Named.		Sounded.	
Hebrew.	*Greek.*	*Hebrew.*	*Greek.*	*Hebrew.*	*Greek.*
ה	E	*He*	*Epsilon.*	h	*e*
ח	H	*Heth*	*Eta.*	hh	*ee*
ע	O	*Ayn*	*O.*	ng (?)	*o*

Secondly, that letters which were not wanted were allowed to drop out of the alphabet, either wholly or partially: wholly, when the name and letter were each allowed to grow obsolete; partially, when either the name alone or the letter alone was ejected. With the Greek equivalent to Kof, the letter was wholly lost, the name being nearly so. The sixth letter, however, or the representative of *Vaw*, although obsolete as the sign of a *sound*, was retained as the sign of a *number*; viz. the number six ($\varsigma = 6$).

Again, there were either sounds in the Greek Language which were wanting in the Phœnician, or (what, for practical purposes, is the same thing) the Greeks determined upon expressing certain differences which the Phœnicians left unrepresented. This, however, could not be done without further change—change which arose out of the insufficiency of the original scanty alphabet of twenty-two signs.

Hence, for such simple siugle elementary articulate sounds for which there was no sign or letter representant, new signs, or letters, were invented. Furthermore, these new signs, as will be seen in the sequel, were not mere modifications of the older ones, but new, distinct, and independent letters—

Called.	*Figured.*	*Sounded.*
Upsilon	Υ	u.
Fi (*Phi*)	Φ	f (*ph*).
Khi (*Chi*)	Χ	kh (*ch*).
Psi	Ψ	ps.
Omega	Ω	ō.

The *place* of these new sounds was at the end of the alphabet. They followed *Tau,* and came altogether. They might have been put in the vacancies left by the ejected or obsolete letters; but they were not.

The *names* of the letters were accommodated to the genius of the Greek Language. Thus, to say nothing about the *minor* modifications, of *Alfa, Beta, Lambda,* from *Alef, Beth, Lamed,* &c., we find that—

Zayn	becomes	*Zeta.*
Heth	—	*Eta.*
Teth	—	*Theta.*
Samekh	—	*Sigma.*
Ayn	—	*O.*
Resh	—	*Rho.*

The *order* of the letters is preserved, the letters themselves being used as numerals. Hence—

Greek.		*Hebrew.*		*Numeral.*
A	=	א	=	1.
B	=	ב	=	2.
Γ	=	ג	=	3.
Δ	=	ד	=	4.
E	=	ה	=	5.
ϝ	=	ו	=	6.
Z	=	ז	=	7.
H	=	ח	=	8.
Θ	=	ט	=	9.
I	=	י	=	10.

Here let us pause; first, to remark that there are at least two epochs in the history of the Greek alphabet, or, changing the expression, two alphabets, the *Older* and the *Newer;* and, next, to consider certain points connected with them both.

§ 313. *The Older Greek Alphabet as compared with the*

Newer.—We get at the difference between the Older Greek Alphabet as opposed to the Newer, by remembering—

1. What has been ejected;
2. What has been changed;
3. What has been added.

The *ejections* were of two kinds.

a. There was the ejection of both name and letter. This took place with the letters and names that grew out of Vau and Kof.

b. There was the ejection of the name only. This took place with *San*.

The *changes* were of two kinds.

a. There was a change of *name*, *e. g.* the addition of the adjectives *psilon* and *mikron* to *e* and *o* respectively; the transfer of the denomination *sigma* to the twenty-first letter, and the substitution for it of the name *Xi* for letter 16.

b. There was a change of *form*. The new letter *Khi* became X, and Ξ became what was originally the representative of the Hebrew Samekh.

The additions have already been noticed.

Now the details respecting the points wherein the Greek alphabet in its newer, differed from the Greek alphabet in its older stage, are of far less importance than the considerations that arise out of the simple fact of there having been two stages at all—viz. the Older and Newer. When did the latter begin? When did the former end? Did they pass into one another by degrees, or was there a broad and definite line of demarcation between them? Did the one become prevalent in one part of the Greek area, and the other in another? Was one Attic rather than Doric or Ionic, the other Doric or Ionic rather than Attic? The answers to all this involve special and minute investigations into the archæology and palæography of Greece, and it is not Greece that the present work is written about. Hence, the points under notice are indicated rather than investigated. On the other hand, a great deal that bears even upon the history of the *English* alphabet up to its very latest date, is to be found in the difference between the Old Greek alphabet of twenty-one (or twenty-two) letters, and the newer one of more than twenty-two.

We may easily understand the nature of these phenomena by asking a few questions, which, however hypothetical they may be, will well illustrate the bearings of the facts under notice. "What" (let us ask) "would be the character of the present alphabet of the English Language if it had been taken direct from the Greek?"

This engenders another question, "Which Greek is meant, the Older alphabet or the Newer; the Older which ran from *Alfa* to *Tau*, or the Newer which ran from *Alfa* to *Omega?*"

Whichever way we answer, we find something different from the present state of things; *e. g.* if we had taken direct from either the Older or Newer Greek, *z* would be the sixth letter in our alphabet instead of the last.

Again, had we taken from the Newer alone, we should have had two different *e's* and different *o's*—one for the *e* in *pen*, and another for the *e* in *glebe;* one for the *o* in *not*, another for the *o* in *note*, &c., &c.

Again, let us look at the two letters *U* and *Q*. The former we could only have got from the Newer, the latter only from the Older alphabet. Yet we have *both;* and that when our alphabet has not been taken from the Greek at all.

This (to which much might be added) suggests the likelihood of the difference of the two stages of the Greek alphabet being important, and deserving of attention. Let us deal with it in as simple a form as possible, unencumbered of unnecessary details, and solely with a view to the phenomena which it will explain. Doing this let us take the two extreme forms—the oldest, which will also be the most Phœnician; the newest, which will also be the most English or Angle form.

1. Alfa	Α	Alfa	1.
2. Beta	Β	Beta	2.
3. Gamma	Γ	Gamma	3.
4. Delta	Δ	Delta	4.
5. Epsilon	Ε	E	5.
6. Zeta	Ζ	*Digamma*	6.
7. Eta	Η	Eta	7.
8. Theta	Θ	Theta	8.
9. Iota	Ι	Iota	9.
10. Kappa	Κ	Kappa	10.

11. Lambda	Λ	Lambda	11.
12. Mu	M	Mu	12.
13. Nu	N	Nu	13.
14. Xi	Ξ	*Samekh*	14.
15. Omikron	O	O	15.
16. Pi	Π	Pi	16.
— ——	—	Koppa	17.
— ——	—	Tsadi (?)	18.
17. Rho	P	Rho	19.
18. Sigma	Σ	*San*	20.
19. Tau	T	Tau	21.
20. Upsilon	Y		
21. Fi	Φ		
22. Khi	X		
23. Psi	Ψ		
24. Omega	Ω		

In this table *Tsadi* has been admitted, because, as it professes to exhibit the extreme forms of the Greek alphabet, the *very* early period to which that letter may be referred is recognised.

It may not be inconvenient to give names to these two extreme forms, names founded upon the character of the resemblance which they bear to the two alphabets with which they are most compared. These are the Phœnician on the one side, and the Slavonic on the other. From these two terms let us coin the words *Phœnicoeid* and *Slavoniform*.*

It is clear that the earlier any alphabet is derived from the Greek, the more Phœnicoeid it will be; nay, it may be so Phœnicoeid as to present the same appearance that would have arisen out of an immediate deduction from the Phœnician itself.

Let us, in fixing upon a rough approximation for the two stages, say that 700 B.C. the Greek alphabet was Phœnicoeid rather than Slavoniform, and 100 B.C. Slavoniform rather than Phœnicoeid.

§ 314. The reader may now either continue the study of the present section, or pass on to § 315. If he do the former, he will meet with some observations upon writing in general, observations which have their bearing upon the criti-

* See note at end of chapter for meaning of this term.

cism of the development, evolution, and affiliation of alphabets of the world at large; observations, however, which are more or less episodical to the present work. On the other hand, by missing these questions for the present, he may take up the history of the Phœnician and Phœnicoeid alphabets of Italy; alphabets whose structure influenced that of the Romans, the Roman alphabet being the basis of our own.

The questions to be noticed are those of—(1.) *Form*, to which are subordinate those of *nexus* and *direction*; (2.) *Power*; (3.) *Name*; and (4.) *Order*.

1. *Form*.—At the present moment we have more forms than one for the same letter, and it is not difficult to see how they originated. There are the Capitals—different in MSS. and in printed books, different, too, from what they were in the days of Black-letter. There are the smaller letters—different in writing and in printing, different, too, from the Black-letter. There are Italics, which are intermediate to type and MS.—print in imitation of penmanship. All this we find within the limits of our own language. Beyond these limits, we find difference as well as likeness. The German and Danish texts are what the English once was, *i. e.* forms of Black-letter—and that in writing as well as printing. It is easy, then, to find varieties in the *form* of the letters.

How do they arise? Printing is one process, writing another. One requires a pen, the other a type. Differences of this kind evidently have a tendency to develope different results. But printing is a recent invention, and, being such, is evidently inadequate to account for the differences of form between the old alphabets. What do we look for here? Difference of material—difference of the material written on, difference in the instrument wherewith men wrote. It is no slight matter in respect to the shape of a letter whether we use a pen, a style, or a reed, a waxen tablet, a strip of papyrus, or a skin of parchment

Again, we have a coinage. So had the ancients. A coin, however, is at least as different from a printed book as a printed book is from a MS.

Finally—we have inscriptions. So had the ancients.

Now, without saying that MS. writing demands that its

letters should be round and curved rather than straight and angular, it is safe to say that inscriptional writing requires angular and straight lines rather than curves and sinuosities.

Hence, with the slightest tendency for the MS. forms of letters to get rounded, there sets in a tendency towards the evolution of two classes of letters—one for inscriptions (or *glyptographic*), one for communications on paper, parchment, &c. (or *cursive*). Now, the cursive forms tolerate the introduction of glyptographic shapes better than the glyptographic tolerate the introduction of cursive ones. Hence, in inscriptions we find the angular forms almost exclusively; in MSS. the curved forms, and, on certain occasions, the angular ones as well. Out of these angular, inscriptional, or glyptographic letters grow the *Capital* as opposed to the Small letters.

Now, as all our early specimens of the alphabet are from coins or inscriptions, it is only the *Capital* or glyptographic forms of the older alphabets that we know anything about. Hence, in working problems connected with the affiliation and derivation of alphabets, we must compare the Capitals rather than the smaller letters—the glyptographic rather than the cursive forms.

Closely akin and (as aforesaid) subordinate to the question of forms, is that of—

Nexus, connection, conjunction, or concatenation.—In glyptography we *carve*, in MS. we *urite*. In the former, the letters may be kept separate; in the latter, they have a tendency to join, or touch each other. Carve such a word as THOMAS on a tombstone, stamp such a word as GEORGE on a coin, and the letters keep separate. Print them, and they *must* be separate. Write them, and they run into each other. This produces modifications of form, *i. e.* connecting lines and abbreviations.

Closely akin, and (as aforesaid) subordinate to the question of *concatenation*, is that of—

Direction.—*We* write from left to right—*George*. But what if we wrote *egroeG*, *i. e.* from right to left? The Hebrews *did* so write.

Again, they or we might have written

G
e
o
r
g
e

i. e. from top to bottom—or *vice versâ*—

e
g
r
o
e
G

from bottom to top.

No known nation writes from bottom to top. The Mongols, however, write from top to bottom.

Hence, the direction of a line of writing may be either *horizontal*, or *perpendicular* (*vertical*)—these being the primary lines. Intermediate to the two we may have one from corner to corner, or a *diagonal* one. This might easily have existed, though it is not known to have done so.

The direction, then, of a line of writing may be *horizontal, vertical*, or a *mixture of the two, i. e. diagonal*—the two first forms being real and actually in practice.

Again, the Greeks give us the adverb βουστροφηδὸν (*bustrofedon*), from βους (*bus* = *ox*) and στρεφ (*stref* = *turn*). This means the way in which an ox at the plough turns, *i. e.* up one furrow and down another. Hence, in the *bustrofedon* direction one line runs from right to left (or *vice versâ*), and the next from left to right (or *vice versâ*).

It is not enough to remember the different possible and actual varieties of *direction*, deducing the *diagonal* from a mixture of the two primary forms of the *vertical* and *horizontal*, as well as noticing the *left-to-right*, the *right-to-left*, and the *bustrofedon* forms of the latter; there is a further distinction to be drawn—the distinction between the *direction of letters* and the *direction of lines*.

Such a line as—

The way was long, the wind was cold,

is written horizontally, and from *left-to-right*.

Divide it into two, and reverse the direction of the latter half, so as to get a sample of *right-to-left* mode of writing; which (as the two hemistichs are taken together) will also be *bustrofedon*.

The way was long,
.dloc saw dniw eht

Could this be written otherwise? Yes. It might run—

The way was long,
·ɓloɔ ɐsw ɓuiw ǝɥʇ

The difference between these two examples is clear. In the former the line is read from right to left, the letters preserving their original aspect. In the latter the direction of the individual letters is changed as well as that of the line in general.

2. *Power*.—Examples of the change of *power* have been given in the cases of the Greek *Eta*, *Epsilon*, &c. They generally arise out of the difference between the sound-system of the language from which the alphabet is taken, and that of the language which takes it. Under certain conditions a long line of alterations may occur, and the power of a given letter may end in being something very different from what it was at the beginning. The Greek, for instance, changes the power of the Phœnician ח. A third language may take from the Greek, and change the Greek *Eta*, and so on *ad infinitum*.

3. *Name*.—The names of *A* and *B* were in Greek and Hebrew Alfa and Alef, Beta and Beth respectively.

The name of the same letters in English are *a* and *bee*. The Greek used an alphabet, we an *A B C*.

There is a transparently visible difference between these two classes of names. The Greek and Hebrew forms are those of ordinary substantives; the English are simply the powers of the letter put in a pronounceable form.

4. *Order*.—That the letters of a language should take some definite *order*, is an absolute necessity, as soon as such a book as a dictionary or glossary comes into use.

There must, then, be some determinate sequence—*i. e.* if *a* precedes *b* once, it must always precede it; and so on.

The real date, however, of this order or sequence is much earlier. It is, at least, as old as the term *Alphabet;* a word compounded of the names of the first two letters of the Greek series—*alfa* and *beta;* in Hebrew, *alef* and *beth.* The following extract from Professor Key gives us an ingenious speculation respecting the word *element*—

"Alphabet is the name given to the series of letters used in different countries at different times. The term is borrowed from the Greek language, in which *alpha*, *beta*, are the first two letters; or if we go a step farther back, we should derive the word from the Hebrew, which gives to the corresponding letters the names *aleph*, *beth*. Thus the formation of the word is precisely analogous to that of our familiar expression, the *A*, *B*, *C;* and some writers have found a similar origin for the Latin name given to the letters, viz. *elementa*, which, it must be allowed, bears an extraordinary similarity in sound to the three liquids, *l*, *m*, *n*; but to make this derivation satisfactory, it should be proved that these letters were at one time the leaders of the alphabet, for otherwise it would be difficult to account for the selection of a name from them in preference to the rest."

Another point connected with the history of the *Alphabet* (the word being used in its strict etymological sense, and meaning the *order of the letters*) is the fact, that in the Greek and Hebrew it had a double function.

In other words, the letters denoted *numbers* as well as *sounds;* so that $\alpha = 1$, $\beta = 2$, $\gamma = 3$, &c. The bearing of this double power is important. Say, that in the present English there were no such signs as 1, 2, 3, 4, 5, &c., but the letters *a*, *b*, *c*, *d*, *e*, &c., instead. Say, too, that some orthographic reformer persuaded his countrymen that the letter *c* was superfluous—as it actually is. Say, that he made out a case for its ejection. A difficulty would then present itself. Though useless and (perhaps) obstructive as the sign of a sound, it would be wanted as a number, and, as a number, it would have to keep its place in the alphabet. It has been seen that something of this kind was the case with the Hebrew *vau*, when taken into the Greek.

Hence, the subtraction of a letter from an alphabet, wherein numbers as well as sounds are expressed, is inconvenient.

But suppose the case to be one of addition as well as subtrac-

tion, *i. e.* that *c* has to be ejected, but that some letter has to be added. In such a case the one may be *substituted* for the other —and the order of the alphabet remained unchanged.

Thirdly—there may be a case of *simple* addition; whereby some letter is added, and no letter taken away. Where must be the place of this new sign? At the end of the alphabet. This, at least, is what we expect *à priori*, and this is what, in many alphabets, we find to have actually been the case. At the same time, there are other likely situations as well—*e. g.* a newly-added letter allied to (say) *b*, or *t*, may easily be placed next to those signs—*intercalated* or *interposed*, so to say.

The conclusion of these episodical sections respecting certain points connected with the general history of alphabetic writing is now at hand; it being only necessary to remind the reader that the only questions under consideration in the present work are those that account for certain phenomena connected with the alphabet of the English Language. The origin of the Phœnician letters is another matter altogether. It is another matter altogether, whether we consider it historically or developmentally, whether we ask from what older literature (if any) the Phœnicians took their letters, or whether we investigate the internal changes by which one form of alphabet was evolved out of another. It is one thing to ask whether Phœnicia may have taken its alphabet from Egypt or Assyria, another to ask whether what is now a letter may not once have been a syllable, and whether what at a later period was a syllable may not at an earlier one have been a whole word. All this, however, we pass over *sicco pede*.

Neither are the details of the changes that converted the Phœnicoeid form of the Greek Alphabet into the Slavoniform of great importance. The letter of the greatest value that they gave us was the U psilon (U-psilon, Upsilon), the parent of *u*, *v*, *y*, and *w*.

"At *tau*," writes Professor Key, "the Hebrew series terminates, while the Greek adds first a υ, then a φ, a χ, a ψ, and an ω. That some of these did not belong to the early Greek alphabet is proved historically. The ω appears rarely before the year 403 B.C.; ψ, χ, and φ, were represented by ΦΣ, ΚΗ, ΠΗ, and υ or ϒ appears to be only a variety of the *ayin*, to which it bears a strong resemblance in form.

The letters *o* and *u*, moreover, in all languages are so closely related in power, that the one might almost supply the place of the other, as is actually the case in the Etruscan, which had a *u*, but no *o*. It is not, therefore, a very bold thing to assert that the early Greek alphabet terminated at the same point as the Hebrew. There is, however, a difficulty which should not be neglected. It has been a common assertion, that the old Greek alphabet consisted of only sixteen letters. But Pliny and Plutarch seem, in the first place, to be the sole authority for the statement; and the assertion of the former, that Palamedes in the time of the Trojan war (!) added Θ, Ξ, Φ, Χ, and Simonides Ζ, Η, Ψ, Ω, is full of so many difficulties that belief could not readily be given to him, even were there no counter authority. For upon what principle could the Greek letters have attained their present order, if they were introduced according to the chronological arrangement given by Pliny? But fortunately in the very passage of Pliny referred to (vii. 56, or 57), he gives another statement from Aristotle, differing from his own in several particulars, but, it must be confessed, not more satisfactory. They mutually serve, however, to weaken the authority of each other. In enumerating the sixteen letters it may be observed that the long vowels Η, Ω, the double letters Ζ, Ξ, Ψ, the aspirates Φ, Χ, Θ, are excluded by Pliny. In defence of Ω, Ψ, Χ, Φ, we say nothing; but the character Η certainly did exist, not indeed as a long vowel, but as an aspirate. Thus with the *digamma*, the letter Η (*cheth*), and the *theta*, the old alphabet possessed a complete trio of aspirates: so erroneous is the notion that they should all be excluded. Lastly, as for Ζ and Ξ, the circumstance of their situation corresponding precisely to the *zain* and *samech* of the Hebrew would induce us to defend them, even at the risk of supposing (if such supposition be necessary) that, in their original power, they were not double letters. We do not, however, mean that the very characters existed, but that sibilants of some kind occupied their places. The precise correspondence of the Greek and Hebrew alphabets in the order and power and names of the letters is an argument of much stronger weight than any testimony from such careless and late writers as Pliny and Plutarch."

Yet one more general observation. In § 277 I have written that "the arrangement of sounds, as far as we have hitherto gone, is a *natural* arrangement; that is, vowels are arranged with vowels, consonants with consonants, mutes with mutes, liquids with liquids, and cognate sounds with cognate sounds. It will soon be seen that, besides the *natural* arrangement of

the sounds of a language, there is an *artificial* arrangement as well."

This *artificial arrangement* is, of course, the Alphabet; in which it may safely be said that the general opinion of philologues is in favour of the order or sequence of its letters being arbitrary or conventional. Why does *b* precede *c* and *d*? The ordinary answer is, that it does so because the first disposer and arranger of the letters chose to place it before them. Had he done the exact contrary he was free to do so. Such sequences as *c, d, b; d, c, b; b, d, c,* would have been just as good had they existed.

But I continue, and qualify my statement, adding to the term "artificial arrangement," the following words, "*or if not artificial, one which at the first view appears to be so.*" This suggests that the conventional, artificial, arbitrary, or non-natural order of the present alphabet may be so only *apparently*. In *reality* it may be natural—its natural character being disguised.

Now, the order of the Hebrew Alphabet is as follows :—

	Name.	*Sound.*
1.	*Alef*	Vowel or breathing.
2.	*Beth*	B.
3.	*Gimel*	G.*
4.	*Daleth*	D.
5.	*He*	Either a vowel or an aspirate.
6.	*Vaw*	V.
7.	*Zayn*	Z.
8.	*Kheth*	a variety of K.
9.	*Teth*	a variety of T.
10.	*Yod*	I.
11.	*Kaph*	K.
12.	*Lamed*	L.
13.	*Mem*	M.
14.	*Nun*	N.
15.	*Samekh*	a variety of S.
16.	*Ayn*	Either a vowel or—ʔ
17.	*Pe*	P.
18.	*Tsadi*	TS.
19.	*Koph*	a variety of K.
20.	*Resh*	R.
21.	*Sin*	S.
22.	*Tau*	T.

Let *beth, vaw,* and *pe* (*b, v, p*) constitute a series called series *P*. Let *gimel, kheth,* and *koph* (*g, kh, k'*) constitute a series called series *K*. Let *daleth, teth,* and *tau* (*d, t', t*) constitute a series called series *T*. Let *alef, he,* and *ayn* con-

* As in *gun*.

stitute a series called the vowel series. Let the first four letters be taken in their order.

1.	*Alef* . . .	of the vowel series.
2.	*Beth* . . .	of series P.
3.	*Gimel* . . .	of series K.
4.	*Daleth* . . .	of series T.

Herein the consonant of series *B* comes next to the letter of the vowel series; that of series *K* follows; and, in the last place comes the letter of series *D*. After this the order changes: *daleth* being followed by *he* of the vowel series.

5.	*He* . . .	of the vowel series.
6.	*Vaw* . . .	of series *P*.
7.	*Zayn* . . .	———
8.	*Keth* . . .	of series *K*.
9.	*Teth* . . .	of series *T*.

In this second sequence the *relative* positions of *v*, *kh*, and *t'* are the same in respect to each other, and the same in respect to the vowel series. The sequence itself is broken by the letter *zayn*, but it is remarkable that the principle of the sequence is the same. Series *P* follows the vowel, and series *T* is farthest from it. After this the system becomes but fragmentary. Still, even now, *pe*, of series *P*, follows *ayn*; *tau*, of series *D*, is farthest from it; and *koph*, of series *K*, is intermediate. I am satisfied that we have in the Hebrew alphabet, and in all alphabets derived from it (consequently in the English), if not a system, the rudiments of a system, and that the system is of the sort indicated above; in other words, that the order of the alphabet is a *circulating order*.

The earliest notification of this natural character, so disguised as to appear artificial, is to be found in the following extract from a work so often quoted already—Key's "Alphabet:"—

"But we are digressing too long from the question about the principle which governed the first arrangement of the Hebrew or old Greek alphabet, if principle there be. Though we cannot satisfactorily account for the whole order throughout the twenty-two letters,

there are certainly traces of some regularity in the arrangement. We find first the simplest of the vowel sounds followed by the three medials, β, γ, δ; then another vowel, followed, with some irregularity indeed, by aspirates corresponding in order to the above consonants, *vau*, *cheth*, *theth*, no bad representatives of ϕ, χ, θ. Then again we have a vowel ι, followed soon after by three consonants related to each other, λ, μ, ν. Soon after we find a fourth vowel o, and after it, with a little interruption it must be allowed, *pi*, *koppa*, *tau*. It cannot well be a mere accident that the several classes of labials, palatals, and dentals occur so nearly together in the different parts of the series, and always in the same order."

We may now follow our alphabet into Italy.

§ 315. *The Early Italian and Etruscan Alphabets.*—This was taken from either the Phœnician itself, or the Phœnicoeid Greek. We know this from the presence of the letters *F* and *Q*—the former from *Vau*, the latter from *Koppa*.

What more took place? Just what did in Greece. Where a letter was not wanted, it was either not taken in or allowed to drop out of the alphabet. Where a modification of its power was necessary, such modification was admitted.

In this way the equivalent to *Vau* took the sound of *F*, rather than that of *V*.

More changes of the kind will be found in the history of the Etruscan alphabet. In the Etruscan language, unless we are misled by the spelling, there was a remarkable preponderance of the *sharp* sounds as opposed to the *flat*, and a corresponding deficiency of the flat sounds as opposed to the *sharp*. Thus, there were the sounds of *p*, *f*, *t*, and *s*, in abundance, but not those of *b*, *v*, *d*, and *z*. Hence the equivalents to *beth*, *daleth*, and *zayn*, are wanting in the Etruscan; whilst that of *vau* is found with an altered power.

An alphabet derived from the Etruscan would be poorer than one derived from the Greek, and if the language to which it applied contained the flat sounds of *b*, *d*, and *z*, the representation of that language in writing would run every chance of being but indifferently good; in other words, it would run every risk of being very bad.

If the Etruscans wanted so many of the common elementary sounds, what did they have in their stead? anything or nothing?

Was the sound-system absolutely poor, or was it only different from the Greek?

It is not necessary to investigate these questions. It is enough to know that the signs for *b* and *d*, were wanting in the Etruscan alphabet—absolutely wanting. The *sign* for *Vau* was admitted—its power being changed. Instead of = *v* it = *f*. The effect of this we find in our own language at the present moment.

But there was another sound which was also said to be wanting in Etruscan, viz. that of the Greek *o-mikron*. What was the effect of this? It might be one of two things.

a. Either the sign which represented the Hebrew *Ayn* might be utterly absent from the Etruscan alphabet, or—

b. It might be incorporated therein with an altered power.

In other words, we might have either a case of ejection or a case of adaptation.

I have little doubt but that the case is one of adaptation. If we look to any of the ordinary tables which give us an Etruscan alphabet, we find that, when we get to the place of the Hebrew *Ayn*, or the Greek *Omikron*, there is a blank, or *hiatus*—indicating that no equivalent thereof is to be found in the Etruscan. We note this, and proceed, until we come to *Tau* (*t*). Here the Phœnician and the Phœnocoeid Greek alphabets end; but not the later Greek nor the Roman, nor yet the Etruscan. After *T* comes *U*—just as, in the later Greek, *Upsilon* follows *Tau*. But this is not all. Though, *place for place, and power for power*, this equivalent to the Greek υ differs from the Hebrew *Ayn*, its *form* is the same.

In considering the origin of *Y*, which he traces to *V* (which is only a modified *U*), Professor Key writes:—

"If we traced the Greek letter *Y* or *V* still farther back, we should perhaps arrive at the opinion that it grew itself out of a carelessly-written *O*. The Hebrew character which corresponds to *O*, viz. ע, already exhibits the opening above, just as the Hebrew ס does, compared with the Greek Θ. So, too, the English often write a capital *O* without joining the circle at the top. To these considerations may be added the fact that the Hebrew alphabet, which ended with a T, contains no other equivalent for the Greek Υ: and again the Etruscans had but one character *V*, without any *O*."

Now, I think that the identity of the Etruscan *U* with the Hebrew *Ayn, form for form,* is beyond question.

If so, it may be doubted whether the current expressions of the differences between the Etruscan and Greek alphabets are strictly accurate. It may be doubted whether we may correctly say that the Etruscans had no equivalent to the Greek *Omikron.* They may easily have had no such *sound.* Whether, however, it is equally accurate to say that they had no such *letter,* is another matter. They certainly had a sign that originated out of the Hebrew *Ayn ;* and this was what the Greeks had also. Hence, if I were writing on the antiquities of the Etruscan alphabet, I would rather, than say that they had no equivalent to the Greek *o,* write that they had such an equivalent, but that they sounded it somewhat differently (*i. e.* as *u*), and wrote it in a modified form, *i. e.* open at the top, and with an angle at the bottom, instead of making it circular (*V* as opposed to *O*).

If so, the Etruscan alphabet ends at *t,* and has no gap between the equivalents of *Samekh* (*Xi*) and *Pe* (*Pi*)—at least *in its earliest stage.* At a later period, when Roman influences may have acted on it, the case was, perhaps, different.

And this leads to the hypothetical explanation of the origin of *u ;* which is as follows :—

a. It was no invention of any Greek, but an original constituent of the early Phœnicoeid alphabet, in which, *form for form, and place for place,* it represented *Ayn.*

b. But this it did in some peculiar dialect wherein *o* was sounded as *u*—a dialect which, *pro tanto,* agreed with the Etruscan, but which was not Etruscan, nor yet (necessarily) the dialect from which the Etruscans took their alphabet.

c. The form of this equivalent of *Ayn* was angular rather than circular. Meanwhile,—

d. In *another* dialect wherein *o* retained its natural sound, the equivalent to *Ayn* was, in *form,* circular rather than angular, and its sound that of the Greek *Omikron.*

Hence, there were (by hypothesis) two Greek dialects that adopted the Phœnician alphabet, one representing, by the equivalent to *Ayn,* the sound of *o* rather than that of *u,* the other that of *u* rather than *o.*

Call these dialects *U* and *O.* In dialect *O* is it found that a

new sign is wanting, a sign for a sound not identical with *o*, but allied to it; viz. that of *u* (whether sounded as in Italian or as in French). Such being the case, recourse is had to the allied dialect (*U*), which supplies the sign that afterwards takes the name *Upsilon*.

Such is the author's hypothesis respecting the evolution of the Greek *Upsilon* and its equivalents—a hypothesis which arises out of the necessity of accounting for two antagonistic facts, viz. its similarity in form to the Hebrew *Ayn*, and its dissimilarity of power, place, and name. The importance of the investigation of the origin of the letter itself becomes apparent when we consider the number of forms that it has given rise to. Out of the Greek *Upsilon* have grown the English *u*, *v*, *w*, and *y*; out of the Hebrew *Ayn* have grown not only *u*, *v*, *w*, and *y*, but *o* also.

Returning to the more general questions connected with the Etruscan alphabet, we find that (to go no further into the list of its deficiencies) it was poorer than the Greek by the signs for *b* and *d*. Wanting these, did it want *g* (as in *gun*) also? We should ask this question. As *b* is to *p*, as *v* to *f*, as *d* to *t*, as *z* to *s*, so is *g* to *k*. With five, then, of the flat sounds being absent, it is by no means unlikely that the sixth was absent also. If so, there should be no Etruscan equivalent to *Gimel* or *Gamma*. But such is not the case. There is one. But, perhaps, this was sounded as *Kaf* or *Kappa*; just as *Vau* was sounded, not as *v*, but as *f*. There is, however, a sign for *Kaf*, or *Kappa*, as well; and this sign engenders a difficulty. It is a fact against the doctrine that the Etruscan equivalent to *Gimel* or *Gamma* = *k*. If it did, what was the use of *Kappa*? I think that this difficulty is got over by supposing that the Etruscan equivalent to *Kappa* was no ordinary *k*, but some guttural variation of it. If so, the original suggestion may stand, viz. that the third letter of the Etruscan alphabet was the sign for *k*. Still there is a complication. There is a sign for the Greek *Khi*, and this, unless either a superfluity or a mere Greek interpolation, was a guttural *k*—such a *k* as *Kappa* is supposed to have represented. I think, however, that this is an interpolation.

If this be the case, there are no difficulties in the current and

generally-admitted doctrine that the *Gamma* of the Greeks, with its sound of the *g* in *gun*, was sounded in Etruscan as *k*.

But as *k* is neither more nor less than the *c* in *cat*, we may say that it is to the Etruscan that we trace the origin of that letter, a letter of which the history is remarkable and complex. First, there grows a *k* out of *g*; and then this *k* becomes, in certain conditions, *s*.

How, however, came its *form?* The remarks in pp. 81—84 explain this. The original ⅂ underwent two changes—one in respect to outline, and one in respect to direction. It lost its angle and became a curve. It faced the right hand instead of the left. So arose the third letter of the alphabet, which in the modern language, is more *s* than *k*, and more *k* than *g*. Still it was out of a *Gamma* that it was evolved.

Let us now repeat a previous question, useful though hypothetical. Supposing the English to have been taken direct from the Etruscan, what would have been its character, or (limiting the question for convenience sake) what would have been its chief peculiarities?

There would have been nothing to spell such words as *not* and *note* with—nothing for such words as *bat*, *date*, *vane*, *zany*, or *gun*—no *b*, no *d*, no *v*, no *z*, no *g*. Besides this, *K* would be the second letter in the alphabet, which would run *A*, *K*, *E*, *F*, &c., instead of *A*, *B*, *C*, *D*, *E*, *V*, &c. Now, this order, though avoided in one respect, is approached in another. Unlike the Etruscans, we have *B* in the second, and *D* in the fourth place; but, like them, we have *F* instead of *V*, and more important still, we have a sound which originated in that of *K* in the third place—viz. the letter *c*.

§ 316. One of the chief objects of the present notices is to show the extent to which many of the facts connected with the modern orthographies are anything but novelties. On the contrary, the greater part of the principles that are exhibited in our orthographic expedients and in other portions of our orthography, are as old as the Greek stage of the alphabet. Thus—

1. *The expression of the so-called aspiration of a letter by the addition of the letter* h *was Greek.*—That it was Italian is well

known; but that it was Greek also is often overlooked. Nevertheless, in the older inscriptions, KH and ΠH stand for what was afterwards X and Φ, just as they do in the Latin and many subsequent alphabets.

I find no notice, however, of the *th* in *thin* being expressed by TH; as analogy suggests. The reason for this is clear. It lies in the fact of there already being the simple single sign of Θ (*theta*).

Now the combinations KH, and ΠH, prove one of two points; either that the orthographic expedient of spelling the simple single sound of the *ch* in *loch* (*Scotch*), and the *ph* in *philosophy*, by means of a combination of two letters, is of such antiquity as to go back to the earlier epochs of the alphabet, or, that the sounds in question are derivatives from the powers of the *kh* and *ph*, in in*k*-*h*orn (in*kh*-orn), and ha*p*-*h*azard (ha*ph*-azard). In the former, there has been an incorrect and conventional mode of spelling from the beginning; in the latter, the method, once correct, has, by subsequent change, become inaccurate. I have no hesitation in committing myself to the former of these two doctrines.

2. *The expression of the shortness of a vowel by the reduplication of the following consonant* (an orthographic expedient already noticed) *is Greek.*—This we infer from such words as κορύσσω, θαλάσσα (*korysso, thalassa*), &c.; words which suggest the same kind of alternative as the one suggested by the combinations KH, ΠH, viz. the fact of either there having been a conventional mode of spelling at a very early date, or a natural one with subsequent change. The former is what I hold; *not* holding that the σσ (*ss*) in θαλάσσα (*thalassa*), &c. was ever sounded as a true double *s*.

3. Do the orthographic expedients for denoting the *long-ness* of vowels go back to the Greek period? Of the reduplication of the same vowel (as the *e* in *feet*), I remember no instances; although I should not be surprised to find them. Of the Greek diphthongs the list was a long one. Without going minutely into the criticism of it, I think that some of them at some stage of the language were sounded as simple single vowels. Cicero, for instance, tells us that *binï* and βινει were pronounced alike; in other words, that ει Greek = *i*

Latin. Whichever way we take this statement, we get a simple single letter, and a combination of two letters sounded alike. Whether, however, this identity belonged to the earliest stage of the alphabet is uncertain.

The conditions of the Greek alphabet, as applied to the expression of the difference between the long and short vowels, were very peculiar—very peculiar, and by no means simple. Between two pairs of vowel sounds the differentiation was an easy matter. It was an easy matter in the case of the *e* in *feet* as opposed to the *e* in *fen*; and it was an easy matter in the case of the *o* in *note* as opposed to the *o* in *not*. In each of these cases there was a separate single sign for the separate single sounds of ε and η, ο and ω.

What, however, was to be done with α, ι, and υ—sometimes long, sometimes short? At the first view, the answer seems simple. Express by some means or other (natural or conventional, as the case may be,) one of the two powers—either the longness of the vowel in question or its shortness, and with this be satisfied. All that is not long will be short, and *vice versâ*. Hence one sign will suffice; its presence indicating one quality, its absence another. This is what we do with our accents, and this is all we need to do.

But the Greeks could only do this by the adoption of just that one orthographic expedient which they least admitted, viz. the *reduplication* of the vowel (*e* as in *feet*). I say that they eschewed this mode of expression. Had they not done so, the equivalents to η and ω (as compared with ε and ο) would, in the cases of α, ι, and υ, have been αα, ιι, and υυ. This might have been carried consistently throughout the language, with only one inconvenience attending, the inconvenience already noticed. When the real sounds of α+α, ι+ι, or υ+υ occurred, there would be no mode of expressing them.

I say that it was only by the adoption of this expedient that the Greeks could express the longness or shortness of their vowels by *one* method.

To understand this, let us look at the other alternatives.

Let us first ask what would have been the effects of what we may call the *diphthongal* system, the system by which the ει=*i* (*bini* and βινει).

Upon what principle is this combination formed?

It is formed upon the principle which gives to ι a semi-vowel power—*i. e.* which considers its power to be that of the *y* in *yet*, rather than the *i* in *i-et*. If it were not so, there would be two vowels, and the combination would be dissyllabic.

This is as much as we can say at present; since notice must be taken of another combination—ου or ϑ. It is safe to say that this stands in the same relation to υ that ει does to ι, being its long sound. And—

That it stands in the same relation to ο that ει does to ε is evident.

Again—the relations of the vowel υ to the semi-vowel *w* (as in *wet*) are those of *i* to *y*. Hence—

In the combination ου the latter letter is a semi-vowel, rather than a vowel, in power. If it were not so, the combination would be dissyllabic.

Now what is the function of this semi-vowel element—an element which may express one of two things, the quality of the sound or its quantity?

If the combination ου be a long sound of υ, which of the two letters denotes the longness and which represents the vowel?

Or—supposing we were to change the principle of representation, and instead of using a letter we were to denote the property of longness by some mark (say ′ or ¯), which of the letters should we eject, and which should we keep? Which would stand as it was, and which would be replaced by our mark? Should we write ό (or ō), or ύ (or ῡ)?

The latter. If the previous view be correct that ου is the long power of υ, the quality is represented by the latter, the quantity by the former, letter.

The same applies to ει.

So much for one view of these combinations. There is another which may easily be anticipated. According to this, ε and ο express the quality, and ι and υ the quantity; so that ει is ε, and ου is ο lengthened by the addition of the semivowels *y* and *w*.

It is not necessary, in a work like the present, to go into

the criticism of these two doctrines. The latter, however, is that of the writer.

The real point of importance is, the inapplicability of *either* principle to *a*.

Affix *ι* to *a* and you have the combination *αι*.

Affix *υ* to *a* and you have the combination *αυ*.

Now, however conveniently, *ει* = *ī*, or *ου* = *ū*, neither *αι* nor *αυ* conveniently = *ā*, inasmuch as they had already their own proper function of expressing something else. Whatever were the sounds of *αι* in *καιω*, or *αυ* in *καυσω*, there were not those that stood in the same relation to *α*, as *ει* did to *ι*, and *ου* to *υ*.

To recapitulate—we have called the principle that gives us *ει* and *ου* the *diphthongal* principle, and have shown that it could not be applied to all the three vowels consistently and steadily throughout.

Hence—in the case of the two alternatives alluded to, the Greeks were debarred from the first. They could *not* express the long vowels by a certain uniform method, and leave the reader to discover the short ones for himself on the principle that whatever was not long was short.

But could they not reverse this process, and by steadily and consistently showing when a vowel was short, leave the reader to find out the long ones?

They could not. Why not?

The orthographic expedient by which we express the shortness of a vowel by doubling the consonant that follows, is no novelty. On the contrary, it has been specially stated that it was to be found so early as the Greek stage of the alphabet. If so, why not act upon it? Why not spell *all* words wherein the *α* was sounded as in *θαλασσα* (*thalassa*), the *ι* as in *περδίκκας* (*Perdikkas*), or the *υ* as in *κορύσσω* (*korysso*) with two *s*'s, or two *k*'s, &c.? If this be done, the long sounds may be left to themselves, whatever is not short being long. The Swedish orthography goes largely on this principle, and a very fair orthography it is. Why could not the early Greeks have done the same? They were prevented by their prosody. Unfortunately for the Greek orthography, the same reduplication of the consonant that *shortened the vowel lengthened the syllable*.

The Greeks, then, could not be consistent in the representation of the longness and the shortness of their vowels; and being unable to be consistent, had recourse to two principles—

a. Sometimes, the *longness* of a syllable was shown by spelling it as a diphthong; and—

b. Sometimes, the *shortness* of a syllable was shown by doubling the consonant that concluded it.

Both these methods are English, inasmuch as we not only write such combinations as *oe*, &c., to show that a vowel is long, but we also write such combinations as *ock* (*okk*), &c., to show that a vowel is short. This has been stated already. The antiquity of the practice is stated now.

§ 317. *The Etymological Principle,—how far was it Greek?* —That the greater part of our chief orthographic expedients are anything but novelties has been shown; for it has been shown that they can be traced up to the earliest period of our alphabetic history. How far is this the case with the Etymological principle? Did the Romans recognise it? Yes. Did the Greeks? No. Such is our answer; affirmative to the one question, negative to the other. Nor is it difficult to find the reason for the difference. The Roman literature began betimes to be affected by Greek influences, and Greek words at an early period found their way into the Latin language.

Now between the Greek and the Phœnician there was no such close literary contact, no great influence, no great borrowing of words; besides which the difference between the alphabets was greater than that between the Roman and the Greek. Neither Greeks nor Romans paid much attention to the study of the languages of the countries with which they came in contact; indeed, they despised them as *barbarous*. Of the two, however, the Romans paid the most. They studied the Greeks, and kept up a connection with their literature. The Greeks, on the other hand, when they had got what they wanted, in the shape of an alphabet, from the East, seem to have done with their instructors in the art of writing, to have dispensed with them entirely, to have distanced them in the race of Literature, and to have ignored all subsequent influences. Hence, if they *did* borrow a word from Asia, they took no more pains to keep up for it its Asiatic character, than we do

to indicate by the outward and visible sign of a peculiar orthography the Chinese, or Indian origin of such words as *tea*, or *shawl*.

The Greeks, then, ignored the etymological principle in the case of words of foreign origin. The Greeks ignored, but the Romans recognised, it; so that it is to the Roman period (and no further) that we can trace it.

Did the Greeks ignore the etymological principle *in toto*, *i.e.* in the spelling of words wherein one sound was changed for another according to the rules of their own grammar? Thus—if the present tense of a word was *tup*, and the preterite *tuf*, how would they spell the latter? Would they concoct any means for retaining the original letter *p* (or some part thereof) in the derivative form, in order to show the connection? *We* do it. So do many others. But did the Greeks? No. If one sound was changed into another, they took the change as they found it, and expressed it accordingly. Thus, one form of τύπτω (*typto*), was written τέτυφα (*tetyfa*), another ἐτύφθην (*etyfþên*). They might, however, have written τύπτω, τέτυπ῾α, and ἐτύπ῾τ῾ην—by which process the etymological connection between the π῾ and τ῾ on the one side, and the π and τ on the other, would have been all the clearer. Nevertheless, the Greeks did nothing of the kind, and they were wise in not doing it. As languages get modern they tend toward the contrary extreme, and so far over-do their etymologies as to conceal difference in order to exhibit likeness—a proceeding generally unnecessary, rarely successful, always and essentially untrue.

The general features, then, of our orthography, are as old as the Greek period. The most important details we get from—

§ 318. *The Roman.*—Here we begin with the notices of such particular letters as claim attention; first of which comes—

C, the third letter of the Roman alphabet as it is of our own; but not the third of the Greek, nor yet the third of the Hebrew. The chief points of its history have already been given; the change, in power, from *g* to *k*, being Etruscan. Now, without saying that the Romans took their alphabet exclusively from the Etruscan, I hold that they did so as far

as the letter *c* is concerned; in other words, I doubt whether the Romans would ever have given it its modern power if it had not been for the Etruscans having done so before them, in their neighbourhood. But the Etruscans did so because the nature of their language (whose sound-system wanted *b*, *g*, and *d*) suggested it. Why do I indicate this? I do it for the sake of showing how little there is of what is *arbitrary* in the structure of the alphabet; which has grown after the fashion of a tree, rather than been built up after the manner of a house.

"This letter," writes Professor Key, "is derived from the Latin alphabet, in which it first appears. But even in that alphabet it originally possessed the power of *g*, as pronounced in *goose*. Thus the Roman proper names *Caius* and *Cneius*, which retained this sound, are correctly represented in the Greek character by Γαιος and Γνηιος; and the Duilian inscription, the orthography of which, however, seems to belong to a later date than the events celebrated in it, presents *macestratus*, *leciones*, *pucnandod*, *ecfociont*, in the place of the modern forms, *magistratus*, *legiones*, *pugnando*, *ecfugiunt*. Indeed the poet Ausonius expressly states that C once performed the duty of G; *Gammæ vice functa prius* C. (See also Festus, *vv. Prodigia*, *Orcum*.) This medial pronunciation corresponds with the power of the letters which occupy the third place in the Greek and Hebrew alphabets, *gamma* and *gimel;* and the identity of the letters is confirmed by the similarity of the forms.

"The letter *c* in English is pronounced as *s* before *i*, *e*, and *k* before *a*, *o*, *u*. This variety in the power of the letter seems difficult to account for; but it may be observed that *i*, *e* belong to one end of the vowel series, *a*, *o*, *u* to the other; and it is further to be noticed that the vowels *i* and *e*, when they precede vowels, have a power approaching to that of *y* in *youth*, and that if, in addition to this, *c* or *g* precede, there often results a sound like that at the beginning of the words *church* and *John*, and this sound of *ch* is not very different from a sibilant. The vowels *i* and *e* produce a similar sound when preceded by a *d* or *t* and followed as before by a vowel. Thus from *ration* the Italians have obtained *ragione;* and from *radio*, *raggio;* from *Diana* the rustics of ancient Italy made *Jana*. These considerations are perhaps supported by the employment of the little mark called *cedilla* in the French language, which is used to denote that *c* is to be pronounced as an *s* even before the other vowels, as *ça;* for the mark appears to have been originally an *i*."

In this extract, the statement that *c* originally possessed the power of the *g* in *goose* requires qualification. As the sentence stands, it looks as if *all* the old *c*'s of the Latin language were once sounded as *g*'s, or, at any rate, that the normal and primary power of the letter was that of *G*, that of *C* being derivative, secondary, aberrant, and exceptional.

Of course, in the *Greek* and *Phœnician*, all of what was afterwards *C* was, originally, *G*. In the *Latin*, however, I find no reason for believing that the sound of *G* was the older. On the contrary, I believe that that of *C* was. How came it, then, ever to be sounded as *G*?

I imagine that the same Etruscan influence which gave the third letter with its peculiar power to the Roman alphabet, also determined either the non-adoption or the non-invention of any representative of the sound of *G*—*in the first instance, at least*. Yet as this sound of *G* was Roman, the sign that should indicate it was necessary. In due course of time it came into existence. Previous, however, to its development, I hold that *C* did double duty—partly as *C*, and partly as *G*—primarily, however, as the former, and not as the latter, letter.

Neither do I deny that at a period thus early its third power of *s* (or some modification of *s*) may have existed.

I cannot, however, think that at the time when *legio* and *pugno* were spelt *lecio* and *pucno*, that such a word as *canis* was either pronounced *ganis*, or spelt *kanis*—admitting, however, the possibility of the latter alternative.

F.—The history of this letter is given in the sketch of the Etruscan stage. It arose out of *Vau*. But what if the sound of *Vau* (*v*) existed in the language as well? A difficulty would arise. Either a new sign must be developed to represent it, or an orthographic expedient must be resorted to. This bears on the history of our letter *v*—now at the end, once at the beginning, of the alphabet.

I see in this modification of the power of *Vau* a confirmation of the views already expressed concerning the influence of the Etruscan alphabet on the Latin. Why should the Romans change the power of either *Gamma* or *Vau*, when they had the sounds of both *G* and *V*? *A fortiori*, why

change both? If we look at the sound-sytem of the language, the alteration is pre-eminently gratuitous. But it is not gratuitous if we look at the sound-system of the Etruscans, and, along with that, the extent to which the Romans borrowed from Etruria.

"*G*.—This letter is derived to us from the Latin alphabet, in which it first appears. In the Greek alphabet its place is supplied by *zeta*. If, as seems probable, the sound of this Greek letter was the same as the consonantal sound at the beginning of the word *judge*, it may perhaps be inferred that the hissing sound now given to the letter *g* existed already in some dialect of ancient Italy. The sound at any rate is familiar to the modern Italian. The sound of the letter *g* in the English language is two-fold. Before *a*, *o*, and *u*, and occasionally before *i* and *e*, it is the medial letter of the guttural order. The other sound, which it possesses only before *i* and *e*, is one of the medials of the sibilant series, and is also represented by the letter *j* as pronounced by the English. The sibilant sound is written in Italian by two letters *gi*, as Giacomo, Jacob, or by *gg*, as *oggi*, to-day. The two-fold nature of the sound corresponds to the double sound of the letter *c*, which is sometimes a *k*, sometimes an *s*."—KEY's *Alphabet*, p. 63.

A great deal of what applies to *C* applies to *G* also; and the history of the two letters is closely connected; indeed the histories of *C*, *G*, and *K* may be said to be complementary to each other.

Add to this that the histories of *Zeta* and *Vau* are, notwithstanding certain details, alike. Each was taken into the Latin alphabets from the Phœnician, either directly or indirectly. Each was changed in power. Each reappears—the one as *v*, the other as *z*, and each at the end of the alphabet.

Place for place, however, and sign for sign, we must remember that *F* is *V*; and also we must remember that, place for place and sign for sign, *G* is *Z*.

That the sibilant power of *G* (=*dzh*) is of the antiquity ascribed to it by Professor Key is probable. If so, the double power of *g* (as in *gun* and *gibbet*=*dzhibbet*) is no novelty.

Neither (if the view concerning *c* be correct) is the double power of that letter (as in *cat* and *city*=*sity*) a novelty.

H.—The effect of the Latin orthography upon this letter

was to fix it as the sign of the so-called aspirate. It was either this or something akin to it in the Phœnician. It was either this or something akin to it in the *Phenicoeid* Greek. But it was neither this nor anything very like it in the *later* Greek. In the *later* Greek it was a vowel, the aspirate being expressed by ‘. But as this ‘ is considered to have been but the left-hand half of H (H) in an abbreviated and rounded form, we may say that *both* its powers were preserved in the Greek—both its powers and half its form. The Latin language, by ignoring the power to which the Greeks gave the greater prominence, fixed (as has been already stated) the power of *H* as an aspirate.

But (as has also been stated) it was not the Latins who devised the notion that such combinations as *PH* and *TH*=*F* and the sound of the *th* in *thin*. This had been excogitated by the Greeks during the time that *Eta* was used as *H*.

A remark of Professor Key's upon the *name* of this letter (the word *aitch*) now finds place. He thinks that it was originally "*ech*, with the vowel prefixed, as *en*, *ef*, *el*, &c." (*Alphabet*, p. 66.)

Now I doubt this. I think that the *ch* (*tsh*) represents no *k* but a *t*, *i. e.* the *t* in *Eta* or *Heth*.

The equivalent to the Greek Theta, Hebrew Teth.—The Latins having no sound for which this sign was wanted never took it up into their alphabet; and hence, our alphabet runs *H*, *I*, instead of *H*, *Th*, *I* (*Eta*, *Theta*, *Iota*, or *Heth*, *Teth*, *Yod*.)

The last remark upon the *H*, a remark concerning the word *aitch*, was upon the question of *name*.

The present remark on the absence of the equivalent to *Theta* is upon a question of *order*.

Both demand our attention.

J is but a modification of *I*—the original power being uncertain, as is the date of its evolution.

"*J* in the English language has a sibilant sound, closely connected with that of the syllable *di* before a vowel. It has a similar, though not the same, sound in the French tongue; but in German it is pronounced altogether as our *y* before a vowel. What its pronunciation was in Latin may admit of dispute, for although it is generally laid down that its power with the Romans was the same as with the Ger-

mans, there is reason for thinking that our own sound of the letter was not unknown to the ancient inhabitants of Italy. The name of Jupiter was undoubtedly written originally Diupiter, so Janus was at first Dianus, just as the goddess Diana was called by the rustics Jana. The argument might be strengthened by comparing the Latin *jungo* with the Greek ζευγνυμι, Jupiter with Ζευ πατερ, &c., and also by referring to the modern Italian forms, *giogo*, *giovare*, *giovenco*, *giovane*, &c. There is no absurdity in supposing that two pronunciations may have co-existed in the same country. As to the form of the letter *j*, it was originally identical with that of *i*, and the distinction between them is of recent date. Exactly in the same way among the numerals used in medical prescriptions, it is the practice to write the last symbol for unity with a longer stroke, *vj. vij. viij.*"—KEY's *Alphabet*, p. 71.

K.—It is only in the later Latin that *K* is absent from the alphabet. The "old inscriptions of the language offer abundant examples of *K*, which in fact began to disappear, just as *Y* and *Z* came into use."—KEY, p. 44. Again—

"The following are some among the Latin words in which the letter *k* is found in inscriptions: Kaeso, Kaia, kalator, kalendae, kandidatus, Kaninius, kanus, kapitolium, kaput, karcer, karitas, Karmenta, Kartago, karus, kasa, Kastor, kasus, kastra, and arka, dedikare, evokare, iudikare, Parka, Volkanus."

This early use of *K*, to a certain extent, invalidates the doctrine laid down under *C*, viz. that that letter was *not* originally *G*. Nevertheless, I hold that the facts on the other side preponderate.

The equivalent to Samekh.—This was neither taken up by the Latins nor wanted. Hence, *x* has no place in their earlier alphabet. When it appears in their later, it takes its place at the end.

O.—The presence of this letter in the Latin alphabet is against its *exclusive* origin from the Etruscan, an origin which is not claimed. All that *is* claimed is a large amount of Etruscan influence, as shown in the cases of *C* and *V*.

The equivalent to Tsadi.—Neither taken in nor wanted.

These omissions make our alphabet run *N*, *O*, *P*, *Q*, *R*, rather than *N*, *X*, *O*, *P*, *TS*, *Q*, as the Hebrew does.

Q has already been noticed. It was kept in the Latin, though in the Greek it was allowed to become obsolete.

U.—How this is supposed to have grown out of *Ayn* has been stated. Out of *U* grew *V*, *i.e.* the semi-vowel sound grew out of the vowel, not *vice versâ*. Such is the genesis of the power.

That of the *form* is different. Here, the semi-vowel form, or the angular one, is the older.

Hence, in one sense (*i. e.* in respect to its *power*) *V* grew out of *U*, whereas, in another sense (*i. e.* in respect to its form), *U* grew out of *V*.

W (as is well known) has originated since the Latin period.

X.—This letter, "to an Englishman, is the representative of what might as well be denoted by the two consonants *ks*. But in the Greek alphabet it was merely a guttural aspirate, equivalent probably to the German *ch*. The cause of this change in the power of the symbol appears to admit of the following explanation:—Before the employment by the Greeks of their character Ξ or ξ, it was their common custom to represent this sound by ΧΣ, as may be seen in Boeckh's inscriptions, rather than by ΚΣ, of which there exist, however, a few examples, as in the so-called Nanian inscription. Now the Romans copied this Greek practice, and we consequently find in Latin inscriptions such forms as MAXSVMVS, PROXSVMVS, &c. (See the Index of Marini's *Fratelli Arvali*.) So again coins give us the proper name AXSIVS, where the later orthography would have been AXIVS; and even existing manuscripts still bear traces of this orthography. Thus the Medicean MS. of Virgil has EXSESA (*Aen.* viii. 418), EXSVIT (*Aen.* viii. 567). But the Romans, being generally averse to the aspirated letters (*h* itself, though written, seems not to have been pronounced by them), had little or no occasion for the character X except in this combination with an S."

The author proceeds—

"The letter X was the last in the Roman alphabet, neither Y nor Z belonging to it, although the majority of Latin grammars include them. On reflection, however, it will be admitted that the words in which those two letters occur are not really part of the Latin language, but borrowed from the Greek, as *zephyrus*, *zona*; or from some Eastern source, as *gaza*. Such forms as *lachryma*, *hyems*, *sylva*, are simply errors of modern editors. The Romans themselves wrote *lacruma* or *lacrima*, *hiems*, or rather *hiemps*, and *silva*."

Having now got through the details of the Latin alphabet, we may ask what principles the Romans recognised in the accommodation of the Greek letters to their own langüage?

There was the ejection of such letters as were not wanted. Thus it was that *theta*, *kappa* (*c* being equivalent to *k*), and the fifteenth letter, were ejected, while ψ and χ were never admitted. In after-times the fifteenth letter (now *xi*) was restored, for the same reason that *z* was restored, both being placed at the end of the alphabet.

2. The power of the retained letters was modified. Hence the sixth letter took the sound, not of *v*, but of *f*, and the eighth that of *h*.

Beyond this the Romans made but slight alterations. By letting *kappa* become obsolete they did mischief, as they did by changing the power of *c*. The representation of ϕ by *ph*, and of θ by *th*, was erroneous. The retention of *x* and *q* was unnecessary. *V* and *j*, two letters whereby the alphabet was really enriched, were mere modifications of *u* and *i* respectively.

It may now be seen that with a language containing such sounds as the *th* in *thin* and *thine*, and the *ch* in the German *auch*, it is to their advantage to derive their alphabet from the Greek; whilst, with a language containing such sounds as *h* and *v*, it is to their advantage to derive it from the Latin.

3. The practice of the Romans of writing from left to right, settled the question of direction for all the western nations; none of whom write from right to left. They would not indeed have done this had they taken their alphabets from the later Greeks. They *would*, however, have done so had they taken them from the earlier Greek, the Etruscan, or the Phœnician itself.

4. The practice of the Romans of calling the letters by their powers, rather than their names, *i. e.* of saying *a* and *bee*, rather than *alfa* and *bêta*, has been adopted by all the other nations of Western Europe. *Aitch*, however, as aforesaid, is probably *Eta* (*heth*); whilst *Zed* is certainly *Zeta*—name for name.

This, indeed, is the greatest innovation referable to the Roman period; the chief orthographic expedients, such as the use of the *h* in the so-called aspirates, the diphthongal expression of the

longness of a vowel, and the doubling of the following consonant to express its shortness, being as much Greek as Latin.

The particular letter from which the most important consequences have flowed, is *k*—and these have followed, not because of its adoption by the Latins, but on account of its having been dropped out of their alphabet. All the modern countries whose languages are derived from the Latin are unwilling to use this sign, and eschew it as much as possible. The Italian has nothing to say to it, but eliminates it from his alphabet; the Spaniard, the Portuguese, and the Frenchman do the same. The Wallachians and Moldavians, whose language is derived from the Roman of the time of Trajan, use a Slavonic alphabet, and as this is of Greek origin, the equivalent to *kappa* is retained.

More than this—one language of even German origin so allows its orthography to be modified by Latin precedents, and by the example of the nations whose languages are derived from the Latin, as to depart from the practice of the allied tongues of Germany, Holland, and Scandinavia, and, without absolutely ejecting *k*, never to use it where a *c* can be used instead of it. This language is our own. In Danish, Swedish, German, and Dutch, such words as *can*, and *come*, &c., &c., are spelt *kan-*, and *kom-*, &c., &c.

In the Anglo-Saxon period of our language this use of *c* was even more general than it is with us. It was used even before the small vowels, and in situations where (perhaps) it ran the chance of being sounded as a sibilant. Thus, what we spell *king* the Angles spelt *cyning*.

That the etymological principle was recognised by the Romans has already been stated. It was recognised by them; but it was recognised, in a far greater degree, by the nations whose languages and literatures were of Roman origin. The remarks upon the use of *c* and the disuse of *k* indicate this.

There is another principle the history of which I have not investigated; but which deserves attention. We may call it the principle of *differentiation*, or, to borrow a phrase from the Latin grammarians, the *ob differentiam* principle.

Let two words differ in meaning, but be sounded alike. A critic in the language wherein they occur may consider it

necessary to represent this difference in the spelling. In such a case he would devise one combination of letters for the word in one sense, and another for the word in another. Let the words *lone* and *loan* explain this principle of differentiation.

How old is it? It is certainly English. Was it also Latin? Was it Greek? The Greeks recognised it, but not to any great extent. But the Greeks had, over and above their letters, a system of accents as well. Now these accents they used as means of differentiation, and, so doing, expressed to the eye differences which the ear did not recognise, and which had had no existence in the language as it was spoken. The Romans, on the other hand, who had no accents in current use, could only differentiate their words by changing the combination of letters by which they were represented. Hence, we may say that, if the Greeks recognised the principle of differentiation, it was the Romans who brought it to bear upon the spelling of words—*spelling* meaning the combination of letters.

§ 319. *The German period.*—It was from the classical alphabets that the German were derived—*classical* meaning *Latin and Greek*, collectively.

This mode of expressing ourselves is necessary; inasmuch as it was from neither the one nor the other of these languages *exclusively* that the German alphabets were derived. Nor is this double origin difficult to explain. The Goths of Mœsia had moved so far eastwards, before they became a Christian and lettered nation, that their area was conterminous with that of the Greek language of Byzantium as well as that of the Latin of Italy.

Let us say, then, that whilst the *Western* German alphabets were Latin, the *Eastern* German alphabets were Latin and Greek as well.

This intermixture of Latin and Greek influences is visible in the alphabet of the Germans just noticed, viz.:—

The Mœso-Gothic Alphabet.—The form and order of the letters may be seen in Hickes' "Thesaurus" and in Lye's "Grammar." With the Greek they agree in the following particulars:—

1. In the sound of the third letter being not that of κ (*c*), but of the *g* in *gun*.

2. In retaining *kappa* and *khi*.

3. In expressing the simple single sound of *th* by a simple single sign. This sign, however, has neither the shape nor the alphabetical position of the Greek *theta*.

With the Latin they agree, 1, in possessing letters equivalent to *h*, *q*, *y*.

2. In placing *z* at the end of the alphabet.

The Mœso-Gothic alphabet seems to have been formed on sound principles, and on principles sufficiently bold. Neither was its application traversed by etymological views.

§ 320. *The Angle Alphabet*.—I hold that the particular Germans from whom the Angles took their alphabet were the Franks.

What were the chief peculiarities of the Angle sound-system?

It contained—

1. The *th* in *thin*.—A sign in Greek (θ), but none in Latin.

2. The *th* in *thine*.—A sign neither in Greek nor Latin.

3. The *ch* in the German *auch*.—A sign in Greek (χ), but none in Latin.

4. The flat sound of the same, or the probable sound of the *h* in *þurh*, *leoht*, &c., Anglo-Saxon.—A sign neither in Greek nor Latin.

5. The *sh* in *shine*.—A sign neither in Greek nor Latin.

6. The *z* in *azure*.—A sign neither in Greek nor Latin.

7. The *ch* in *chest*.—A sign neither in Greek nor Latin, unless we suppose that at the time when the Anglo-Saxon alphabet was formed, the Latin *c* in words like *civitas* had the power, which it has in the present Italian, of *ch*.

8. The *j* in *jest*.—A sign neither in Greek nor Latin, unless we admit the same supposition in respect to *g*, that has been indicated in respect to *c*.

9. The sound of the *kj* in the Norwegian *kjenner*; viz. that (thereabouts) of *ksh*.—A sign neither in Latin nor Greek.

10. The English sound of *w*.—A sign neither in Latin nor Greek.

11. The sound of the German *ü*, Danish *y*.—No sign in Latin, probably one in Greek, viz. *υ*.

12. Signs for distinguishing the long and short powers of ε and η, o and ω.—Wanting in Latin, but existing in Greek.

In all these points the classical alphabets (one or both) were deficient. To make up for their insufficiency one of two things was necessary—either to coin new letters, or to use conventional combinations of the old.

In the Anglo-Saxon alphabet (derived from the Latin) we have the following features:—

1. *C* used to the exclusion of *k*.

2. The absence of the letter *j*, either with the power of *y*, as in German, of *zh*, as in French, or of *dzh*, as in English.

3. The absence of *q*; a useful omission, *cw* serving instead.

4. The absence of *v*; *u*, either single or double, being used instead.

5. The use of *y* as a vowel, and of *e* as *y*.

6. The absence of *z*.

7. Use of *uu*, as *w*, or *v* in *Old* Saxon.

8. The use, in certain conditions, of *f* for *v*.

9. The presence of the simple single signs þ and ð, for the *th* in *thin*, and the *th* in *thine*, these being introduced as new signs.

"Literam *T* pronunciaturo, si spiritus pinguius exeat, et quasi per foramen; formatur Graecorum θ; Hebraeorum *Thau* raphatum; Arabum *The:* hoc est Anglorum *th* in vocibus *thigh*, femur; *thin*, tenuis; *thing*, res; *thought*, cogitatio; *throng*, caterva, &c.

"Anglo-Saxones olim scribebant hac nota þ quam *Spinam* vocabant. Cambro-Britanni per *th* semper scribunt."

"Literam *D* pronunciaturo, si spiritus erumpat modo pinguiori, et quasi per foramen, formatur Arabum *Dhal;* Hebraeorum *Daleth* raphatum; Hispanorum *D* mollius, qualitur nempe proferri solet ea litera in medio et fine vocabulorum, ut *Majestad*, *Trinidad*, &c.

"Hunc sonum Angli eodem prorsus modo scribunt quo sonum alium paulo supra nominatum, nempe per *th*, ut in vocibus *thy*, *thine*, tuus; *this*, hoc; *though*, quamvis; &c. Anglo-Saxones olim sonum illum per þ, hunc vero per Ð, ð, scripsisse puto, prout ex eorum scriptis, liquet (quanquam et ipsi characteres illos non raro promiscue usurpabant):

"Sequentibus autem seculis Angli eundem characterem þ utrique sono adhibuerunt, qui paulatim degeneravit in characterem ȝ, qui in libris quamplurimis manu-scriptis perpetuo conspicitur in iis vocabulis

quae nunc per *th* scribuntur: Atque hinc est quod mos olim invaluerit, qui etiam adhuc non raro retinetur, scribendi y^{e}, y^{t}, y^{u}, pro *the*, *that*, *thou*, &c. Cambro-Britanni sonum illum per *th*, hunc per *dd* perpetuo scribunt; nisi quod aliqui melius scribi posse contendunt per *dh*, qui non tamen obtinuerunt ut mos olim receptus immutetur.

"Nos autem (ut dictum est) utrumque sonum promiscue scribimus per *th*. Sed male quidem; cum neuter eorem sit sonus compositus, sed plane simplex, a sonis literarum *t* et *d* eodem fere modo deflectentes quo *f* et *v* a sonis literarum *p* et *b*."

I cannot say whether the Mœso-Gothic practice of expressing the sound of the Greek *θ* by a simple single sign did, or did not, help in the evolution of these two sounds.

The letter *w* was evolved out of *u*, being either an original improvement of the Anglo-Saxon orthographists, or a mode of expression borrowed from one of the allied languages of the Continent. Probably the latter was the case; since we find the following passage in the Latin dedication of Otfrid's "Krist:"—"Hujus enim linguæ barbaries, ut est inculta et indisciplinabilis, atque insueta capi regulari freno grammaticæ artis, sic etiam in multis dictis scriptu est difficilis propter literarum aut congeriem, aut incognitam sonoritatem. Nam interdum tria *u u u* ut puto quærit in sono; priores duo consonantes, ut mihi videtur, tertium vocali sono manente."

The Anglo-Saxon alphabet, although not originally meant to express a Gothic tongue at all, answered the purpose to which it was applied tolerably.

Change, however, went on; and the orthography which suited the earlier Anglo-Saxon would not suit the later; at any rate, it would not suit the language which had become, or was becoming, *English*, wherein the sounds for which the Latin alphabet had no equivalent signs increase. Thus there is at present—

1. The sound of the *sh* in *shine*.
2. The sound of the *z* in *azure*.

How are these to be expressed? The rule has hitherto been to denote simple single sounds by simple single signs, and where such signs have no existence already, to *originate new ones*.

To *combine existing letters*, rather than to coin new ones,

has but been done rarely. The Latin substitution of the combination *th* for the simple single *θ*, was exceptionable. It was a precedent, however, which was generally followed.

It is this precedent which accounts for the absence of any letter in English, expressive of either of the sounds in question.

Furthermore, our alphabet has not only not increased in proportion to our sound-system, but it has *decreased.* The Anglo-Saxon þ = the *th* in *thin* and ð = the *th* in *thine,* have become obsolete. Hence, a difference in pronunciation, which our ancestors expressed, *we* overlook.

This leads us to—

§ 321. *The Anglo-Norman Alphabet.*—The Anglo-Saxon language was *Gothic,* the alphabet *Roman.*

The Anglo-Norman language was *Roman,* the alphabet *Roman* also.

The Anglo-Saxon took his speech from one source; his writing from another.

The Anglo-Norman took both from the same.

Between the Latin alphabet as applied to the Anglo-Saxon, and the Latin alphabet, as applied to the Norman-French, there are certain points of difference. In the first place, the sound-system of the languages (like the French) derived from the Latin, bore a greater resemblance to that of the Romans, than was to be found amongst the Gothic tongues. Secondly, the alphabets of the languages in point were more exclusively Latin. In the present French, Italian, Spanish, and Portuguese, there is an exclusion of the *k.* This is not the case with the Anglo-Norman. Like the Latins, the Anglo-Normans considered that the sound of the Greek *θ* was represented by *th*: not, however, having this sound in their language, they had no corresponding sign in their alphabet. The greatest mischief done by the Norman influence was the ejection from the English alphabet of þ and ð. In other respects the alphabet was improved. The letters *z, k, j,* were either imported or more currently recognised. The letter *y* took a semi-vowel power, having been previously represented by *e,* itself having the power of *i.* The mode of spelling the compound sibilant with *ch* was evolved. My notions concerning this mode of spelling are as follows:—At a given period the sound of *ce* in

ceaster, originally that of *ke*, had become, first, that of *ksh*, and, secondly, that of *tsh*; still it was spelt *ce*, the *e*, in the eyes of the Anglo-Saxons, having the power of *y*. In the eyes also of the Anglo-Saxons the compound sound of *ksh*, or *tsh*, would differ from that of *k* by the addition of *y*; this, it may be said, was the Anglo-Saxon view of the matter. The Anglo-Norman view was different. Modified by the part that, in the combination *th*, was played by the aspirate *h*, it was conceived by the Anglo-Normans, that *ksh*, or *tsh*, differed from *k*, not by the addition of *y* (expressed by *e*), but by that of *h*. Hence, the combination *ch* as sounded in *chest*. The same was the case with *sh*.

It is safe to say that in his adaptation of the alphabet of one language to the sound-system of another, the Angle allowed himself greater latitude, and acted with a more laudable boldness, than the Norman.

The *forms* of the Anglo-Saxon letters are as follows :—

ENGLISH.		ANGLO-SAXON.	
Capital.	*Small.*	*Capital.*	*Small.*
A	a	A	a
B	b	B	b
C	c	C	c
D	d	D	ð
E	e	E	e
F	f	F	f
G	g	G	ȝ
H	h	H	h
I	i	I	ı
L	l	L	l
M	m	M	m
N	n	N	n
O	o	O	o
P	p	P	p
R	r	R	ɲ
S	s	S	ſ
T	t	T	ꞇ
U	u	U	u
W	w	W	ƿ
X	x	X	x
Y	y	Y	ẏ

A.—The line across the top of this letter in its capital form, is Old German as well as A. S.

F.—The Angle form for this letter appears in a MS. from continental Germany, to which a date as early as A.D. 700 has been assigned. It is one containing a portion of the text of Livy. A notice on the last page states that it belonged to Suitbert, Bishop of Duurstede, in the Netherlands. Now, Suitbert was the Apostle of the Frisians, and was made Bishop A.D. 693. The MS. is now in the Imperial Library at Vienna.

The more modern form, however, seems to have been in use at the same time—at least for small letters. In the case of capitals the Angle form is pretty general.

H.—The capital H is simply the small one with the upper part of its left limb truncated or cut off. The form is Old German as well as A. S.

M.—The Angle form in this is early German also. I occurs in the same MS. as the Angle F, as well as in many others.

R.—This form is got at by bringing the left limb of the Latin letter below the line, by *producing* it (so to say) or making an underlength of it. In this form it appears in the Suitbert MS., both as a small letter and as a capital. The form of the right limb seems to be wholly Angle.

S.—The old form ſ originates in the Angle ꞃ. The underlength is Old German as well as English. In the Old German orthographies, however, there is an over-length as well, *i. e.* the letter both rises above, and sinks below the line.

T.—This is like a *c* with a line across its top. This is Old German as well as A. S. It is really the Greek *τ*, with its vertical line rounded.

Y.—The dot over the top is Old German as well as A. S.

§ 322. One of our orthographic expedients, viz. the reduplication of the consonant following, to express the shortness (dependence) of the preceding vowel, is as old as the classical languages: *terra*, *θάλασσα*. This has been already stated. In respect, however, to its application in English, the following extract from the Ormulum written in the thirteenth

century) is the fullest recognition of the practice that I have met with.

And whase wilenn shall þis boc,
  Efft oþerr siþe writenn,
Himm bidde icc þatt hett write rihht,
  Swa sum þiss boc himm tæcheþþ;
All þwerrt utt affterr þatt itt iss
  Oppo þiss firrste bisne,
Wiþþ all swilc rime als her iss sett,
  Wiþþ alse fele wordess:
And tatt he loke well þatt he
  *An boc-staff write twiggess,**
Eggwhær þær itt uppo þiss boc
  Iss writenn o þatt wise:
Loke he well þatt hett write swa,
  Forr he ne magg noht elless,
On Englissh writenn rihht te word,
  þatt wite he well to soþe.

Parallel and equivalent orthographies.—Let there be in two given languages the sound of *k*, as in *kin*. Let each of these languages represent it by the same letter, *k*. In this case, the two orthographies are identical. Let, however, one nation represent it by *k*, and another by *c*. In this case the orthographies are not identical, but parallel. The same is the case with combinations. Let one nation (say the Anglo-Saxon) represent the sound of *y* (in *ye*) by *e*, whilst another nation (the Norse) represents it by *j*. What the Anglo-Saxon spells *ceaster*, the Northman spells *kjaster;* and what the Northman spells *kjære*, the Anglo-Saxon spells *ceære*. Let the sound of this *ce* and *kj* undergo a change, and become *ksh; kjære*, and *ceære*, being pronounced *kshære*. The view of the Northman and Anglo-Saxon will be the same; each will consider that the compound sound differs from the simple one by the addition of the sound of *y*; that sound being expressed in one nation by *e*, and in the other by *j*. In this case the two expressions of the compound sound are parallel, its elements being considered the same, although the signs by which those elements are expressed are different.

* Write one letter twice.

Let, however, a different view of the compound sound be taken. Let it be thought that the sound of *ksh* differs from that of *k*, not by the addition of the sound of *y*, but by that of *h*; and so let it be spelt *kh* or *ch*. In this case, the orthographies *kh* and *kj* (or *ce*) are not parallel, but equivalent. They express the same sound, but they do not denote the same elements. The same sound is, very possibly, expressed by the Anglo-Saxon *ce*, the Norwegian *kj*, and the English *ch*. In this case *ce* and *kj* are *parallel*, *ce* and *ch equivalent*, orthographies.

Note.—The chief alphabets derived from the Greek were the Slavonic. Hence, in proportion as the Greek alphabet approached the time at which that derivation took place, it was *Slavoniform*—the word meaning, not so much actual likeness to the *Slave* as the form of the Greek itself out of which the Slave originated.

Note.—The notices of p. 115, on the extent to which the Anglo-Saxon form of the letters was also German, are founded on the specimens of *Die Buchschriften des Mittelalters*, &c., Vienna, 1852.

PART IV.

ETYMOLOGY.

CHAPTER I.

ON THE PROVINCE OF ETYMOLOGY.

§ 323. The word etymology has a double meaning. At times it is used in a wide, and at times in a restricted, sense.

If we take such a word as *fathers*, we can divide it into two parts, or reduce it into two elements. By comparing it with *father*, we see that the *s* is neither part nor parcel of the original word. *Fathers* is capable of being analysed: *father* being the original primitive word, and *s* the secondary superadded termination. From the word *father*, the word *fathers* is derived, deduced, or descended. What has been said of this may also be said of *fatherly*, *fatherlike*, *fatherless*, &c. Now, from the word *father*, all these words (*fathers*, *fatherly*, *fatherlike*, and *fatherless*) differ in form, and in meaning. To become such a word as *fathers*, &c., the word *father* is changed.

Of changes of this sort, it is the province of etymology to take cognizance.

Compared with the form *fathers*, the word *father* is the older form of the two. The word *father* is a word current in this the nineteenth century. The same word was current in the first century, although under a different form, and in a different language. Thus, in the Latin language, the form was *pater*; and in the Greek πατήρ. Now, just as the word *father*, compared with *fathers*, is original and primitive, so is *pater*, compared with *father*, original and primitive also. The

difference is, that in respect to *father* and *fathers*, the change that takes place, takes place within the same language, whilst the change that takes place between *pater* and *father* takes place within different languages.

Of changes of this latter kind it is the province of etymology to take cognizance.

In its widest signification, etymology takes cognizance *of the changes of the form of words*. However, as the etymology that compares the forms *fathers* and *father* is different from the etymology that compares *father* and *pater*, we have, of etymology, two sorts: one dealing with the changes of form that words undergo in one and the same language (*father, fathers*), the other dealing with the changes that words undergo in passing from one language to another (*pater, father*).

The first of these sorts may be called etymology in the limited sense of the word, or the etymology of the grammarian. In this case it is opposed to orthöepy, orthography, syntax, and the other parts of grammar. This is the etymology of the ensuing pages.

The second may be called etymology in the wide sense of the word, historical etymology, or comparative etymology.

It must be again repeated that the two sorts of etymology agree in one point, viz. in taking cognizance of the *changes of form that words undergo*. Whether the change arise from grammatical reasons, as *father, fathers*, or from a change of language taking place in the lapse of time, as *pater, father*, is a matter of indifference.

In the Latin *pater*, and in the English *father*, we have one of two things, either two words descended or derived from each other, or two words descended or derived from a common original source.

In *fathers* we have a formation deduced from the radical word *father*.

In *fatherlike* we have a compound word capable of being analysed into the two primitive words, 1. *father*; 2. *like*.

With these preliminaries we may appreciate (or criticise) Dr. Johnson's explanation of the word etymology.

"ETYMOLOGY, *n. s.* (*etymologia*, Lat.) ἔτυμος (*etymos*) *true*, and λόγος (*logos*) a word.

"1. *The descent or derivation of a word from its original; the deduction of formations from the radical word; the analysis of compounds into primitives.*

"2. *The part of grammar which delivers the inflections of nouns and verbs.*"

CHAPTER II.

COMPOSITION.

§ 324. In the following words, amongst many others, we have palpable and indubitable specimens of composition. *Day-star, vine-yard, sun-beam, apple-tree, ship-load, silver-smith,* &c. The words *palpable* and *indubitable* have been used, because, in many cases, as will be seen hereafter, it is difficult to determine whether a word be a true compound or not.

Now, in each of the compounds quoted above, it may be seen that it is the second word which is qualified or defined, by the first, and that it is not the first which is qualified or defined, by the second. Of *yards, beams, trees, loads, smiths,* there may be many sorts, and, in order to determine what *particular* sort of *yard, beam, tree, load,* or *smith,* may be meant, the words *vine, sun, apple, ship,* and *silver,* are prefixed. In compound words it is the *first* term that defines or particularises the second.

That the idea given by the word *apple-tree* is not referable to the words *apple* and *tree,* irrespective of the order in which they occur, may be seen by reversing the position of them. The word *tree-apple,* although not existing in the language, is as correct a word as *thorn-apple.* In *tree-apple,* the particular sort of *apple* meant is denoted by the word *tree,* and if there were in our gardens various sorts of plants called *apples,* of which some grew along the ground and others upon trees, such a word as *tree-apple* would be required in order to be opposed to *earth-apple,* or *ground-apple,* or some word of the kind.

In the compound words *tree-apple* and *apple-tree,* we have the same elements differently arranged. However, as the

word *tree-apple* is not current in the language, the class of compounds indicated by it may seem to be merely imaginary. Nothing is further from being the case. A *tree-rose* is a rose of a particular sort. The generality of roses being on *shrubs*, this grows on a *tree*. Its peculiarity consists in this fact, and this particular character is expressed by the word *tree prefixed*. A *rose-tree* is a *tree* of a particular sort, distinguished from *apple-trees*, and *trees* in general (in other words, particularised or defined) by the word *tree prefixed*.

A *ground-nut* is a *nut* particularised by growing in the ground. A *nut-ground* is a *ground* particularised by producing nuts.

A *finger-ring*, as distinguished from *ear-rings*, and from *rings* in general (and so particularised), is a *ring* for the *finger*. A *ring finger*, as distinguished from *fore-fingers*, and from *fingers* in general (and so particularised), is a *finger* whereon *rings* are worn.

At times this rule seems to be violated. The words *spitfire* and *daredevil* seem exceptions to it. At the first glance it seems, in the case of a *spitfire*, that what he (or she) *spits* is *fire*; and that, in the case of a *daredevil*, what he (or she) *dares* is the *devil*. In this case the initial words *spit* and *dare*, are particularised by the final ones *fire* and *devil*. The true idea, however, confirms the original rule. A *spitfire* voids his fire by spitting. A *daredevil*, in meeting the fiend, would not shrink from him, but would defy him. A *spitfire* is not one who spits fire, but one whose fire is *spit*. A *daredevil* is not one who dares even the devil, but one by whom the devil is even dared.

§ 325. Of the two elements of a compound word, which is the most important? In one sense the latter, in another sense the former. The latter word is the most *essential*; since the general idea of *trees* must exist before it can be defined or particularised; so becoming the idea which we have in *apple-tree*, *rose-tree*, &c. The former word, however, is the most *influential*. It is by this that the original idea is qualified. The latter word is the staple original element: the former is the superadded influencing element. Compared with each

other, the former element is active, the latter passive. Etymologically speaking, the former element, in English compounds, is the most important.

Before we come to the details of the composition of words it is necessary to, 1, define the meaning of the term composition; 2, explain the nature of some obscure compounds.

§ 326. Composition is the joining together, *in language*, of two *different words*, and *treating the combination as a single term*. Observe the words in italics.

In Language.—A great number of our compounds, like the word *merry-making*, are divided by the sign -, or the hyphen. It is very plain that if all words *spelt* with a hyphen were to be considered as compounds, the formation of them would be not a matter of speech or language, but one of writing or spelling. This distinguishes compounds in language from mere printers' compounds.

Different.—In Old High-German we find the form *sëlp-sëlpo*. Here there is the junction of two words, but not the junction of two *different* ones. This distinguishes composition from gemination.—GRIMM, *Deutsche Grammatik*, iii. 405.

Words.—In *father-s*, *clear-er*, *four-th*, &c., there is the addition of a letter or a syllable, and it may be even of the part of a word. There is no addition, however, of a whole word. This distinguishes composition from derivation.

Treating the combination as a single term.—In determining, in certain cases, between derived words and compound words, there is an occasional perplexity; the perplexity, however, is far greater in determining between a compound word and *two words*. In the eyes of one grammarian the term *mountain height* may be as truly a compound word as *sunbeam*. In the eyes of another grammarian it may be no compound word, but two words, just as *Alpine height* is two words; *mountain* being dealt with as an adjective. It is in the determination of this that the accent plays an important part.

§ 327. The attention of the reader is drawn to the following line, slightly altered, from Churchill:—

"Then rést, my friénd, *and spáre* thy précious bréath."

On each of the syllables *rest*, *friend*, *spare*, *prec-*, *breath*,

there is an accent. Each of these syllables must be compared with the one that precedes it; *rest* with *then*, *friend* with *my*, and so on throughout the line. Compared with the word *and*, the word *spare* is not only accented, but the accent is conspicuous and prominent. There is so little on *and*, and so much on *spare*, that the disparity of accent is very manifest.

Now, if in the place of *and*, there was some other word, a word not so much accented as *spare*, but still more accented than *and*, this disparity would be diminished, and the accents of the two words might be said to be at *par*, or nearly so. As said before, the line was slightly altered from Churchill, the real reading being—

Then rést, my friénd, *spare*, *spare* thy précious breath.—

In the true reading we actually find what had previously only been supposed. In the words *spare*, *spare*, the accents are nearly at *par*. Such is the difference between accent at *par* and disparity of accent.

Good illustrations of the parity and disparity of accent may be drawn from certain names of places. Let there be such a sentence as the following: *the lime house near the new port.* Compare the parity of accent on the separate words *lime* and *house*, *bridge* and *north*, *new* and *port*, with the disparity of accent in the compound words *Límehouse*, and *Néwport*. The separate words *beef steak*, where the accent is nearly at *par*, compared with the compound word *sweépstakes*, where there is a great disparity of accent, are further illustrations of the same difference.

The difference between a compound word and two words is greatest where the first is an adjective. This we see in comparing such terms as the following: *bláck bírd*, meaning a *bird that is black*, with *bláckbird* = the Latin *merula*; or *blúe béll*, meaning a *bell that is blue*, with *blúebell*, the flower. Expressions like a *shárp edgéd instrument*, meaning *an instrument that is sharp and has edges*, as opposed to *a shárp-edged instrument*, meaning *an instrument with sharp edges*, further exemplify this difference.

Subject to four small classes of exceptions, it may be laid down, that, in the English language, *there is no composition unless there is either a change of form or a change of accent.*

The reader is now informed, that unless, in what has gone before, he has taken an exception to either a statement or an inference, he has either seen beyond what has been already laid down by the author, or else has read him with insufficient attention. This may be shown by drawing a distinction between a compound form and a compound idea.

In the words *a red house,* each word preserves its natural and original meaning, and the statement is *that a house is red.* By a parity of reasoning, *a mad house* should mean a *house that is mad;* and, provided that each word retain its natural meaning and its natural accent, such is the fact. Let a *house* mean, as it often does, a *family.* Then the phrase, *a mad house,* means that the *house, or family, is mad,* just as *a red house* means that the *house is red.* Such, however, is not the current meaning of the word. Every one know that *a mad house* means *a house for mad men;* in which case it is treated as a compound word, and has a marked accent on the first syllable, just as *Límehouse* has. Now, compared with the words *red house,* meaning a house of a *red colour,* and compared with the words *mad house,* meaning a *deranged family,* the word *mádhouse,* in its common sense, expresses a compound idea; as opposed to two ideas, or a double idea. The word *beef steak* is evidently a compound idea; but, as there is no disparity of accent, it is not a compound word. Its sense is compound; its form is not compound, but double. This indicates the objection anticipated, which is this: viz. that a definition, which would exclude such a word as *beef steak* from the list of compounds, is, for that very reason, exceptionable. I answer to this, that the term in question is a compound idea, and not a compound form; in other words, that it is a compound in logic, but not a compound in etymology. Now etymology, taking cognizance of forms only, has nothing to do with ideas, except so far as they influence forms.

Such is the commentary upon the words, "*treating the combination as a single term;*" in other words, such the difference between a compound word and two words. The rule, being repeated, stands (subject to the four classes of exceptions) thus: *There is no true composition without either a change of form or*

a change of accent. As I wish to be clear upon this point, I shall illustrate the statement by its application.

The word *trée-rose* is often pronounced *trée róse;* that is, with the accent at *par*. It is compound in the one case; it is two words in the other.

The words *mountain ash* and *mountain height* are generally (perhaps always) pronounced with an equal accent on the syllables *mount-* and *ash*, *mount-* and *height*, respectively. In this case the word *mountain* must be dealt with as an adjective, and the words considered as two. The word *moúntain wave* is often pronounced with a visible diminution of accent on the last syllable. In this case there is a disparity of accent, and the word is compound.

The following quotations indicate a further cause of perplexity in determining between compound words and two words :—

1.

A wet sheet and a blowing gale,
  A breeze that follows fast;
That fills the white and swelling sail,
  And bends the *gallant mast*.

ALLAN CUNNINGHAM.

2.

Britannia needs no bulwarks,
  No towers along the steep;
Her march is o'er the *mountain-wave*,
  Her home is on the deep.

THOMAS CAMPBELL.

To speak first of the word (or words) *gallant mast*. If *gallant* mean *brave*, there are *two words*. If the words be two, there is a stronger accent on *mast*. If the accent on *mast* be stronger, the rhyme with *fast* is more complete; in other words, the metre favours the notion of the words being considered as *two*. *Gallant-mast*, however, is a compound word, with an especial nautical meaning. In this case the accent is stronger on *gal-* and weaker on *-mast*. This, however, is not the state of things that the metre favours. The same applies to *mountain wave*.

The same person who in prose would throw a stronger accent on *mount-* and a weaker one on *wave* (so dealing with the word as a compound), might, in poetry, make the words *two*, by giving to the last syllable a parity of accent.

The following quotation from Ben Jonson may be read in two ways; and the accent may vary with the reading.

1.
Lay thy bow of pearl apart,
And thy *silver shining* quiver.

2.
Lay thy bow of pearl apart,
And thy *silver-shining* quiver.

Cynthia's Revels.

§ 328. *On certain words wherein the fact of their being compound is obscured.*—Composition is the addition of a word to a word, derivation is the addition of letters or syllables to a word. In a compound form each element has a separate and independent existence; in a derived form, only one of the elements has such. Now it is very possible that in an older stage of a language two words may exist, may be put together, and may so form a compound; at the time in point each word having a separate and independent existence: whilst, in a later stage of language, only one of these words may have a separate and independent existence, the other having become obsolete. In this case a compound word would take the appearance of a derived one, since but one of its elements could be exhibited as a separate and independent word. Such is the case with, amongst others, the word *bishopric*. In the present language the word *ric* has no separate and independent existence. For all this, the word is a true compound, since, in Anglo-Saxon, we have the noun *ríce* as a separate, independent word, signifying *kingdom* or *domain*.

Again, without becoming obsolete, a word may alter its form. This is the case with most of our adjectives in *-ly*. At present they appear derivative; their termination *-ly* having no separate and independent existence. The older language, however, shows that they are compounds; since *-ly* is nothing else than *-lic*, Anglo-Saxon; *-lih*, Old High-German; *-leiks*,

Mœso-Gothic; = *like*, or *similis*, and equally with it an independent separate word.

For the following words a separate independent root is presumed rather than shown. It is presumed, however, on grounds that satisfy the etymologist.

Mis-, as in *misdeed*, &c.—Mœso-Gothic, *missô* = *in turns*; Old Norse, *á mis* = *alternately*; Middle High-German, *misse* = *mistake*. The original notion *alternation*, thence *change*, thence *defect*. Compare the Greek ἄλλως.—GRIMM, *Deutsche Grammatik*, ii. 470.

Dom, as in *wisdom*, &c.—the substantive *dôm* presumed.—*Deutsche Grammatik*, ii. 491.

Hood, and *head*, as in *Godhead*, *manhood*, &c.—The substantive *háids* = *person*, *order*, *kind*, presumed.—*Deutsche Grammatik*, ii. 497. Nothing to do with the word *head*.

Ship, as in *friendship*.—Anglo-Saxon, *-scipe* and *-sceäft*; German, *-schaft*; Mœso-Gothic, *gaskafts* = *a creature*, or *creation*. The substantive *skafts* or *skap* presumed. The *-skip* or *-scape* in *landskip* is only an older form.—*Deutsche Grammatik*, ii. 522.

Less, as in *sleepless*, &c., has nothing to do with *less*. Derived from *láus*, *lôs*, *destitute of* = Latin, *expers*.—*Deutsche Grammatik*, ii. 565.

For the further details, which are very numerous, see the *Deutsche Grammatik*, vol. iii.

§ 329. "Subject to four classes of exceptions, it may be laid down that *there is no true composition unless there is either a change of form or a change of accent*."—The first class of exceptions consists of those words where the natural tendency to disparity of accent is traversed by some rule of euphony. For example, let two words be put together, which at their point of contact form a combination of sounds foreign to our habits of pronunciation. The rarity of the combination will cause an effort in utterance. The effort in utterance will cause an accent to be laid on the latter half of the compound. This will equalize the accent, and abolish the disparity. The word *monkshood*, the name of a flower (*aconitum napellus*), where, to my ear at least, there is quite as much accent on the *-hood* as on the *monks-*, may serve in the way of illustration. *Monks*

is one word, *hood* another. When joined together, the *h-* of the *-hood* is put in immediate opposition with the *-s* of the *monks-*. Hence the combination *monkshood*. At the letters *s* and *h* is the point of contact. Now the sound of *s* followed immediately by the sound of *h* is a true aspirate. But true aspirates are rare in the English language. Being of rare occurrence, the pronunciation of them is a matter of attention and effort; and this attention and effort creates an accent which otherwise would be absent. Hence words like *monks-hóod, well-héad,* and some others.

Real reduplications of consonants, as in *hop-pole,* may have the same parity of accent with the true aspirates: and for the same reasons. They are rare combinations that require effort and attention.

The second class of exceptions contains those words wherein between the first element and the second there is so great a disparity, either in the length of the vowel, or the length of the syllable *en masse,* as to counteract the natural tendency of the first element to become accented. One of the few specimens of this class (which after all may consist of double words) is the term *upstánding*. Here it should be remembered, that words like *hapházard, foolhárdy, uphólder,* and *withhóld* come under the first class of the exceptions.

The third class of exceptions contains words like *perchánce* and *perháps*. In all respects but one these are double words, just as *by chance* is a double word. *Per,* however, differs from *by* in having no separate existence. This sort of words we owe to the multiplicity of elements (classical and Gothic) in the English language.

To anticipate objections to the rule respecting the disparity of accent, it may be well to state in fresh terms a fact already indicated, viz. that the same combination of words may in one sense be compound, and in the other double (or two). *An up-hill game* gives us the combination *up* + *hill* as a compound. *He ran up hill* gives us the combination *up* + *hill* as two words. So it is with *down* + *hill, down* + *right,* and other words. *Man-servant, cock-sparrow,* &c. are double or compound, as they are pronounced *mán-sérvant, mán-servant, cóck-spárrow,* or *cóck-sparrow*.

The fourth class is hypothetical. I can, however, imagine that certain compounds may, if used almost exclusively in poetry and with the accent at *par*, become so accented even in the current language.

For a remark on the words *peacock*, *peahen*, see the chapter upon Gender.—If these words be rendered masculine or feminine by the addition of the elements *-cock* and *-hen*, the statements made in the beginning of the present chapter are invalidated; since, if the word *pea-* be particularised, qualified, or defined by the words *-cock* and *-hen*, the second term defines or particularises the first, which is contrary to rule. The truth, however, is, that the words *-cock* and *-hen* are defined by the prefix *pea-*. Preparatory to the exhibition of this, let us remember that the word *pea* (although now found in composition only) is a true and independent substantive, the name of a species of fowl, like *pheasant*, *partridge*, or any other appellation. It is the Latin *pavo*, German *pfau*. Now, if the word *peacock* mean a *pea* (*pfau* or *pavo*) that is a male, then do *wood-cock*, *black-cock*, and *bantam-cock*, mean *woods*, *blacks*, and *bantams* that are male. Or if the word *peahen* mean a *pea* (*pfau* or *pavo*) that is female, then do *moorhen* and *guineahen* mean *moors* and *guineas* that are female. Again, if a *peahen* mean a *pea* (*pfau* or *pavo*) that is female, then does the compound *pheasant-hen* mean the same as *hen-pheasant*; which is not the case. The fact is that *peacock* means a *cock that is a pea* (*pfau* or *pavo*); *peahen* means a *hen that is a pea* (*pfau* or *pavo*); and, finally, *peafowl* means a *fowl that is a pea* (*pfau* or *pavo*). In the same way *moorfowl* means, not a *moor that is connected with a fowl*, but a *fowl that is connected with a moor*.

§ 330. It must be clear, *ex vi termini*, that in every compound word there are two parts; *i. e.* the whole or part of the original, and the whole or part of the superadded, word. In the most perfect forms of inflection there is a third element, viz. a vowel, consonant, or syllable that joins the first word with the second.

In the older forms of all the Gothic languages the presence of this third element was the rule rather than the exception. In the present English it exists in but few words.

a. The *-a-* in *black-a-moor* is possibly such a connecting element.

b. The *-in-* in *night-in-gale* is most probably such a connecting element. Compare the German form *nacht-i-gall*, and remember the tendency of vowels to take the sound of *-ng* before *g*.

Improper compounds.—The *-s-* in words like *Thur-s-day*, *hunt-s-man*, may be one of two things—

a. It may be the sign of the genitive case, so that *Thursday* = *Thoris dies*. In this case the word is an improper compound, since it is like the word *pater-familias* in Latin, in a common state of syntactic construction.

b. It may be a connecting sound, like the *-i-* in *nacht-i-gall*. Reasons for this view occur in the following fact :—

In the modern German languages the genitive case of feminine nouns ends otherwise than in *-s*. Nevertheless, the sound of *-s-* occurs in composition equally, whether the noun it follows be masculine or feminine. This fact, as far as it goes, makes it convenient to consider the sound in question as a connective rather than a case. Probably, it is neither one nor the other exactly, but the effect of a false analogy.

Decomposites.—"Composition is the joining together of *two* words."

Compound radicals, like *midship* and *gentleman*, in *midshipman* and *gentleman-like*, are, for the purposes of composition, single words. Compounds wherein one element is compound are called decomposites.

There are a number of words which are never found by themselves; or, if so found, have never the same sense that they have in combination. Mark the word combination. The terms in question are points of combination, not of composition : since they form not the part of words, but the parts of phrases. Such are the expressions *time and tide—might and main—rede me my riddle—pay your shot—rhyme and reason*, &c. These words are evidently of the same class, though not of the same species, with *bishopric, colewort, spillikin, gossip, mainswearer*, &c. These last-mentioned terms give us obsolete words preserved in composition. The former give us obsolete words preserved in combination.

§ 331. By attending to the following sections we shall see in what way the different parts of speech are capable of being put together by composition.

Substantives preceded by Substantives.—A large and important class. *Day-star, morning-star, evening-star, land-slip, watch-house, light-house, rose-tree, oak-tree, fir-tree, harvest-time, goose-grass, sea-man, collar-bone, shoulder-blade, ground-nut, earth-nut, hazel-nut, wall-nut, fire-wood, sun-light, moon-light, star-light, torch-light, &c.*

Substantives preceded by Adjectives.—(1.) Proper Names.—*Good-man, New-man, North-humberland, South-hampton.* (2.) Common Names.—*Blind-worm, free-man, free-thinker, half-penny, grey-beard, green-sward, white-thorn, black-thorn, mid-day, mid-summer, quick-silver, holy-day, &c.*

Substantives preceded by Verbs.—Turn-spit, spit-fire, dare-devil, whet-stone, kill-cow, sing-song, turn-coat, &c.

Substantives preceded by the Present Participle.—Turning-lathe, sawing-mill.

Substantives preceded by the Past Participle of the Strong form.—None.

Substantives preceded by the Past Participle of the Weak form.—None.

Adjectives preceded by Substantives.—Sin-ful, thank-ful, and other words ending in *-ful. Blood-red, eye-bright, coal-black, snow-white, nut-brown, heart-whole, ice-cold, foot-sore, &c.*

Adjectives preceded by Adjectives.— All-mighty, two-fold, many-fold, &c.

Adjectives preceded by Verbs.—Stand-still, live-long. Very rare.

Adjectives preceded by Present Participles.—None.

Adjectives preceded by Past Participles of the Strong form.—None.

Adjectives preceded by Past Participles of the Weak form.—None.

Verbs preceded by Substantives. — God-send. Rare, and doubtful.

Verbs preceded by Adjectives.—Little-heed, rough-hew. Rare, and doubtful.

Verbs preceded by Verbs.—Hear-say. Rare.

Verbs preceded by Present Participles.—None.

Verbs preceded by Past Participles of the Strong form.—None.

Verbs preceded by Past Participles of the Weak form.—None.

Present Participles preceded by Adjectives.—*All-seeing, all-ruling, soft-flowing, fast-sailing, merry-making.*

Past Participles of the Strong form preceded by an Adjective.—*New-born, free-spoken.*

Present Participles preceded by Substantives.—*Fruit-bearing, music-making.*

Past Participles of the Strong form preceded by Substantives.—*Heaven-born, bed-ridden.*

Past Participles of the Weak form preceded by Substantives.—*Blood-stained.*

Past Participles of the Weak form preceded by an Adjective.—*Dear-bought, fresh-made, new-made, new-laid.*

Verbal Substantives preceded by Substantives.—*Man-eater, woman-eater, kid-napper, horn-blower.*—Numerous.

Verbal Substantives preceded by Adjectives.—None.

Verbal Substantives preceded by Verbs.—None.

Verbal Substantives preceded by Participles.—None.

Verbal Substantives preceded by Verbals.—None.

Verbal Adjectives preceded by Substantives.—*Mop-headed, chicken-hearted.*

Verbal Adjectives preceded by Adjectives.—*Cold-hearted, flaxen-haired, hot-headed, curly-pated.*

Verbal Adjectives preceded by Verbs.—None.

Verbal Adjectives preceded by Participles.—None.

Verbal Adjectives preceded by Verbals.—None.

Adverbs entering into composition are of two sorts:—

1st. Those that can be separated from the word with which they combine, and, nevertheless, appear as independent words; as *over, under, well,* &c. These are called Separable Adverbs.

2nd. Those that, when they are separated from the verb with which they combine, have no independent existence as separate words; *e. g.* the syllable *un-* in *unloose.* These are called Inseparable Adverbs.

Words preceded by Separable Adverbs.—*Over-do, under-go, well-beloved,* &c. Numerous.

Words preceded by Inseparable Adverbs.

Words preceded by the Inseparable Adverb be-.—*Be-hove, be-fit, be-seem, be-lieve, be-lie, be-spatter, be-smear, be-get, be-labour, be-do, be-gin* (*on-ginnan* in A. S.), *be-gird, be-hold, be-mourn, be-reave, be-deck, be-think, be-mire, be-rhyme.* The forms throughout the allied languages are generally *bi-* or *be-*.

Words formed by the Inseparable Adverb un-.—*Un-bind, un-do, un-loose, un-lock, un-wind.* The forms of the Inseparable in the different allied languages are—in Mœso-Gothic, *and-*; in Old High-German, *ind-, int-, in-*; in Old Saxon, *ant-*; in Middle and New High-German, *ent-*; in Anglo-Saxon, *on-*; as *on-bindan* (*un-bind*), *on-don* (*un-do*), *on-lŷsan* (*un-loose*), *on-lúcan* (*un-lock*), *on-windan* (*un-wind*).

Words formed by the Inseparable Adverb a-.—*A-light, a-rouse, a-rise, a-wake, a-wak-en, a-bet, a-bide, a-llay.* The forms of this Inseparable, different in different allied languages, are —in Mœso-Gothic, *us-*; in Old High-German, *ur-, ar-, ir-, er-, ër-*; in Old Saxon and in Anglo-Saxon, *â-*; as *â-rîsan* (*a-rise*), *â-weccan* (*a-wake*).

Words formed by the Inseparable Adverb for-.—*For-get, for-do, fore-go, for-give, for-bid, for-bear, for-swear.* The *for-* here is of a different origin, and different in meaning and power, from the *fore-* in words like *fore-tell.* In different allied languages it takes different forms. In Mœso-Gothic, *fáir, faúr, fra.* In Old High-German, *far, fer, fir, for.* In Middle and New High-German, *ver.* In Anglo-Saxon, *for.*

CHAPTER III.

ON DERIVATION AND INFLECTION.

§ 332. DERIVATION, like *etymology*, is a word used in a wide and in a limited sense. In the wide sense of the term every word, except it be in the simple form of a root, is a derived word. In this sense the cases, numbers, and genders of nouns, the persons, moods, and tenses of verbs, the ordinal numbers, the diminutives, and even the compound words, are alike matters of derivation. In the wide sense of the term the word *fathers*, from *father*, is equally in a state of derivation with the word *strength*, from *strong*.

In the use of the word, even in its limited sense, there is considerable laxity and uncertainty, as may be seen by attending to the following terms:—

Gender, number, case.—These have been called the *accidents* of the *noun*, and these it has been agreed to separate from derivation in its stricter sense, or from derivation properly so called, and to class together under the name of *declension*. Nouns are declined.

Person, number, tense, voice.—These have been called the accidents of a *verb*, and these it has been agreed to separate from derivation properly so called, and to class together under the name of *conjugation*. Verbs are conjugated.

Conjugation and declension constitute inflection. Nouns and verbs, speaking generally, are inflected.

Inflection, a part of derivation in its wider sense, is separated from derivation properly so called, or from derivation in its limited sense.

Derivation proper may be divided according to a variety of principles. Amongst others—

I. *According to the evidence.*—In the evidence that a word is not simple, but derived, there are at least two degrees.

1. That the word *strength* is a derived word I collect to a certainty from the word *strong*, an independent form, which I can separate from it. Of the nature of the word *strength* there is the clearest evidence, or evidence of the first degree.

2. *Fowl, hail, nail, sail, tail, soul;* in Anglo-Saxon, *fugel, hægel, nægel, segel, tægel, sawel.*—These words are by the best grammarians considered as derivatives. Now, with these words I can not do what was done with the word *strength*, I can not take from them the part which I look upon as the derivational addition, and after that leave an independent word. *Strength* —*th* is a true word; *fowl* or *fugel*—*l* is no true word. If I believe these latter words to be derivations at all, I do it because I find in words like *handle*, &c., the *-l* as a derivational addition. Yet, as the fact of a word being sometimes used as a derivational addition does not preclude it from being at other times a part of the root, the evidence that the words in question are not simple, but derived, is not cogent. In other words, it is evidence of the second degree.

II. *According to the effect.*—The syllable *-en* in the word *whiten* changes the noun *white* into a verb. This is its effect. We may so classify as to arrange combinations like *-en* (whose effect is to give the idea of the verb) in one order; whilst combinations like *th* (whose effect is, as in the word *strength*, to give the idea of abstraction) form another order.

III. *According to the form.*—Sometimes the derivational element is a vowel (as the *-ie* in *doggie*); sometimes a consonant combined: sometimes a syllable (as the *-en* in *whiten*); sometimes a change of vowel without any addition (as the *i* in *tip*, compared with *top*); sometimes a change of consonant without any addition (as the *z* in *prize*, compared with *price*). Sometimes, too, it is a change of *accent*, like *a súrvey*, compared with *to survéy*. To classify derivations in this manner is to classify them according to their form. For the detail of the derivative forms, see *Deutsche Grammatik*, ii. 89—405.

IV. *According to the historical origin of the derivational elements.*—For this see Vol. I.

V. *According to the number of the derivational elements.*—In

fisher, as compared with *fish*, there is but one derivational affix. In *fishery*, as compared with *fish*, the number of derivational elements is two.

§ 333. Forms like *tip*, from *top*, *price* and *prize*, &c., are of importance in general etymology. Let it be received as a theory (as with some philologists is really the case) that fragmentary sounds like the *-en* in *whiten*, the *-th* in *strength*, &c., were once *words*; or, changing the expression, let it be considered that all derivation was once composition. Let this view be opposed. The first words that are brought to militate against it are those like *tip* and *prize*, where, instead of any *addition*, there is only *a change*; and, consequently, no vestiges of an older *word*. This argument, good as far as it goes, is rebutted in the following manner. Let the word *top* have attached to it a second word, in which second word there is a small vowel. Let this small vowel act upon the full one in *top*, changing it to *tip*. After this, let the second word be ejected. We then get the form *tip* by the law of accommodation, and not as an immediate sign of derivation. The *i* in *chick* (from *cock*) may be thus accounted for, the *-en* in *chicken* being supposed to have exerted, first, an influenee of accommodation, and afterwards to have fallen off.

§ 334. *Derivation by means of the addition of a Vowel.*— The* only vowel sound that in English constitutes by itself a form of derivation is that of the *ee* in *feet*, expressed for the most part by the letter *y*. It occurs with two very distinct powers.

1. As a Diminutive; *babe, bab-y*. In Lowland Scotch it is far more common, and is spelt *-ie*; as *dogg-ie, lass-ie, ladd-ie, mous-ie, wif-ie* = *little* (or *dear*) *dog, lass, lad, mouse, wife*. In the word *baby* its power as a diminutive is obsolete.

2. After certain words ending in *-r*; as *fish-er-y, rook-er-y, brav-er-y, fool-er-y, prud-er-y, slav-er-y, witch-er-y, nurs-er-y, stitch-er-y*, and a few others. Respecting these latter words it must be remembered—

a. That they are Double Derivatives;

b. That the *-r* is probably the same as the *-r* in *children*;

* The *-y* in words like *might-y* originated in *-ig*; as *miht-ig*, A. S.

c. That the vowel sound is not of Saxon or even Gothic origin. It originates from the *-y* in words like *astronom-y, histor-y, prophec-y, necromanc-y*, &c., all of which are words derived, not from any Gothic language, but from the Latin or Greek. The original forms of these endings was *-ia*, as *astronom-i-a, histor-i-a*, &c. Hence words like *fish-er-y*, &c., are improperly formed.

Derivation by means of the addition of the liquid L.—1. *Substantives.—Gird-le, kern-el.*

2. *Adjectives.—Litt-le, mick-le.*

3. *Verbs.—Spark-le.*

Derivation by means of the addition of the liquid R.—*Substantives.*—Words that in A. S. ended in *-er*, and were (or would have been) of the masculine gender—*laugh-t-er, slaugh-t-er.*

Words that in A. S. ended in *-er*, and were (or would have been) of the neuter gender — *lay-er, lai-r* (A. S. læg-er), *fodd-er* (from the root of *feed*).

Substantives that in A. S. ended in *-ere*, and were (or would have been) of the masculine gender.—These form a numerous and important class. They are almost all the names of agents, and, if we subtract from almost any of them the ending *-er*, the remainder is either a verb or a word that can be used as such; *e. g.* a *bak-er* performs the act of *baking*, and (as such) is an agent (or one who acts or does), so that the word *bak-er* is the name of an agent. Subtract *-er*, and the remainder is *bake*, a word that can be used as a verb, *e. g. to bake, I bake*, &c.—*read-er, sinn-er, harp-er, full-er, begg-er* (or *begg-ar*), *hunt-er, lend-er, borrow-er, reap-er, mow-er, sow-er, plough-er, fish-er, deal-er, wander-er, writ-er, lead-er, steer-er, look-er, heal-er, cobbl-er, li-ar, robb-er, sail-or, teach-er, help-er, los-er, hear-er, buy-er, sell-er, shap-er, leap-er, runn-er, walk-er, jump-er, murder-er, slaughter-er, fiddl-er, giv-er, work-er, rid-er, kill-er, slay-er, slumber-er, sleep-er, keep-er, dream-er, tell-er, bak-er, brew-er, thatch-er, weaver, spinn-er, wait-er, eat-er, drink-er, din-er, rov-er, lov-er, mov-er, flatter-er, mill-er, glov-er, hatt-er.*

Substantives that in A. S. ended in *-ra*, and were (or would have been) masculine—*gander* (A. S. *gand-ra*).

Verbs.—Hind-er, low-er.

Derivation by means of the addition of the liquid M.—Few or none.

Derivations by means of the addition of the liquid N.—*Substantives.—Maid-en, gamm-on* (*game*), *mai-n* (as in *might and main*). That the *-n* is no part of the original word in *mai-n*, we see from the word *may*. The idea in both *may* and *mai-n* is that of *power*.

Adjectives.—1. Words where the *-n* is preceded in the Old High-German and the Old Saxon by *-a-* = *an*; *e. g. eik-an* (*own*), O. H. G.; *êg-an* (*own*), O. S.—*ow-n, op-en.*

2. Words where the *-n* is preceded in Mœso-Gothic by *-ei-*, in Old High-German by *-i-*, and in Old Saxon by *-i-*; *e. g. þaúrn-ein-s* (*thorny*), M. G.; *îrd-in* (*earthen*), O. H. G; *bôm-in* (*woody, i. e.* made of *beams*), O. S. Words of this sort express in English the circumstances of the object to which they are applied being *made of the material of which* the radical part of the derivative is the name: thus, *gold-en* is a derivative from *gold; gold* is the radical part of the derivative *gold-en;* the radical word *gold* is the name of a material of which certain objects (such as *guineas,* &c.) may be made. When we say *golden guinea* we apply the word *golden* to the object *guinea,* and express the circumstance of guineas being made of *gold,* or (in other words) of that material of which *gold* (the radical part of the derivative word *gold-en*) is the name. *Oak-en, ash-en, beech-en, braz-en, flax-en, gold-en, lead-en, silk-en, wood-en, wooll-en, twigg-en* (obsolete), *hemp-en, wheat-en, oat-en, wax-en.*

Derivations formed by the addition of the mute letter P.—None.

Derivations formed by the addition of the mute letter B.—None.

Derivations formed by the addition of the mute letter F.—None.

Derivations formed by the addition of the mute letter V.—In the *present* stage of the current English language, none.

Derivations formed by the addition of the sound *of the semi-vowel* W.—In the present stage of the current English, none.

Derivations formed by the addition of the sound *of the vowel*

O, *originating in* -ow *or* -ov, *and spelt in the present English* -ow.—Although it is proper in all cases of grammar to consider the sound rather than the spelling of words, the derivatives in question are more fitly connected with O than V. By comparison with *shade* and *mead*, the forms *shad-ow* and *mead-ow* are shown to be derivative; whilst the following forms prove that the *-ow*, although now sounded as the vowel *-o* (*shadd-o*, *medd-o*), originated in *-w* or *-v*: *skad-v-j-an* = to *sha-dow*, M. G.; *scead-uw-es* = *shadow's*, A. S.; *scead-ew-an* = to *sha-dow*, A. S.

Derivation by means of the addition of the mute consonant T.—1. *Substantives.*—Words which in A. S. ended in *-t*, *gif-t*, *shrif-t*, *thef-t*, *wef-t* (*weave*), *rif-t*, *drif-t*, *thrif-t*, *fros-t* (*freeze*), *gris-t* (*grind*), *fligh-t*, *sigh-t*, *draugh-t* (*draw*), *weigh-t*.

2. Words which in A. S. ended in *-ta*. The compounds of the word *wright* (from the root *work*); such as *cart-wrigh-t*, *wheel-wrigh-t*, *mill-wrigh-t*, &c.

Adjective.—*Tigh-t* (*tie*).

Derivations by means of the addition of the mute consonant D. —*Substantives.*—*Bran-d* (*burn*, *brenn*, obsolete), *floo-d* (*flow*), *mai-d* (*may* in Lowland Scotch), *see-d* (*sow*), *bur-d-en* (*bear*).

Adjectives.—*Dea-d* (*die*), *col-d* (*cool*). In the word *thir-d*, from *three*, the *d* stands for *th* (as in *fif-th*, &c.), in order to avoid the occurrence of the sound of *th* twice within the same syllable.

Derivation by means of the addition of TH (A. S. þ) *as sounded in* thin.—*Substantives.*—The following words ending in *-th* are the names of abstract ideas; *dea-th*, *bir-th* (*bear*), *heal-th*, *leng-th*, *bread-th*, *heigh-th*, *dep-th*, *mir-th*, *tru-th* (*trow*, Lowland Scotch), *weal-th*, *fil-th*, *til-th* (*tillage*, or *tilled ground*), *ki-th* (as in the phrase *kith and kin*).

Adjectives.—The syllable *-cou-th* in the compound word *un-cou-th*. This word originally meant *unknown*, originating in the word *ken* = *to know*. This we see from the following forms, *kun-þ-s*, in the Mœso-Gothic, and *chun-t*, in the Old High-German, signifying *known* (*kenned*).

Derivatives by means of the addition of TH (A. S. ð) *as sounded in* thine.—*Bur-th-en*, derived from *bear*.

Derivatives by means of the addition of the sound of the mute

consonant S, *sounded as in* sin.—*Substantives.*—In the word *goose* (*goo-se*) the *-s* is no part of the original word, in which also an *-n* and a *-d* have been lost. Compare the German word *gan-s*, and the English word *gand-er*. The *-s* in *goo-se* is derivative.

Derivatives by means of the addition of the sound of the Z *in* zeal *and the* S *in* flags (flagz).—*Verbs.*—*Clean-se* (*clenz*), from *clean*. In A. S. *clæn-s-i-an.*

Derivatives by means of the addition of the sound of the SH *in* shine.—Few or none.

Derivation by means of the addition of the sound of the Z *in* azure.—None.

Derivation by means of the addition of the mute letter K.—*Hill-ock.*

Derivation by means of the addition of the mute letter G.—None.

Derivations formed by the addition of the sound of the vowel E (*as in* feet), *originating in* -ig, *and spelt in the present English* -y.—All the derivative adjectives that now end in *-y*, ended in A. S. in *ig*; as *blood-y, craft-y, drear-y, might-y, mist-y, mood-y, merr-y, worth-y,* of which the A. S. forms were *blód-ig, cræft-ig, dreór-ig, miht-ig, mist-ig, mód-ig, myr-ig, worth-ig*. Although it is proper in all cases of grammar to consider the sound rather than the spelling of words, the derivatives in question are more fitly placed in the present section than elsewhere.

Derivation by means of the addition of the syllable -ing.—*Farth-ing* (¼), *rid-ing** (⅓, a corruption from *thrith-ing*). Also *clean-s-ing, dawn-ing, morn-ing*. In these words the *-ing* was originally *-ung*; as *clæn-s-ung, dag-ung,* A. S. It is clear that forms like *cleansing* from the A. S. *clæns-ung,* are different in origin from the participles in *-ing,* as *cleans-ing*. This double origin of words in *-ing* should be remembered.

Derivation by means of the addition of the syllable -l-ing.—*Gos-l-ing* (*little goose*), *duck-l-ing* (*little duck*), *dar-l-ing* (*little dear*), *hire-l-ing, found-l-ing, fond-l-ing, nest-l-ing,* &c. The words of this class are generally diminutives, or words expressive of smallness. The word *diminutive* is derived from the Latin word *diminuo* = to *diminish.*

Derivation by means of the addition of the syllable -kin.—

* As the *three ridings of Yorkshire.*

Lamb-kin (*little lamb*), *mann-i-kin* (*little man*). Words ending in *-kin* are chiefly diminutives.

Derivation by means of the addition of the syllable -rel.—*Cock-erel* (*little cock*), *pick-erel* (*little pike*). Diminutives.

Derivation by means of the addition of the syllable -ard.—*Drunk-ard, stink-ard.*

Derivation by means of the addition of the syllable -old.—*Thresh-old.*

Derivation by means of the addition of the syllable -ern.—*East-ern, west-ern, north-ern, south-ern.*

Derivation by means of the addition of the syllable -ish.—*Child-ish, Engl-ish, self-ish, whit-ish.* This class comprises several adjectives. It must not be thought that the forms in *-ish* are examples of the sound of the *sh* in *shine* being used in derivation; since the original form was *-isk*; *cild-isc* (*child-ish*), *Engl-isc* (*Engl-ish*), A. S. This softening down of the sound of *-sk* (or *-sc*) into that of the *sh* in *shine* occurs in many languages.

Derivation by means of the addition of the syllable -ness—*Good-ness, bad-ness, wicked-ness, bright-ness, dark-ness, weari-ness, dreari-ness,* &c. These form a numerous and important class. The fact to be here noticed is, that the *-n-* is, most probably, no part of the original form. This was simply *-ass*—or *-uss*—as in words like *fil-ussi* (*a crowd*) in the Mœso-Gothic; and hence the proper way of showing the structure of the words in question is to write them as follows:—*good-n-ess, bad-n-ess, dark-n-ess,* &c. The origin of the *-n-* has not been satisfactorily determined.

Derivation by means of the addition of the syllable -ster.—*Song-ster, pun-ster.* Originally words in *-str-* were limited to the names of females, and were opposed to the substantives in *-er*, the names of *male* agents. Thus, in A. S.—

Sangere, *a male singer*	were opposed to	Sængestre, *a female singer.*
Bæcere, *a male baker*		Bæcestre, *a female baker.*
Fidelere, *a male fiddler*		Fidelestre, *a female fiddler.*
Webbere, *a male weaver*		Webbestre, *a female weaver.*
Rædere, *a male reader*		Rædestre, *a female reader.*
Seamere, *a male seamer*		Seamestre, *a female seamer* (or *seamstress*).

The single word *spin-ster*, still retains its feminine force.

Derivation by means of changing *the sound of a consonant.*—*Price, prize; cloth, clothe;* use, use* (pronounced *uze*); *grass, graze; grease* (pronounced *greace*), *grease* (pronounced *greaze*). In each of the pairs of words given above, the former is a substantive, and the latter a verb.

The verb is formed from the substantive by changing the sharp mute into its corresponding flat one.

Derivation by means of changing *the sound of a vowel.*—*Rise, raise; lie, lay; fall, fell; sit, set.* The generality of these words are verbs. There are, however, a few nouns, as *top, tip; cat, kit.*

Derivation by means of transposing the accent.—See p. 44. This takes place only with words *not* of Anglo-Saxon origin.

Certain words have the appearance of being derived when they are really compound. This takes place when they alter in form, and no longer look like original independent words. The adjectives and adverbs ending in *-ly* are of this kind; such as *man-ly, bright-ly.* In the present language the syllable *-ly* has not, by itself, any meaning at all, and, consequently, is no separate independent word. Originally, however, it *was* a separate and independent word; in A. S. *-lic,* in O. H. G. *-lih,* in M. S. *-leik.* In other words, it was neither more nor less than the word *like.*

The same is the case with words ending in *-ric* (as *bishop-ric*), with words ending in *-ship* (as *friend-ship*), with words ending in *-hood* (as *man-hood*), and with words ending or beginning with *miss-* (as *a-miss, mis-take*), and with several others. In some older stages of language the words *-ric, -ship, -hood, miss-* (or *-miss*), were separate independent words with separate independent meanings. The precise meaning, however, is not always easily ascertained.

Certain words have the appearance of being compounds when they are really derived. This is the case with words like *up-most* (see chapter on Superlatives), where combinations like those of the sound of *-m* and *-ost,* take the appearance of separate independent words.

§ 335. *Current and obsolete processes.*—The present is a

* Pronounced *clodhe.*

proper time for exhibiting the difference between the current and the obsolete processes of a language.

By adding the sound of the *s* in *seal* to the word *father*, we change it into *father-s*. Hence the addition of the sound in question is the process by which the word *father* is changed into *fathers*. Such is the nature of a process in language. The process by which *ox* is changed into *ox-en* is the addition of the sound of the syllable *-en*. The words *father* and *ox* are said to be affected by a certain process; and, as they are affected, the language, of which they form a part, is affected also.

In all languages there are two sorts of processes, those that are in operation at a certain period, and those that have ceased to operate.

In illustration of this, let us suppose that, from the Latin, Greek, French, or some other language, a new word was introduced into the English; and that this word was a substantive of the singular number. Suppose the word was *tek*, and that it meant a sort of *dwelling-house*. In the course of time it would be necessary to use this word in the plural; and the question would arise as to the manner in which that number should be formed.

Now there are three simple forms of the plural in English, and consequently three processes by which a singular may be converted into a plural:

1. The addition of *-s*, *-z*, or *-ez* (*es*).
2. The change of vowel.
3. The addition of *-n*.

Notwithstanding this, it is very certain that the plural of a new word would *not* be formed in *-en* (like *oxen*), nor yet by a change of vowel (like *feet*); but by addition of the sound of *s*, *z*, or *ez* (like *stack-z*, *dog-z*, *loss-ez*, spelt *stack-s*, *dog-s*, *loss-es*).

This shows that the process by which *ox* is changed into *ox-en*, *foot* into *feet*, and *child* into *children*, is no longer in operation; in other words, that it is *obsolete*; whilst the process that changes *father* into *father-s* is still in operation; in other words, *current*.

With each and all of the forms in grammar, as they successively present themselves, we should ask whether they were brought about by a current process, or by an obsolete one.

CHAPTER IV.

DIMINUTIVES AND AUGMENTATIVES.

§ 336. Compared with the words *lamb*, *man*, and *hill*, the words *lambkin*, *mannikin*, *and hillock* convey the idea of comparative smallness or diminution. Now, as the word *hillock* = *a little hill* differs in form from *hill*, we have in English a series of diminutive forms, or diminutives.

The English diminutives may be arranged according to a variety of principles. Amongst others:—

1. *According to the form.*—The word *hillock* is derived from *hill*, by the addition of a syllable. The word *tip* is derived from *top*, by the change of a vowel.

2. *According to their meaning.*—In the word *hillock* there is the simple expression of comparative smallness in size. In the word *doggie* for *dog*, *lassie* for *lass*, the addition of the *-ie* makes the word not so much a diminutive as a term of tenderness or endearment. The idea of smallness, accompanied, perhaps, with that of neatness, generally carries with it the idea of approbation. The word *clean* in English, means, in German, *little* = *kleine*. The feeling of protection which is extended to small objects engenders the notion of endearment.* In Middle High-German we have *vaterlîn* = *little father*, *mütterlîn* = *little mother*. In Middle High-German there is the diminutive *sunnelîn*; and the French *soleil* is from the Latin form *solillus*. In Slavonic the word *slunze* = *sun* is a diminutive form.

The Greek word μείωσις (*meiósis*) means diminution; the Greek word ὑποκόρισμα means an endearing expression. Hence we get names for the two kinds of diminutives; viz. the term *meiotic* for the true diminutives, and the term *hypo-*

* As *kleen* is to *clean* in German and English, so is *petitus* (*sought*, *desired*) to *petit* (*small*) in Latin and French.

coristic for the diminutives of endearment.—GRIMM, *Deutsche Grammatik*, iii. 664.

3. *According to their historical origin.*—The syllable *-ock*, as in *hillock*, is of Anglo-Saxon and Gothic origin. The *-et*, as in *lancet*, is of French and classical origin.

4. *According as they affect proper names or common names.*—*Hawkin*, *Perkin*, *Wilkin*, &c. In these words we have the diminutives of *Hal*, *Peter*, *Will*, &c.

The diminutive forms of Gothic origin are the first to be considered.

1. *Those formed by a change of vowel.*—*Tip*, from *top*. The relation of the feminine to the masculine is allied to the ideas conveyed by many diminutives. Hence in the word *kit*, from *cat*, it is doubtful whether there be meant a female cat or a little cat. *Kid* is a diminutive form of goat.

2. *Those formed by the addition of a letter or letters.*—Of the diminutive characteristics thus formed the commonest, beginning from the simpler forms, are—

Ie.—Almost peculiar to the Lowland Scotch; as *daddie*, *lassie*, *minnie*, *wifie*, *mousie*, *doggie*, *boatie*, &c.—*Deutsche Grammatik*, iii. 686.

Ock.—*Bullock*, *hillock*.

Kin.—*Lambkin*, *mannikin*, *ladikin*, &c. As is seen above, common in proper names.

En.—*Chicken*, *kitten*, from *cock*, *cat*. The notion of diminution, if indeed that be the notion originally conveyed, lies not in the *-en*, but in the vowel. In the word *chicken*, from *cock*, observe the effect of the small vowel on the *c*.

The consideration of words like *duckling* and *gosling* is purposely deferred.

The chief diminutive of classical origin is—

Et, as in *trumpet*, *lancet*, *pocket*; the word *pock*, as in *meal-pock* = *a meal bag*, being found in the Scottish. From the French *-ette*, as in *caissette*, *poulette*.

The forms *-rel*, as in *cockerel*, *pickerel*, and *-let*, as in *streamlet*, require a separate consideration. The first has nothing to do with the Italian forms *acquerella* and *coserella*—themselves, perhaps, of Gothic, rather than of classical origin.

In the Old High-German there are a multitude of diminutive forms in *-l*; as *ouga = an eye, ougili = a little eye, lied = a song, liedel = a little song.* "In Austria and Bavaria are the forms *mannel, weibel, hundel,* &c., or *mannl, weibl, hundl,* &c. In some districts there is an *r* before the *l*, as *madarl = a little maid, muadarl = a little mother, briadarl = a little brother,* &c. This is occasioned by the false analogy of the diminutives of the derived form in *r*."—*Deutsche Grammatik,* iii. p. 674. This indicates the nature of words like *cockerel.*

Even in English the diminutive power of *-el* can be traced in the following words:—

Soare = a deer in its third year. *Sor-rel* = a deer in its second year.—See *Love's Labour's Lost,* with the note.

Tiercel = a small sort of hawk, one-third less (*tierce*) than the common kind.

Kantle = small corner, from *cant = corner.*—*Henry IV.*

Hurdle; in Dutch, *horde;* German, *hurde. Hording,* without the *-l,* is used in an allied sense by builders in English.

In the words in point we must assume an earlier form, *cocker* and *piker,* to which the diminutive form *-el* is affixed. If this be true, we have, in English, representatives of the diminutive form *-l,* so common in the High-Germanic dialects. *Wolfer = a wolf, hunker = a haunch, flitcher = a flitch, teamer = a team, fresher = a frog,*—these are north country forms of the present English.*

The termination *-let,* as in *streamlet,* seems to be double, and to consist of the Gothic diminutive *-l,* and the French diminutive *-t.*

§ 337. *Augmentatives.*—Compared with *capello = a hat,* the Italian word *capellone = a great hat* is an augmentative. The augmentative forms, pre-eminently common in the Italian language, often carry with them a depreciating sense.

The termination *-rd* (in Old High-German, *-hart*), as in *drunkard, braggart, laggard, stinkard,* carries with it this idea of depreciation. In *buzzard,* and *reynard,* the name of the fox, it is simply augmentative. In *wizard,* from *witch,* it has the power of a masculine form.

The termination *-rd,* taken from the Gothic, appears in the

* Guest, ii. 192.

modern languages of classical origin: French, *vieillard;* Spanish, *codardo.* From these we get at, second-hand, the word *coward.—Deutsche Grammatik,* iii. 707.

The word *sweetheart* is a derived word of this sort, rather than a compound word; since in Old High-German and Middle High-German, we have the corresponding form *liebhart.* Now the form for *heart* is in German not *hart,* but *herz.*

Words like *braggadocio, trombone, balloon,* being words of foreign origin, prove nothing as to the further existence of augmentative forms in English.

CHAPTER V.

PATRONYMICS.

§ 338. In the Greek language the notion of lineal descent, in other words, the relation of the son to the father, is expressed by a particular termination; as, Πηλεὺς (*Peleus*), Πηλείδης (*Peleidæs*), the son of Peleus. It is very evident that this mode of expression is very different from either the English form *Johnson*, or Gaelic *MacDonald*. In these last-named words, the words *son* and *Mac* mean the same thing; so that *Johnson* and *MacDonald* are not derived, but compound words. This Greek way of expressing descent is peculiar, and the words wherein it occurs are classed together by the peculiar name *patronymic*, from *patær* = *father*, and *onoma* = *a name*. Is there anything in English corresponding to the Greek patronymics? It was for the sake of this question that the consideration of the termination *-ling*, as in *duckling*, &c., was deferred.

The termination *-ling*, like the terminations *-rel* and *-let*, is compound. Its simpler form is *-ing*. This, from being affixed to the derived forms in *-l*, has become *-ling*.

In Anglo-Saxon the termination *-ing* is as truly patronymic as -ιδης is in Greek. In the Bible-translation the son of Elisha is called *Elising*. In the Anglo-Saxon Chronicle occur such genealogies as the following:—*Ida wæs Eopping, Eoppa Ésing, Ésa Inging, Inga Angenviting, Angenvit Alocing, Aloc Beonocing, Beonoc Branding, Brand Bældæging, Bældæg, Vódening, Vóden Friðowulfing, Friðowulf Finning, Finn Godwulfing, Godwulf Geating* = Ida was the son of Eoppa, Eoppa of Esing, Esing of Inga, Inga of Angenvit, Angenvit of Aloc, Aloc of Beonoc, Beonoc of Brand, Brand of Bældag, Bældag of Woden, Woden of Friðowulf, Friðowulf of Finn, Finn of

Godwulf, Godwulf of Geat.—In Greek, Ἴδα ἦν Ἐοππείδης, Ἔοππα Ἡσείδης, Ἔσα Ἰγγείδης, Ἴγγα Ἀγγενφιτείδης, &c. In the plural number these forms denote the *race of;* as *Scyldingas = the Scyldings,* or the race of *Scyld,* &c. Edgar Atheling means Edgar of the race of the nobles. The primary of *-ing* and *-l-ing* is descent or relationship; from these comes the idea of youth and endearment, and thence the true diminutive idea. In *darling, stripling, duckling, gosling* (pr. *gesling*), *kitling* (pr. *kitten*), *nestling, yearling, chickling, fatling, fledgling, firstling,* the idea of descent still remains. In *hireling* the idea of diminution is accompanied with the idea of contempt. In *changeling* we have a Gothic termination and a classical root. See, for the full exposition of this view, *Deutsche Grammatik,* ii. 349—364, iii. 682.

CHAPTER VI.

GENTILE FORMS.

§ 339. THESE have been illustrated by Mr. Guest in the Transactions of the Philological Society.

The only word in the present English that requires explanation is the name of the principality *Wales*.

1. The form is plural, however much the meaning may be singular; so that the *-s* in *Wale-s* is the *-s* in *fathers*, &c.

2. It has grown out of the Anglo-Saxon from *wealhas* = *foreigners*, the name by which the Welsh are spoken of by the Germans of England, just as the Italians are called Welsh by the Germans of Germany: *wal-nuts* = *foreign nuts*.

3. The transfer of the name of the *people* inhabiting a certain country to the *country* so inhabited, was one of the commonest processes in both Anglo-Saxon and Old English.—GUEST, *Phil. Trans.*

CHAPTER VII.

ON GENDER.

§ 340. The nature of gender is best exhibited by reference to those languages wherein the distinction of gender is most conspicuous. Such a language, amongst others, is the Latin.

How far is there such a thing as gender in the English language? This depends upon the meaning that we attach to the word.

In the Latin language, where there are confessedly genders, we have the words *taurus*, meaning a *bull*, and *vacca*, meaning a *cow*. Here the natural distinction of sex is expressed by *wholly* different words. With this we have corresponding modes of expression in English: *e. g.*—

Male.	*Female.*	*Male.*	*Female.*
Bachelor	Spinster.	Horse	Mare.
Boar	Sow.	Ram	Ewe.
Boy	Girl.	Son	Daughter.
Brother	Sister.	Uncle	Aunt.
Buck	Doe.	Father	Mother, &c.

The mode, however, of expressing different sexes by *wholly* different words is not a matter of gender. The words *boy* and *girl* bear no *etymological* relation to each other; neither being derived from the other, nor in way connected with it.

Neither are words like *cock-sparrow*, *man-servant*, *he-goat*, &c., as compared with *hen-sparrow*, *maid-servant*, *she-goat*, &c., specimens of gender. Here a difference of sex is indicated by the addition of a fresh term, from which is formed a compound word.

In the Latin words *genitrix* = *a mother*, and *genitor* = *a father*, we have a nearer approach to gender. Here the difference of sex is expressed by a difference of termination;

the words *genitor* and *genitrix* being in a true etymological relation, *i. e.* either derived from each other, or from some common source. With this we have, in English, corresponding modes of expression: *e. g.*—

Male.	*Female.*	*Male.*	*Female.*
Actor	Actress.	Lion	Lioness.
Arbiter	Arbitress.	Peer	Peeress.
Baron	Baroness.	Poet	Poetess.
Benefactor	Benefactress.	Sorcerer	Sorceress.
Count	Countess.	Songster	Songstress.
Duke	Duchess.	Tiger	Tigress.

This, however, in strict grammatical language, is an approach to gender rather than gender itself. Its difference from true grammatical gender is as follows:—

Let the Latin words *genitor* and *genitrix* be declined:—

Sing.	*Nom.*	Genitor	Genitrix.
	Gen.	Genitor-*is*	Genitric-*is*.
	Dat.	Genitor-*i*	Genitric-*i*.
	Acc.	Genitor-*em*	Genitric-*em*.
	Voc.	Genitor	Genitrix.
Plur.	*Nom.*	Genitor-*es*	Genitric-*es*.
	Gen.	Genitor-*um*	Genitric-*um*.
	Dat.	Genitor-*ibus*	Genitric-*ibus*.
	Acc.	Genitor-*es*	Genitric-*es*.
	Voc.	Genitor-*es*	Genitric-*es*.

The syllables in italics are the signs of the cases and numbers. Now these signs are the same in each word, the difference of meaning (or sex) not affecting them.

Contrast, however, with the words *genitor* and *genitrix* the words *domina* = *a mistress*, and *dominus* = *a master*.

Sing.	*Nom.*	Domin-*a*	Domin-*us*.
	Gen.	Domin-*æ*	Domin-*i*.
	Dat.	Domin-*æ*	Domin-*o*.
	Acc.	Domin-*am*	Domin-*um*.
	Voc.	Domin-*a*	Domin-*e*.
Plur.	*Nom.*	Domin-*æ*	Domin-*i*.
	Gen.	Domin-*arum*	Domin-*orum*.
	Dat.	Domin-*abus*	Domin-*is*.
	Acc.	Domin-*as*	Domin-*os*.
	Voc.	Domin-*æ*	Domin-*i*

Here the letters in italics, or the signs of the cases and numbers, are different, the difference being brought about by the difference of gender. Now it is very evident that, if *genitrix* be a specimen of gender, *domina* is something more.

As terms, to be useful, must be limited, it may be laid down as a sort of definition, that *there is no gender where there is no affection of the declension:* consequently, that, although we have, in English, words corresponding to *genitrix* and *genitor*, we have no true genders until we find words corresponding to *dominus* and *domina*.

Again, let us add to some substantive some such word as *good, bad, brave,* &c., &c.; in other words, some adjective; and say *a good father, a good mother, a brave boy, a brave girl, a fierce lion, a fierce lioness, a good actor, a good actress.* Having done this, we remark that the words *good, bad, brave,* &c., &c., whether joined to words like *actor* and *lion* (the names of male objects), or to words like *actress* or *lioness* (the names of female objects), are precisely the same. We use the words *good* and *bold* in speaking of males, and we use the same words in speaking of females. Now, although this is the case in English, it is not the case with all languages. In many languages the word *bold,* or *good,* would take one form when it was used to denote males, and another to denote females. In the Latin language *vir* means *man* (the name of a male object), *mulier* means *woman* (the name of a female object), and *bon* means *good.* Now, if the Latin language were like the English, they would say *bon vir* = *good man; bon mulier* = *good woman.* But, as the Latin is unlike the English, they do not say so. The Latin phrase is *bon-us vir* = *good man, bon-a mulier* = *good woman;* that is, the letter *-a* is added if the substantive be the name of a female, and the letters *-us* are added if it be the name of a male. Again, if the English language were the same in this respect as the Latin, we should say, *good-us man* = *good man* (*bonus vir*), *good-a woman* (*bona mulier*).

§ 341. The second element in the notion of gender, although I will not venture to call it an essential one, is the following:— In the words *domina* and *dominus, mistress* and *master,* there is a *natural* distinction of sex; the one being masculine, or male, the other feminine, or female. In the words *sword* and *lance* there is *no natural* distinction of sex. Notwithstanding this,

the word *hasta*, in Latin, is as much a feminine gender as *domina*, whilst *gladius* = *a sword*, is, like *dominus*, a masculine noun. From this we see that, in languages wherein there are true genders, a fictitious or conventional sex is attributed even to inanimate objects. Sex is a natural distinction, gender a grammatical one.

§ 342. "Although we have, in English, words corresponding to *genitrix* and *genitor*, we have no true genders until we find *words corresponding to dominus and domina*."—The sentence was intentionally worded with caution. Words like *dominus* and *domina*, that is, words where the declension is affected by the sex, *are* to be found.

The pronoun *him*, from the Anglo-Saxon and English *he*, as compared with the pronoun *her*, from the Anglo-Saxon *heò*, is affected in its declension by the difference of sex, and is a true, though fragmentary, specimen of gender: for be it observed, that as both words are in the same case and number, the difference in form must be referred to a difference of sex expressed by gender. The same is the case with the form *his* as compared with *her*.

The pronoun *it* (originally *hit*), as compared with *he*, is a specimen of gender. It is the *neuter* gender of which *t* is the sign—*He, hi-t, i-t.*

The relative *what*, as compared with the masculine *who*, is a specimen of gender. It is the neuter gender of which *t* is the sign—*Who, wha-t.*

Who and *what*, *it* (for *hit*) and *he*, are as much genders as *hic* and *hæc*, and the forms *hic* and *hæc* are as much genders as *dominus* and *domina*.

The formation of the neuter gender by the addition of *-t*, in words like *wha-t*, and *i-t*, *tha-t*, occurs in other Indo-European languages. The *-t* in *tha-t* is the *-d* in *istu-d*, Latin, and the *-t* in *ta-t*, Sanskrit.

Which, as seen below, is *not* the neuter of *who*.

§ 343. Just as there are, in English, fragments of a gender modifying the declension, so are there, also, fragments of the second element of gender; viz. the attribution of sex to objects naturally destitute of it. *The sun in* his *glory, the moon in* her *wane*, are examples of this. A sailor calls his ship *she*. A

husbandman, according to Mr. Cobbett, does the same with his *plough* and working implements :—"In speaking of a *ship* we say *she* and *her*. And you know that our country-folks in Hampshire call almost everything *he* or *she*. It is curious to observe that country labourers give the feminine appellation to those things only which are more closely identified with themselves, and by the qualities or conditions of which their own efforts, and their character as workmen, are affected. The mower calls his *scythe* a *she*, the ploughman calls his *plough* a *she* : but a prong, or a shovel, or a harrow, which passes promiscuously from hand to hand, and which is appropriated to no particular labourer, is called a *he*."—*English Grammar*, Letter V.

Now, although Mr. Cobbett's statements may account for a sailor calling his ship *she*, they will not account for the custom of giving to the sun a masculine, and to the moon a feminine, pronoun, as is done in the expressions quoted at the head of this section ; still less will it account for the circumstance of the Germans reversing the gender, and making the *sun* feminine, and the *moon* masculine.

The explanation here is different.

Let there be a period in the history of a nation wherein the sun and moon are dealt with, not as inanimate masses of matter, but as animated divinities. Let there, in other words, be a period in the history of a nation wherein dead things are personified, and wherein there is a mythology. Let an object like the *sun* be deemed a male, and an object like the *moon* a female, deity.

The Germans say the *sun in* her *glory ;* the *moon in* his *wane*. This difference between the usage of the two languages, like so many others, is explained by the influence of the classical languages upon the English.—"*Mundilfori had two children ; a son, Mâni* (*Moon*), *and a daughter, Sôl* (*Sun*)."—Such is an extract taken out of an Icelandic mythological work, viz. the prose Edda. In the classical languages, however, *Phœbus* and *Sol* are masculine, and *Luna* and *Diana* feminine. Hence it is that, although in Anglo-Saxon and Old Saxon the *sun* is *feminine*, it is in English masculine.

Philosophy, charity, &c., or the names of abstract qualities

personified, take a conventional sex, and are feminine from their being feminine in Latin.

As in these words there is no change of form, the consideration of them is a point of rhetoric, rather than of etymology.

§ 344. The remainder of this chapter is devoted to miscellaneous remarks upon the true and apparent genders of the English language.

With the false genders, like *baron, baroness,* it is a general rule that the feminine form is derived from the masculine, and not the masculine from the feminine; as *peer, peeress.* The words *widower, gander,* and *drake* are exceptions. For the word *wizard,* from *witch,* see the section on augmentative forms.

The termination *-ess,* in which so large a portion of our feminine substantives terminate, is not of Saxon but of classical origin, being derived from the termination *-ix, genitrix.*

The words *shepherdess, huntress,* and *hostess* are faulty; the radical part of the word being German, and the secondary part classical: indeed, in strict English grammar, the termination *-ess* has no place at all. It is a classical, not a German, element.

The termination *-inn,* so current in German, as the equivalent to *-ess,* and as a feminine affix (*freund*=*a friend*; *freundinn*=*a female friend*), is found only in a very few words in English. One of these is *vixen,* a true feminine derivative from *fox*—German *füchsinn.*

Words like *margravine* and *landgravine* prove nothing, being scarcely naturalised.

The termination *-str,* as in *webster, songster,* and *baxter,* was originally a feminine affix. Thus, in Anglo-Saxon,—

Sangere, *a male singer*	were opposed to	Sangëstre, *a female singer.*
Bäcere, *a male baker*		Bacestre, *a female baker.*
Fiðelere, *a male fiddler*		Fiðelstre, *a female fiddler.*
Vebbere, *a male weaver*		Vëbbëstre, *a female weaver.*
Rædere, *a male reader*		Rædestre, *a female reader.*
Seamere, *a male seamer*		Seamestre, *a female seamer.*

The same is the case in the present Dutch of Holland: *e. g.*

spookster=*a female fortune-teller; bakster*=*a baking-woman waschster*=*a washerwoman.* (GRIMM, *Deutsche Grammatik*, iii. p. 339.) The word *spinster* still retains its original feminine force.

The words *songstress* and *seamstress*, besides being, as far as concerns the intermixture of languages, in the predicament of *shepherdess*, have, moreover, a double feminine termination; 1st. *-str*, of Germanic, 2nd. *-ess*, of classical, origin.

In the word *heroine* we have a Greek termination, just as *-ix* is a Latin, and *-inn* a German, one. It must not, however, be considered as derived from *hero*, by any process of the English language, but be dealt with as a separate importation from the Greek language.

The form *deaconess* is not wholly unexceptionable; since the termination *-ess* is of Latin, the root *deacon* of Greek, origin: this Greek origin being rendered all the more conspicuous by the spelling, *deacon* (from *diaconos*), as compared with the Latin *decanus*.

The circumstance of *prince* ending in the sound of *s*, works a change in the accent of the word. As *s* is the final letter, it is necessary, in forming the plural number, and the genitive case, to add, not the simple letter *s*, as in *peers*, *priests*, &c., but the syllable *-es*. This makes the plural number and genitive case the same as the feminine form. Hence the feminine form is accented *princéss*, while *peéress*, *príestess*, &c., carry the accent on the first syllable. *Princéss* is remarkable as being the only word in English where the accent lies on the subordinate syllable.

Goose, *gander*.—One peculiarity in this pair of words has already been indicated. In the older forms of the word *goose*, such as χὴν, Greek; *anser*, Latin; *gans*, German, as well as in the derived form *gander*, we have the proofs that, originally, there belonged to the word the sound of the letter *n*. In the forms ὀδοὺς, ὀδόντος, Greek; *dens*, *dentis*, Latin; *zahn*, German; *tooth*, English, we find the analogy that accounts for the ejection of the *n*, and the lengthening of the vowel preceding. With respect, however, to the *d* in *gander*, it is not easy to say whether it is inserted in one word or omitted in the other. Neither can we give the precise power of the *-er*. The follow-

ing forms (taken from Grimm, iii. p. 341) occur in the different Gothic dialects. *Gans*, fem.; *ganazzo*, masc., Old High-German—*gôs*, f.; *gandra*, m., Anglo-Saxon—*gâs*, Icelandic, f.; *gaas*, Danish, f.; *gassi*, Icelandic, m.; *gasse*, Danish, m.—*ganser*, *ganserer*, *gansart*, *gänserich*, *gander*, masculine forms in different New German dialects.

Observe, the form *gänserich* has a masculine termination. The word *täuberich*, in provincial New German, has the same form and the same power. It denotes a *male dove*; *taube*, in German, signifying a *dove*. In *gänserich* and *täuberich*, we find preserved the termination *-rich* (or *-rik*), with a masculine power. Of this termination we have a remnant, in English, preserved in the curious word *drake*. To *duck* the word *drake* has no etymological relation whatsoever. It is derived from a word with which it has but one letter in common; viz. the Latin *anas*=*a duck*. Of this the root is *anat-*, as seen in the genitive case *anatis*. In Old High-German we find the form *anetrëkho*=*a drake*; in provincial New High-German there is *enterich* and *äntrecht*, from whence come the English and Low-German form *drake*.—Grimm, *Deutsche Grammatik*, iii. p. 341.

Peacock, *peahen*, *bridegroom*.—In these compounds, it is not the words *pea* and *bride* that are rendered masculine or feminine by the addition of *cock*, *hen*, and *groom*, but it is the words *cock*, *hen*, and *groom* that are modified by prefixing *pea* and *bride*. For an appreciation of this distinction, see the chapter on Composition.

CHAPTER VIII.

THE NUMBERS.

§ 345. In the Greek language the word *patær* signifies a *father*, speaking of *one*, whilst *patere* signifies *two fathers*, speaking of a pair, and thirdly, *pateres* signifies *fathers*, speaking of any number beyond two. The three words, *patær*, *patere*, and *pateres*, are said to be in different numbers, the difference of meaning being expressed by a difference of form. These numbers have names. The number that speaks of *one* is the *singular*, the number that speaks of *two* is the *dual* (from the Latin word *duo* = *two*), and the number that speaks of *more than two* is the *plural*.

All languages have numbers, but all languages have not them to the same extent. The Hebrew has a dual, but it is restricted to nouns only (in Greek being extended to verbs). It has, moreover, this peculiarity; it applies, for the most part, only to things which are naturally double, as *the two eyes*, *the two hands*, &c. The Latin has no dual number at all, except the natural dual in the words *ambo* and *duo*.

The question presents itself,—to what extent have we numbers in English? Like the Greek, Hebrew, and Latin, we have a singular and a plural. Like the Latin, and unlike the Greek and Hebrew, we have no dual.

Different from the question, to what degree have we numbers? is the question,—over what extent of our language have we numbers? This distinction has already been foreshadowed or indicated. The Greeks, who said *typtó* = *I beat*, *typteton* = *ye two beat*, *typtomen* = *we beat*, had a dual number for their verbs as well as their nouns; while the Hebrew dual was limited to the nouns only. In the Greek, then, the dual num-

ber is spread over a greater extent of the language than in the Hebrew.

There is no dual in the present English. It has been seen, however, that in the Anglo-Saxon there *was* a dual. But the Anglo-Saxon dual, being restricted to the personal pronouns (*wit* = *we two*; *git* = *ye two*), was not co-extensive with the Greek dual.

There is no dual in the present German. In the ancient German there was one.

In the present Danish and Swedish there is no dual. In the Old Norse and in the present Icelandic a dual number is to be found.

From this we learn that the dual number is one of those inflections that languages drop as they become modern.

The numbers, then, in the present English are two, the singular and the plural. Over what extent of language have we a plural? The Latins say, *bonus pater* = *a good father*; *boni patres* = *good fathers*. In the Latin, the adjective *bonus* changes its form with the change of number of the substantive that it accompanies. In English it is only the substantive that is changed. Hence we see that in the Latin language the numbers were extended to adjectives, whereas in English they are confined to the substantives and pronouns. Compared with the Anglo-Saxon, the present English is in the same relation as it is with the Latin. In the Anglo-Saxon there were plural forms for the adjectives.

For the forms *selves* and *others*, see the Syntax.

Words like *wheat*, *pitch*, *gold*, &c., where the idea is naturally singular; words like *bellows*, *scissors*, *lungs*, &c., where the idea is naturally plural; and words like *deer*, *sheep*, where the same form serves for the singular and plural, inasmuch as there takes place no change of form, are not under the province of etymology.

§ 346. The current rule is, that the plural number is formed from the singular by adding *s*, as *father*, *fathers*. However, if the reader will revert to the remarks upon the sharp and flat Mutes, where it is stated that mutes of different degrees of sharpness and flatness cannot come together in the same syllable, he will find occasion to take to the current rule a verbal

exception. The letter added to the word *father*, making it *fathers*, is *s* to the eye only. To the ear it is *z*. The word sounds *fatherz*. If the *s* retained its sound, the spelling would be *fatherce*. In *stags, lads*, &c., the sound is *stagz, ladz*. The rule, then, for the formation of the English plurals, rigorously expressed, is as follows :—*The plural is formed from the singular, by adding to words ending in a vowel a liquid or flat mute, the flat lene sibilant* (*z*) ; *and to words ending in a sharp mute, the sharp lene sibilant* (*s*) : *e. g.* (the *sound* of the word being expressed), *pea, peaz ; tree, treez ; day, dayz ; hill, hillz ; hen, henz ; gig, gigz ; trap, traps ; pit, pits ; stack, stacks.* Upon the formation of the English plural some further remarks are necessary.

1. In the case of words ending in *b, v, d,* the *th* in *thine* = ð, or *g,* a change either of the final flat consonant, or of the sharp *s* affixed, is not a matter of choice, but of necessity ; the combinations *abs, avs, ads, aðs, ags,* being unpronounceable.

2. Whether the first of the two mutes should be accommodated to the second (*aps, afs, ats, aþs, asks*), or the second to the first (*abz, avz, aðz, agz*), is determined by the habit of the particular language in question ; and, with a few apparent exceptions (mark the word *apparent*), it is the rule of the English language to accommodate the second sound to the first, and not *vice versâ.*

3. Such combinations as *peas, trees, hills, hens,* &c. (the *s* preserving its original power, and being sounded as if written *peace, treece, hillce, hence*), being pronounceable, the change from *s* to *z,* in words so ending, is *not* a matter determined by the necessity of the case, but by the habit of the English language.

4. Although the vast majority of our plurals ends, not in *s,* but in *z,* the original addition was not *z,* but *s.* This we infer from three facts : 1. From the spelling ; 2. from the fact of the sound of *z* being either rare or non-existent in Anglo-Saxon ; 3. from the sufficiency of the causes to bring about the change.

§ 347. It may now be seen that some slight variations in the form of our plurals are either mere points of orthography, or

else capable of being explained on very simple euphonic principles.

Boxes, churches, judges, lashes, kisses, blazes, princes.—Here there is the addition, not of the mere letter *s*, but of the syllable *-es*. As *s* cannot be immediately added to *s*, the intervention of a vowel becomes necessary; and that all the words whose plural is formed in *-es* really end either in the sound of *s*, or in the allied sounds of *z*, *sh*, or *zh*, may be seen by analysis; since *x* = *ks*, *ch* = *tsh*, and *j* or *ge* = *dzh*, whilst *ce*, in *prince*, is a mere point of orthography for *s*.

Monarchs, heresiarchs.—Here the *ch* equals not *tsh*, but *k*, so that there is no need of being told that the words do not follow the analogy of *church*, &c.

Cargoes, echoes.—From *cargo* and *echo*, with the addition of *e*, an orthographical expedient for the sake of denoting the length of the vowel *o*.

Beauty, beauties; key, keys.—Like the word *cargoes*, &c., these forms are points, not of etymology, but of orthography.

Plural of certain words in f.—The following words end in the sharp mute *f*—*loaf, half, wife, life, calf, leaf*. Now, according to § 346, their plurals should be formed by the addition of the sound of *s* in *seal*, and so be *loafs, halfs, wifes, lifes, calfs, leafs* (pronounced *loafce, halfce, wifce, lifce, calfce, leafce*). This, however, is not the case. Their plurals are formed by the addition of the sound of *z* in *zeal*, and are *loaves, halves, wives, lives, calves, leaves* (pronounced *loavz, halvz, wivz, livz, calvz, leavz*); the sound of the *f* being changed into that of *v*. Respecting these words we must observe—

1. That the vowel before *f* is *long*. Words like *muff*, where the vowel is short, form their plurals by means of the sound of the *s* in *seal*; as *muff, muff-s* (pronounced *muffce*).

2. That they are all of Anglo-Saxon origin. In the words *mischief, chief, handkerchief, grief, relief*, the plural is formed as in *muff*, that is, by the addition of the sound of *s*—*mischiefs, chiefs*, &c.

Putting these two facts together, we can use more general language, and say that—

When a word ends in the sound of *f*, preceded by a long

vowel, and is of Anglo-Saxon origin, the plural is formed by the addition of the sound of the *z* in *zeal*.

To this rule there are two exceptions.

1. *Dwarf;* a word of Anglo-Saxon origin, but which forms its plural by means of the sound of *s*—*dwarfs* (pronounced *dwarfce*).

2. *Beef;* a word *not* of Anglo-Saxon origin, but which forms its plural by means of the sound of *z*—*beeves* (pronounced *beevz*).

If we ask the reason of this peculiarity in the formation of the plurals of these words in *-f*, we shall find reason to believe that it lies with the singular rather than the plural forms. In Anglo-Saxon, *f* at the end of a word was sounded as *v*; and it is highly probable that the original *singulars* were sounded *loav, halv, wive, calv, leav.*

Can this be explained? Perhaps it can. In the Swedish language the letter *f* has the sound of *v*; so that *staf* is sounded *stav.*

Again, in the allied languages the words in question end in the *flat* (not the *sharp*) mute,—*weib, laub, calb, halb, stab,* &c. = *wife, leaf, calf, half, staff.*

Hence, the *plural is* probably normal; it being the *singular* form on which the irregularity lies.

Pence.—The peculiarity of this word consists in having a *flat* liquid followed by the sharp sibilant *s* (spelt *ce*), contrary to the rule given above. In the first place, it is a contracted form from *pennies;* in the second place, its sense is collective rather than plural; in the third place, the use of the sharp sibilant lene distinguishes it from *pens*, sounded *penz.* That its sense is collective rather than plural (a distinction to which the reader's attention is directed), we learn from the word *sixpence,* which, compared with *sixpences,* is no plural, but a singular form.

Dice.—In respect to its form, peculiar for the reason that *pence* is peculiar. We find the sound of *s* after a vowel, where that of *z* is expected. This distinguishes *dice* for play, from *dies* (*diez*) for coining. *Dice,* perhaps, like *pence,* is collective rather than plural.

In *geese, lice,* and *mice,* we have, apparently, the same phe-

nomenon as in *dice*, viz. a sharp sibilant (*s*) where a *flat* one (*z*) is expected. The *s*, however, in these words is not the sign of the plural, but the last letter of the original word.

1. *Alms*.—Some say, *these alms* are *useful;* in which case the word *alms* is plural. Others say, *this alms* is *useful;* in which case the word *alms* is singular. Now in the word *alms* the -*s* is no sign of the plural number, but part of the original singular, like the *s* in *goose* or *loss*. The Anglo-Saxon form was *ælmesse*. Notwithstanding this, we cannot say *alms-es* in the same way that we *can* say *loss-es*. Hence the word *alms* is, in respect to its original form, singular; in respect to its meaning, either singular or plural.

2. *Riches*.—Most writers say, *riches* are *useful;* in which case the word *riches* is plural. Still there are a few who say, *riches* is *useful;* in which case the word *riches* is singular. Now in the word *riches* the -*s* is no sign of the plural number, since there is no such *substantive* as *rich;* on the contrary, it is part of the original singular, like the *s* in *distress*. The form in the original French, from which language it was derived, was *richesse*. Notwithstanding this, we cannot say *richess-es* in the same way that we *can* say *distress-es*. Hence the word *riches* is, in respect to its original form, singular; in respect to its meaning, either singular or plural, most frequently the latter.

3. *News*.—Some say, *this news* is *good;* in which case the word *news* is singular. More rarely we find the expression *these news* are *good;* in which case the word *news* is plural. Now in the word *news* the -*s* (unlike the *s* in *alms* and *riches*) is no part of the original singular, but the sign of the plural, like the *s* in *trees*. Notwithstanding this, we cannot subtract the *s*, and say *new*, in the same way that we *can* form *tree* from *trees*. Hence the word *news* is, in respect to its original form, plural; in respect to its meaning, either singular or plural, most frequently the former.

4. *Means*.—Some say, *these means* are *useful;* in which case the word *means* is plural. Others say, *this means* is *useful;* in which case the word *means* is singular. Now in the word *means* the -*s* (unlike the *s* in *alms* and *riches*, but like the *s* in *news*) is no part of the original singular, but the sign of the

plural, like the *s* in *trees*. The form in the original French, from which language the word is derived, is *moyen*, singular; *moyens*, plural. If we subtract from the word *means* the letter *s*, we say *mean*. Now as a singular form of the word *means*, with the sense it has in the phrase *ways and means*, there is, in the current English, no such word as *mean*, any more than there is such a word as *new* from *news*. But, in a different sense, there *is* the singular form *mean*; as in the phrase *the golden mean*, meaning *middle course*. Hence the word *means* is, in respect to its form, plural; in respect to its meaning, either singular or plural.

5. *Pains*.—Some say, *these pains* are *well-taken*; in which case the word *pains* is plural. Others say, *this pains* is *well-taken*; in which case the word *pains* is singular. The form in the original French, from which language the word is derived, is *peine*. The reasoning that has been applied to the word *means* is closely applicable to the word *pains*.

6. The same also applies to the word *amends*. The form in French is *amende*, without the *s*.

7, 8, &c. *Mathematics, metaphysics, politics, ethics, optics, physics*.—The following is an exhibition of my hypothesis respecting these words, to which I invite the reader's criticism. All the words in point are of Greek origin, and all are derived from a Greek adjective. Each is the name of some department of study, of some art, or of some science. As the words are Greek, so also are the sciences which they denote either of Greek origin, or else such as flourished in Greece. Let the arts and sciences of Greece be expressed, in Greek, rather by a substantive and an adjective combined, than by a simple substantive; for instance, let it be the habit of the language to say *the musical art*, rather than *music*. Let the Greek for *art* be a word in the feminine gender; *e. g.* τέχνη (*tekhnæ*), so that the *musical art* be ἡ μουσίκη τέχνη (*hæ mousikæ tekhnæ*). Let, in the progress of language (as was actually the case in Greece), the article and substantive be omitted, so that, for the *musical art*, or for *music*, there stand only the feminine adjective, μουσίκη. Let there be, upon a given art or science, a series of books, or treatises; the Greek for *book*, or *treatise*, being a neuter substantive, βίβλιον (*biblion*). Let the sub-

stantive meaning *treatise* be, in the course of language, omitted, so that whilst the science of physics is called φυσίκη (*fysikæ*), *physic*, from ἡ φυσίκη τέχνη, a series of treatises (or even chapters) upon the science shall be called φύσικα (*fysika*) or *physics*. Now all this was what happened in Greece. The science was denoted by a feminine adjective singular, as φυσίκη (*fysicæ*), and the treatises upon it, by the neuter adjective plural, as φύσικα (*fysicā*). The treatises of Aristotle are generally so named. To apply this, I conceive that, in the middle ages, a science of Greek origin might have its name drawn from two sources, viz. from the name of the art or science, or from the name of the books wherein it was treated. In the first case it had a singular form, as *physic*, *logic*; in the second place a plural form, as *mathematics*, *metaphysics*, *optics*.

In what number these words, having a collective sense, require their verbs to be, is a point of syntax.

§ 348. The plural form *children* (*child-er-en*) requires particular notice.

In the first place it is a double plural: the *-en* being the *-en* in *oxen*, whilst the simpler form *child-er* occurs in the Old English, and in certain provincial dialects.

Now, what is the *-er* in *child-er?*

In Icelandic, no plural termination is commoner than that in *-r*; as *geisl-ar* = *flashes*, *tung-ur* = *tongues*, &c. Nevertheless, it is not the Icelandic that explains the plural form in question.

Besides the word *childer*, we collect from the other Gothic tongue the following forms in *-r*:—

Hus-er,	*Houses.*	Old High-German.
Chalp-ir,	*Calves.*	ditto.
Lemp-ir,	*Lambs.*	ditto.
Plet-ir,	*Blades of grass.*	ditto.
Eig-ir,	*Eggs.*	ditto.

and others, the peculiarity of which is the fact of their all being *of the neuter gender*. The particular Gothic dialect wherein they occur most frequently is the Dutch of Holland.

Now, the theory respecting this form, as propounded by Grimm (D. G. iii. p. 270), is as follows:—

1. The *-r* represents an earlier *-s*.

2. Which was, originally, no sign of a plural number, but merely a neuter derivative affix, common to the singular as well as to the plural number.

3. In this form it appears in the Mœso-Gothic: *ag-is* = *fear* (whence *ague* = *shivering*), *hat-is* = *hate*, *rigv-is* = *smoke* (*reek*). In none of these words is the *-s* radical, and in none is it limited to the singular number.

It should be added, that the reason why a singular derivational affix should become the sign of the plural number, lies, most probably, in the *collective* nature of the words in which it occurs:—*Husir* = *a collection of houses*, *eigir* = *a collection of eggs*, *eggery* or *eyry*. For further observations on the power of *-r*, and for reasons for believing it to be the same as in the words *Jew-r-y*, *yeoman-r-y*, see a paper of Mr. Guest's, *Philol. Trans.*, May 26, 1843. There we find the remarkable form *lamb-r-en*, from Wicliffe, Joh. xxi. *Lamb-r-en* : *lamb* : : *child-r-en* : *child*.

§ 349. *The form in -en.*—In the Anglo-Saxon no termination of the plural number is more common than *-n*: *tungan*, tongues; *steorran*, stars.

In the present English the word *oxen* is the only specimen of this form in current use. In the old and middle English stages of our language the number of words in *-en* was much greater than at present.

hos-*en*	=	hose or stockings
shoo-*n*	=	shoe-*s*
ey-*ne*	=	eye-*s*
bischop-*en*	=	bishop-*s*
eldr-*en*	=	elder-*s*
arw-*en*	=	arrow-*s*
scher-*en*	=	shire-*s*
doghtr-*en*	=	daughter-*s*
sustr-*en*	=	sister-*s*
uncl-*en*	=	uncle-*s*
tre-*en*	=	tree-*s*
souldr-*en*	=	soldier-*s*.

Men, feet, teeth, mice, lice, geese.—In these we have some of the oldest words in the language. If these were, to a cer-

tainty, true plurals, we should have an appearance somewhat corresponding to the weak and strong tenses of verbs; viz. one series of plurals formed by a change of the vowel, and another by the addition of the sibilant. The word *kye*, used in Scotland for *cows*, is of the same class. The list in Anglo-Saxon of words of this kind is different from that of the present English.

Sing.	*Plur.*	
Freónd . .	Frýnd . .	*Friends.*
Feónd . .	Fynd . .	*Foes.*
Niht . .	Niht . .	*Nights.*
Bóc . .	Béc . .	*Books.*
Burh . .	Byrig . .	*Burghs.*
Bróc . .	Bréc . .	*Breeches.*
Turf . .	Týrf . .	*Turves.*

Brethren.—Here there are two changes. 1. The alteration of the vowel. 2. The addition of *-en*. Mr. Guest quotes the forms *brethre* and *brothre* from the Old English. The sense is collective rather than plural.

Peasen = pulse.—As *children* is a double form of one sort (*r* + *en*), so is *peasen* a double form of another (*s* + *en*); *pea, pea-s, pea-s-en.* Wallis speaks to the *singular* power of the form in *-s*:—"Dicunt nonnulli *a pease*, pluraliter *peasen*; at melius, singulariter *a pea*, pluraliter *pease*."—P. 77. He might have added, that, theoretically, *pease* was the proper singular form; as shown by the Latin *pis-um.*

Pullen = poultry.

Lussurioso—What? three-and-twenty years in law?

Vendice.—I have known those who have been five-and-fifty, and all about *pullen* and pigs.—*Revenger's Tragedy*, iv. 1.

If this were a plural form, it would be a very anomalous one. The *-en*, however, is no more a sign of the plural than is the *-es* in *rich-es* (*richesse*). The proper form is in *-ain* or *-eyn.*

A false theefe,
That came like a false fox, my *pullain* to kill and mischeefe.
Gammer Gurton's Needle, v. ii.

Chickens.—A third variety of the double inflection (*en* + *s*), with the additional peculiarity of the form *chicken* being used,

at present, almost exclusively in the singular number, although, originally, it was, probably, the plural of *chick*. So Wallis considered it:—"At olim etiam per *-en* vel *-yn* formabant pluralia; quorum pauca admodum adhuc retinemus. Ut, *an ox, a chick,* pluraliter *oxen, chicken* (sunt qui dicunt in singulari *chicken,* et in plurali *chickens*)."—P. 77. *Chick, chick-en, chick-en-s.*

Fern.—According to Wallis the *-n* in *fer-n* is the *-en* in *oxen,* in other words, a plural termination:—"A *fere* (*filix*) pluraliter *fern* (verum nunc plerumque *fern* utroque numero dicitur, sed et in plurali *ferns*); nam *fere* et *feres* prope obsoleta sunt."—P. 77. Subject to this view, the word *fer-n-s* would exhibit the same phenomenon as the word *chicke-n-s*. It is doubtful, however, whether Wallis's view be correct. A reason for believing the *-n* to be radical is presented by the Anglo-Saxon form *fearn,* and the Old High-German, *varam.*

Women.—Pronounced *wimmen,* as opposed to the singular form *woomman.*

Houses.—Pronounced *houz-ez*. The same peculiarity in the case of *s* and *z,* as occurs between *f* and *v* in words like *life, lives,* &c.

Paths, youths.—Pronounced *padhz, yoodhz*. The same peculiarity in the case of þ and ð, as occurs between *s* and *z* in the words *house, houses*. "Finita in *f* plerumque alleviantur in plurali numero, substituendo *v*; ut *wife, wives,* &c. Eademque alleviatio est etiam in *s* et *th,* quamvis retento charactere, in *house, cloth, path.*"—P. 79.

CHAPTER IX.

ON THE CASES.

§ 350. The extent to which there are, in the English language, cases, depends on the meaning which we attach to the word *case*. In the sentence *a house of a father*, the idea expressed by the words *of a father*, is an idea of a relation between them and the word *house*. This idea is an idea of property or possession. The relation between the words *father* and *house* may be called the possessive relation. This relation, or connection, between the two words is expressed by the preposition *of*.

In *a father's house* the idea is, there or thereabouts, the same; the relation or connection between the two words being the same. The expression, however, differs. In *a father's house* the relation, or connection, is expressed, not by a preposition, but by a change of form, *father* becoming *father's*.

He gave the house to a father.—Here the words *father* and *house* stand in another sort of relationship; the relationship being expressed by the preposition *to*. The idea *to a father* differs from the idea *of a father*, in being expressed in one way only; viz. by the preposition. There is no second mode of expressing it by a change of form, as was done with *father's*.

The father taught the child.—Here there is neither preposition nor change of form. The connection between the words *father* and *child* is expressed by the arrangement only.

Now if the relation alone between two words constitutes a case, the words or sentences, *child; to a father; of a father;* and *father's*, are all equally cases; of which one may be called

the accusative, another the dative, a third the genitive, and so on.

Perhaps, however, the relationship alone does not constitute a case. Perhaps there is a necessity of either the addition of a preposition (as in *of a father*), or of a change in form (as in *father's*). In this case (although *child* be not so) *father's, of a father,* and *to a father,* are all equally cases.

Now it is a remark, at least as old as Dr. Beattie, that if the use of a preposition constitute a case, there must be as many cases in a language as there are prepositions, and that "*above a man, beneath a man, beyond a man, round about a man, within a man, without a man,* shall be cases, as well as *of a man, to a man,* and *with a man.*"—MURRAY'S *Grammar*, vol. i. p. 79.

For etymological purposes it is necessary to limit the meaning of the word case; and, as a sort of definition, it may be laid down that *where there is no change of form there is no case.* With this remark, the English language may be compared with the Latin.

		Latin.	*English.*
Sing.	*Nom.*	*Pater* . . .	*a father.*
	Gen.	*Patris* . . .	*a father's.*
	Dat.	*Patri* . . .	*to a father.*
	Acc.	*Patrem* . . .	*a father.*
	Abl.	*Patre* . . .	*from a father.*

Here, since in the Latin language there are five changes of form, whilst in English there are but *two,* there are (as far, at least, as the word *pater* and *father* are concerned) three more cases in Latin than in English. It does not, however, follow that because in *father* we have but two cases, there may not be other words wherein there are more than two.

In order to constitute a case there must be a change of form.—This statement is a matter of definition. A second question, however, arises out of it: viz. whether *every change of form constitute a case?* In the Greek language there are the words ἔριν (*erin*), and ἔριδα (*erida*). Unlike the words *father* and *father's,* these two words have precisely the same meaning. Each is called an accusative; and each, consequently, is said to be in the same case with the other. This indicates the

statement, that in order to constitute a case there must be not *only a change of form, but also a change of meaning*. Whether such a limitation of the word be convenient, is a question for the general grammarian. At present we merely state that there *is no change of case unless there be a change of form*. Hence, in respect to the word *patribus* (and others like it), which is sometimes translated *from fathers*, and at other times *to fathers*, we must say, not that in the one case the word is ablative and in the other dative, but that a certain case is used with a certain latitude of meaning. This remark bears on the word *her* in English. In *her book* the sense is that of the case currently called genitive. In *it moved her*, the sense is that of the case currently called the accusative. If we adhere, however, to what we have laid down, we must take exceptions to this mode of speaking. It is not that out of the single form *her* we can get two cases, but that a certain form has two powers; one that of the Latin genitive, and another that of the Latin accusative.

This leads to an interesting question, viz. what notions are sufficiently allied to be expressed *by* the same form, and *in* the same case? The word *her*, in its two senses, may, perhaps, be dealt with as a single case, because the notions conveyed by the genitive and accusative are, perhaps, sufficiently allied to be expressed by the same word. Are the notions, however, *of a mistress*, and *mistresses*, so allied? I think not; and yet in the Latin language the same form, *dominæ*, expresses both. Of *dominæ* = *of a mistress*, and of *dominæ* = *mistresses*, we cannot say that there is one and the same case with a latitude of meaning. The words were, perhaps, once different. And this leads to the distinction between *a real and an accidental identity of form*.

In the language of the Anglo-Saxons the genitive cases of the words *smith* (*smiƀ*), *end* (*ende*), and *day* (*dæg*), were, respectively, *smithes* (*smiƀes*), *endes*, and *dayes* (*dæges*); whilst the nominative plurals were, respectively, *smithas* (*smiƀas*), *endas*, and *dayas* (*dægas*). A process of change took place, by which the vowel of the last syllable in each word was ejected. The result was, that the forms of the genitive singular and the nominative plural, originally different, became one and the same; so that the identity of the two cases is an accident.

This fact relieves the English grammarian from a difficulty. The nominative plural and the genitive singular are, in the present language of England, identical; the apostrophe in *father's* being a mere matter of orthography. However, there was *once* a difference. This modifies the previous statement, which may now stand thus:—*for a change of case there must be a change of form existing or presumed.*

§ 351. *The number of our cases and the extent of language over which they spread.*—In the English language there is undoubtedly a *nominative* case. This occurs in substantives, adjectives, and pronouns (*father, good, he*) equally. It is found in both numbers.

Accusative.—Some call this the objective case. The words *him* (singular) and *them* (plural) (whatever they may have been originally) are now true accusatives. The accusative case is found in pronouns only. *Thee, me, us,* and *you* are, to a certain extent, true accusatives.

They are accusative thus far: 1. They are not derived from any other case. 2. They are distinguished from the forms *I, my,* &c. 3. Their meaning is accusative. Nevertheless, they are only imperfect accusatives. They have no sign of case, and are distinguished by negative characters only.

One word of English is probably a true accusative in the strict sense of the term, viz. the word *twain* = *two*. The *-n* in *twai-n* is the *-n* in *hine* = *him* and *hwome* = *whom*. This we see from the following inflection:—

	Neut.	*Masc.*	*Fem.*
N. and Ac.	Twá,	Twégen,	Twá.
Abl. and Dat.		Twám,	Twæ'm.
Gen.		Twegra,	Twega.

Although nominative as well as accusative, I have little doubt as to the original character of *twégen* being accusative. The *-n* is by no means radical; besides which, it *is* the sign of an accusative case, and is *not* the sign of a nominative.

The words *him* and *them* are true accusatives in even a less degree than *thee, me, us,* and *you*. The Anglo-Saxon equivalents to the Latin words *eos* and *illos* were *hi* (or *hig*) and *þá*

(or *þæge*); in other words, the sign of the accusative was other than the sound of *-m*. The case which *really* ended in *-m* was the so-called dative; so that the Anglo-Saxon forms *him* (or *heom*) and *þám* = the Latin *iis* and *illis*.

This fact explains the meaning of the words, *whatever they may have been originally*, in a preceding sentence. It also indicates a fresh element in the criticism and nomenclature of the grammarian; viz. the extent to which the *history* of a form regulates its position as an inflection.

Dative.—In the antiquated word *whilom* (*at times*), we have a remnant of the old dative in *-m*. The *sense* of the word is adverbial; its form, however, is that of a dative case.

Genitive.—Some call this the possessive case. It is found in substantives and pronouns (*father's, his*), but not in adjectives. It is formed like the nominative plural, by the addition of the lene sibilant (*father, fathers; buck, bucks*); or, if the word end in *s*, by that of *es* (*boxes, judges*, &c.). It is found in both numbers: *the men's hearts; the children's bread.* In the plural number, however, it is rare; so rare, indeed, that wherever the plural ends in *s* (as it almost always does), there is no genitive. If it were not so, we should have such words as *fatherses, foxeses, princesseses*, &c.

Instrumental.—The following extracts from Rask's "Anglo-Saxon Grammar," teach us that there exist in the present English two powers of the word spelt *t-h-e*, or of the so-called definite article.

"The demonstrative pronouns are *þæt, se, seó* (*id, is, ea*), which are also used for the article; and *þis, þes, þeós* (*hoc, hic, hæc*). They are thus declined:—

		Neut.	*Masc.*	*Fem.*	*Neut.*	*Masc.*	*Fem.*
Sing.	*N.*	þæt	se	seó	þis	þes	þeós.
	A.	þæt	þone	þá	þis	þisne	þás.
	Abl.		þý	þæ′re		þise	þisse.
	D.		þám	þæ′re		þisum	þisse.
	G.		þæs	þæ′re		þises	þisse.
Plur.	*N. and A.*			þá			þás.
	Abl. and D.			þám			þisum.
	G.			þára			þissa.

"The indeclinable *þe* is often used instead of *þæt, se, seo,* in all cases, but especially with a relative signification, and, in later times, as an article. Hence the English article *the.*

"*þy* seems justly to be received as a proper *ablativus instrumenti,* as it occurs often in this character, even in the masculine gender; as, *mid þy áþe = with that oath* (Inæ Reges, 53). And in the same place in the dative, *on þæ'm áþe = in that oath.*"—Pp. 56, 57.

Hence the *the* that has originated out of the Anglo-Saxon *þy* is one word; the *the* that has originated out of the Anglo-Saxon *þe,* another. The latter is the common article: the former the *the* in expressions like *all the more, all the better = more by all that, better by all that,* and the Latin phrases *eo majus, eo melius.*

That *why* is in the same case with the instrumental *the* (= *þy*) may be seen from the following Anglo-Saxon inflection of the interrogative pronoun :—

	Neut.	*Masc.*
N.	Hwæt	Hwá.
A.	Hwæt	Hwone (hwæne).

Abl.	*Hwi.*
D.	Hwám (hwæ'm).
G.	Hwæs.

Hence, then, in *the* and *why* we have instrumental ablatives, or, simply, *instrumentals.*

§ 352. *The determination of cases.*—How do we determine cases? In other words, why do we call *him* and *them* accusatives rather than datives or genitives? By one of two means; viz. either by the sense or the form.

Suppose that in the English language there were ten thousand dative cases and as many accusatives. Suppose, also, that all the dative cases ended in *-m,* and all the accusatives in some other letter. It is very evident that, whatever might be the meaning of the words *him* and *them,* their form would be dative. In this case the meaning being accusative, and the form dative, we should doubt which test to take.

My own opinion is, that it would be convenient to determine cases by the *form* of the word *alone;* so that, even if a

word had a dative sense only once, where it had an accusative sense ten thousand times, such a word should be said to be in the dative case. Now, as stated above, the words *him* and *them* (to which we may add *whom*) were once dative cases; *-m* in Anglo-Saxon being the sign of the dative case. In the time of the Anglo-Saxons their sense coincided with their form. At present they are dative forms with an accusative meaning. Still, as the word *give* takes after it a dative case, we have, even now, in the sentence, *give it him, give it them,* remnants of the old dative sense. To say *give it to him, to them,* is unnecessary and pedantic: neither do I object to the expression, *whom shall I give it?* If ever the formal test become generally recognised and consistently adhered to, *him, them,* and *whom* will be called datives with a latitude of meaning; and then the approximate accusatives in the English language will be the forms *you, thee, us, me,* and the only true accusative will be the word *twain.*

My, an accusative form (*meh, me, mec*), has now a genitive sense. The same may be said of *thy.*

Me, originally an accusative form (both *me* and *my* can grow out of *mec* and *meh*), had, even with the Anglo-Saxons, a dative sense. *Give it me* is correct English. The same may be said of *thee.*

Him, a dative form, has now an accusative sense.

Her.—For this word, as well as for further details on *me* and *my,* see the chapters on the Personal and Demonstrative Pronouns.

When all traces of the original dative signification are effaced, and when all the dative cases in a language are similarly affected, an accusative case may be said to have originated out of a dative.

§ 353. Thus far the question has been concerning the immediate origin of cases: their remote origin is a different matter.

The word *um* occurs in Icelandic. In Danish and Swedish it is *om;* in the Germanic languages *omme, umbi, umpi, ymbe,* and also *um.* Its meaning is *at, on, about.* The word *whilom* is the substantive *while* = *a time* or *pause* (Dan. *hvile* = *to rest*), with the addition of the preposition *om.* That the par-

ticular dative form in *om* has arisen out of the noun + the preposition, is a safe assertion. I am not prepared, however, to account for the formation of all the cases in this manner.

§ 354. *Analysis of cases.*—In the word *children's* we are enabled to separate the word into three parts. 1. The root *child.* 2. The plural signs *r* and *en.* 3. The sign of the genitive case, *s.* In this case the word is said to be analysed, since we not only take it to pieces, but also give the respective powers of each of its elements; stating which denotes the case, and which the number. Although it is too much to say that the analysis of every case of every number can be thus effected, it ought always to be attempted.

§ 355. *The true nature of the genitive form in s.*—It is a common notion that the genitive form *father's* is contracted from *father his.* The expression in our liturgy, *for Jesus Christ his sake,* which is merely a pleonastic one, is the only foundation for this assertion. As the idea, however, is not only one of the commonest, but also one of the greatest errors in etymology, the following three statements are given for the sake of contradiction to it.

1. The expression the *Queen's Majesty* is not capable of being reduced to the *Queen his Majesty.*

2. In the form *his* itself, the *s* has precisely the power that it has in *father's,* &c. Now *his* cannot be said to arise out of *he + his.*

3. Even if the words *father his* would account for the English word *father's,* it would not account for the Sanskrit genitive *pad-as,* of a foot; the Zend *dughdhar-s,* of a daughter; the Lithuanic *dugter-s;* the Greek ὀδόντ-ος; the Latin *dent-is,* &c.

CHAPTER X.

ON CERTAIN FORMS IN -ER.

§ 356. We now pass from the Cases and Numbers of Substantives to the Degrees of Comparison of Adjectives.

Preparatory, however, to the consideration of this part of Etymology, we must attend to certain phenomena connected with the forms in -ER—as wheth-*er*, oth-*er*, &c.

Let these serve as a text.

I. *First*, it may be stated of them that the idea which they express is not that *of one out of many*, but that of *one out of two*.

II. *Secondly*, it may be stated of them, that the termination -*er* is the same termination that we find in the comparative degree.

As the Sanskrit form *kataras* corresponds with the comparative degree, where there is the comparison of *two things with each other*, so the word *katamas* is a superlative form, and in the superlative degree lies the comparison of *many* things with each other.

Hence *other* and *whether* (to which may be added *either* and *neither*) are pronouns with the comparative form.

Let us now go to some other words. In the list come—

1. Certain pronouns, as *ei-th-er*, *n-ei-th-er*, *whe-th-er*, *o-th-er*.

2. Certain prepositions and adverbs, as *ov-er*, *und-er*, *af-t-er*.

3. Adjectives of the comparative degree; as *wis-er*, *strong-er*, *bett-er*, &c.

4. Certain adjectives, with the form of the comparative, but the power of the positive degree; as *upp-er*, *und-er*, *inn-er*, *out-er*, *hind-er*.

Now what is the idea common to all these words, which is expressed by the sign *-er*, and which connects the four divisions into one class? It is not the mere idea of comparison. Bopp, who has best generalised the view of these forms, considers the fundamental idea to be that of *duality*. In the comparative degree we have a relation between one object and *some* other object like it, or a relation between two single elements of comparison: *A is wiser than B*. In the superlative degree we have a relation between one object and *all* others like it, or a relation between one single and one complex element of comparison: *A is wiser than B, C, D*, &c.

The more important of the specific modifications of the general idea involved in the comparison of two objects are,—

1. Contrariety; as in *inner, outer, under, upper, over*. In Latin the words for *right* and *left* end in *-er*,—*dexter, sinister*.

2. Choice in the way of an alternative; as *either, neither, whether, other*.

An extension of the reasoning probably explains forms like the Greek *ἀμφό-τερ-ος*, and the *plural* possessive forms *νωΐ-τερ-ος, ἡμέ-τερ-ος*, &c., which, like our own forms in *-r*, (*ou-r, you-r*) correspond in termination with the comparative degree (*σοφώ-τερ-ος, wiser*). Words, also, like *hither* and *thither* are instances of what is probably the effect of a similar association of ideas.

A confirmation of Bopp's view is afforded by the Laplandic languages. Herein the distinction between *one of two* and *one of more than two* is expressed by affixes; and these affixes are the signs of the comparative and superlative: *gi*=*who*; *gua-bba* =*who of two*; *gutte-mush*=*who of many*.

1. *Gi*=*who*, so that *guabba* may be called its comparative form.

2. *Gutte* also=*who*, so that *guttemush* may be called its superlative.

3. Precisely as the words *guabba* and *guttemush* are formed, so also are the regular degrees of adjectives.

a. Nuorra = *young*; *nuor-ab* = *younger*; *nuora-mush* = *youngest*.

b. Bahha=*bad*; *baha-b*=*worse*; *baha-mush*=*worst*.

The following extracts from Stockfleth's Lappish Grammar, were probably written without any reference to the Sanskrit or Greek. "*Guabba,* of which the form and meaning are comparative, appears to have originated in a combination of the pronoun *gi,* and the comparative affix *-abbo.*"—"*Guttemush,* of which the form and meaning are superlative, is similarly derived from the pronoun *gutte,* and the superlative affix *-mush.*"—*Grammatik i det Lappiske Sprog,* §§ 192, 193.

CHAPTER XI.

THE COMPARATIVE DEGREE.

§ 357. In the present English the Adjectives preserve the same form throughout both numbers, and in all genders. Consequently they are destitute of case; the objective, the nominative, and the possessive senses being expressed alike.—*A* good *man*, *a* good *woman*, *a* good *sword*; *the* good *men*, *the* good *women*, *the* good *swords*; *a* good *man's son*, *a* good *woman's son*, *a* good *sword's edge*.

The only mode in which adjectives change their form is in the case of the *Degrees of Comparison*.

The adjective in its simple form is called the Positive Adjective. From the adjective in its *Positive* form, are formed—1, the *Comparative*; 2, the *Superlative* Degree.

The sign of the Comparative Degree is equivalent in meaning to the word *more*. In the word *bright-er*, the syllable *-er* is the sign of the Comparative Degree. The word *bright-er* is equivalent in meaning to *more bright*.

The sign of the Superlative Degree is equivalent in meaning to the word *most*. In the word *bright-est*, the syllable *-est* is the sign of the Superlative Degree. Also, the word *bright-est* is equivalent in meaning to the words *most bright*.

The comparative degree is formed from the positive by the addition of the syllable *-er*; as *cold, cold-er*; *rich, rich-er*; *dry, dry-er*; *low, low-er*. This is the manner in which the greater part of the English comparatives is formed.

§ 358. *Comparison of Adverbs.—The sun shines bright.*—Herein the word *bright* means *brightly*; and although the use of the latter word would have been the more elegant, the expression is not ungrammatical; the word *bright* being looked upon as an adjectival adverb.

The sun shines to-day brighter than it did yesterday, and to-morrow it will shine brightest.—Here also the sense is adverbial; from whence we get the fact, that adverbs take degrees of comparison.

Now let the root *mag-*, as in *magnus*, *μέγας*, and *mikil* (Norse), give the idea of greatness. In the Latin language we have from it two comparative forms: 1. the adjectival comparative *major* = *greater*; 2. the adverbial comparative *magis* = *more* (*plus*). The same takes place in Mœso-Gothic: *maiza* means *greater*, and is adjectival; *mais* means *more*, and is adverbial. The Anglo-Saxon forms are more instructive still; *e. g. þäs þe mâ* = *all the more*, *þäs þé bet* = *all the better*, have a comparative sense, but not a comparative form, the sign *r* being absent.

§ 359. *Change of vowel.*—By reference to Rask's "Grammar" (§ 128), it may be seen that in the Anglo-Saxon there were, for the comparative and superlative degrees, two forms; viz. *-or* and *-re*, and *-ost* and *-este*, respectively.

The fulness or smallness of a vowel in a given syllable may work a change in the nature of the vowel in a syllable adjoining. In the Anglo-Saxon the following words exhibit a change of vowel:—

Positive.	*Comparative.*	*Superlative.*	
Lang,	Lengre,	Lengest.	*Long.*
Strang,	Strengre,	Strengest.	*Strong.*
Geong,	Gyngre,	Gyngest.	*Young.*
Sceort,	Scyrtre,	Scyrtest.	*Short.*
Heáh,	Hyrre,	Hyhst.	*High.*
Eald,	*Yldre*,	*Yldest.*	*Old.*

Of this change, the word last quoted is a still-existing specimen, as *old*, *elder* and *older*, *eldest* and *oldest*. Between the two forms there is a difference in meaning, *elder* being used as a substantive, and having a plural form, *elders*.

It has been stated above that in Anglo-Saxon there were two forms for the comparative and superlative degrees, one in *-re* and *-este*, the other in *-or* and *-ost*, respectively. Now the first of these was the form taken by adjectives; as *se*

scearpe sweord = *the sharper sword*, and *se scearpeste sweord* = *the sharpest sword*. The second, on the other hand, was the form taken by adverbs; as, *se sweord scyrð scearpor* = *the sword cuts sharper*, and *se sweord scyrð scearpost* = *the sword cuts sharpest*.

The adjectival form has, as seen above, a tendency to make the vowel of the preceding syllable small; *old, elder*.

The adverbial form has a tendency to make the vowel of the preceding syllable full.

Of this effect on the part of the adverbial form the adverbial comparative *rather* is a specimen. We pronounce the *a* as in *father*, or full. Nevertheless, the positive form is small, the *a* being pronounced as the *a* in *fate*.

The word *rather* means *quick, easy* = the classical root ῥαδ- in ῥάδιος. What we do *quickly* and *willingly* we do *preferably*. Now if the word *rather* were an adjective, the vowel of the comparative would be sounded as the *a* in *fate*. As it is, however, it is adverbial, and as such is properly sounded as the *a* in *father*.

The difference between the action of the small vowel in *-re*, and of the full in *-or*, effects this difference.

§ 360. *Excess of expression*.—Of this two samples have already been given: 1. in words like *songstress*; 2. in words like *children*. This may be called *excess of expression*; the feminine gender, in words like *songstress*, and the plural number, in words like *children*, being expressed twice over. In the vulgarism *betterer* for *better*, and in the antiquated forms *worser* for *worse*, and *lesser* for *less*, we have in the case of the comparatives, as elsewhere, an excess of expression. In the Old High-German we have the forms *betsërôro, mêrôro, êrërëra* = *better, more, ere*.

§ 361. *Difference between a sequence in logic and a sequence in etymology*.—The ideas or notions of *thou, thy, thee*, are ideas between which there is a metaphysical or logical connection. The train of such ideas may be said to form a sequence, and such a sequence may be called a logical one.

The forms (or words) *thou, thy, thee*, are forms or words between which there is a formal or an etymological con-

nection. A train of such words may be called a sequence, and such a sequence may be called an etymological one.

In the case of *thou, thy, thee,* the etymological sequence tallies with the logical one.

The ideas of *I, my,* and *me* are also in a logical sequence: but the forms *I, my,* and *me* are not altogether in an etymological one.

In the case of *I, my, me,* the etymological sequence does *not* tally (or tallies imperfectly) with the logical one.

This is only another way of saying that between the words *I* and *me* there is no connection in etymology.

It is also only another way of saying, that, in the oblique cases, *I,* and, in the nominative case, *me,* are defective.

Now the same is the case with *good, better, bad, worse,* &c. *Good* and *bad* are defective in the comparative and superlative degrees; *better* and *worse* are defective in the positive; whilst between *good* and *better, bad* and *worse,* there is a sequence in logic, but no sequence in etymology.

§ 362. It is necessary to know that in the Mœso-Gothic the comparative degree was formed differently from the comparative degree in Anglo-Saxon, English, and the other allied languages. Instead of being formed by the addition of the sound of *-r,* it was formed by the addition of the sound of *-s* or *-z*.

Positive.	*Comparative.*	*English.*
ald,	ald-iza,	old, old-er.
sut,	sut-iza,	sweet, sweet-er.
blind,	blind-oza,	blind, blind-er.

In the latter stages of language this *s* became *r*.

In the word *worse* we may suppose that there is a remnant of the old comparative in *-s* or *-z*. The Mœso-Gothic form is *váirsiza,* the Anglo-Saxon *vyrsa*.

The following forms help to illustrate the history of the difficult word:—

Mœso-Gothic, *vairsiza;* Old High-German, *wirsiro;* Middle High-German, *wirser;* Old Saxon, *wirso;* Anglo-Saxon, *vyrsa;* Old Norse, *vërri;* Danish, *værre;* and Swedish, *värre*. Such

are the adjectival forms. The adverbial forms are—Mœso-Gothic, *vairs*; Old High-German, *virs*; Middle High-German, *wirs*; Anglo-Saxon, *vyrs*; Old Norse, *vërr*; Danish, *værre*; Swedish, *värre*.—GRIMM, *D. G.* iii. 606. Whether the present form in English be originally adjectival or adverbial is indifferent; since, as soon as the final *a* of *vyrsa* was omitted, the two words would be the same. The forms, however, *vairsiza*, *wirser*, *worse*, and *vërri*, make the word one of the most perplexing in the language.

If the form *worse* be taken without respect to the rest, the view of the matter is simply that in the termination *s* we have a remnant of the Mœso-Gothic forms, like *sutiza*, &c., in other words, the old comparative in *s*.

Wirser and *vairsiza* traverse this view. They indicate the likelihood of the *s* being no sign of the degree, but a part of the original word. Otherwise the *r* in *wirser*, and the *z* in *vairsiza*, denote an excess of expression.

The analogies of *songstress*, *children*, and *betsësrôro* show that excess of expression frequently occurs.

The analogy of *mâ* and *bet* show that *worse* may possibly be a positive form.

The word *vërri* indicates the belief that the *s* is no part of the root.

Finally, the euphonic processes of the Scandinavian languages tell us that, even had there been an *s*, it would, in all probability, have been ejected. These difficulties verify the statement that the word *worse* is one of the most perplexing in the language.

Much, *more*.—Here, although the words be unlike each other, there is a true etymological relation. Mœso-Gothic, *mikils*; Old High-German, *mihhil*; Old Saxon, *mikil*; Anglo-Saxon, *mycel*; Old Norse, *mickill*; Scotch, *muckle* and *mickle* (all ending in *l*); Danish, *megen*, m.; *meget*, n.; Swedish, *mycken*, m.; *myckett*, n. (where no *l* is found). Such is the adjectival form of the positive, rarely found in the Modern Gothic languages, being replaced in German by *gross*, in English by *great*, in Danish by *stor*. The adverbial forms are *miök* and *miög*, Norse; *much*, English. It is remarkable

that this last form is not found in Anglo-Saxon, being replaced by *sâre*, Germ. *sehr*.—GRIMM, *D. G.* iii. 608.

The adverbial and the Norse forms indicate that the *l* is no part of the original word. Comparison with other Indo-European languages gives us the same circumstance: Sanskrit, *maha*; Latin, *mag-nus*; Greek, μέγας (*megas*).

There is in Mœso-Gothic the comparative form *máiza*, and there is no objection to presuming a longer form, *magiza*; since in the Greek form μείζων, compared with μέγας, there is a similar disappearance of the *g*. In the Old High-German we find *mêro*, corresponding with *máiza*, Mœso-Gothic, and with *more*, English.

Mickle (replaced by *great*) expresses size; *much*, quantity; *many*, number. The words *more* and *most* apply equally to number and quantity. I am not prepared either to assert or to deny that *many*, in Anglo-Saxon *mænig*, is from the same root with *much*. Of the word *má* notice has already been taken. Its later form, *moe*, occurs as late as Queen Elizabeth, with an adjectival as well as an adverbial sense.

Little, less.—Like *much* and *more*, these words are in an etymological relation to each other. Mœso-Gothic, *leitils*; Old High-German, *luzil*; Old Saxon, *luttil*; Anglo-Saxon, *lytel*; Middle High-German, *lützel*; Old Norse, *lîtill*. In these forms we have the letter *l*. Old High-German Provincial, *luzíc*; Old Frisian, *litich*; Middle Dutch, *luttik*; Swedish, *liten*; Danish, *liden*. — *Deutsche Grammatik*, iii. 611. From these we find that the *l* is either no part of the original word, or one that is easily got rid of. In Swedish and Danish there are the forms *lille* and *liden*; whilst in the neuter form, *lidt*, the *d* is unpronounced. Even the word *liden* the Danes have a tendency to pronounce *leen*. My own notion is that these changes leave it possible for *less* to be derived from the root of *little*. According to Grimm, the Anglo-Saxon *lässa* is the Gothic *lasivóza*, the comparative of *lasivs* = *weak*.—*Deutsche Grammatik*, iii. 611. In Anglo-Saxon there was the adjectival form *læssa*, and the adverbial form *læs*. In either case we have the form *s*.

Near, nearer.—Anglo-Saxon, *neah*; comparative, *nearre*,

near, nyr; superlative, *nyhst, nehst.* Observe, in the Anglo-Saxon positive and superlative, the absence of the *r.* This shows that the English positive *near* is the Anglo-Saxon comparative *nearre,* and that in the secondary comparative *nearer,* we have an excess of expression. It may be, however, that the *r* in *near* is a mere point of orthography, and that it is not pronounced. The fact that in the English language the words *father* and *farther* are, for the most part, pronounced alike, is the key to the forms *near* and *nearer.*

Farther.—Anglo-Saxon, *feor, fyrre, fyrrest.* The *th* seems euphonic, inserted by the same process that gives the δ in ἄνδρος.

Further.—Confounded with *farther,* although in reality from a different word, *fore.* Old High-German, *furdir;* New High-German, *der vordere;* Anglo-Saxon, *fyrðre.*

Former.—A comparative formed from the superlative; *forma* being such. Consequently, an instance of excess of expression, combined with irregularity.

CHAPTER XII.

THE SUPERLATIVE DEGREE.

§ 363. The comparative degree is formed from the positive by the addition of the syllable *-er;* as *dark, dark-er; cold, cold-er; rich, rich-er; dry, dry-er; low, low-er.*

The superlative degree is formed from the positive by the addition of the syllable *-est;* as *dark, dark-est; cold, cold-est; rich, rich-est; dry, dry-est; low, low-est.*

But the superlative may also be formed from the comparative by changing the *r* of the comparative into *s*, and adding *t;* as *dark-er, dark-es, dark-es-t; cold-er, cold-es, cold-es-t; rich-er, rich-es, rich-es-t; dry-er, dry-es, dry-es-t; low-er, low-es, low-es-t.*

To understand the reason why this complex and apparently unnecessary process has been noticed, we must remember what has been said concerning the Mœso-Gothic language, and the extent to which it preserves the *older* forms of the Gothic inflections.

The Mœso-Gothic Comparative was not formed in r, but in s. —*Ald-iza, bat-iza, sut-iza,* were the original forms of what became in Old High-German *alt-iro, bets-iro, suats-iro,* and in English, *old-er, bett-er, sweet-er.*

This is one fact. Another is, that *whilst many languages have a Comparative without a Superlative degree, few or none have a Superlative without a Comparative.* Hence, in the case of a Superlative in *-st*, two views may be taken. According to the one it is the Positive with the addition of *st;* according to the other, it is the old Comparative in *-s* with the addition only of *t.* Now, Grimm, and others, lay down as a rule, that the Superlative is formed, not *directly* from the *Positive*, but *indirectly* through the *Comparative.*

With the exception of *worse* and *less*, all the English Comparatives end in *r*; yet no Superlative ends in *rt*, the form being, not *wise, wiser, wisert*, but *wise, wiser, wisest*. This fact, without invalidating the notion just laid down, gives additional importance to the Comparative forms in *s*; since it is from these, before they have changed to *r*, that we must suppose the Superlatives to have been derived. This theory being admitted, we can, by approximation, determine the comparative antiquity of the Superlative degree. It was introduced into the languages allied to the English, *after* the establishment of the Comparative and before the change of *s* into *r*.

Of the other English superlatives, the only ones that demand a detailed examination, are those that are generally despatched without difficulty; viz. the words in *most;* such as *midmost, foremost*, &c. The current view is, that they are compound words, formed from simple ones, by the addition of the superlative term *most*. Grimm's view is opposed to this. In appreciating Grimm's view, we must bear in mind the phenomena of *excess of expression;* at the same time we must not depart from the current theory without duly considering a fact stated by Rask; which is, that we have in Icelandic the forms *nærmeir, fjærmeir*, &c. *nearer*, and *farther*, most unequivocally compounded of *near* and *more*, and of *far* and *more*.

The A. S. gives us the following forms:—

Anglo-Saxon.	*English.*
innema (inn-ema)	inmost
ûtema (ût-ema)	outmost
siðema (sið-ema)	latest
lætema (læt-ema)	latest
niðema (nið-ema)	nethermost
forma (for-ma)	foremost
æftema (æft-ema)	aftermost
ufema (uf-ema)	utmost
hindema (hind-ema)	hindmost
midema (mid-ema)	midmost.

Besides these, there are in the other allied languages, words like *fruma* = *first, aftuma* = *last, miduma* = *middle*.

Now the words in question show at once, that, as far as

they are concerned, the *m* that appears in the last syllable of each has nothing to do with the word *most*.

Hence, from the words in question there was formed, in Anglo-Saxon, a regular superlative form in the usual manner; viz. by the addition of *st*; as *æfte-m-est*, *fyr-m-est*, *læte-m-est*, *siδ-m-est*, *yfe-m-est*, *ute-m-est*.

And, hence, in the present English, the different parts of the syllable *most* (in words like *upmost*), come from different quarters. The *m* is the *m* in the Anglo-Saxon words *innema*, &c.; whilst the *-st* is the common sign of the superlative. In separating such words as *midmost* into its component parts, we should write—

mid-m-ost	*not*	mid-most
ut-m-ost	—	ut-most
up-m-ost	—	up-most
fore-m-ost	—	fore-most
in-m-ost	—	in-most
hind-m-ost	—	hind-most
out-m-ost	—	out-most.

In certain words the syllable *m-ost* is added to a word already ending in *er*; that is, to a word already marked with the sign of the comparative degree.

neth-er-m-ost	hind-er-m-ost
utt-er-m-ost	out-er-m-ost
upp-er-m-ost	inn-er-m-ost.

Having accounted for the *m* in the words just mentioned, we can account for the *m* in the word *former*. *Former* (*for-m-er*) is a comparative from the Anglo-Saxon superlative *forma* (*for-m-a*).

The words *inmost*, *outmost*, *upmost*, *midmost*, *foremost*, *hindmost*, *utmost*, are *doubly* superlative.

The words *nethermost*, *uppermost*, *uttermost*, *undermost*, *outermost*, and *innermost*, are *trebly* superlative.

CHAPTER XIII.

THE PERSONAL PRONOUNS.

§ 364. *I—we, us, me—thou—ye.*—These constitute the true personal pronouns. From *he, she,* and *it,* they differ in being destitute of gender.

These latter words are demonstrative rather than personal, so that there are in English true personal pronouns for the first two persons only.

In most other languages the current pronouns of the third person are, as in English, demonstrative rather than personal.

The usual declension of the personal pronouns is exceptionable. *I* and *me, thou* and *ye,* stand in no etymological relations to each other. The true view of the words is, that they are not irregular but defective. *I* has no *oblique,* and *me* no nominative case. And so with respect to the rest.

My.—My, as stated above, is a form originally accusative, but now used in a genitive sense.

Me.—In Anglo-Saxon this was called a dative form. The fact seems to be that both *my* and *me* grow out of an accusative form, *meh, mec.*

That the sound of *k* originally belonged to the pronouns *me* and *thee,* we learn not only from the Anglo-Saxon *mec, þec, meh, þeh,* but from the Icelandic *mik, þik,* and the German *mich, dich.* This accounts for the form *my;* since *y* = *ey,* and the sounds of *y* and *g* are allied. That both *me* and *my* can be evolved from *mik,* we see in the present Scandinavian languages, where, very often even in the same district, *mig* is pronounced both *mey* and *mee.*

We and *our.*—These words are not in the condition of *I* and *me.* Although the fact be obscured, they are really in an etymological relation to each other. This we infer from the alli-

ance between the sounds of *w* and *ou*, and from the Danish forms *vi* (*we*), *vor* (*our*). It may be doubted, however, whether *our* be a true genitive rather than an adjectival form. In the form *ours* we find it playing the part, not of a case, but of an independent word. Upon this, however, too much stress cannot be laid. In Danish it takes a neuter form: *vor* = *noster*; *vort* = *nostrum*. From this I conceive that it agrees, not with the Latin genitive *nostrúm*, but with the adjective *noster*.

We, *our*, and *us*.—Even *us* is in an etymological relation to *we*. That *we* and *our* are so, has just been shown. Now in Anglo-Saxon there were two forms of *our*, viz. *úre* (= *nostrúm*), and *user* (= *noster*). This connects *we* and *us* through *our*.

From these preliminary notices we have the changes in form of the true personal pronouns, as follows:—

1ST PERSON.

1*st Term.* (*for nominative singular*).

I. Undeclined.

2*nd Term.* (*for the singular number*).

Acc. *Me.* Gen. *My.* Form in *n*—*Mine.*

3*rd Term.* (*for the plural number*).

Nom. *We.* Acc. *Us.* Forms in *r* and *-r-s*—*Our, ours.*

2ND PERSON.

1*st Term.* (*for the singular number*).

Nom. *Thou.* Acc. *Thee.* Gen. *Thy.* Form in *n*—*Thine.*

2*nd Term.* (*for the plural number*).

Nom. *Ye* and *you.* Acc. *You* and *ye.* Forms in *r* and *-r-s*—*Your, yours.*

We and *me* have been dealt with as distinct words. But it is only for practical purposes that they can be considered to be thus separate; since the sound of *m* and *w* are allied.

You.—As far as the practice of the present mode of speech is concerned, the word *you* is a *nominative* form; since we say *you move, you are moving, you were speaking.*

Why should it not be treated as such? There is no absolute reason why it should not. All that can be said is, that the historical reason and the logical reason are at variance. The Anglo-Saxon form for *you* was *eow*, for *ye, ge*. Neither bear any sign of case at all, so that, form for form, they are

equally and indifferently nominative and accusative, as the habit of language may make them. Hence it, perhaps, is more logical to say that a certain form (*you*) is used *either* as a nominative or accusative, than to say that the accusative case is used instead of a nominative. It is clear that *you* can be used instead of *ye* only so far as it is nominative in power.

Ye.—As far as the evidence of such expressions as *get on with ye* is concerned, the word *ye* is an accusative form.

Me.—Carrying out the views just laid down, and admitting *you* to be a nominative, or *quasi*-nominative case, we may extend the reasoning to the word *me*, and call it also a secondary nominative; inasmuch as such phrases as *it is me* = *it is I* are common.

Now to call such expressions incorrect English is to assume the point. No one says that *c'est moi* is bad French, and that *c'est je* is good. The fact is, that the whole question is a question of degree. Has or has not the custom been sufficiently prevalent to have transferred the forms *me*, *ye*, and *you* from one case to another?

At the same time it must be observed that the expression *it is me* = *it is I* will not justify the use of *it is him*, *it is her* = *it is he* and *it is she*. *Me*, *ye*, *you*, are what may be called *indifferent* forms, *i. e.* nominative as much as accusative, and accusative as much as nominative. *Him* and *her*, on the other hand, are not indifferent. The *-m* and *-r* are respectively the signs of cases other than the nominative.

Again: the reasons which allow the form *you* to be considered as a nominative plural, on the strength of its being used for *ye*, will not allow it to be considered a nominative singular on the strength of its being used for *thou*. It is submitted to the reader, that in phrases like *you are speaking*, &c., even when applied to a single individual, the idea is really plural; in other words, that the courtesy consists in treating *one* person as *more than one*, and addressing him as such, rather than in using a plural form in a singular sense. It is certain that, grammatically considered, *you* = *thou* is a plural, since the verb with which it agrees is plural. Thus we say, *you are speaking*; not *you art speaking*.

CHAPTER XIV.

ON THE TRUE REFLECTIVE PRONOUN IN THE GOTHIC LANGUAGES, AND ON ITS ABSENCE IN ENGLISH.

§ 365. A TRUE reflective pronoun is wanting in English. In other words, there are no equivalents to the Latin pronominal forms, *se, sibi.*

Nor yet are there any equivalents in English to the so-called adjectival forms *suus, sua, suum:* since *his* and *her* are the equivalents to *ejus* and *illius*, and are not adjectives but genitive cases.

At the first view, this last sentence seems unnecessary. It might seem superfluous to state, that, if there were no such primitive form as *se* (or its equivalent), there could be no such secondary form as *suus* (or its equivalent).

Such, however, is not the case. *Suus* might exist in the language, and yet *se* be absent; in other words, the derivative form might have continued whilst the original one had become extinct.

Such is really the case with the *Old* Frisian. The reflective personal form, the equivalent to *se*, is lost, whilst the reflective possessive form, the equivalent to *suus*, is found. In the *Modern* Frisian, however, both forms are lost.

The history of the reflective pronoun in the Gothic tongues is as follows:—

In Mæso-Gothic.—Found in two cases, *sis, sik* = *sibi, se.*

In Old Norse.—Ditto. *Ser, sik* = *sibi, se.*

In Old High-German.—The dative form lost; there being no such word as *sir* = *sis* = *sibi.*

In Old Frisian.—As stated above, there is here no equivalent to *se*; whilst there *is* the adjectival form *sin* = *suus.*

In Old Saxon.—The equivalent to *se* and *sibi* very rare.

The equivalent to *suus* not common, but commoner than in Anglo-Saxon.

In Anglo-Saxon.—No instance of the equivalent to *se* at all. The forms *sinne* = *suum*, and *sinum* = *suo*, occur in Beowulf. In Cædmon cases of *sin* = *suus*, are more frequent. Still the usual form is *his* = *ejus*.

In the Dutch, Danish, and Swedish, the true reflectives, both personal and possessive, occur; so that the modern Frisian and English stand alone in respect to the entire absence of them.—*Deutsche Grammatik*, iv. 321—348.

The statement concerning the absence of the true reflective in English, although negative, has an important philological bearing on more points than one.

1. It renders the use of the word *self* much more necessary than it would be otherwise.

2. It renders us unable to draw a distinction between the meanings of the Latin words *suus* and *ejus*.

3. It precludes the possibility of the evolution of a middle voice like that of the Old Norse, where *kalla-sc* = *kalla-sik*.

CHAPTER XV.

THE DEMONSTRATIVE PRONOUNS, &c.

§ 366. The demonstrative pronouns are, 1. *He, it.* 2. *She.* 3. *This, that.* 4. *The.*

He, she, and *it,* generally looked on as personal, are here treated as demonstrative pronouns, for the following reasons.

1. The personal pronouns form an extremely natural class, if the pronouns of the two first persons be taken by themselves. This is not the case if they be taken along with *he, it,* and *she.* The absence of gender, the peculiarity in their declension, and their defectiveness, are marked characters wherein they agree with each other, but not with any other words.

2. The idea expressed by *he, it,* and *she* is naturally that of demonstrativeness. In the Latin language *is, ea, id; ille, illa, illud; hic, hæc, hoc,* are demonstrative pronouns in sense, as well as in declension.

3. The plural forms *they, them,* in the present English, are the plural forms of the root of *that,* a true demonstrative pronoun; so that even if *he, she,* and *it* could be treated as personal pronouns, it could only be in the singular number.

4. The word *she* has grown out of the Anglo-Saxon *seó.* Now *seó* was in Anglo-Saxon the feminine form of the definite article; the definite article being a demonstrative pronoun.

Compared with the Anglo-Saxon the present English stands as follows:—

She.—The Anglo-Saxon form *heó,* being lost to the language, is replaced by the feminine article *seó.*

Her.—This is a case, not of the present *she,* but of the Anglo-Saxon *heó:* so that *she* may be said to be defective in the oblique cases and *her* to be defective in the nominative.

Him.—A true dative form, which has replaced the Anglo-Saxon *hine*. When used as a dative, it was neuter as well as masculine.

His.—Originally neuter as well as masculine. Now, as a neuter, replaced by *its*—"et quidem ipsa vox *his*, ut et interrogativum *whose*, nihil aliud sunt quam *hee's*, *who's*, ubi *s* omnino idem præstat quod in aliis possessivis. Similiter autem *his* pro *hee's* eodem errore quo nonnunquam *bin* pro *been*; item *whose* pro *who's* eodem errore quo *done*, *gone*, *knowne*, *growne*, &c., pro *doen*, *goen*, *knowen*, vel *do'n*, *go'n*, *know'n*, *grow'n*; utrobique contra analogiam linguæ; sed usu defenditur."—WALLIS, c. v.

It.—Changed from the Anglo-Saxon *hit*, by the ejection of *h*. The *t* is no part of the original word, but a sign of the neuter gender, forming it regularly from *he*. The same neuter sign is preserved in the Latin *id* and *illud*.

Its.—In the course of time the nature of the neuter sign *t*, in *it*, the form being found in but a few words, became misunderstood. Instead of being looked on as an affix, it passed for part of the original word. Hence was formed from *it* the anomalous genitive *its*, superseding the Saxon *his*. The same was the case with—

Hers.—The *r* is no part of the original word, but the sign of the dative case. These formations are of value in the history of cases.

They, their, them.—As *hit* changed into *it*; as *heó* became replaced by *she*, and as the vowel form *the*, as an article, came to serve for all the cases of all the genders, two circumstances took place: 1. The forms *þám* and *þára* as definite articles became superfluous; and, 2. The connection between the plural forms *hí*, *heom*, *heora*, and the singular forms *he* and *it*, grew indistinct. These were conditions favourable to the use of the forms *they*, *them*, and *their*, instead of *hí*, *heom*, *heora*.

Theirs.—In the same predicament with *hers* and *its*.

Than or *then*, and *there.*—Although now adverbs, they were once demonstrative pronouns, in a certain case and in a certain gender—*than* and *then* masculine accusative and singular, *there* feminine dative and singular.

An exhibition of the Anglo-Saxon declension is the best explanation of the English. Be it observed, that the cases marked in italics are found in the present language.

I.

Se, *seó.*

Of this word the Anglo-Saxon has two forms only, both of the singular number, and both in the nominative case; viz. masc. *se;* fem. *seó* (the). The neuter gender and the other cases of the article were taken from the pronoun *þæt.*

II.

þæt (that, the), and *þis* (this).

		Neut.	*Masc.*	*Fem.*	*Neut.*	*Masc.*	*Fem.*
Sing.	Nom.	*þæt*	—	—	*þis*	es	*þeós.*
	Acc.	*þæt*	*þone*	*þâ*	*þis*	*þisne*	*þás.*
	Abl.	*þy*	*þy*	*þære.*	*þise*	*þise*	*þisse.*
	Dat.	*þám*	*þám*	*þære.*	*þisum*	*þisum*	*þisse.*
	Gen.	*þæs*	*þæs*	*þære.*	*þises*	*þises*	*þisse.*
Plur.	Nom. Acc.	*þá.*			*þás.*		
	Abl. Dat.	*þám.*			*þisum.*		
	Gen.	*þára.*			*þissa.*		

III.

Hit (it), *he* (he), *heó* (she).

Sing.	Nom.	*hit*	*he*	heó.
	Acc.	*hit*	hine	hí.
	Dat.	*him*	*him*	*hire.*
	Gen.	*his*	*his*	*hire.*
Plur.	Nom. Acc.		hi.	
	Dat.		him (heom).	
	Gen.		hira (heora).	

IV.

þe (the)—Undeclined, and used for all cases and genders.

These.—Here observe—

1st. That the *s* is no inflection, but a radical part of the word, like the *s* in *geese.*

2nd. That the Anglo-Saxon form is *þâs.*

These facts create difficulties in respect to the word *these*. Mr. Guest's view is, perhaps, the best; viz. that the plural element of the word is the letter *e*, and that this *-e* is the old English and Anglo-Saxon adjective plural; so that *thes-e* is formed from *thes*, as *gode* (= *boni*) is formed from *god* (= *bonus*).

The nominative plural in the Old English ended in *e*; as,—

Singular.			*Plural.*		
M.	*F.*	*N.*	*M.*	*F.*	*N.*
God,	*god,*	*god.*	*gode.*		

In Old English MSS. this plural in *-e* is general. It occurs not only in adjectives and pronouns as a regular inflection, but even as a plural of the genitive *his*, that word being treated as a nominative singular; so that *hise* is formed from *his*, as *sui* from *suus*, or as *eji* might have been formed from *ejus*; provided that in the Latin language this last word had been mistaken for a nominative singular. The following examples are Mr. Guest's.

1. In these lay a gret multitude of *syke* men, *blinde*, crokid, and *drye*.
—WICLIFFE, Jon. v.

2. In all the orders foure is non that can
So much of dalliance and faire language,
He hadde ymade ful many a marriage—
His tippet was ay farsed ful of knives,
And pinnes for to given *faire* wives.
CHAUCER, *Prol.*

3. And *al* the cuntre of Judee wente out to him, and *alle* men of Jerusalem.—WICLIFFE, Mark i.

4. He ghyueth lif to *alle* men, and brething, and *alle* thingis; and made of von *al* kynde of men to inhabit on *al* the face of the erthe.
—WICLIFFE, *Dedis of Apostlis*, xvii.

5. That fadres sone which *alle* thinges wrought;
And *all*, that wrought is with a skilful thought,
The Gost that from the fader gan procede,
Hath souled hem.
CHAUCER, *The Second Nonnes Tale.*

6. And *alle* we that ben in this aray
And maken *all* this lamentation,
We losten *alle* our husbondes at that toun.
CHAUCER, *The Knightes Tale.*

7. A *good* man bryngeth forth *gode* thingis of *good* tresore.—WICLIFFE, Matt. xii.

8. So every *good* tree maketh *gode* fruytis, but an yvel tree maketh yvel fruytes. A *good* tree may not make yvel fruytis, neither an yvel tree may make *gode* fruytis. Every tree that maketh not *good* fruyt schal be cut down.—WICLIFFE, Matt. vii.

9. Men loveden more darknessis than light for her werkes weren *yvele*, for ech man that doeth *yvel*, hateth the light.—WICLIFFE, Jon. iii.

10. And *othere* seedis felden among thornes wexen up and strangliden hem, and *othere* seedis fedlen into good lond and gaven fruyt, sum an hundred fold, *another* sixty fold, an *other* thritty fold, &c.—WICLIFFE, Matt. xiii.

11. Yet the while he spake to the puple lo *his* mother and *hise* brethren stonden withoute forth.—WICLIFFE, Matt. xii.

12. And *hise* disciples camen and token *his* body.—WICLIFFE, Matt. xiv.

13. Whan *thise* Bretons tuo were fled out of *this* lond
Ine toke his feaute of alle, &c.
ROB. BRUNE, p. 3.

14. *This* is thilk disciple that bereth witnessyng of *these* thingis, and wroot them.—WICLIFFE, John xxi.

15. Seye to us in what powers thou doist *these* thingis, and who is he that gaf to thee *this* power.—WICLIFFE, Luke xx.

Those.—Perhaps the Anglo-Saxon *þá* with *s* added. Perhaps the *þás* from *þis* with its power altered. Rask, in his "Anglo-Saxon Grammar," writes, "from þis we find, in the plural, þæs for þás. From which afterwards, with a distinction in signification, *these* and *those*." The English form *they* is illustrated by the Anglo-Saxon form *ðage* = *þá*. The whole doctrine of the forms in question has yet to assume a satisfactory shape.

The present declension of the demonstrative pronouns is as follows:—

I.

The—Undeclined.

II.

She—Defective in the oblique cases.

III.

He.

	Masc.	*Neut.*	*Fem.*
Nom.	He	It (from *hit*)	—
Acc.	Him	It	Her.
Dat.	Him	—	Her.
Gen.	His	—	Her.
Secondary Gen.	—	Its	Hers.

No plural form.

IV.

That.

		Neut.	*Masc.*	*Fem.*
Sing.	*Nom.*	That	—	—
	Acc.	That	Than,* then	—
	Dat.	—	—	There.*
Plur.	*Nom.*		They.†	
	Acc.		Them.†	
	Gen.		Their.†	
	Secondary Gen.		Theirs.†	

V.

Singular, This. *Plural*, These.

VI.

Those.

* Used as adverbs.

† Used as the plurals of *he*, *she*, and *it*.

CHAPTER XVI.

THE RELATIVE, INTERROGATIVE, AND CERTAIN OTHER PRONOUNS.

§ 367. In the relative and interrogative pronouns, *who, what, whom, whose*, we have, expressed by a change of form, a neuter gender, *what*; a dative case, *whom*; and a genitive case, *whose*; the true power of the *s* (viz. as the sign of a case) being obscured by the orthographic addition of the *e* mute.

To these may be added, 1, the adverb *why*, originally the ablative form *hvi* (*quo modo? quâ viâ?*). 2. The adverb *where*, a feminine dative, like *there*. 3. *When*, a masculine accusative (in Anglo-Saxon *hwæne*), and analogous to *then*.

The following points in the history of the demonstrative and relative pronouns are taken from Grimm's "Deutsche Grammatik," vol. iii. pp. 1, 2, 3.

Throughout the Indo-European tribe the interrogative or relative idea is expressed by *k*, or by a modification of *k*; *e. g.* *qu*, *hv*, or *h*; as, Sanskrit, *kas*, who; *kataras*, which of two; *katama*, which of many.—Lithuanic, *kas*, who; *koks*, of what sort; *kokelys*, how great; *kaip*, how.—Slavonic: *kto*, who, Russian and Polish; *kdo*, who, Bohemian; *kotory*, which, Russian; *kolik*, how great.—*Quot*, *qualis*, *quantus*, Latin.—Κόσος, κοῖος, κότε, Ionic Greek; in the other dialects, however, πότερος, πόσος, &c.—Gothic: *hvas*, who, Mœso-Gothic; *huer*, Old High-German; *hvaþar*, which of two, Mœso-Gothic; *huëdar*, Old High-German; *hvem*, *hvad*, *huanne*, *huar*, Norse; *what*, *why*, *which*, *where*, &c., English.

Throughout the Indo-European tribe the demonstrative idea is expressed by *t*, or by a modification of it; as, Sanskrit, *tat*, that; *tata-ras*, such a one out of two.—Lithuanic, *tas*, he;

toks, such; *tokelys*, so great; *taip*, so.—Slavonic, *t*, or *ta*, he; *taku*, such; *tako*, so.—*Tot*, *talis*, *tantum*, Latin.—Τόσος, τοῖος, τότε, Greek; *this*, *that*, *thus*, English, &c.

The two sounds in the Danish words *hvi*, *hvad*, &c., and the two sounds in the English, *what*, *when* (Anglo-Saxon, *hwæt*, *hwæne*), account for the forms *why* and *how*. In the first the *w* alone, in the second the *h* alone, is sounded. The Danish for *why* is *hvi*, pronounced *vi*; in Swedish the word is *hu*.

The following remarks (some of them not strictly etymological) apply to a few of the remaining pronouns. For further details, see GRIMM, *D. G.* iii. 4.

Same.—Wanting in Anglo-Saxon, where it was replaced by the word *ylca*, *ylce*. Probably derived from the Norse.

Self.—In *myself*, *thyself*, *herself*, *ourselves*, *yourselves*, a substantive (or with a substantival power), and preceded by a genitive case. In *himself* and *themselves* an adjective (or with an adjectival power), and preceded by an accusative case. *Itself* is equivocal, since we cannot say whether its elements are *it* and *self*, or *its* and *self*; the *s* having been dropped in utterance. It is very evident that either the form like *himself*, or the form like *thyself*, is exceptionable; in other words, that the use of the word is inconsistent. As this inconsistency is as old as the Anglo-Saxons, the history of the word gives us no elucidation. In favour of the forms like *myself* (*self* being a substantive), are the following facts:—

1. The plural word *selves*, a substantival, and not an adjectival form.

2. The Middle High-German phrases, *mîn lîp*, *dîn lîp*, *my body*, *thy body*, equivalent in sense to *myself*, *thyself*.

3. The circumstance that if *self* be dealt with as a substantive, such phrases as *my own self*, *his own great self*, &c. can be used; whereby the language is a gainer.

"Vox *self*, pluraliter *selves*, quamvis etiam pronomen a quibusdam censeatur (quoniam ut plurimum per Latinum *ipse* redditur), est tamen plane nomen substantivum, cui quidem vix aliquod apud Latinos substantivum respondet; proxime tamen accedet vox *persona* vel *propria persona*, ut *my self*, *thy self*, *our selves*, *your selves*, &c. (*ego ipse*, *tu ipse*, *nos ipsi*, *vos*

ipsi, &c.), ad verbum *mea persona, tua persona*, &c. Fateor tamen *himself, itself, themselves*, vulgo dici pro *his-self, its-self, theirselves ;* at (interposito *own*) *his own self*, &c., *ipsius propria persona*," &c.—WALLIS, c. vii.

4. The fact that many persons actually say *hisself* and *theirselves*.

Whit.—As in the phrase *not a whit*. This enters in the compound pronouns *aught* and *naught*.

One.—As in the phrase *one does so and so*. From the French *on*. Observe that this is from the Latin *homo*, in Old French *hom, om*. In the Germanic tongues *man* is used in the same sense: *man sagt = one says = on dit*. *One*, like *self* and *other*, is so far a substantive, that it is inflected. Gen. sing. *one's own self :* plural, *my wife and little ones are well*.

Derived pronouns.—Any, in Anglo-Saxon, *ænig*. In Old High-German we have *einîc = any*, and *einac = single*. In Anglo-Saxon *ánega* means *single*. In Middle High-German *einec* is always *single*. In New High-German *einig* means, 1. *a certain person* (*quidam*), 2. *agreeing ; einzig* meaning *single*. In Dutch *énech* has both meanings. This indicates the word *án, one*, as the root of the word in question.—GRIMM, *D. G.* iii. 9.

Compound pronouns.—Which, as has been already stated more than once, is most incorrectly called the neuter of *who*. Instead of being a neuter, it is a compound word. The adjective *leiks, like*, is preserved in the Mœso-Gothic words *galeiks*, and *missaleiks*. In Old High-German the form is *lih*, in Anglo-Saxon *lic*. Hence we have Mœso-Gothic, *hvêleiks ;* Old High-German, *huëlih ;* Anglo-Saxon, *huilic* and *hvilc ;* Old Frisian, *hwelik ;* Danish, *hvilk-en ;* German, *welch ;* Scotch, *whilk ;* English, *which*. (GRIMM, *D. G.* iii. 47.) The same is the case with—

1. *Such.*—Mœso-Gothic, *svaleiks ;* Old High-German, *sôlîh ;* Old Saxon, *sulîc ;* Anglo-Saxon, *svilc ;* German, *solch ;* English, *such*. (GRIMM, *D. G.* iii. 48.) Rask's derivation of the Anglo-Saxon *swilc* from *swa-ylc*, is exceptionable.

2. *Thilk.* — An old English word, found in the provincial dialects, as *thick, thuck, theck*, and hastily derived by Tyrwhitt, Ritson, and Weber, from *së ylca*, is found in the following

forms: Mœso-Gothic, *þêleiks;* Norse, *þvilikr.* (GRIMM, iii. 49.)

3. *Ilk.*—Found in the Scotch, and always preceded by the article; *the ilk*, or *that ilk*, meaning *the same.* In Anglo-Saxon this word is *ylca*, preceded also by the article *se ylca, seó ylce, þæt ylce.* In English, as seen above, the word is replaced by *same.* In no other Gothic dialect does it occur. According to Grimm, this is no simple word, but a compound one, of which some such word as *ei* is the first, and *lîc* the second element. (*Deutsche Grammatik*, iii. 50.)

Aught.—In Mœso-Gothic is found the particle *aiv, ever*, but only in negative propositions; *ni* (*not*) preceding it. Its Old High-German form is *êo, io;* in Middle High-German, *ie;* in New High-German, *je;* in Old Saxon, *io;* in Anglo-Saxon, *â;* in Norse, *æ.* Combined with this particle the word *whit* (*thing*) gives the following forms: Old High-German, *éowiht;* Anglo-Saxon, *âviht;* Old Frisian, *âwet;* English, *aught.* The word *naught* is *aught* preceded by the negative particle. (*Deutsche Grammatik*, iii. 52.)

Each.—The particle *gi* enters, like the particle, in the composition of pronouns. Old High-German, *êogalîher*, every one; *êocalih*, all; Middle High-German, *iegelich;* New High-German, *jeglich;* Anglo-Saxon, *ælc;* English, *each;* the *l* being dropped, as in *which* and *such.* *Ælc*, as the original of the English *each* and the Scotch *ilka*,* must by no means be confounded with the word *ylce, the same.* (GRIMM, *D. G.* iii. 54.)

Every, in Old English, *everich, everech, everilk one*, is *ælc*, preceded by the particle *ever.* (GRIMM, *D. G.* iii. 54.)

Either.—Old High-German, *êogahuëdar;* Middle High-German, *iegewëder;* Anglo-Saxon, *æghväðer, æyðer;* Old Frisian, *eider.*

Neither.—The same, with the negative article prefixed. *Neither* : *either* : : *naught* : *aught.*

* Different from *ilk.*

CHAPTER XVII.

THE ARTICLES.

§ 368. In the generality of grammars the definite article *the*, and the indefinite article *an*, are the very first parts of speech that are considered. This is exceptionable. So far are they from being essential to language, that, in many dialects, they are wholly wanting. In Greek there is no indefinite, in Latin there is neither an indefinite nor a definite article. In the former language they say ἀνήρ τις = *a certain man*: in the Latin the words *filius patris* mean equally *the son of the father, a son of a father, a son of the father*, or *the son of a father*. In Mœso-Gothic and in Old Norse, there is an equal absence of the indefinite article; or, at any rate, if there be one at all, it is a different word from what occurs in English. In these the Greek τις is expressed by the Gothic root *sum*.

Now, as it is very evident that, as far as the sense is concerned, the words *some man, a certain man*, and *a man*, are, there or thereabouts, the same, an exception may be taken to the statement that in Greek and Mœso-Gothic there is no indefinite article. It may, in the present state of the argument, be fairly said that the words *sum* and τις are pronouns with a certain sense, and that *a* and *an* are no more; consequently, that in Greek the indefinite atticle is τις, in Mœso-Gothic *sum*, and in English *a* or *an*.

A distinction, however, may be made. In the expression ἀνήρ τις (*anær tis*) = *a certain man*, or *a man*, and in the expression *sum mann*, the words *sum* and τις preserve their natural and original meaning: whilst in *a man* and *an ox* the words *a* and *an* are used in a secondary sense. These words, as is currently known, are one and the same, the *n*, in the form *a*, being ejected through a euphonic process.

They are, moreover, the same words with the numeral *one*; Anglo-Saxon, *a'n*; Scotch, *ane*. Now, between the words *a man* and *one man*, there is a difference in meaning; the first expression being the most indefinite. Hence comes the difference between the English and the Mœso-Gothic expressions. In the one word *sum* has a natural, in the other the word *an* has a secondary power.

The same reasoning applies to the word *the*. Compared with *a man*, the words *the man* are very definite. Compared, however, with the words *that man*, they are the contrary. Now, just as *an* and *a* have arisen out of the numeral *one*, so has *the* arisen out of the demonstrative pronoun *þæt*, or at least from some common root. It will be remembered that in Anglo-Saxon there was a form *þe*, undeclined, and common to all the cases of all the numbers.

In no language in its oldest stage is there ever a word giving, in its primary sense, the ideas of *a* and *the*. As tongues become modern, some noun with a *similar* sense is used to express them. In the course of time a change of form takes place, corresponding to the change of meaning; *e.g.* *one* becomes *an*, and afterwards *a*. Then it is that articles become looked upon as separate parts of speech, and are dealt with accordingly. No invalidation of this statement is drawn from the Greek language. Although the first page of the etymology gives us ὁ, ἡ, τὸ (*ho*, *hæ*, *to*), as the definite articles, the corresponding page in the syntax informs us, that in the oldest stage of the language, ὁ (*ho*) = *the*, had the power of οὗτος (*howtos*) = *this*.

The origin of the articles seems uniform. In German *ein*, in Danish *en*, stand to *one* in the same relation that *an* does. The French *un*, Italian and Spanish *uno*, are similarly related to *unus* = *one*.

And as, in English *the*, in German *der*, in Danish *den*, come from the demonstrative pronouns, so in the classical languages are the French *le*, the Italian *il* and *lo*, and the Spanish *el*, derived from the Latin demonstrative, *ille*.

In his Outlines of Logic, the present writer has given reasons for considering the word *no* (as in *no man*) an article.

That *the*, in expressions like *all the more, all the better*, &c., is no article, has already been shown.

The declension of the pronouns, as given in a tabular view, is as follows:—

Pronouns of the First Person Singular.

Nom.	*I.*	Nom.	—
Poss.	—	Poss.	*my*
Obj.	—	Obj.	*me.*

Pronoun of the First Person Plural.

Nom.	*we*
Poss.	*our*
Obj.	*us.*

Pronoun of the Second Person Singular.

Nom.	*thou*
Poss.	*thy*
Obj.	*thee.*

Pronoun of the Second Person Plural.

Nom.	*ye* or *you*
Poss.	*your*
Obj.	*you* or *ye.*

Pronouns of the Third Person Singular, originally Demonstrative.

1.

	Masc.	*Fem.*	*Neut.*
Nom.	*he*	—	*it* *
Poss.	*his*	*her*	*its* †
Obj.	*him*	*her*	*it.*

2.

	Masc.	*Fem.*	*Neut.*
Nom.	—	*she* ‡	—
Poss.	—	—	—
Obj.	—	—	—

* Originally *hit; t* being the sign of the neuter gender.

† Originally *his.*

‡ The masculine form *se* existed in Anglo-Saxon, but is now extinct.

3.

Pronoun of the Third Person Plural, originally Demonstrative.

For all Genders alike.

Nom.	Poss.	Obj.
they	*their*	*them.*

4.

Demonstrative Pronouns, signifying nearness or proximity.

Sing.	Plur.
this	*thee.*

Demonstrative Pronouns, signifying distance.

1.

Sing.	Plur.
that	*those.*

Relative Pronoun.

1.

	Sing.		*Plur.*	
	Masc. and Fem.	Neut.	Masc. and Fem.	Neut.
Nom.	*who*	*what*	*who*	—
Poss.	*whose*	—	*whose*	
Obj.	*whom*	*what.*	*whom.*	

The Reflective Pronoun.

Sing.	*Plur.*
Nom. *self*	Nom. *selves*
Poss. *self's.*	Poss. *selves'.*

This is my own dear self, and this my own dear self's handiwork. These are our own selves' making.

Such forms as *self's* and *selves'* are undoubtedly rare; perhaps no instance can be found of them. At the same time they are possible forms, and, if wanted, are strictly grammatical. Substitute the word *individuality* for *self*, and we see how truly its nature is *substantival.*

A. *This is the opinion of a humble individual* (*my self*).

B. *Then I don't think much of your humble individuality* (*self*), *nor yet of your humble individuality's* (*self's*) *opinion.*

Indeterminate Pronoun.

Sing.		*Plur.*	
Nom.	*one*	Nom.	*ones*
Poss.	*one's.*	Poss.	*ones'.*

One is unwilling to put one's friend to trouble. My wife and little ones are well. These are my two little ones' playthings.

CHAPTER XVIII.

OF THE CARDINAL NUMBERS.

§ 369. In one sense the cardinal numbers form no part of a work on etymology. They are single words, apparently simple, and, as such, appertaining to a dictionary rather than to a grammar.

In another sense they are strictly etymological. They are the basis of the ordinals, which are formed from them by derivation. Furthermore, some of them either have, or are supposed to have, certain peculiarities of form which can be accounted for only by considering them derivatives, and that of a very peculiar kind.

It is an ethnological fact, that the numerals are essentially the same throughout the whole Indo-European class of languages. The English *three* is the Latin *tres*, the Sanskrit *tri*, &c. In the Indo-European languages the numerals agree, even when many common terms differ.

And it is also an ethnological fact, that in a great many other groups of languages the numerals differ, even when many of the common terms agree. This is the case with many of the African and American dialects. Languages alike in the common terms for common objects differ in respect to the numerals.

What is the reason for this inconsistency in the similarity or dissimilarity of the numerals as compared with the similarity or dissimilarity of other words? I believe that the following distinction leads the way to it:—

The word *two* = 2, absolutely and unequivocally, and in a primary manner.

The word *pair* also = 2; but not absolutely, not unequivocally, and only in a secondary manner.

Hence the distinction between absolute terms expressive of number, and secondary terms expressive of number.

When languages separate from a common stock before the use of certain words is fixed as *absolute*, there is room for considerable latitude in the choice of numerals; *e. g.* whilst with one tribe the word *pair* = *two*, another tribe may use the word *couple*, a third *brace*, and so on. In this case dialects that agree in other respects may differ in respect to their numerals.

When, on the other hand, languages separate from a common stock after the meaning of such a word as *two* has been fixed absolutely, there is no room for latitude; and the numerals agree where the remainder of the language differs.

1. *One* = *unus*, Latin; εἷς (ἓν), Greek.
2. *Two* = *duo*, δύο.
3. *Three* = *tres*, τρεῖς.
4. *Four* = *quatuor*, τέτταρα—this is apparently problematical. Nevertheless, the assumed changes can be verified by the following forms:—

a. *Fidvor*, Mœso-Gothic—to be compared with *quatuor*.

b. Πίσυρες, Æolic—illustrates the change between τ- and π- (allied to *f*-), within the pale of the classical languages.

5. *Five* = *quinque*, πέντε — verified by the following forms:—

a. Πέμπε, Æolic Greek.

b. *Pump*, Welsh—these account for the change from the *n* + *t* in πέντε to *m* + *p*.

c. *Fimf*, Mœso-Gothic; *fünf*, Modern High-German.

d. *Fem*, Norse.

The change from the π- of πέντε to the *qu*- of *quinque* is the change so often quoted by Latin and Celtic scholars between *p* and *k*: ἵππος, ἵκκος, *equus*.

6. *Six* = ἕξ, *sex*.
7. *Seven* = ἑπτὰ, *septem*.

This form is difficult. The Mœso-Gothic form is *sibun*, without a -*t*-; the Norse, *syv*, without either -*t*- or -*n* (= -*m*). A possible explanation of the form *seven*, &c., will be found in the following chapter.

8. *Eight* = ὀκτὼ, *octo*.

9. *Nine* = ἐννέα, *novem*. The Mœso-Gothic form is *nigun*, the Icelandic *niu*. In the Latin *novem*, the *v* = the *g* of *nigun*. In the English and Greek it is wanting. The explanation of the *-n* and *-m* will be found in the following chapter.

10. *Ten* = δέκα, *decem*. The Mœso-Gothic form is *tihun*; wherein the *h* = the *c* of *decem* and the κ of δέκα. The Icelandic form is *tiu*, and, like δέκα, is without the *-n* (or *-m*). The hypothesis as to the *-m* or *-n* will be given in the next chapter.

11. *Eleven*. By no means the equivalent to *undecim* = 1 + 10.

a. The *e* is *ein* = *one*. *Ein*lif, *ein*-lef, *ei*lef, *ei*lf, *e*lf, Old High-German; *and*lova, Old Frisian; *end*-leofan, *end*lufan, Anglo-Saxon. This is universally admitted.

b. The *-lev-* is a modification of the root *laib-an* = *manere* = *to stay* = *to be over*. Hence *eleven* = *one over* (*ten*). This is *not* universally admitted.

c. The *-n* has not been well accounted for. It is peculiar to the Low Germanic dialects.—*Deutsche Grammatik*, ii. 946.

12. *Twelve* = the root *two* + the root *laib* = *two over* (*ten*). *Tvalif*, Mœso-Gothic; *zuelif*, Old High-German; *toll*, Swedish. The same doubts that apply to the doctrine of the *-lv-* in *eleven* representing the root *-laib*, apply to the *-lv-* in *twelve*.—*Deutsche Grammatik*, ii. 946.

13. *Thirteen* = 3 + 10. So on till twenty.

30. *Thirty* = 3 + 10, or three decads. This difference in the decimal power of the syllables *-teen* and *-ty* is illustrated by—

a. The Mœso-Gothic.—Here we find the root *tig-* used as a true substantive, equivalent in form as well as power to the Greek δέκ-ας. *Tváim tigum þusandjom* = *duobus decadibus myriadum*. (Luke xiv. 31.) *Jérê þrijê tigivê* = *annorum duarum decadum*. (Luke iii. 23.) *þrins tiguns silubrinaize* = *tres decadas argenteorum*. (Matthew xxvii. 3, 9.) — *Deutsche Grammatik*, ii. 948.

b. The Icelandic.—"The numbers from 20 to 100 are formed by means of the numeral substantive, *tigr*, declined

like *viðr*, and naturally taking the word which it numerically determines in the genitive case.

Nom.	Fjórir tigir manna	=	*four tens of men.*
Gen.	Fjögurra tiga manna	=	*of four tens of men.*
Dat.	Fjórum tigum manna	=	*to four tens of men.*
Acc.	Fjóra tiga manna	=	*four tens of men.*

"This is the form of the inflection in the best and oldest MSS. A little later was adopted the *indeclinable* form *tigi*, which was used adjectivally."—*Det Oldnorske Sprogs Grammatik*, af P. A. Munch, og C. B. Unger, Christiania, 1847.

Generally speaking, the greater part of the numerals are undeclined, even in inflected languages. As far as *number* goes, this is necessary.

One is naturally and exclusively singular.

Two is naturally dual.

The rest are naturally and exclusively plural.

As to the inflection of gender and cases, there is no reason why all the numerals should not be as fully inflected as the Latin *unus, una, unum, unius.*

CHAPTER XIX.

ON THE ORDINAL NUMBERS.

§ 370. THE remarks at the close of the last chapter but one indicated the fact that superlative forms were found beyond the superlative degree. The present chapter shows that they are certainly found in some, and possibly in all of the ordinal numbers.

First.—In Mœso-Gothic, *fruma, frumist;* in Anglo-Saxon, *forma, fyrmest;* in Old High-German, *vurist;* in Old Norse, *fyrst;* in New High-German, *erst.* In all these words, whether in *m,* in *mst,* or in *st,* there is a superlative form. The same is the case with *pratamas,* Sanskrit; *fratemas,* Zend; *πρῶτος,* Greek; *primus,* Latin; *primas,* Lithuanic. Considering that, *compared with the other ordinals,* the ordinal of *one* is a sort of superlative, this is not at all surprising.

Between the words *one* and *first* there is no etymological relation. This is the case in most languages. *Unus, primus, εἷς, πρῶτος,* &c.

Second.—Between this word and its cardinal, *two,* there is no etymological connection. This is the case in many, if not in most, languages. In Latin the cardinal is *duo,* and the ordinal *secundus,* a gerund of *sequor,* and meaning *the following.* In Anglo-Saxon the form was *se oðer = the other.* In the present German, the ordinal is *zweite,* a word etymologically connected with the cardinal *zwei = two.*

Old High-German, *andar;* Old Saxon, *othar;* Old Frisian, *other;* Middle Dutch, *ander.* In all these words we have the comparative form *-ter;* and considering that, *compared with the word first,* the word *second* is a sort of comparative, there is nothing in the circumstance to surprise us. The Greek

forms δεύτερος and ἕτερος, the Latin *alter*, and the Lithuanic *antras*, are the same.

§ 371. With the third ordinal number begin difficulties: 1, in respect to their form; 2, in respect to the idea conveyed by them.

1. Comparing *third*, *fourth*, *fifth*, &c., with *three*, *four*, and *five*, the formation of the ordinal from the cardinal form may seem simply to consist in the addition of *d* or *th*. Such, however, is far from being the case.

2. Arguing from the nature of the first two ordinals, namely, the words *first* and *second*, of which one has been called a superlative and the other a comparative, it may seem a simple matter to associate, in regard to the rest, the idea of ordinalism with the idea of comparison. A plain distinction, however, will show that the case of the first two ordinals is peculiar. *First* is a superlative, not as compared with its cardinal, *one*, but as compared with the other numerals. *Second*, or *other*, is a comparative, not as compared with its cardinal, *two*, but as compared with the numeral *one*. Now, it is very evident, that, if the other cardinals be either comparatives or superlatives, they must be so, not as compared with one another, but as compared with their respective cardinals. *Sixth*, to be anything like a superlative, must be so when compared with *six*.

Now, there are, in etymology, two ways of determining the affinity of ideas. The first is the metaphysical, the second the empirical method.

This is better than that, is a sentence which the pure metaphysician may deal with. He may first determine that there is in it the idea of comparison; and next, that the comparison is the comparison between *two* objects, and no more than two. The idea he may compare with others. He may determine, that, with a sentence like *this is one and that is the other*, it has something in common; since both assert something concerning *one out of two objects*. Upon this connection in sense he is at liberty to reason. He is at liberty to conceive that in certain languages words expressive of allied ideas may also be allied in form. Whether such be really the case, he leaves to etymologists to decide.

The pure etymologist proceeds differently. He assumes the

connection in meaning from the connection in form. All that he at first observes is, that words like *other* and *better* have one and the same termination. For this identity he attempts to give a reason, and finds that he can best account for it by presuming some affinity in sense. Whether there be such an affinity, he leaves to the metaphysician to decide. This is the empirical method.

At times the two methods coincide, and ideas evidently allied are expressed by forms evidently allied.

At times the connection between the ideas is evident; but the connection between the forms obscure: and *vice versâ*. Oftener, however, the case is as it is with the subjects of the present chapter. Are the ideas of ordinalism in number, and of superlativeness in degree, allied? The metaphysical view, taken by itself, gives us but unsatisfactory evidence; whilst the empirical view, taken by itself, does the same. The two views, however, taken together, give us evidence of the kind called cumulative, which is weak or strong according to its degree.

Compared with *three, four,* &c., all the ordinals are formed by the addition of *th,* or *t*; and *th,* ϑ, *t,* or *d,* is the ordinal sign, not only in English, but in the other Gothic languages. But, as stated before, this is not the whole of the question.

The letter *t* is found, with a similar power, 1. In Latin, as in *tertius, quartus, quintus, sextus;* 2. Greek, as in τρίτος (*tritos*), τέταρτος (*tetartos*), πέμπτος (*pemptos*), ἕκτος (*hectos*), ἔνατος (*ennatos*), δέκατος (*dekatos*); 3. Sanskrit, as in *tritîyas, 'catur'tas, shasht'as* = *third, fourth, sixth;* 4. In Zend, as in *thrityas* = *the third, haptathas* = *the seventh;* 5. In Lithuanic, as *ketwirtas* = *fourth, penktas* = *fifth, szesztas* = *sixth;* 6. In Old Slavonic, as in *cétvertyi* = *fourth, pjatyi* = *fifth, shestyi* = *sixth, devjatyi* = *ninth, desjatyi* = *tenth.* Speaking more generally, it is found, with a similar force, throughout the Indo-European stock.

The following forms indicate a fresh train of reasoning. The Greek ἑπτὰ (*hepta*), and Icelandic *sjau,* have been compared with the Latin *septem* and the Anglo-Saxon *seofon.* In the Greek and Icelandic there is the absence, in the Latin and Anglo-Saxon the presence, of a final liquid (*m* or *n*).

Again, the Greek forms ἐννέα (*ennea*), and the Icelandic *níu* = *nine*, have been compared with the Latin *novem* and the Gothic *nigun*.

Thirdly, the Greek δέκα (*deka*), and the Icelandic *tíu*, have been compared with the Latin *decem* and the Gothic *tihun* = *ten*.

These three examples indicate the same circumstance; viz. that the *m* or *n*, in *seven*, *nine*, and *ten*, is no part of the original word.

The following hypotheses account for these phenomena; viz. that the termination of the ordinals is the superlative termination *-tam* : that in some words, like the Latin *septimus*, the whole form is preserved; that in some, as in τέταρτος = *fourth*, the *t* only remains; and that in others, as in *decimus*, the *m* alone remains. Finally, that in *seven*, *nine*, and *ten*, the final liquid, although now belonging to the cardinal, was once the characteristic of the ordinal number. For a fuller exhibition of these views, see GRIMM, *Deutsche Grammatik*, iii. 640.

CHAPTER XX.

ON THE GRAMMATICAL POSITION OF THE WORDS *MINE* AND *THINE*.

§ 372. BEFORE we pass from the *Declension* of Nouns to the Conjugation of Verbs, a few remarks must be made on the grammatical position of the words *mine* and *thine*.

The inflection of pronouns has its natural peculiarities in language. It has also its natural difficulties in philology. These occur not in one language in particular, but in all generally.

The most common peculiarity in the grammar of pronouns is the fact of what may be called their *convertibility*. Of this *convertibility* the following statements serve as illustration :—

1. *Of case.*—In our own language the words *my* and *thy*, although at present possessives, were previously datives, and, earlier still, accusatives. Again, the accusative *you* replaces the nominative *ye*, and *vice versâ*.

2. *Of number.*—The words *thou* and *thee* are, except in the mouths of Quakers, obsolete. The plural forms, *ye* and *you*, have replaced them.

3. *Of person.*—The Greek language gives us examples of this in the promiscuous use of *νιν*, *μιν*, *σφε*, and *ἑαυτοῦ*; whilst *sich* and *sik* are used with a similar latitude in the Middle High-German and Scandinavian.

4. *Of class.*—The demonstrative pronouns become—

a. Personal pronouns.
b. Relative pronouns.
c. Articles.

These statements are made for the sake of illustrating, not

of exhausting, the subject. It follows, however, as an inference from them, that the classification of pronouns is complicated. Even if we knew the original power and derivation of every form of every pronoun in a language, it would be far from an easy matter to determine therefrom the paradigm that they should take in grammar. To place a word according to its power in a late stage of language might confuse the study of an early stage. To say that because a word was once in a given class, it should always be so, would be to deny that in the present English *they*, *these*, and *she* are personal pronouns at all.

The two tests, then, of the grammatical place of a pronoun, its *present power* and its *original power*, are often conflicting.

In the English language the point of most importance in this department of grammar is the place of forms like *mine* and *thine*; in other words, of the forms in *-n*. Are they genitive cases of a personal pronoun, as *mei* and *tui* are supposed to be in Latin, or are they possessive pronouns, like *meus* and *tuus*?

Now, if we take up the common grammars of the English language *as it is*, we find, that, whilst *my* and *thy* are dealt with as genitive cases, *mine* and *thine* are considered adjectives. In the Anglo-Saxon grammars, however, *min* and *þin*, the older forms of *mine* and *thine*, are treated as genitives; of which *my* and *thy* have been dealt with as abbreviated forms, and that by respectable scholars.

Now, to prove from the syntax of the older English that in many cases the two forms were convertible, and to answer that the words in question are *either* genitive cases or adjectives, is lax philology; since the real question is, *which of the two is the primary, and which the secondary meaning?*

The *à priori* view of the likelihood of words like *mine* and *thine* being genitive cases, must be determined by the comparison of three series of facts.

1. The ideas expressed by the genitive case, with particular reference to the two preponderating notions of possession and partition.

2. The circumstance of the particular notion of possession

being, in the case of the personal pronouns of the two first persons singular, generally expressed by a form undoubtedly adjectival.

3. The extent to which the idea of partition becomes merged in that of possession, and *vice versâ*.

The ideas of possession and partition as expressed by genitive forms.—If we take a hundred genitive cases, and observe their construction, we shall find, that, with a vast majority of them, the meaning is reducible to one or two heads; viz. the idea of possession or the idea of partition.

Compared with these two powers all the others are inconsiderable, both in number and importance; and if, as in the Greek and Latin languages, they take up a large space in the grammars, it is from their exceptional character rather than from their normal genitival signification.

Again, if both the ideas of possession and partition may, and in many cases must be, reduced to the more general idea of relation, this is a point of grammatical phraseology by no means affecting the practical and special bearings of the present division.

The adjectival expression of the idea of possession.—All the world over, a property is a possession; and *persons*, at least, may be said to be the owners of their attributes. Whatever may be the nature of words like *mine* and *thine*, the adjectival character of their Latin equivalents, *meus* and *tuus*, is undoubted.

The ideas of partition and possession merge into one another. —*A man's spade is the* possession *of a man; a man's hand is the* part *of a man.* Nevertheless, when a man uses his hand as the instrument of his will, the idea which arises from the fact of its being *part* of his body is merged in the idea of the possessorship which arises from the feeling of ownership or mastery which is evinced in its subservience and application. Without following the refinements to which the further investigation of these questions would lead us, it is sufficient to suggest that the preponderance of the two allied ideas of partition and possession is often determined by the personality or the non-personality of the subject, and that, when the subject is a person, the idea is chiefly possessive; when a

thing, partitive—*caput fluvii = the head, which is a part, of a river; caput Toli = the head, which is the possession, of Tolus.*

But as persons may be degraded to the rank of things, and as things may, by personification, be elevated to the level of persons, this distinction, although real, may become apparently invalid. In phrases like, *a tributary to the Tiber—the criminal lost his eye—this field belongs to that parish*—the ideas of possessorship and partition, as allied ideas subordinate to the idea of relationship in general, verify the interchange.

These observations should bring us to the fact that there are two ideas which, more than any other, determine the evolution of a genitive case—the idea of partition and the idea of possession; *and that genitive cases are likely to be evolved just in proportion as there is a necessity for the expression of these two ideas.*—Let this be applied to the question of the *à priori* probability of the evolution of a genitive case to the pronouns of the first and second persons of the singular number.

The idea of possession, *and its likelihood of determining the evolution of a genitive form to the pronouns of the first and second person singular.*—It is less likely to do so with such pronouns than with other words, inasmuch as it is less necessary. It has been before observed, that the practice of most languages shows a tendency to express the relation by adjectival forms—*meus, tuus.*

An objection against the conclusiveness of this argument will be mentioned in the sequel.

The idea of partition, *and its likelihood of determining the evolution of a genitive form, &c.* — Less than with other words.

A personal pronoun of the *singular* number is the name of a unity, and, as such, the name of an object far less likely to be separated into parts than the name of a collection. Phrases like, *some of them, one of you, many of us, any of them, few of us, &c.*, have no analogues in the singular number, such as, *one of me, a few of thee,* &c. The partitive words that can combine with singular pronouns are comparatively few; viz. *half, quarter, part,* &c.: and they can all combine equally with plurals—*half of us, a quarter of them, a part of you, a portion of us.*

The partition of a singular object with a pronominal name is of rare occurrence in language.

This last statement proves something more than appears at first sight. It proves that no argument in favour of the so-called *singular* genitives, like *mine* and *thine*, can be drawn from the admission (if made) of the existence of the true plural genitives *ou-r*, *you-r*, *thei-r*. The two ideas are not in the same predicament. We can say, *one of ten*, or *ten of twenty*; but we cannot say *one of one*—*Wæs hira Matheus sum* = *Matthew was one of them*; Andreas: *Your noither* = *neither of you*; Amis and Ameloun—from Mr. Guest: *Her eyder* = *either of them*; Octavian.—Besides this, the form of the two numbers is neither identical, nor equally genitival; as may be seen by contrasting *mi-n* and *thi-n* with *ou-r* and *you-r*.

Such are the chief *à priori* arguments against the genitival character of words like *mine* and *thine*.

Akin to these, and a point which precedes the *à posteriori* evidence as to the nature of the words in question, is the determination of the side on which lies the *onus probandi*. This question is material; inasmuch as, although the present writer believes, for his own part, that the forms under discussion are adjectival rather than genitival, this is not the point upon which he insists. What he insists upon is, the fact of the genitival character of *mine* and *thine* requiring a particular proof; which particular proof no one has yet given: in other words, his position is, that they are not to be thought genitive until proved to be such.

It has not been sufficiently considered that the *primâ facie* evidence is against them. They have not the form of a genitive case—indeed, they have a different one; and whoever assumes a second form for a given case has the burden of proof on his side.

Against this circumstance of the *-n* in *mine* and *thine* being the sign of anything rather than of a genitive case, and against the *primâ facie* evidence afforded by it, the following facts may be, or have been, adduced as reasons on the other side. The appreciation of their value, either taken singly or in the way of cumulative evidence, is submitted to the reader. It will be seen that none of them are unexceptionable.

The fact that, if the words mine *and* thine *are not genitive cases, there is not a genitive case at all.*—It is not necessary that there should be one. Particular reasons in favour of the probability of personal pronouns of the singular number being destitute of such a case have been already adduced. *It is more likely that a word should be defective than that it should have a separate form.*

The analogy of the forms mei *and* ἐμοῦ *in Latin and Greek.*—It cannot be denied that this has some value. Nevertheless, the argument deducible from it is anything but conclusive.

1. It is by no means an indubitable fact that *mei* and ἐμοῦ are really cases of the pronoun. The *extension* of a principle acknowledged in the Greek language might make them the genitive cases of adjectives used pronominally. Thus—

Τὸ ἐμὸν = ἐγὼ,
Τοῦ ἐμοῦ = ἐμοῦ,
Τῷ ἐμῷ = ἐμοί.

Assume the omission of the article and the extension of the Greek principle to the Latin language, and ἐμοῦ and *mei* may be cases, not of ἐμὲ and *me*, but of ἐμὸς and *meus*.

2. In the classical languages the *partitive* power was expressed by the genitive.

"——— multaque pars mei
Vitabit Libitinam."

This is a reason for the evolution of a genitive power. Few such forms exist in the Gothic; *part my* is not English, nor was *dæl min* Anglo-Saxon = *part of me*, or *pars mei*.

§ 373. The following differences of form are found in the different Gothic languages, between the equivalents of *mei* and *tui*, the so-called genitives of *ego* and *tu*, and the equivalents of *meus* and *tuus*, the so-called possessive adjectives.

Mæso-Gothic . .	meina	= *mei* as opposed to	meins	= *meus*.
	þeina	= *tui*	þeins	= *tuus*.
Old High-German.	mîn	= *mei*	mîner	= *meus*.
	dîn	= *tui*	dîner	= *tuus*.
Old Norse . . .	min	= *mei*	minn	= *meus*.
	þin	= *tui*	þinn	= *tuus*.

Middle Dutch . .	mîns	= *mei* as opposed to	mîn	= *meus.*
	dîns	= *tui*	dîn	= *tuus.*
Modern High-German	mein	= *mei*	meiner	= *meus.*
	dein	= *tui*	deiner	= *tuus.*

In this list, those languages where the two forms are alike are not exhibited. This is the case with the Anglo-Saxon and Old Saxon.

In the above-noticed differences of form lie the best reasons for the assumption of a genitive case, as the origin of an adjectival form; and, undoubtedly, in those languages where both forms occur, it is convenient to consider one as a case and one as an adjective.

§ 374. But this is not the present question. In Anglo-Saxon there is but one form, *min* and *þin* = *mei* and *meus*, *tui* and *tuus*, indifferently. Is this form an oblique case or an adjective?

This involves two sorts of evidence.

Etymological evidence.—Assuming two *powers* for the words *min* and *þin*, one genitive and one adjectival, which is the original one? or, going beyond the Anglo-Saxon, assuming that of two *forms* like *meina* and *meins*, the one has been derived from the other, which is the primitive, radical, primary, or original one?

Men, from whom it is generally unsafe to differ, consider that the adjectival form is the derived one; and, as far as forms like *mîner*, as opposed to *mîn*, are concerned, the evidence of the foregoing list is in their favour. But what is the case with the Middle Dutch? The genitive *mîns* is evidently the derivative of *mîn*.

The reason why the forms like *mîner* seem derived is because they are longer and more complex than the others. Nevertheless, it is by no means an absolute rule in philology that the least compound form is the oldest. A word may be adapted to a secondary meaning by a change in its parts in the way of omission, as well as by a change in the way of addition. Such is the general statement. Reasons for believing that in the particular cases of the words in question such is the fact, will be found hereafter.

As to the question whether it is most likely for an adjective

to be derived from a case, or a case from an adjective, it may be said, that philology furnishes instances both ways. *Ours* is a case derived, in syntax at least, from an adjective. *Cujus* (as in *cujum pecus*) and *sestertium* are Latin instances of a nominative case being evolved from an oblique one.

§ 375. *Syntactic evidence.*—If in Anglo-Saxon we found such expressions as *dæl min* = *pars mei, hælf þin* = *dimidium tui,* we should have a reason, as far as it went, for believing in the existence of a genitive with a partitive power. Such instances, however, have yet to be quoted; whilst, even if quoted, they would not be *conclusive.* Expressions like *σοῦ πόθος* = *desiderium tui, σῇ προμηθίᾳ* = *providentiâ propter te,* show the extent to which the possessive expression encroaches on the partitive.

1. The words *min* or *þin,* with a power anything rather than possessive, would not for that reason be proved (on the strength of their meaning) to be genitive cases rather than possessive pronouns; since such latitude in the power of the possessive pronoun is borne out by the comparison of languages—*πατὲρ ἡμῶν* (not *ἡμέτερος*) in Greek is *pater noster* (not *nostrum*) in Latin.

Again—as *min* and *þin* are declined like adjectives, even as *meus* and *tuus* are so declined, we have means of ascertaining their nature from the form they take in certain constructions; thus, *min*ra = *me*orum, and *min*re = *meæ,* are the genitive plural and the dative singular respectively. Thus, too, the Anglo-Saxon for *of thy eyes* should be *eagena þinra,* and the Anglo-Saxon for *to my widow,* should be *wuduwan minre;* just as, in Latin, they would be *oculorum tuorum,* and *viduæ meæ.*

If, however, instead of this we find such expressions as *eagena þin,* or *wuduwan min,* we find evidence in favour of a genitive case; for then the construction is not one of concord, but one of government, and the words *þin* and *min* must be construed as the Latin forms *tui* and *mei* would be in *oculorum mei,* and *viduæ mei;* viz. as genitive cases. Now, whether a sufficient proportion of such constructions (real or apparent) exist or not, they have not yet been brought forward.

Such instances have yet to be quoted; whilst even if quoted, they would not be conclusive.

A few references to the *Deutsche Grammatik* will explain this.

As early as the Mœso-Gothic stage of our language, we find rudiments of the omission of the inflection. The possessive pronouns in the *neuter singular* sometimes take the inflection, sometimes appear as crude forms: *nim thata badi theinata* = *ἆρον σοῦ τὸν κράββατον* (Mark ii. 9), opposed to *nim thata badi thein*, two verses afterwards. So also with *mein* and *meinata.—Deutsche Grammatik*, iv. 470. It is remarkable that this omission should begin with forms so marked as those of the neuter (*-ata*). It has, perhaps, its origin in the adverbial character of that gender.

Old High-German.—Here the nominatives, both masculine and feminine, lose the inflection, whilst the neuter retains it—*thin dohter, sîn quenâ, min dohter, sinaz lîb*. In a few cases, when the pronoun comes after, even the *oblique* cases drop the inflection.—*Deutsche Grammatik*, 474–478.

Middle High-German.—Preceding the noun, the nominative of all genders is destitute of inflection; *sîn lîb, mîn ere, dîn lîb*, &c. *Following* the nouns, the oblique cases do the same; *ine herse sîn.—Deutsche Grammatik*, 480. The influence of position should here be noticed. Undoubtedly a place *after* the substantive influences the omission of the inflection. This appears in its *maximum* in the Middle High-German. In Mœso-Gothic we have *mein leik* and *leik meinata.—Deutsche Grammatik*, 470.

Now, by assuming (which is only a fair assumption) the extension of the Middle High-German omission of the inflection to the Anglo-Saxon; and by supposing it to affect the words in question in *all* positions (*i. e.* both before and after their nouns), we may explain the constructions in question, in case they occur. But, as already stated, no instances of them have been quoted.

To suppose *two* adjectival forms, one inflected (*min, minre*, &c.), and one uninflected, or common to all genders and both numbers (*min*), is to suppose no more than is the case with the uninflected *þe*, as compared with the inflected *þæt*.

Hence, the evidence required in order to make a single instance of *min* or *þin* the *necessary* equivalent to *mei* and *tui*,

rather than to *meus* and *tuus*, must consist in the quotation from the Anglo-Saxon of some text, wherein *min* or *þin* occurs with a feminine substantive, in an *oblique* case, the pronoun *preceding* the noun. When this has been done, it will be time enough to treat *mine* and *thine* as the equivalents to *mei* and *tui*, rather than as those to *meus* and *tuus*.

CHAPTER XXI.

ON THE CONNECTION BETWEEN THE NOUN AND VERB, AND ON THE INFLECTION OF THE INFINITIVE MOOD.

§ 376. In order to understand clearly the use of the so-called infinitive mood in English, it is necessary to bear in mind two facts, one a matter of logic, the other a matter of history.

In the way of logic, the difference between a noun and a verb is less marked than it is in the way of grammar.

Grammatically, the contrast is considerable. The inflection of nouns expresses the ideas of sex as denoted by gender, and of relation in place as denoted by cases. That of verbs rarely expresses sex, and never position in space. On the other hand, however, it expresses what no noun ever does or can express; *e. g.* the relation of the agent to the individual speaking, by means of person; the *time* in which acts take place, by means of tense; and the conditions of their occurrence, by means of mood.

The idea of number is the only one that, on a superficial view, is common to these two important parts of speech.

Logically, the contrast is inconsiderable. A noun denotes an object of which either the senses or the intellect can take cognizance, and a verb does no more. *To move* = *motion*, *to rise* = *rising*, *to err* = *error*, *to forgive* = *forgiveness*. The only difference between the two parts of speech is this, that, whereas a noun may express any object whatever, verbs can only express those objects which consist in an action. And it is this superadded idea of action that superadds to the verb the phenomena of tense, mood, person, and voice; in other words, the phenomena of conjugation.

A noun is a word capable of declension only. A verb is a word capable of declension and conjugation also. The fact of verbs being declined as well as conjugated must be remembered. The participle has the declension of a noun adjective, the infinitive mood the declension of a noun substantive. Gerunds and supines, in languages where they occur, are only names for certain cases of the verb.

Although in all languages the verb is equally capable of declension, it is not equally declined. The Greeks, for instance, used forms like

τὸ φθονεῖν = *invidia*,
τοῦ φθονεῖν = *invidiæ*,
ἐν τῷ φθονεῖν = *in invidiâ*,

oftener than the Romans. The fact of there being an article in Greek may account for this.

In respect to the substantival character of the so-called infinitive mood, we may easily see—

a. The name of any action may be used without any mention of the agent. Thus, we may speak of the simple fact of *walking* or *moving*, independently of any specification of the *walker* or *mover*.

b. That, when actions are spoken of thus indefinitely, the idea of either person or number has no place in the conception; from which it follows that the so-called infinitive mood must be at once impersonal, and without the distinction of singular, dual, and plural.

c. That, nevertheless, the ideas of time and relation in space *have* place in the conception. We can think of a person being *in the act of striking a blow*, of his *having been in the act of striking a blow*, or of his *being about to be in the act of striking a blow*. We can also think of a person being *in the act of doing a good action*, or of his being *from the act of doing a good action*.

§ 377. This has been written to show that verbs are as naturally declinable as nouns. What follows will show that the verbs of the Gothic languages in particular were actually declined, and that fragments of this declension remain in the present English.

The inflection of the verb in its impersonal (or infinitive)

form consisted, in full, of three cases, a nominative (or accusative), a dative, and a genitive. The genitive is put last, because its occurrence in the Gothic language is the least constant.

In Anglo-Saxon the nominative (or accusative) ended in *-an*:

Lufian = *to love* = *amare.*
Bærnan = *to burn* = *urere.*
Syllan = *to give* = *dare.*

Caution.—The *-en* in words like *strengthen*, &c., is a derivational termination, and by no means a representation of the Anglo-Saxon infinitive inflection.

The Anglo-Saxon infinitive inflection is lost in the present English, except in certain provincial dialects.

In Anglo-Saxon the dative of the infinitive verb ended in *-nne*, and was (as a matter of syntax) generally, perhaps always, preceded by the preposition *to*.

To lufienne = *ad amandum.*
To bærnenne = *ad urendum.*
To syllanne = *ad dandum.*

The genitive, ending in *-es*, occurs only in Old High-German and Modern High-German, *plâsannes, weinnenes.*

With these preliminaries we can take a clear view of the English infinitives. They exist under two forms, and are referable to a double origin.

1. The independent form.—This is used after the words *can, may, shall, will*, and some others, as, *I can speak, I may go, I shall come, I will move.* Here there is no preposition, and the origin of the infinitive is from the form in *-an.*

2. The prepositional form.—This is used after the majority of English verbs, as *I wish to speak, I mean to go, I intend to come, I determine to move.* Here we have the preposition *to* and the origin of the infinitive is from the form in *-nne.*

Expressions like *to err* = *error, to forgive* = *forgiveness,* in lines like

"To err is human, to forgive divine,"

are very remarkable. They exhibit the phenomena of a nominative case having grown not only out of a dative, but out of a dative *plus* its governing preposition.

CHAPTER XXII.

ON DERIVED VERBS.

§ 378. Of number, person, mood, tense, and conjugation, special notice is taken in their respective chapters. Of the divisions of verbs into active and passive, transitive and intransitive, unless there be an accompanying change of form, etymology takes no cognisance. The forces of the auxiliary verbs, and the tenses to which they are equivalent, are also points of syntax rather than of etymology.

Four classes, however, of derived verbs, as opposed to simple, especially deserve notice.

1. Those ending in *-en ;* as *soften, whiten, strengthen,* &c. Here it has been already remarked that the *-en* is a derivational affix ; and not a representative of the Anglo-Saxon infinitive form *-an* (as *lufian, bærnan = to love, to burn*), and the Old English *-en* (as *tellen, loven*).

2. Transitive verbs derived from intransitives by a change of the vowel of the root.

Primitive Intransitive Form.	*Derived Transitive Form.*
Rise	Raise.
Lie	Lay.
Sit	Set.
Fall	Fell.
Drink	Drench.

In Anglo-Saxon these words were more numerous than they are at present. The following list is taken from the "Cambridge Philological Museum," ii. 386.

Intrans. Infinitive.	*Trans. Infinitive.*
Yrnan, *to run*	Ærnan, *to make to run.*
Byrnan, *to burn*	Bærnan, *to make to burn.*

Intrans. Infinitive.	*Trans. Infinitive.*
Drincan, *to drink* . .	Drencan, *to drench.*
Sincan, *to sink* . .	Sencan, *to make to sink.*
Liegan, *to lie* . . .	Lecgan, *to lay.*
Sittan, *to sit* . . .	Settan, *to set.*
Drífan, *to drift* . . .	Dræfan, *to drive.*
Fëallan, *to fall* . . .	Fyllan, *to fell.*
Wëallan, *to boil* . . .	Wyllan, *to make to boil.*
Flëogan, *to fly* . . .	A-fligan, *to put to flight.*
Bëogan, *to bow* . . .	Bígan, *to bend.*
Faran, *to go* . . .	Feran, *to convey.*
Wacan, *to wake* . . .	Weccan, *to awaken.*

All these intransitives form their præterite by a change of vowel, as *sink, sank;* all the transitives by the addition of *d* or *t,* as *fell, fell'd.*

3. Verbs derived from nouns by a change of accent; as *to survéy,* from a *súrvey.* Walker attributes the change of accent to the influence of the participial termination *-ing.* All words thus affected are of foreign origin.

4. Verbs formed from nouns by changing a final sharp consonant into its corresponding flat one; as—

The use	*to* use,	*pronounced*	uze.
The breath . . .	*to* breathe	—	breadhe.
The cloth	*to* clothe	—	clodhe.

CHAPTER XXIII.

ON THE PERSONS.

§ 379. Compared with the Latin, the Greek, the Mœso-Gothic, and almost all the ancient languages, there is, in English, in respect to the persons of the verbs, but a very slight amount of inflection. This may be seen by comparing the English word *call* with the Latin *voco*.

Sing.	*Plur.*	*Sing.*	*Plur.*
1. Voc-*o*.	Voc-*amus*.	Call.	Call.
2. Voc-as.	Voc-*atis*.	Call-est.	Call.
3. Voc-at.	Voc-*ant*.	*Call-eth.	Call.

Here the Latins have different forms for each different person, whilst the English have forms for two only; and even of these one (*callest*) is becoming obsolete. With the forms of *voco* marked in italics there is, in the current English, nothing correspondent.

In the word *am*, as compared with *are* and *art*, we find a sign of the first person singular.

In the old forms *tellen*, *weren*, &c. we have a sign of the plural number.

In the Modern English, the Old English, and the Anglo-Saxon, the peculiarities of our personal inflections are very great. This may be seen from the following tables of comparison :—

Present Tense, Indicative Mood.

Mœso-Gothic.

	1*st person.*	2*nd person.*	3*rd person.*
Singular.	Sôkja.	Sôkeis.	Sôkeiþ—*seek*.
Plural.	Sôkjam.	Sôkeiþ.	Sôkjand.

* Or *call-s*.

Present Tense, Indicative Mood.

Old High-German.

	1*st person.*	2*nd person.*	3*rd person.*
Singular.	Prennu.	Prennîs.	Prennit—*burn.*
Plural.	Prennames.	Prennat.	Prennant.

Icelandic.

Singular.	Kalla.	Kallar.	Kallar—*call.*
Plural.	Köllum.	Kalliþ.	Kalla.

Old Saxon.

Singular.	Sôkju.	Sôkîs.	Sôkîd—*seek.*
Plural.	Sôkjad.	Sôkjad.	Sôkjad.

Anglo-Saxon.

Singular.	Lufige.	Lufast.	Lufaƀ.
Plural.	Lufiaƀ.	Lufiaƀ.	Lufiaƀ.

Old English.

Singular.	Love.	Lovest.	Loveth.
Plural.	Loven.	Loven.	Loven.

Modern English.

Singular.	Love.	Lovest.	Loveth (or Loves).
Plural.	Love.	Love.	Love.

Herein remark; 1. the *Anglo*-Saxon addition of *t* in the second person singular; 2. the identity in form of the three persons of the plural number; 3. the change of *-aƀ*, into *-en* in the Old English plural; 4. the total absence of plural forms in the Modern English; 5. the change of the *th* into *s*, in *loveth* and *loves*.

§ 380. The present state of the personal inflection in English, so different from that of the older languages, has been brought about by two processes.

1. *Change of form.*—[a]) The ejection of *-es* in *-mes*, as in *sôkjam* and *köllum*, compared with *prennames;* [b]) the ejection of *-m*, as in the first person singular, almost throughout; [c]) the change of *-s* into *-r*, as in the Norse *kallar*, compared with the Germanic *sókeis;* [d]) the ejection of *-d* from *-nd*, as in *loven* (if this be the true explanation of that form) compared with *prennant;* [e]) the ejection of *-nd*, as in *kalla;* [f]) the addition of *-t*, as

in *lufast* and *lovest*. In all these cases we have a change of form.

2. *Confusion or extension.*—In vulgarisms like *I goes, I is,* one person is used instead of another. In vulgarisms like *I are, we goes,* one number is used instead of another. In vulgarisms like *I be tired,* or *if I am tired,* one mood is used instead of another. In vulgarisms like *I give* for *I gave,* one tense is used for another. In all this there is confusion. There is also extension: since, in the phrase *I is,* the third person is used instead of the first; in other words, it is used with an extension of its natural meaning. It has the power of the third person + that of the first. In the course of time one person may entirely supplant, supersede, or replace another. The application of this is as follows:—

The only person of the plural number originally ending in ð is the second; as *sókeiþ, prennat, kalliþ, lufiað*; the original ending of the first person being *-mes* or *-m,* as *prennames, sókjam, köllum.* Now, in Anglo-Saxon, the other two persons end in ð, as *lufiað.* Has *-m,* or *-mes,* changed to ð, or has the second person superseded the first? The latter alternative seems the likelier.

§ 381. The detail of the persons seems to be as follows:—

I call, first person singular.—The word *call* is not one person more than another. It is the simple verb, wholly uninflected. It is very probable that the first person was the one where the characteristic termination was first lost. In the Modern Norse language it is replaced by the second: *Jeg taler* = *I speak,* Danish.

Thou callest, second person singular.—The final *-t* appears throughout the Anglo-Saxon, although wanting in Old Saxon. In Old High-German it begins to appear in Otfrid, and is general in Notker. In Middle High-German and New High-German it is universal.—*Deutsche Grammatik,* i. 1041. 857.

He calleth or *he calls,* third person singular.—The *-s* in *calls* is the *-th* in *calleth,* changed. The Norse form *kallar* either derives its *-r* from the *-th* by way of change, or else the form is that of the second person replacing the first.

Lufiað, Anglo-Saxon, first person plural.—The second person in place of the first. The same in Old Saxon.

Lufiaƕ, Anglo-Saxon, third person plural.—Possibly changed from -ND, as in *sókjand*. Possibly the second person.

Loven, Old English.—For all the persons of the plural. This form may be accounted for in three ways: 1. The *-m* of the Mœso-Gothic and Old High-German became *-n*; as it is in the Middle and Modern German, where all traces of the original *-m* are lost. In this case the first person has replaced the other two. 2. The *-nd* may have become *-n*; in which case it is the third person that replaces the others. 3. The indicative form *loven* may have arisen out of a subjunctive one; since there was in Anglo-Saxon the form *lufion*, or *lufian*, subjunctive.

§ 382. *The person in* -T.—*Art, wast, wert, shalt, wilt.* Here the second person singular ends, not in *-st*, but in *-t*. A reason for this (though not wholly satisfactory) we find in the Mœso-Gothic and the Icelandic.

In those languages the form of the person changes with the tense, and the second singular of the præterite tense of one conjugation is not *-s*, but *-t*; as Mœso-Gothic, *svôr = I swore, svôrt = thou swarest, gráip = I griped, gráipt = thou gripedst*; Icelandic, *brannt = thou burnest, gaft = thou gavest*. In the same languages ten verbs are conjugated like præterites. Of these, in each language, *skal* is one.

Mœso-Gothic.

Singular.	*Dual.*	*Plural.*
1. Skal.	Skulu.	Skulum.
2. Skalt.	Skuluts.	Skuluþ.
3. Skall.	Skuluts.	Skulun.

Icelandic.

Singular.	*Plural.*
1. Skall.	Skulum.
2. Skalt.	Skuluƕ.
3. Skal.	Skulu.

§ 383. *Thou spakest, thou brakest, thou sungest.*—In these forms there is a slight though natural anomaly. The second singular præterite in A. S. was formed not in *-st*, but in *-e*; as þú *funde = thou foundest*, þú *sunge = thou sungest*. Hence,

the present English termination is derived from the present. Observe that this applies only to the præterites formed by changing the vowel—the *strong* præterites so-called. *Thou loved'st* is Anglo-Saxon as well as English, viz. *þú lufodest.*

Again, in A. S., the vowel of the plural of certain (so-called) strong præterites was different from that of the singular.

More than this—the vowel of the *second person singular* was *different* from that of the first and third, but the *same* as that of the plural. Hence—

Singular.	*Plural.*
1. Ic *sang*.	1. We *sungon*.
2. þu *sunge*.	2. Ge *sungon*.
3. He *sang*.	3. Hi *sungon*.

Is this difference still existing or is it obsolete? It is obsolete. The only persons who use the second person singular at all are the Quakers, and I have specially inquired of many of them whether they draw any distinction in respect to correctness or incorrectness between the form in *u* and the form in *a*. No one, however, has recognised it.

Thou sangest, then, is a form to the evolution of which two irregularities have contributed.

1. The vowel of the first and third persons displaced that of the third.

2. The *-est* of the present displaced the simple *-e* of the original præterite.

Probably, this adoption of the plural vowel in the singular second person, is only another result of the principle by which we say *you* for *thou*.

§ 384. In the northern dialects of the Anglo-Saxon the *-ð* of plurals like *lufiað* = *we love* becomes *-s*. In the Scottish this change was still more prevalent:

> The Scottes come that to this day
> *Havys*, and Scotland haldyn ay.
>
> WINTOUN, 11, 9, 73.

James I. of England ends nearly all his plurals in *-s*.

CHAPTER XXIV.

ON THE NUMBERS OF VERBS.

§ 385. THE inflection of the present tense, not only in Anglo-Saxon, but in several other languages as well, has been given in the preceding chapter. As compared with the present plural forms, *we love, ye love, they love,* both the Anglo-Saxon *we lufiaƀ, ge lufiaƀ, hi lufiaƀ,* and the Old English *we loven, ye loven, they loven,* have a peculiar termination for the plural number which the present language wants. In other words, the Anglo-Saxon and the Old English have a plural *personal* characteristic, whilst the Modern English has nothing to correspond with it.

The word *personal* is printed in italics. It does not follow, that, because there is no plural *personal* characteristic, there is also no plural characteristic.

There is no reason against the inflection of the word *love* running thus:—*I love, thou lovest, he loves; we lave, ye lave, they lave;* in other words, there is no reason against the vowel of the root being changed with the number. In such a case there would be no *personal* inflection, though there would be a plural, or a *numeral,* inflection.

Now, in Anglo-Saxon, with a great number of verbs such a plural inflection not only actually takes place, but takes place most regularly. It takes place, however, in the past tense only. And this is the case in all the Gothic languages as well as in Anglo-Saxon. Amongst the rest, in—

Mœso-Gothic.

Skáin, *I shone;* skinum, *we shone.*	Gab, *I gave;* gêbum, *we gave.*
Smáit, *I smote;* smitum, *we smote.*	At, *I ate;* étum, *we ate.*
Káus, *I chose;* kusum, *we chose.*	Stal, *I stole;* stêlum, *we stole.*
Láug, *I lied;* lugum, *we lied.*	Qvam, *I came;* qvêmum, *we came.*

Anglo-Saxon.

Arn, *I ran;* urnon, *we run.*
Ongan, *I began;* ongunnon, *we begun.*
Span, I *span;* spunnon, *we spun.*
Sang, *I sang;* sungon, *we sung.*
Swang, *I swang;* swungon, *we swung.*
Dranc, *I drank;* druncon, *we drunk.*
Sanc, *I sank;* suncon, *we sunk.*
Sprang, *I sprang;* sprungon, *we sprung.*
Swam, *I swam;* swummon, *we swum.*
Rang, *I rang;* rungon, *we rung.*

In all the Anglo-Saxon words, it may be remarked that the change is from *a* to *u,* and that both the vowels are short, or dependent. Also, that the vowel of the present tense is *i* short; as *swim, sing,* &c. The Anglo-Saxon form of *run* is *yrnan.*

In the following words the change is from the Anglo-Saxon *á* to the Anglo-Saxon *ī.* In English, the regularity of the change is obscured by a change of pronunciation.

Bát, *I bit;* biton, *we bit.* | Smát, *I smote;* smiton, *we smit.*

For the fact of the second person singular taking the vowel of the plural, see § 383.

CHAPTER XXV.

ON MOODS.

§ 386. The Anglo-Saxon infinitive has already been considered.

Between the second plural imperative, and the second plural indicative, *speak ye* and *ye speak*, there is no difference of form. Between the second singular imperative *speak*, and the second singular indicative *speakest*, there is a difference in form. Still, as the imperative form *speak* is distinguished from the indicative form *speakest*, by the negation of a character rather than by the possession of one, it cannot be said that there is in English any imperative mood.

If he speak, as opposed to *if he speaks*, is characterised by a negative sign only, and consequently is no true example of a subjunctive. *Be*, as opposed to *am*, in the sentence *if it be so*, is an uninflected word used in a limited sense, and consequently no true example of a subjunctive.

The only true subjunctive inflection in the English language is that of *were* and *wert*, as opposed to the indicative forms *was* and *wast*.

Indicative.		Subjunctive.	
Singular.	*Plural.*	*Singular.*	*Plural.*
1. I was.	We were.	If I were.	If we were.
2. Thou wast.	Ye were.	If thou wert.	If ye were.
3. He was.	They were.	If he were.	If they were.

CHAPTER XXVI.

ON TENSES IN GENERAL.

§ 387. The nature of tenses in general is best exhibited by reference to the Greek; since in that language they are more numerous, and more strongly marked than elsewhere.

In Greek τύπτω (*typtó*) = *I am beating*, ἔτυπτον (*etypton*) = *I was beating*; τύψω (*typsó*) = *I shall beat*; ἔτυψα (*etypsa*) = *I beat*; τέτυφα (*tetyfa*) *I have beaten*; ἐτετύφειν (*etetyfein*) = *I had beaten*. In these words we have, of the same mood, the same voice, and the same conjugation, six different tenses; whereas, in English, there are but two. The forms τέτυφα and ἔτυψα are so strongly marked, that we recognise them wheresoever they occur. The first is formed by a reduplication of the initial τ, and, consequently, may be called the reduplicate form. As a tense, it is called the perfect.

In the form ἔτυψα an ε is prefixed, and a σ is added. In the allied language of Italy the ε disappears, whilst the σ (*s*) remains. Ἔτυψα is said to be an aorist tense. *Scripsi* : *scribo* : : ἔτυψα : τύπτω.

Now in the Latin language a confusion takes place between these two tenses. Both forms exist. They are used, however, indiscriminately. The aorist form has, besides its own, the sense of the perfect. The perfect has, besides its own, the sense of the aorist. In the following pair of quotations, *vixi*, the aorist form, is translated *I have lived*, while *tetigit*, the perfect form, is translated *he touched*.

> *Vixi*, et quem dederat cursum Fortuna peregi;
> Et nunc magna mei sub terras ibit imago.—*Æn.* iv.
>
> Ut primum alatis *tetigit* magalia plantis.—*Æn.* iv.

When a difference of form has ceased to express a difference

of meaning, it has become superfluous. This is the case with the two forms in question. One of them may be dispensed with; and the consequence is, that, although in the Latin language both the perfect and the aorist forms are found, they are, with few exceptions, never found in the same word. Wherever there is the perfect, the aorist is wanting, and *vice versâ*. The two ideas *I have struck* and *I struck* are merged into the notion of past time in general, and are expressed by one of two forms, sometimes by that of the Greek perfect, and sometimes by that of the Greek aorist. On account of this the grammarians have cut down the number of Latin tenses; forms like *cucurri* and *vixi* being dealt with as one and the same tense. The true view is, that in *curro* the aorist form is replaced by the perfect, and in *vixi* the perfect form is replaced by the aorist.

§ 388. In the present English there is no undoubted perfect or reduplicate form. The form *moved* corresponds in meaning not with *τέτυφα* and *momordi*, but with *ἔτυψα* and *vixi*. Its sense is that of *ἔτυψα*, and not that of *τέτυφα*. The notion given by *τέτυφα* we express by the circumlocution I *have beaten*. We have no such form as *bebeat* or *memove*. In the Mœso-Gothic, however, there was a true reduplicate form; in other words, a perfect tense as well as an aorist. It is by the possession of this form that the verbs of the first six conjugations are characterized.

1st.	Falþa,	*I fold*	Fáifalþ,	*I have folded*, or *I folded*.
	Halda,	*I feed*	Háihald,	*I have fed*, or *I fed*.
	Haha,	*I hang*	Háihah,	*I have hanged*, or *I hanged*.
2nd.	Háita,	*I call*	Háiháit,	*I have called*, or *I called*.
	Láika,	*I play*	Láiláik,	*I have played*, or *I played*.
3rd.	Hláupa,	*I run*	Hláiláup,	*I have run*, or *I ran*.
4th.	Slêpa,	*I sleep*	Sáizlêp,	*I have slept*, or *I slept*.
5th.	Láia,	*I laugh*	Láilô,	*I have laughed*, or *I laught*.
	Sáija,	*I sow*,	Sáisô,	*I have sown*, or *I sowed*.
6th.	Grêta,	*I weep*	Gáigrôt,	*I have wept*, or *I wept*.
	Têka,	*I touch*	Táitôk,	*I have touched*, or *I touched*.

In Mœso-Gothic, as in Latin, the perfect forms have, besides their own, an aorist sense, and *vice versâ*.

In Mœso-Gothic, as in Latin, few (if any) words are found in both forms.

In Mœso-Gothic, as in Latin, the two forms are dealt with as a single tense; *láilô* being called the præterite of *láia*, and *svôr* the præterite of *svara*. The true view, however, is that, in Mœso-Gothic, as in Latin, there are two past tenses, each having a certain latitude of meaning, and each, in certain words, replacing the other.

The reduplicate form, in other words, the perfect tense, is current in none of the Gothic languages except the Mœso-Gothic. A trace of it is said to be found in the Anglo-Saxon, in the word *heht*, which is considered to be *hê-ht*, the Mœso-Gothic *háiháit*, *vocavi*.—(*Cambridge Philological Museum*, ii. 378.) *Did* from *do* is also considered to be a reduplicate form. (*See below*.)

§ 389. In the English language the tense corresponding in power with the Greek aorist and the Latin forms like *vixi*, is formed after two modes; 1, as in *fell*, *sang*, and *took*, from *fall*, *sing*, and *take*, by changing the vowel of the present; 2, as in *moved* and *wept*, from *move* and *weep*, by the addition of *d* or *t*; the *d* or *t* not being found in the original word, but being a fresh element added to it. In forms, on the contrary, like *sang* and *fell*, no addition being made, no new element appears. The vowel, indeed, is changed, but nothing is added. Verbs, then, of the first sort, may be said to form their prætérites out of themselves; whilst verbs of the second sort require something from without. To speak in a metaphor, words like *sang* and *fell* are comparatively independent. Be this as it may, the German grammarians call the tenses formed by a change of vowel the *Strong* tenses, the *Strong* verbs, the *Strong* conjugation, or the *Strong* order; and those formed by the addition of *d* or *t*, the *Weak* tenses, the *Weak* verbs, the *Weak* conjugation, or the *Weak* order. *Bound*, *spoke*, *gave*, *lay*, &c., are *Strong*; *moved*, *favoured*, *instructed*, &c., are *Weak*.

CHAPTER XXVII.

THE SO-CALLED STRONG PRÆTERITES.

§ 390. The Strong præterites are formed from the present by changing the vowel.

Present.	*Præterite.*	*Present.*	*Præterite.*
fall	fell	forget	forgot
befall	befell	eat	ate
hold	held	tread	trod
draw	drew	come	came
slay	slew	overcome	overcame
fly	flew	become	became
blow	blew	bid	bade
crow	crew	forbid	forbade
know	knew	give	gave
grow	grew	forgive	forgave
throw	threw	wake	woke
beat	beat	strike	struck
weave	wove	arise	arose
freeze	froze	abide	abode
steal	stole	smite	smote
speak	spoke	ride	rode
swear	swore	stride	strode
bear	bore	drive	drove
forbear	forbore	thrive	throve
tear	tore	strive	strove
wear	wore	write	wrote
break	broke	climb	clomb
shake	shook	bite	bit
take	took	*swim	swam
forsake	forsook	*begin	began
get	got	*spin	spun
beget	begot	win	won

Present.	*Præterite.*	*Present.*	*Præterite.*
*sing	sang	*shrink	shrunk
*spring	sprung	dig	dug
*sting	stung	stick	stuck
*ring	rang	run	ran
*wring	wrung	burst	burst
*fling	flung	bind	bound
*cling	clung	find	found
*string	strung	grind	ground
*sling	slung	wind	wound
*sink	sunk	choose	chose.
*drink	drank		

How far can these varied forms be reduced to rule? What are the divisions and sub-divisions of the so-called *Strong* class?

Before we consider this let us be sure that we have got the full amount of irregularity—real or apparent. Now we do not get this until we have noted a fact connected with those verbs of the above-given list which are marked with an asterisk.

To each and all of these there are (or have been at some earlier stage of the language) two præterites, one of which is formed in *a* (as *swam*), and the other in *u* (as *swum*), as—

Present.	*Præterite in a.*	*Præterite in u.*
sw*i*m	sw*a*m	sw*u*m
beg*i*n	beg*a*n	beg*u*n
s*i*ng	s*a*ng	s*u*ng
s*i*nk	s*a*nk	s*u*nk
dr*i*nk	dr*a*nk	dr*u*nk.

Such is the fact. Its explanation lies in the facts of chapter xxiv.

There we learn that in A. S. several præterites changed, in the plural, the vowel of their singular.

Singular.	*Plural.*
Ic s*a*ng = I s*a*ng	We s*u*ngon = We s*u*ng
Þu s*u*nge = Thou s*u*ngest	Ge s*u*ngon = Ye s*u*ng
He s*a*ng = He s*a*ng.	Hi s*u*ngon = They s*u*ng.

What inference is clearer than that the præterite in *a* comes

from the singular, and the præterite in *u* from the plural of the A. S. ?

Note.—In cases where but one form is preserved, that form is not necessarily the singular; indeed, it is often the plural; —*e. g.* Ic f*a*nd, *I found,* we f*u*ndon, *we found,* are the Anglo-Saxon forms. Now the present word *found* comes, not from the singular *fand,* but from the plural *fundon;* although, in the Lowland Scotch dialect and in the old writers, the *singular* form occurs :

> Donald Caird finds orra things,
> Where Allan Gregor *fand* the tings.—Scott.

The verbs wherein the double form of the present præterite is thus explained, fall into two classes.

1. In the first class, the Anglo-Saxon forms were *á* in the singular, and *i* in the plural; as—

Sing.	*Plur.*
sceán (*I shone*)	scinon (*we shone*)
arás (*I arose*)	arison (*we arose*)
smát (*I smote*).	smiton (*we smote*)

This accounts for—

Present.	*Præt. from Sing. form.*	*Præt. from Plur. form.*
rise	rose	*ris
smite	smote	smit
ride	rode	*rid
stride	strode	strid
slide	*slode	slid
chide	*chode	chid
drive	drove	*driv
thrive	throve	*thriv
write	wrote	writ
slit	*slat	slit
bite	*bat	bit.

2. In the second class, the Anglo-Saxon forms were *a* in the singular, and *u* in the plural; as—

* The forms marked thus * are either obsolete or provincial.

Sing.	*Plur.*
band	bundon (*we bound*)
fand	fundon (*we found*)
grand	grundon (*we ground*)
wand.	wundon (*we wound*).

This accounts for—

Present.	*Præt. from Sing. form.*	*Præt. from Plur. form.*
swim	swam	swum.
begin	began	begun
spin	*span	spun
sing	sang	sung
swing	*swang	swung
spring	sprang	sprung
sting	*stang	stung
ring	rang	rung
wring	*wrang	wrung
fling	flang	flung
string	*strang	strung
sink	sank	sunk
drink	drank	drunk
shrink	shrank	shrunk
stink	*stank	stunk
burst	*brast	burst
bind	*band	bound
find	*fand	found.

§ 391. The following double præterites are differently explained. The one *often* (but not *always*) is from the Anglo-Saxon *participle*, the other from the Anglo-Saxon *præterite*.

Present.	*Præterite in o.*	*Præterite in a.*
cleave	clove	*clave
steal	stole	*stale
speak	spoke	spake
swear	swore	sware
bear	bore	bare
tear	tore	*tare
wear	wore	*ware

Obsolete.

Present.	*Præterite in o.*	*Præterite in a.*
break	broke	brake
get	got	*gat
tread	trod	*trad
bid	bade	bid.

This is as much as need, at present, be said respecting the so-called Strong Præterites.

Whatever they are, they are anything but *Irregular*, as may be seen in chapter xxxiii., a chapter which, for the sake of convenience, finds its place after those on the Weak Præterites and the Participles.

* Obsolete.

CHAPTER XXVIII.

THE SO-CALLED WEAK PRÆTERITES.

§ 392. THE præterite tense of the so-called Weak Verbs is formed by the addition of *-d* or *-t*. If necessary, the syllable *-ed* is substituted for *-d*.

The current statement that the syllable *-ed*, rather than the letter *-d*, is the sign of the præterite tense, is true only in regard to the written language. In *stabbed, moved, bragged, whizzed, judged, filled, slurred, slammed, shunned, barred, strewed*, the *e* is a point of spelling only. In *language*, except in declamation, there is no second vowel sound. The *-d* comes in immediate contact with the final letter of the original word, and the number of syllables remains the same as it was before.

When, however, the original word ends in *-d* or *-t*, as *slight* or *brand*, then, and then only (and that not always), is there the addition of the syllable *-ed;* as in *slighted, branded*. This is necessary, since the combinations *slightt* and *brandd* are unpronounceable.

Whether the addition be *-d* or *-t* depends upon the flatness or sharpness of the preceding letter.

After *b, v, th* (as in *clothe*), *g*, or *z*, the addition is *-d*. This is a matter of necessity. We say *stabd, mȯvd, clȯthd, braggd, whizzd*, because *stabt, mȯvt, clȯtht, braggt, whizzt*, are unpronounceable.

After *l, m, n, r, w, y*, or a vowel, the addition is also *-d*. This is no matter of necessity, but simply the *habit* of the English language. *Filt, slurt, strayt*, &c. are as pronounceable as *filld, slurrd, strayd*, &c. It is the habit, however, of the English language to prefer the latter forms. All this, as

the reader has probably observed, is merely the reasoning concerning the *s*, in words like *father's*, &c., applied to another letter and to another part of speech.

§ 393. The verbs of the Weak conjugation fall into three classes. In the first there is the simple addition of *-d*, *-t*, or *-ed*.

Serve, served.	Dip, dipped (*dipt*)
Cry, cried.	Slip, slipped (*slipt*).
Betray, betrayed.	Step, stepped (*stept*).
Expel, expelled.	Look, looked (*lookt*).
Accuse, accused.	Pluck, plucked (*pluckt*).
Instruct, instructed.	Toss, tossed (*tost*).
Invite, invited.	Push, pushed (*pusht*).
Waste, wasted.	Confess, confessed (*confest*).

To this class belong the greater part of the Weak Verbs and all verbs of foreign origin.

In the second class, besides the addition of *-t* or *-d*, the vowel is *shortened*. It also contains those words which end in *-d* or *-t*, and at the same time have a short vowel in the præterite. Such, amongst others, are *cut*, *cost*, &c., where the two tenses are alike, and *bend*, *rend*, &c., where the præterite is formed from the present by changing *-d* into *-t*, as *bent*, *rent*, &c.

In the following list, the words ending in *-p* are remarkable; since, in Anglo-Saxon, each of them had, instead of a Weak, a Strong præterite.

Leave, left.	Creep, crept.
Cleave, cleft.	Sleep, slept.
Bereave, bereft.	Leap, lept.
Deal, deăl*t*.	Keep, kept.
Feel, fel*t*.	Weep, wept.
Dream, dreăm*t*.	Sweep, swept.
Lean, leăn*t*.	Lose, lost.
Learn, learn*t*.	Flee, fled.

In this class we sometimes find *-t* where the *-d* is expected; the forms being *left* and *dealt*, instead of *leaved* and *dealed*.

Third class.—In the second class the vowel of the present

tense was *shortened* in the præterite. In the third class it is *changed.*

Tell, told.	Sell, sold.
Will, would.	Shall, should.

To this class belong the remarkable præterites of the verbs *seek, beseech, catch, teach, bring, think,* and *buy,* viz. *sought, besought, caught, taught, brought, thought,* and *bought.* In all these, the final consonant is either *g* or *k,* or else a sound allied to those mutes. When the tendency of these sounds to become *h* and *y,* as well as to undergo further changes, is remembered, the forms in point cease to seem anomalous. In *wrought,* from *work,* there is a transposition. In *laid* and *said* the present forms make a show of regularity which they have not. The true original forms should be *legde* and *sægde,* the infinitives being *lecgan, secgan.* In these words the *i* represents the semi-vowel *y,* into which the original *g* was changed. The Anglo-Saxon forms of the other words are as follows:—

Byegan, bóhte.	Bringan, bróhte.
Sêcan, sóhte.	þencan, þóhte.

Wyrcan, wórhte.

§ 394. Out of the three classes into which the Weak Verbs in Anglo-Saxon are divided, only one takes a vowel before the *d* or *t.* The other two add the syllables *-te,* or *-de,* to the last letter of the original word. The vowel that, in one out of the three Anglo-Saxon classes, precedes *d* is *o.* Thus we have *lufian, lufode; clypian, clypode.* In the other two classes the forms are respectively *bærnan, bærnde;* and *tellan, tealde,* no vowel being found. The participle, however, as stated above, ended, not in *-de* or *-te,* but in *-d* or *-t;* and in two out of three classes it was preceded by a vowel, *gelufod, bærned, geteald.* Now in those conjugations where no vowel preceded the *d* of the præterite, and where the original word ended in *-d* or *-t,* a difficulty, which has already been indicated, arose. To add the sign of the præterite to a word like *eard-ian* (*to dwell*) was an easy matter, inasmuch as *eard-ian* was a word

belonging to the first class, and in the first class the præterite was formed in *-ode*. Here the vowel *o* kept the two *d*'s from coming in contact. With words, however, like *métan* and *sendan*, this was not the case. Here no vowel intervened; so that the natural præterite forms were *met-te*, *send-de*, combinations wherein one of the letters ran every chance of being dropped in the pronunciation. Hence, with the exception of the verbs in the first class, words ending in *-d* or *-t* in the root admitted no additional *d* or *t* in the præterite. This difficulty, existing in the present English as it existed in the Anglo-Saxon, modifies the præterites of most words ending in *-t* or *-d*.

In several words there is the actual addition of the syllable *-ed;* in other words *d* is separated from the last letter of the original word by the addition of a vowel; as *ended*, *instructed*, &c. Of this *e* two views may be taken.

1. It may be derived from the original *o* in *-ode*, the termination of the first class in Anglo-Saxon. This is the opinion which we form when the word in question is known to have belonged to the Anglo-Saxon language, and, in it, to the first class. *Ended*, *planted*, *warded*, *hated*, *heeded*, are (amongst others) words of this sort; their Anglo-Saxon forms being *endode*, *plantode*, *weardode*, *hatode*, and *eahtode*, from *endian*, *plantian*, *weardian*, *hatian*, and *eahtian*.

2. The form may be looked upon, not as that of the præterite, but as that of the participle in a transferred sense. This is the view when we have two forms, one with the vowel, and the other without it, as *bended* and *bent*, *wended* and *went*, *plighted* and *plight*.

In several words the final *-d* is changed into *-t*, as *bend*, *bent*; *rend*, *rent*; *send*, *sent*; *gild*, *gilt*; *build*, *built*; *spend*, *spent*, &c.

In several words the vowel of the root is changed; as *feed*, *fed*; *bleed*, *bled*; *breed*, *bred*; *meet*, *met*; *speed*, *sped*; *rēad*, *rĕad*, &c. Words of this last-named class cause occasional difficulty to the grammarian. No addition is made to the root, and, in this circumstance, they agree with the Strong Verbs. Moreover, there is a change of the vowel. In this

circumstance also they agree with the Strong Verbs. Hence with forms like *fed* and *led* we are in doubt as to the Conjugation. This doubt we have three means of settling.

1. *By the form of the Participle.*—The *-en* in *beaten* shows that the word *beat* is Strong.

2. *By the nature of the Vowel.*—The Weak form of *to beat* would be *bet*, after the analogy of *feed* and *rēad*. By some persons the word is pronounced *bet*, and with those who do so the word is Weak.

3. *By a knowledge of the Older forms.*—The A. S. form is *beáte, beot*. There is no such a Weak form as *beáte, bætte*. The præterite of *sendan* is *sende*, Weak. There is in A. S. no such form as *sand*, Strong.

In all this we see a series of expedients for separating the præterite form from the present, when the root ends with the same sound with which the affix begins.

The addition of the vowel takes place only in verbs of Class I.

The change from a long vowel to a short one, as in *feed, fed*, &c., can only take place where there is a long vowel to be changed.

Where the vowels are short, and, at the same time, the word ends in *d*, the *d* of the present may became *t* in the præterite. Such is the case with *bend, bent*.

Where there is no long vowel to shorten, and no *d* to change into *t*, the two tenses, of necessity, remain alike; such is the case with *cut, cost*, &c., &c.

Words like *planted, heeded*, &c. belong to Class I.; words like *feed, lead*, to Class II. *Bend* and *cut* belong also to the Second Class; they belong to it, however, by what may be called an etymological fiction. The vowel would be changed if it could.

§ 395. Certain *so-called* irregularities may now be noticed.—*Made, had.*—In these words there is nothing remarkable but the ejection of a consonant. The Anglo-Saxon forms are *macode* and *hæfde*, respectively.

Would, should, could.—It must not be imagined that *could* is in the same predicament with these words. In *will* and *shall*

the *-l* is part of the original word. This is not the case with *can*.

Yode.—Instead of *goed*, a regular præterite from *go*, now obsolete, and replaced by *went*, the præterite of *wend*,—*he wends his way—he went his way*. Except that the initial *g* has become *y*, and the *e* follows instead of preceding the *d* (a mere point of spelling), there is nothing peculiar in this word.

For *could*, *aught*, *minded*, and *did*, see the following chapters.

This is as much as need, at present, be said about the so-called Weak præterites.

Whatever they are, they are anything but *Irregular*, as may be seen in chapter xxxiii.

CHAPTER XXIX.

THE PRESENT PARTICIPLE.

§ 396. The present participle, called also the active participle and the participle in *-ing*, is formed from the original word by adding *-ing ;* as, *move, moving*. In the older languages the termination was more marked, being *-nd*. Like the Latin participle in *-ns*, it was originally declined. The Mœso-Gothic and Old High-German forms are *habands* and *hapêntêr* = *having*, respectively. The *-s* in the one language, and the *-êr* in the other, are the signs of the case and gender. In the Old Saxon and Anglo-Saxon the forms are *-and* and *-ande ;* as *bindand, bindande* = *binding*. In all the Norse languages, ancient and modern, the *-d* is preserved. So it is in the Old Lowland Scotch, and in many of the modern provincial dialects of England, where *strikand, goand,* is said for *striking, going*. In Staffordshire, where the *-ing* is pronounced *-ingg*, there is a fuller sound than that of the current English. In Old English the form in *-nd* is predominant, in Middle English the use fluctuates, and in New English the termination *-ing* is universal. In the Scotch of the modern writers we find the form *-in*.

> The rising sun o'er Galston muirs
> Wi' glorious light was glintin';
> The hares were hirplin' down the furs,
> The lav'rocks they were chantin'.
>
> Burns' *Holy Fair*.

It is with the oblique cases of the present participles of the classical languages, rather than with the nominative, that we

must compare the corresponding participle in Gothic; *e.g.* ἔχοντ-ος (*ekhontos*), Greek; *habent-is*, Latin; *hapênt-êr*, Old High-German.

§ 397. It has often been remarked that the participle is used in many languages as a substantive. This is true in Greek—

Ὁ πράσσων = *the actor*, when a male.
Ἡ πρασσοῦσα = *the actor*, when a female.
Τὸ πράττον = *the active principle of a thing*.

But it is also stated, that, in the English language, the participle is used as a substantive in a greater degree than elsewhere, and that it is used in several cases and in both numbers, *e. g.*—

Rising early is healthy.
There is health *in rising* early.
This is the advantage *of rising* early.
The *risings* in the North, &c.

Archbishop Whately has some remarks on this substantival power, in his Logic.

Some remarks of Mr. R. Taylor, in the Introduction to his edition of Tooke's "Diversions of Purley," modify this view. According to these, the *-ing* in words like *rising* is not the *-ing* of the present participle; neither has it originated in the Anglo-Saxon *-end*. It is rather the *-ing* in words like *morning*, which is anything but a participle of the non-existent verb *morn*, and which has originated in the Anglo-Saxon substantival termination *-ung*. Upon this Rask writes as follows:—"*Gitsung, gewilnung = desire; swutelung = manifestation; clænsung = a cleansing; sceawung = view, contemplation; eorðbeofung = an earthquake; gesomnung = an assembly.* This termination is chiefly used in forming substantives from verbs of the first class in *-ian*; as, *hálgung = consecration*, from *hálgian = to consecrate*. These verbs are all feminine."—*Anglo-Saxon Grammar*, p. 107.

Now, whatever may be the theory of the origin of the termination *-ing* in old phrases like *rising early is healthy*, it

cannot apply to expressions of recent introduction. Here the direct origin in *-ung* is out of the question.

The view, then, that remains to be taken of the forms in question is this:

1. That the older forms in *-ing* are substantival in origin, and = the Anglo-Saxon *-ung*.

2. That the latter ones are participial, and have been formed on a false analogy.

CHAPTER XXX.

THE PAST PARTICIPLE.

§ 398. The participle in *-en.* — In the Anglo-Saxon this participle was declined like the adjectives. Like the adjectives, it is, in the present English, undeclined.

In Anglo-Saxon it always ended in *-en*, as *sungen*, *funden*, *bunden*. In English this *-en* is often wanting, as *found*, *bound*; the word *bounden* being antiquated. Words where the *-en* is wanting may be viewed in two lights; 1, they may be looked upon as participles that have lost their termination; 2, they may be considered as præterites with a participial sense.

Drank, drunk, drunken.—With all words wherein the vowel of the plural differs from that of the singular, the participle takes the plural form. To say *I have drunk*, is to use an ambiguous expression; since *drunk* may be either a participle *minus* its termination, or a præterite with a participial sense. To say *I have drank*, is to use a præterite for a participle. To say *I have drunken*, is to use an unexceptionable form.

In all words with a double form, as *spake* and *spoke*, *brake* and *broke*, *clave* and *clove*, the participle follows the form in *o*, as *spoken*, *broken*, *cloven*. *Spaken*, *braken*, *claven*, are impossible forms. There are degrees in laxity of language, and to say *the spear is broke* is better than to say *the spear is brake*.

These two statements bear upon the future history of the præterite. That of the two forms *sang* and *sung*, one will, in the course of language, become obsolete, is nearly certain; and, as the plural form is also that of the participle, it is the plural form which is most likely to be the surviving one.

As a general rule, we find the participle in *-en* wherever the præterite is strong; indeed, the participle in *-en* may be called the strong participle, or the participle of the strong conjugation. Still the two forms do not always coincide. In *mow, mowed, mown; sow, sowed, sown;* and several other words, we find the participle strong, and the præterite weak. I remember no instances of the converse. This is only another way of saying that the præterite has a greater tendency to pass from strong to weak than the participle.

§ 399. In the Latin language the change from *s* to *r*, and *vice versâ*, is very common. We have the double forms *arbor* and *arbos*, *honor* and *honos*, &c. Of this change we have a few specimens in English. The words *rear* and *raise*, as compared with each other, are examples. In Anglo-Saxon a few words undergo a similar change in the plural number of the strong præterites.

Ceóse, *I choose;* ceâs, *I chose;* curon, *we chose;* gecoren, *chosen.*
Forleóse, *I lose;* forleás, *I lost;* forluron, *we lost;* forloren, *lost.*
Hreose, *I rush;* hreás, *I rushed;* hruron, *we rushed;* gehroren, *rushed.*

This accounts for the participial form *forlorn* or *lost*, in New High-German *verloren*. In Milton's lines,

> ——————— the piercing air
> Burns *frore*, and cold performs the effect of fire.
> *Paradise Lost*, b. ii.

we have a form from the Anglo-Saxon participle *gefroren* = *frozen.*

§ 400. The participle in *-d, -t,* or *-ed.*—In the Anglo-Saxon this participle was declined like the adjective. Like the adjective, it is, in the present English, undeclined.

In Anglo-Saxon it differed in form from the præterite, inasmuch as it ended in *-ed,* or *t,* whereas the præterite ended in *-ode, -de,* or *-te:* as *lufode, bærnde, dypte,* præterites; *gelufod, bærned, dypt,* participles.

As the ejection of the *e* reduces words like *bærned* and *bærnde* to the same form, it is easy to account for the present identity of form between the weak præterites and the participles in *-d*: *e. g. I moved, I have moved,* &c.

§ 401. In the older writers, and in works written, like Thomson's "Castle of Indolence," in imitation of them, we find prefixed to the præterite participle the letter *y-*, as *yclept* = *called*; *yclad* = *clothed*; *ydrad* = *dreaded*.

The following are the chief facts and the current opinion concerning this prefix:—

1. It has grown out of the fuller forms *ge-*: Anglo-Saxon, *ge-*: Old Saxon, *gi-*: Mœso-Gothic, *ga-*: Old High-German, *ka-*, *cha-*, *ga-*, *ki-*, *gi-*.

2. It occurs in each and all of the Germanic languages of the Gothic stock.

3. It occurs, with a few fragmentary exceptions, in none of the Scandinavian languages of the Gothic stock.

4. In Anglo-Saxon it occasionally indicates a difference of sense; as *hâten* = *called*, *ge*-hâten = *promised*; *boren* = *borne*, *ge*-boren = *born*.

5. It occurs in nouns as well as verbs.

6. Its power, in the case of nouns, is generally some idea of *association* or *collection*.—Mœso-Gothic, *sinþs* = *a journey*, *ga-sinþa* = *a companion*; Old High-German, *perc* = *hill*; *ki-perki* (*ge birge*) = *a range of hills*.

7. But it has also a *frequentative* power; a frequentative power which is, in all probability, secondary to its collective power: since things which recur frequently recur with a tendency to collection or association; Middle High-German, *ge-rassel* = *rustling*; *ge-rumpel* = *c-rumple*.

8. And it has also the power of expressing the possession of a quality.

Anglo-Saxon.	*English.*	*Anglo-Saxon.*	*Latin.*
feax	*hair*	*ge*-feax	*comatus*
heorte	*heart*	*ge*-heort	*cordatus*
stence	*odour*	*ge*-stence	*odorus*.

This power is also a collective, since every quality is associated with the object that possesses it: *a sea with waves* = *a wavy sea*.

9. Hence it is probable that the *ga-*, *ki-*, or *gi-*, Gothic, is the *cum* of Latin languages. Such is Grimm's view, as given in *Deutsche Grammatik*, i. 1016.

Concerning this, it may be said that it is deficient in an essential point. It does not show how the participle past is collective. Undoubtedly it may be said that every such participle is in the condition of words like *ge-feax* and *ge-heort*; *i. e.* that they imply an association between the object and the action or state. But this does not seem to be Grimm's view; he rather suggests that the *ge-* may have been a prefix to verbs in general, originally attached to all their forms, but finally abandoned everywhere except in the case of the participle. The theory of this prefix has yet to assume a satisfactory form.

§ 402. The most important verbs, wherein the præterite participle differs in form from the præterite tense are the following :—

Present.	*Præterite.*	*Participle.*
fall	fell	fallen
befall	befell	befallen
hold	held	holden
draw	drew	drawn
shew	shewed	shewn
slay	slew	slain
fly	flew	flown
blow	blew	blown
crow	crew	crown
know	knew	known
grow	grew	grown
throw	threw	thrown
beat	beat	beaten
weave	wove	woven
freeze	froze	frozen
steal	stole	stolen
speak	spoke	spoken
swear	swore	sworn
bear	bore	borne
bear	bare	born
forbear	forbore	forborne
tear	tore	torn
shear	shore	shorn
wear	wore	worn
break	broke	broken

Present.	*Præterite.*	*Participle.*
shake	shook	shaken
take	took	taken
forsake	forsook	forsaken
get	got	gotten
forget	forgot	forgotten
eat	ate	eaten
tread	trod	trodden
come	came	come
overcome	overcame	overcome
become	became	become
bid	bade *	bidden
forbid	forbade †	forbidden
give	gave	given
forgive	forgave	forgiven
arise	arose	arisen
smite	smote	smitten
ride	rode	ridden
stride	strode	stridden
drive	drove	driven
thrive	throve	thriven
strive	strove	striven
write	wrote	written
bite	bit	bitten

* Also *bid.*

* Also *forbid.*

CHAPTER XXXI.

CONSTITUTION OF THE PRÆTERITE FORMS.—THE SO-CALLED STRONG PRÆTERITE.

§ 403. When we ask how the method employed by the Angles and the other early Germans, of forming a certain number of præterites by changing the vowel of the present, came into use, we ask a question that has a twofold bearing. It bears, in the first instance, upon the special history of the German class of languages. But it does something besides. It suggests a point of Comparative Philology. How far is the method in question unique, or (if not unique) rare? How far is it a process distinctive of the German class of languages rather than one common to them and the allied tongues of the (so-called) Indo-European class?

If our answer to this latter question be to the effect that the process is peculiarly and exclusively German, and (as such) characteristic of the German tongues as opposed to the Classical and Sarmatian, all references to the Latin, the Greek, the Lithuanian, the Slavonic, or the Sanskrit become unnecessary.

Again, another effect of such an answer is to engender the idea that language in general is, *pro tanto*, so much the more irregular, and so much the less reducible to some general law of growth or development.

What, however, is our answer? It is to the effect that, though the particular form under notice be peculiar to the German tongues, the processes by which it is developed are those of certain of the allied languages other than German.

The most probable hypothesis as to the origin of the so-called Strong Præterites, is that they are the ordinary redupli-

cate forms of the Latin, Greek, Sanskrit, and Mœso-Gothic, *minus* the reduplication, and *plus* the accommodation of the vowel.

Such is the explanation of its *form*.

In respect to its power the remarks of chapter xxvi. find their application. It is, at the present time, more *aorist* than *perfect*; originally, it was more *perfect* than *aorist*.

Mutatis mutandis, the history of the *power* of words like *tetigi* and *cucurri*, is the history of the power of words like *fell* and *spoke*.

CHAPTER XXXII.

CONSTITUTION OF THE PRÆTERITE FORMS. — THE SO-CALLED WEAK PRÆTERITE.

§ 404. The remote origin of the weak præterite in *-d* or *-t*, has been considered by Grimm. He maintains that it is the *d* in *d-d*, the reduplicate præterite of *do*. In all the Gothic languages the termination of the past tense is either *-da*, *-ta*, *-de*, *ði*, *-d*, *-t*, or *-ed*, for the singular, and *-don*, *-ton*, *-tûmês*, or *-ðum*, for the plural; in other words, *d*, or an allied sound, appears once, if not oftener. In the *plural* præterite of the *Mæso-Gothic*, however, we have something more, viz. the termination *-dêdum*; as *nas-idêdum*, *nas-idêduþ*, *nas-idedun*, from *nas-ja*; *sôk-idêdum*, *sôk-idêduþ*, *sôk-idêdun*, from *sôk-ja*; *salb-ôdedum*, *salb-ôdêduþ*, *salb-ôdêdun*, from *salbô*. Here there is a second *d*. The same takes place with the dual form *salb-ôdêduts*, and with the subjunctive forms, *salb-ôdêdjan*, *salb-ôdéduts*, *salb-ôdedi*, *salb-ôdêdeits*, *salb-ôdêdeima*, *salb-ôdedeiþ*, *salb-ôdedina*. The English phrase, *we did salve*, as compared with *salb-ôdedum*, is confirmatory of this. (*D. G.* i. 1042.)

§ 405. Some remarks of Dr. Trithen's on the Slavonic præterite, in the "Transactions of the Philological Society," induce me to prefer a different doctrine, and to identify the *-d* in words like *moved*, &c., with the *-t* of the passive participles of the Latin language; as found in mon-*it*-us, voc-*at*-us, rap-*t*-us, and probably in Greek forms like τυφ-θ-εἰς.

1. The Slavonic præterite is commonly said to possess genders: in other words, there is one form for speaking of a past action when done by a male, and another for speaking of a past action when done by a female.

2. These forms are identical with those of the participles, masculine and feminine, as the case may be. Indeed the præterite is a participle. If, instead of saying *ille amavit*, the Latins said *ille amatus*, whilst, instead of saying *illa amavit*, they said *illa amata*, they would exactly use the grammar of the Slavonians.

3. Hence, as one class of languages, at least, gives us the undoubted fact of an active præterite being identical with a passive participle, and as the participle and præterite in question are nearly identical, we have a fair reason for believing that the *d*, in the English active præterite, is the *d* of the participle, which, in its turn, is the *t* of the Latin passive participle.

The following extract gives Dr. Trithen's remarks on the Slavonic verb in his own words:—

"A peculiarity which distinguishes the grammar of all the Slavish languages, consists in the use of the past participle, taken in an active sense, for the purpose of expressing the præterite. This participle generally ends in *-l*; and much uncertainty prevails both as to its origin and its relations, though the termination has been compared by various philologists with similar affixes in the Sanscrit, and the classical languages.

"In the Old Slavish, or the language of the church, there are three methods of expressing the past tense: one of them consists in the union of the verb substantive with the participle; as—

Rek esm'	. . .	*chital esmi"*
Rek esi"	. . .	*chital esi"*
Rek est'	. . .	*chital est.*

"In the corresponding tense of the Slavonic dialect we have the verb substantive placed before the participle:—

Ya sam imao	. .	*mi" smo imali*
Ti si imao	. .	*vi" ste imali*
On ye imao	. .	*omi su imali.*

"In the Polish it appears as a suffix:—

Czytalem	. . .	*czytalismy*
Czytales	. . .	*czytaliscie*
Czytal	. . .	*czytalie.*

"And in the Servian it follows the participle :—

Igrao sam	. . .	*igrali smo*
Igrao si	. . .	*igrali ste*
Igrao ye	. . .	*igrali su.*

"The ending *-ao*, of *igrao* and *imao*, stands for the Russian *al*, as in some English dialects *a'* is used for *all*."

CHAPTER XXXIII.

DEFECT AND IRREGULARITY.

§ 406. In the chapter upon the Strong Præterites, I went out of my way to state that, whatever those forms were, they were not *Irregular*. Nevertheless, in nine grammars out of ten they are called so.

The same caution against the habit of multiplying irregularities may be found amongst the remarks on the comparisons of adjectives.

The present chapter is devoted to the illustration of the same subject. The better the grammarian the fewer the irregularities of his grammar. If it were not so, the phenomena of language would scarcely be worth studying.

Now the pre-eminently *irregular* part of the ordinary grammars is the part that deals with the so-called Strong Verbs—not that there are no irregularities elsewhere, but that this is the great field for them; the field wherein language most especially runs riot, and least shows itself reducible to law.

The words that have hitherto served as illustrations are the personal pronouns *I* and *me*, and the adjectives *good*, *better*, and *best*.

The view of these words was as follows: viz. that none of them were irregular, but that they were all defective. *Me* wanted the nominative, *I* the oblique cases. *Good* was without a comparative, *better* and *best* had no positive degree.

Now *me* and *better* may be said to make good the defectiveness of *I* and *good;* and *I* and *good* may be said to replace the forms wanting in *me* and *better*. This gives us the principle of compensation. To introduce a new term, *I* and *me*, *good* and *better*, may be said to be complementary to each other.

What applies to nouns applies to verbs also. *Go* and *went* are not irregularities. *Go* is (at least in the present stage of our language) defective in the past tense. *Went* (at least in its current sense) is without a present. The two words, however, compensate their mutual deficiencies, and are to each other complementary.

The distinction between defectiveness and irregularity, is the first instrument of criticism for coming to true views concerning the proportion of the regular and irregular verbs.

§ 407. The second instrument of criticism in determining the irregular verbs, is the meaning that we attach to terms.

It is very evident that it is in the power of the grammarian to raise the number of etymological irregularities to any amount, by narrowing the definition of the word irregular; in other words, by framing an exclusive rule. The current rule of the common grammarians is that the præterite is formed *by the addition of* *-t*, or *-d*, or *-ed*. Now this position is sufficiently exclusive; since it proscribes not only the whole class of strong verbs, but also words like *bent* and *sent*, where *-t* exists, but where it does not exist as *an addition*. The regular forms, it may be said, should be *bended* and *sended*.

Exclusive, however, as the rule in question is, it is plain that it might be made more so. The regular forms might, by the *fiat* of a rule, be restricted to those in *-d*. In this case words like *wept* and *burnt* would be added to the already numerous list of irregulars.

Finally, a further limitation might be made, by laying down as a rule that no word was regular, unless it ended in *-ed*.

Thus much concerning the modes of making rules exclusive, and, consequently, of raising the amount of irregularities. This is the last art that the philosophic grammarian is ambitious of acquiring. True etymology reduces irregularity by making the rules of grammar not exclusive, but general. The *quantum* of irregularity is in the inverse proportion to the generality of our rules. In language itself there is no irregularity. The word itself is only another name for our

ignorance of the processes that change words; and, as irregularity is in the direct proportion to the exclusiveness of our rules, the exclusiveness of our rules is in the direct proportion to our ignorance of etymological processes.

§ 408. The explanation of some fresh terms will lead us towards (but not to) the definition of the word irregular.

1. *Vital and obsolete processes.*—The word *moved* is formed from *move*, by the addition of *-d*. The addition of *-d* is the process by which the present form is rendered præterite. The word *fell* is formed from *fall*, by changing *a* into *e*. The change of vowel is the process by which the present form is rendered præterite. Of the two processes the result is the same. In what respect do they differ?

For the sake of illustration, let a new word be introduced into the language. Let a præterite tense of it be formed. This præterite would be formed, not by changing the vowel, but by adding *-d*. No new verb ever takes a strong præterite. The like takes place with nouns. No new substantive would form its plural, like *oxen* or *geese*, by adding *-en*, or by changing the vowel. It would rather, like *fathers* and *horses*, add the lene sibilant.

Now, the processes that change *fall*, *ox*, and *goose* into *fell*, *oxen*, and *geese*, inasmuch as they cease to operate on the language in its present stage, are obsolete processes; whilst those that change *move* into *moved*, and *horse* into *horses*, operating on the language in its present stage, are vital processes.

A definition of the word irregular might be so framed as to include all words whose forms could not be accounted for by the vital processes. Such a definition would, in the present English, make words like *bent*, *sought*, &c. (the euphonic processes being allowed for), regular, and all the strong verbs irregular.

The very fact of so natural a class as that of the strong verbs being reduced to the condition of irregulars, invalidates such a definition as this.

2. *Processes of necessity as opposed to processes of habit.*—The combinations *-pd-*, *-fd-*, *-kd-*, *-sd-*, and some others, are unpronounceable. Hence words like *step*, *quaff*, *back*, *kiss*, &c.,

take after them the sound of *-t*; *stept*, *quafft*, &c. (the *sound* being represented), being their præterites, instead of *stepd*, *quaffd*. Here the change from *-d* (the natural termination) to *-t* is a matter (or process) of necessity. It is not so with words like *weep* and *wept*, &c. Here the change of vowel is not necessary. *Weept* might have been said if the habit of the language had permitted.

A definition of the word irregular might be so framed as to include all words whose natural form was modified by any euphonic process whatever. In this case *stept* (modified by a process of necessity), and *wept* (modified by a process of habit), would be equally irregular.

A less limited definition might account words regular as long as the process by which they are deflected from their natural form was a process of necessity. Those, however, which were modified by a process of habit it would class with the irregulars.

Definitions thus limited arise from ignorance of euphonic processes, or rather from an ignorance of the generality of their operation.

3. *Ordinary processes as opposed to extraordinary processes.* —The whole scheme of language is analogical. A new word introduced into a language takes the forms of its cases or tenses, &c., from the forms of the cases or tenses, &c., of the old words. The analogy is extended. Now few forms (if any) are so unique as not to have some others corresponding with them; and few processes of change are so unique as not to affect more words than one. The forms *wept* and *slept* correspond with each other. They are brought about by the same process; viz. by the shortening of the vowel in *weep* and *sleep*. The analogy of *weep* is extended to *sleep*, and *vice versâ*. Changing our expression, a common influence affects both words. The alteration itself is an ultimate fact. The extent of its influence is an instrument of classification. When processes affect a considerable number of words, they may be called ordinary processes; as opposed to extraordinary processes, which affect one or few words.

When a word stands by itself, with no other corresponding to it, we confess our ignorance, and say that it is affected by an

extraordinary process, by a process peculiar to itself, or by a process to which we know nothing similar.

A definition of the word irregular might be so framed as to include all words affected by extraordinary processes; the rest being considered regular.

4. *Positive processes as opposed to ambiguous processes.*—The words *wept* and *slept* are similarly affected. Each is changed from *weep* and *sleep* respectively; and we know that the process which affects the one is the process that affects the other also. Here there is a positive process.

Reference is now made to words of a different sort. The nature of the word *worse* is explained in § 362, and the reader is referred to the section. There the form is accounted for in two ways, of which only one can be the true one. Of the two processes, each might equally have brought about the present form. Which of the two it was, we are unable to say. Here the process is ambiguous.

A definition of the word irregular might be so framed as to include all words affected by ambiguous processes.

5. *Normal processes as opposed to processes of confusion.*—Let a certain word come under Class A. Let all words under Class A be similarly affected. Let a given word come under Class A. This word will be affected even as the rest of Class A is affected. The process affecting, and the change resulting, will be normal, regular, or analogical.

Let, however, a word, instead of really coming under Class A, *appear* to do so. Let it be dealt with accordingly. The analogy then is a false one. The principle of imitation is a wrong one. The process affecting is a process of confusion.

Examples of this (a few amongst many) are words like *songstress, theirs, minded,* where the words *songstr—, their—,* and *mind—,* are dealt with as roots, which they are not.

Ambiguous processes, extraordinary processes, processes of confusion—each, or all of these, are legitimate reasons for calling words irregular. The practice of etymologists will determine what definition is most convenient.

With extraordinary processes we know nothing about the word. With ambiguous processes we are unable to make a

choice. With processes of confusion we see the analogy, but, at the same time, see that it is a false one.

§ 409. *Approximate example of irregularity.*—The nearest approach to a real irregularity is the case of the word *could*.

With all persons who pronounce the *l* it is truly irregular. The A. S. form is *cuðe*. The *-l* is inserted by a process of confusion.

Can, cunne, canst, cunnon, cunnan, cuðe, cuðon, cuð—such are the remaining forms in A. S. None of them account for the *l*. The presence of the *l* makes the word *could* irregular. No reference to the allied languages accounts for it.

Notwithstanding this, the presence of the *l* is accounted for. In *would* and *should* the *l* has a proper place. It is part of the original words, *will* and *shall*. A false analogy looked upon *could* in the same light. Hence a true irregularity; *provided that the* L *be pronounced.*

The L, however, is pronounced by few, and that only in pursuance to the spelling. This reduces the word *could* to an irregularity, not of language, but only of orthography.

That the mere ejection of the *n* in *can*, and that the mere lengthening of the vowel, are not irregularities, we learn from a knowledge of the processes that convert the Greek ὄδοντος (*odontos*) into ὀδῶς (*odows*).

§ 410. *Example of defect.*—The verb *quoth* is truly defective. It is found in only one tense, one number, and one person. It is the third person singular of the præterite tense. It has the further peculiarity of preceding its pronoun. Instead of saying *he quoth*, we say *quoth he*. In A. S., however, it was not defective. It was found in the other tenses, in the other number, and in other moods. *Ic cweðe, þú cwyst, he cwyð. Ic cwæð, þú cwæðe, he cwæð, we cwædon, ge cwædon, hi cwædon.* Imperative, *cweð*. Participle, *gecweden*. In the Scandinavian it is current in all its forms. There, however, it means, not *to speak*, but, *to sing*. As far as its conjugation goes, it is strong. As far as its class goes, it follows the form of *speak, spoke*. Like *speak*, its A. S. form is in *æ*, as *cwæð*. Like one of the forms of *speak*, its English form is in *o*, as *quoth, spoke*.

The principle that I recognise for myself is to consider no

words irregular unless affected by ambiguous processes, or by processes of confusion. The words affected by extraordinary processes form a provisional class, which a future increase of our etymological knowledge may show to be regular. *Worse* and *could* (its spelling alone being considered) are the fairest specimens of our irregulars. The class, instead of filling pages, is exceedingly limited.

We get a partial commentary on this text in the following chapters.

CHAPTER XXXIV.

THE VERB SUBSTANTIVE.

§ 411. THE verb substantive is generally dealt with as an irregular verb. This is inaccurate. The true notion is, that the idea of *being* or *existing* is expressed, in the present language, by three different verbs, each of which is defective in some of its parts. The parts, however, that are wanting in one verb, are made up by the inflections of one of the others. There is, for example, no præterite of the verbs *be* and *am*, and no present of the verb *was*. The forms, however, that one word wants another supplies.

Was.—Defective, except in the præterite tense, where it is found both in the indicative and conjunctive.

INDICATIVE.		CONJUNCTIVE.	
Sing.	*Plur.*	*Sing.*	*Plur.*
1. Was.	Were.	1. Were.	Were.
2. Wast.	Were.	2. Wert.	Were.
3. Was.	Were.	3. Were.	Were.

Be.—In the present English its inflection is as follows:—

Present.

CONJUNCTIVE.		IMPERATIVE.	
Sing.	*Plur.*	*Sing.*	*Plur.*
Be.	Be.	—	—
—	Be.	Be.	Be.
Be.	Be.	—	—

Infin. To be. *Pres. P.* Being. *Past Part.* Been.

Note.—In the "Deutsche Grammatik," i. 1051, it is stated

that the Anglo-Saxon forms *beô, bist, biᵭ, beoᵭ,* or *beó,* have not a present, but a future sense; that whilst *am* means *I am, beó* means *I shall be;* and that in the older languages it is only where the form *am* is not found that *be* has the power of a present form. The same root occurs in the Slavonic and Lithuanic tongues with the same power; as, *esmi* = *I am; búsu* = *I shall be,* Lithuanic.—*Esmu* = *I am; buhshu* = *I shall be,* Livonian.—*Jesm* = *I am; budu* = *I shall be,* Slavonic.—*Gsem* = *I am; budu* = *I shall be,* Bohemian. This, however, proves, not that there is in Anglo-Saxon a future tense (or form), but that the word *beó* has a future sense. There is no fresh tense where there is no fresh form.

The following is a specimen of the future power of *beón* in Anglo-Saxon:—"*Hi ne* beóᵭ *na cílde, soᵭlice, on domesdæge, ac* beóᵭ *swa micele menn swa swa hi, migton beón gif hi full weoxon on gewunlicre ylde.*"—Ælfric's *Homilies.* "They *will not be* children, forsooth, on Domesday, but *will be* as much (so muckle) men as they might be if they were full grown (waxen) in customary age."

This is explained if we consider the word *beón* to mean not so much *to be* as to *become,* a view which gives us an element of the idea of futurity. Things which are *becoming anything* have yet something further to do. Again, from the idea of futurity we get the idea of contingency, and this explains the subjunctive power of *be.*

Am.—Of this form it should be stated, that the letter *-m* is no part of the original word. It is the sign of the first person, just as it is in all the Indo-European languages.

It should also be stated, that, although the fact be obscured, and although the changes be insufficiently accounted for, the forms *ám, art, are,* and *is,* are not, like *am* and *was,* parts of different words, but forms of one and the same word; in other terms, that, although between *am* and *be* there is no etymological connection, there is one between *am* and *is.* This we collect from the comparison of the Indo-European languages.

	1.	2.	3.
Sanskrit . . .	*Asmi.*	*Asi.*	*Asti.*
Zend	*Ahmi.*	*Asi.*	*Ashti.*

	1.	2.	3.
Greek	*Εἰμι.*	*Εἰς.*	*Εἰ.*
Latin	*Sum.*	*Es.*	*Est.*
Lithuanic . . .	*Esmi.*	*Essi.*	*Esti.*
Old Slavonic . . .	*Yesmy.*	*Yesi.*	*Yesty.*
Mœso-Gothic . . .	*Im.*	*Is.*	*Ist.*
Old Saxon . . .	—	**Is.*	*Ist.*
Anglo-Saxon . . .	*Eom.*	*Eart.*	*Is.*
Icelandic . . .	*Em.*	*Ert.*	*Er.*
English	*Am.*	*Art.*	*Is.*

In English and Anglo-Saxon the word is found in the present indicative only. In English it is inflected through both numbers: in A. S. in the singular number only. The A. S. plurals are forms of what appears, in German, as *seyn*, a word of which we have, in the present English, no vestiges.

Worth.—This is a fragment of the A. S. *weord-an* = *werd-en*, German, = *be, become.*

> Woe *worth* the chase, woe worth the day
> That cost thy life, my gallant grey.
>
> *Lady of the Lake.*

* Found rarely; *bist* being the current form.—*Deutsche Grammatik*, i. 894.

CHAPTER XXXV.

FURTHER CONSIDERATION OF THE SO-CALLED STRONG PRÆTERITES.

§ 412. THE previous chapters have been, more or less, general; the question with which they dealt being the meaning of the word *irregular*.

The present chapter, along with those that follow it, is of a different character.. It deals with the details of our more remarkable strong præterites and participles.

With some of the strong forms, the key to the apparent irregularity of a double præterite was found in the fact of the plural having supplied one form, and the singular another; but this only explained a part of the subject.

The consideration of the phenomena of defect and complement, and the difference between real and fictitious irregularities, carried us farther.

We may, however, go farther still.

The first series of facts to which we now refer in our attempts at the arrangement of the so-called Strong Verbs, according to the divisions and sub-divisions of the great class to which they belong, lie in the older stages of our own languages, and the older allied dialects—pre-eminent among which stand the Mœso-Gothic and the Anglo-Saxon; the Anglo-Saxon for its special relations to the English, the Mœso-Gothic from its antiquity. The chief repertorium of examples is, as may be anticipated, the "Deutsche Grammatik." An abstract of the doctrines of that great work may be found in the second volume of the "Philological Museum"

(pp. 372–388); an able abstract, and something more, viz. some valuable criticism of the author's (Mr. Kemble). To this the English reader is referred.

If we look to the possible combinations that a certain number of (say) ten vowels, and a certain number of (say) twenty consonants, are capable of supplying, we shall get a prodigiously high number.

We shall not, however, do so if we look to what actually takes place.

The actual roots of the German verbs that end in a vowel, followed by *one* consonant, as they appear in the Mœso-Gothic, are all reducible to one of the following combinations —combinations which are grouped and numbered, for a reason which will soon be made manifest—(1.) *al. am. an. ar. ap. ab. af. at. ad. aþ. as. ak. ag. ah.* (2.) *il. im. in. aír* (= *er*). *ip. ib. if. iv. it. id. iþ. is. ik. ig. aíh* (= *ih*). (3.) *ul. um. un. aúr* (= *ur*). *up. ub. uf. uv. ut. ud. uþ. us. uk. ug. aúh* (= *uh*). (4.) *êl. êm. én. êr. êp. êb. êf. êt. êd. êþ. és. êk. êg. êh.* (5.) *ôl. ôn. ór. ôp. ôb. ôf. ôt. ód. óþ. ôk. ôg. óh.* (6.) *áim. áin. áip. áib. áif. áiv. áit. áid. áiþ. áis. áik. áig. áih.* (7.) *áup. áub. áuf. áuv. áut. áud. áuþ. áus. áuk. áug. áuh.* (8.) *eim. ein. eip. eib. eif. eiv. eit. eid. eiþ. eis. eik. eig. eih.* (9.) *iup. iub. iuf. iuv. iut. iud. iuþ. ius. iuk. iug. iuh.*

And what is the case where the combination consists of a vowel followed by *two* consonants?

1. In the first place, the vowel so followed is always one of the following three, *a*, *i*, or *u*—not *o*, nor yet the German *ö*, nor yet *ü*.

2. In the second, the vowel (*a*, *i*, or *u*, as the case may be) is always short—a fact for which we are prepared by our knowledge of the chief phenomena of Phonêsis.

3. In the third, the consonant combinations are limited to the following—*ll. mm. nn. rr. pp. tt. kk. lm. lp. lb. lf. lv. lt. ld. lþ. ls. lk. lg. lh. mp. mb. mf. ms. nt. nd. nþ. ns. nk. ng. rm. rn. rp. rb. rf. rt. rd. rþ. rs. rk. rg. rh. ft. fs. zd. zg. sp. st. sk. ht. hs.*

Altogether, we have, in the Mœso-Gothic, *twelve* classes.

In the first four of these twelve Mœso-Gothic classes the

præterite is formed by reduplication—simple reduplication, *the vowel being unaltered.*

In the two next, the reduplication is continued, *the vowel being altered.*

In the last six the vowel is altered, but the reduplication is non-existent.

The following table illustrates this:—

PRESENT.	PAST.		PARTICIPLE.	
	Sing.	*Plur.*		
1. Salta	Sáisalt	Sáisaltum	Saltans	*Leap.*
2. Háita	Háiháit	Háiháitum	Háitans	*Call.*
3. Stáut-a	Stái-stáut	Stái-staúpum	Stáutans	*Strike.*
4. Slêpa	Sáizlêp	Sáislêpum	Slêpans	*Sleep.*
5. Láia	Láilô	Láilôum	Láilans	*Laugh.*
6. Grêta	Gáigrôt	Gáigrôtum	Grêtans	*Weep.*
7. Svara	Svôr	Svôrum	Svarans	*Swear.*
8. Greipa	Gráip	Gripum	Gripans	*Gripe.*
9. Biuda	Báuþ	Budum	Budans	*Offer.*
10. Giba	Gab	Gêbum	Gibans	*Give.*
11. Stila	Stal	Stêlum	Stulans	*Stole.*
12. Rinna	Rann	Runnum	Runnans	*Run.*

Exhibited more compendiously, the changes of the vowels in Mœso-Gothic are as follows:—

Prs.	*Pst. S.*	*Pst. Pl.*	*Part.*	*Prs.*	*Pst. S.*	*Pst. Pl.*	*Part.*
1. a	a	a	a	7. a	ô	ô	a
2. ái	ái	ái	ái	8. ei	ái	i	i
3. áu	áu	áu	áu	9. iu	áu	u	u
4. ê	ê	ê	ê	10. i	a	ê	i
5. ái	ô	ô	ai	11. i	a	ê	u
6. ê	ô	ô	ê	12. i	a	u	u

§ 413. With these preliminaries we may follow Mr. Kemble in comparing the A. S. with the Mœso-Gothic—the oldest English with the oldest German, the earlier insular with the earliest continental, forms. The six first groups, though ceasing to be reduplicate, have not ceased to be regular.

PRESENT.	PAST. *Sing.*	PAST. *Plur.*	PARTICIPLE.	
1. Fëalle	Fëol	Fëollon	Feallen	*Fall.*
2. Swâpe	Swëôp	Swëôpon	Swâpen	*Sweep.*
3. Hleápe	Hlëôp	Hlëôpon	Hleápen	*Leap.*
4. Slæpe	Slêp	Slêpon	Slæpen	*Sleep.*
5. Blâwe	Blëôw	Blëôwon	Blâwen	*Blow.*
6. ——	——	——	——	——
7. Far-e	Fôr	Fôr-on	Far-en	*Fare.*
8. Bîd-e	Bâd	Bid-on	Bid-en	*Bide.*
9. Crëópe	Creáp	Crup-on	Crop-en	*Creep.*
10. Swëf-e	Swäf	Swæfon	Swëf-en	*Slumber.*
11. Nim-e	Nam	Nâm-on	Nom-en	*Take.**
12. Hëlp-e	Hëalp	Hulpon	Holp-en	*Help.*

§ 414. For the Old English, Mr. Kemble gives us the following tables:—

Infinitive.	*Præterite.*	*Participle.*
1. Fallen	Fëol	Fallen.
2. Hâten	Haihte Heihte Hâte Hôte	Hâten. Hôten.
3. Hleápen	Hlêp hlëôp (hlup)	Hleápen.
4. Slæpen	Slêp	Slæpen.
5. Blâwen	Blêw blëôw	Blâwen. Blôwen.

and in the six last—

7. Slajen	Slôj (slôh)	Islajen. (slawen)
Faren	Fôr	I-faren.
8. Drîfen	Drâf	I-driven.
Rîden	Râd	Riden.
9. For-lëôse	For-lëás	For-loren.
10. Queðen	Quað	Iqueðen.
11. Cumen Comen	Com Cume	Icumen. Icomen.
12. Finden	Funde	I-funden.
Ginnen	Gan Gon	I-gunnen.

* *Nim* = *take* in Shakspere, &c.

The sixth (A. S.) seems to have gone entirely over in the fourth—*græte, grêt, grêton, græten = weep.*

§ 415. There is clearly a considerable amount of agreement between the three languages (or, more correctly, between the Mœso-Gothic and the two forms of the English) in respect to the regularity with which the vowels of any one of them either absolutely reappear in the other two, or (failing to do this) are replaced after a systematic and regular fashion. On the other hand, there is a certain amount of difference. The Mœso-Gothic variations lie within narrower limits than the Anglo-Saxon, the Anglo-Saxon within narrower limits than the Old English.

The later the stage of a given language, the less complete is the coincidence of its classes. This is what the tables before us indicate, and what all further investigation confirms.

In what does this coincidence consist?

For a full and perfect coincidence three things are necessary:—1. the coincidence of form; 2. the coincidence of distribution; 3. the coincidence of order.

1. *Coincidence of form.*—Compared with the Mœso-Gothic *rinna, rann, runnum, runnans*, the Old High-German inflection coincides most rigidly; *e. g. rinnu, ran, runnumês, runnanér.* The vowel is the same in the two languages, and it is similarly changed in each. It is very evident that this might be otherwise. The Mœso-Gothic *i* might have become *e*, or the *u* might have become *o*. In this case, the formula for the two languages would not have been the same. Instead of *i, a, u, u* serving for the Old High-German as well as the Mœso-Gothic, the formula would have been, for the Mœso-Gothic, *i, a, u, u*, and for the Old High-German *e, a, u, u*, or *i, a, o, o*. The forms in this latter case would have been equivalent, but not the same.

2. *Coincidence of distribution.*—A certain number of words in the Mœso-Gothic form their præterites by changing *i* into *a*; in other words, a certain number of verbs in Mœso-Gothic are inflected like *rinna* and *rann*. The same is the case with the Old High-German. Now if these words are the same in the two languages, the Mœso-Gothic and the Old High-Ger-

man (as far as the agreement extends) coincide in the distribution of their verbs; that is, the same words are arranged in the same class, or (changing the phrase) are distributed alike.

3. *Coincidence of order.*—The conjugation to which the Mœso-Gothic words *rinna* and *rann* belong is the twelfth. The same is the case in Old High-German. It might, however, have been the case that in Old High-German the class corresponding with the twelfth in Mœso-Gothic was the first, second, third, or any other.

Now a coincidence of form, a coincidence of distribution, and a coincidence of order, in all the classes of all the Gothic languages, is more than can be expected. If such were the case, the tenses would be identical throughout.

Coincidence of form is infringed upon by the simple tendency of sounds to change. *Hilpa* in Mœso-Gothic is *helpe* in Anglo-Saxon: *hulpans* in Mœso-Gothic is *holpanêr* in Old High-German, and *holpen* in Anglo-Saxon. A change, however, of this sort is insufficient to affect the arrangement. *Helpan*, in Anglo-Saxon, is placed in the same class with *spinnan*; and all that can be said is, that the Mœso-Gothic *i* is, in Anglo-Saxon, represented not by *i* exclusively, but sometimes by *i* and sometimes by *ĕ*.

Coincidence of distribution is of great etymological importance. A word may in one stage of a language take the form of one conjugation, and in another that of another. The word *climban* is, in Anglo-Saxon, placed in the same conjugation with *drincan*, &c. For this there was a reason; viz. the fact of the *i* being *short*. For the *i* being short there was a reason also. The *b* preceded the vowel *a*, and consequently was sounded. This was the case whether the word was divided *clim-ban* or *climb-an*. *An*, however, was no part of the original word, but only the sign of the infinitive mood. As such it became ejected. The letter *b* then came at the end of the word; but as the combination *mb*, followed by nothing, was unstable, *b* was soon lost in pronunciation. Now *b* being lost, the vowel which was once short became lengthened, or rather it became the sound of the diphthong *ei*; so that the word was no longer called *climb*, but *clime*. Now the words that follow the analogy of *spin*, *span*, &c. (and consequently consti-

tute the twelfth class), do so, not because the vowel is *i*, but because it is a short *i*; and when the *i* is sounded like a diphthong, the præterite is formed differently. The Anglo-Saxon præterite of *climban* was sounded *clŏmm*, and rhymed to *from*; the English præterite (when strong) of *climb* is sounded *clōmbe*, rhyming to *roam*. The word *climb*, which was once classed with *spin* and *sing*, is now to be classed with *arise* and *smite*; in other words, it is distributed differently.

Coincidence in the order of the classes is violated when a class which was (for instance) the third in one language becomes, in another language, the fourth, &c. In Mœso-Gothic the class containing the words *smeita*, *smáit*, *smitum*, *smitans*, is the eighth. This is a natural place for it. In the class preceding it, the vowel is the same in both numbers. In the classes that follow it, the vowel is changed in the plural. The number of classes that in Mœso-Gothic change the vowel is five; viz. the eighth, ninth, tenth, eleventh, and twelfth. Of these the eighth is the first. The classes where the change in question takes place form a natural subdivision, of which the eighth class stands at the head. Now in Anglo-Saxon the vowel is not changed so much as in the Mœso-Gothic. In words like *choose*, *give*, and *steal*, the vowel remains unaltered in the plural. In Mœso-Gothic, however, these words are, respectively, of the ninth, tenth, and eleventh classes. It is not till we get to the eleventh that the Anglo-Saxon plurals take a fresh vowel. As the presence or absence of a change of vowel naturally regulates the order of the classes, the eighth class in Mœso-Gothic becomes the eleventh in Anglo-Saxon. If it were not so, the classes where a change took place in the plural would be separated from each other.

§ 416. The later the stage of the language, the more numerous are the complexities of the Strong Conjugation. And there are other complications (in the present English, at least) besides.

Sometimes we have to allow for the difference between the spelling and the speaking.

Sometimes a provincial mode of sounding the vowel will give us an agreement with the older forms that the literary language disguises. Thus when—

Break is pronounced *Breek*,
Bear — *Beer*,
Tear — *Teer*,
Swear — *Sweer*,
Wear — *Weer*,

as they actually are by many speakers, they come in the same class with—

Speak pronounced *Speek*,
Cleave — *Cleeve*,

and form their præterite by means of a similar change, *i. e.* by changing the sound of the *ee* in *feet* (spelt *ea*) into that of the *a* in *fate*.

Again, *tread* is usually pronounced *tredd*, but many provincial speakers say *treed*, and so said the Anglo-Saxons, whose form was *ic trede* = *I tread*. Their præterite was *træd*.

The following divisions give us the classification of the strong verbs of the English language of the nineteenth century.

First Class.

Contains the two words *fall* and *fell*, *hold* and *held*, where the sound of *o* is changed into that of *ĕ*. Here must be noticed the natural tendency of *a* to become *o*; since the forms in Anglo-Saxon are, *Ic fealle*, I fall; *Ic feoll*, I fell; *Ic healde*, I hold; *Ic heold*, I held.

Second Class.

Here the præterite ends in *-ew*. Words of this class are distinguished from those of the third class by the different form of the present tense.

Present.	*Præterite.*
Draw	Drew.
Slay	Slew.
Fly	Flew.

In these words the *w* has grown out of a *g*, as may be seen from the Anglo-Saxon forms. The word *see* (*saw*) belongs to this class; since, in Anglo-Saxon, we find the forms *geseáh* and *gesegen*, and in the Swedish the præterite form is *såg*.

Third Class.

Here an *o* before *w*, in the present, becomes *e* before *w* in the præterite; as—

Present.	*Præterite.*	*Present.*	*Præterite.*
Blow	Blew.	Know	Knew.
Crow	Crew.	Grow	Grew.
Throw	Threw.		

Fourth Class.

Contains the single word *let*, where a short *e* in the present remains unchanged in the præterite. In the Anglo-Saxon the present form was *Ic læte*, the præterite *Ic lét*.

Fifth Class.

Contains the single word *beat*, where a long *e* remains unchanged. In Anglo-Saxon the forms were *Ic beate, Ic beot.*

Sixth Class.

Present *come*, præterite *came*, participle *come*. In Anglo-Saxon, *cume, com, cumen.*

Seventh Class.

In this class we have the sounds of the *ee*, in *feet*, and of the *a* in *fate* (spelt *ea* or *a*), changed into *o* or *oo*. Several words in this class have a second form in *a*.

Present.	*Præterite in o.*	*Præterite in a.*
Heave	*Hove	—
Cleave	Clove	*Clave.
Weave	Wove	—
Freeze	Froze	—
Steal	Stole	*Stale.
Speak	Spoke	Spake.
Swear	Swore	Sware.
Bear	Bore	Bare.
Tear	Tore	*Tare.
Shear	*Shore	—
Wear	Wore	*Ware.
Break	Broke	Brake.
Shake	Shook	—
Take	Took	—
Forsake	Forsook	—
Staud	Stood	—
—	Quoth	—
Get	Got	*Gat.

* Obsolete or provincial.

The præterite of *stand* was originally long. This we collect from the spelling, and from the Anglo-Saxon form *stód.*

All the words with secondary forms will appear again in the eighth class.

Eighth Class.

In this class the sounds of the *i* in *fit*, the *ee* in *feet*, and the *a* in *fate*, (spelt *ea*), are changed into *a.* Several words of this class have secondary forms. Further details may be seen in the remarks that come after the following list of verbs.

Present.	*Præterite in a.*	*Præterite in o.*
Speak	Spake	Spoke.
Break	Brake	Broke.
Cleave	*Clave	Clove.
Steal	*Stale	Stole.
Eat	Ate	—
Seethe	—	*Sod.
Tread	*Trad	Trod.
Bear	Bare	Bore.
Tear	Tare	Tore.
Swear	Sware	Swore.
Wear	*Ware	Wore.
Bid	Bade	Bid.
Sit	Sate	—
Give	a	—
Lie	L y	—
Get	*Gat	Got.

Here observe,—1. That in *speak, cleave, steal*, the *ea* has the same power with the *ee* in *freeze* and *seethe ;* so that it may be dealt with as the long (or independent) sound of the *i* in *bid, sit, give.*

2. That the same view may be taken of the *ea* in *break*, although the word by some persons is pronounced *brake. Ga-brika, gabrak*, Mœso-Gothic ; *briku, brak*, Old Saxon ; *brece, brac*, Anglo-Saxon. Also of *bear, tear, swear, wear.* In the provincial dialects these words are even now pronounced *beer, teer, sweer.* The forms in the allied languages are, in respect

* Obsolete or provincial.

to these last-mentioned words, less confirmatory; Mœso-Gothic, *svara, báira;* Old High-German, *sverju, piru.*

3. That the *ea* in *tread* was originally long; Anglo-Saxon, *tredan, trede, træ'd, treden.*

4. *Lie.*—Here the sound is diphthongal, having grown out of the Anglo-Saxon forms *licgan, læ'g, legen.*

5. *Sat.*—The original præterite was long. This we collect from the spelling *sate,* and from the Anglo-Saxon *sæ't.*

Ninth Class.

A, as in *fate,* is changed either into the *o* in *note,* or the *oo* in *book.* Here it should be noticed that, unlike *break* and *swear,* &c., there is no tendency to sound the *a* of the present as *ee,* neither is there, as was the case with *clove* and *spoke,* any tendency to secondary forms in *a.* A partial reason for this lies in the original nature of the vowel. The original vowel in *speak* was *e.* If this was the *é fermé* of the French, it was a sound from which the *a* in *fate* and the *ee* in *feet* might equally have been evolved. The vowel sound of the verbs of the present class was that of *a* for the present and that of *ó* for the præterite forms; as *wace, wóc, grafe, gróf.* Now of these two sounds it may be said that the *a* has no tendency to become the *ee* in *feet,* and that the *ó* has no tendency to become the *a* in *fate.*

The sounds that are evolved from the accentuated *ó,* are the *o* in *note* and the *oo* in *book.*

Present.	*Præterite.*	*Present.*	*Præterite.*
Awake	Awoke.	Take	Took.
Wake	Woke.	Shake	Shook
Lade	*Lode.	Forsake	Forsook.
Grave	*Grove.	Shape	*Shope.

Tenth Class.

Containing the single word *strike, struck, stricken.* It is only in the Middle High-German, the Middle Dutch, the New

* Obsolete or provincial.

High-German, the Modern Dutch, and the English, that this word is found in its præterite forms. These are, in Middle High-German, *streich*; New High-German, *strich*; Middle Dutch, *strêc*; Modern Dutch, *strîk*. Originally it must have been referable to the ninth class.

Eleventh Class.

In this class we first find the secondary forms accounted for by the difference of form between the singular and plural numbers. The change is from the *i* in *bite* to the *o* in *note*, and the *i* in *pit*. Sometimes it is from the *i* in *bit* to the *a* in *bat*. The Anglo-Saxon conjugation (A) may be compared with the present English (B).

A.

Present.	*Præterite Sing.*	*Præterite Plur.*
Scine (*shine*)	Sceán (*I shone*)	Scinon (*we shone*).
Arise (*arise*)	Arás (*I arose*)	Arison (*we arose*).
Smite (*smite*)	Smát (*I smote*)	Smiton (*we smite*).

B.

Present.	*Præt.—Sing. form.*	*Præt.—Plur. form.*
Rise	Rose	*Ris.
Abide	Abode	—
Shine	Shone	—
Smite	Smote	Smit.
Ride	Rode	*Rid.
Stride	Strode	Strid.
Slide	*Slode	Slid.
Glide	*Glode	—
Chide	*Chode	Chid.
Drive	Drove	*Driv.
Thrive	Throve	*Thriv.
Strive	Strove	—
Write	Wrote	Writ.
Climb	Clomb	—
Slit	*Slat	Slit.
Bite	*Bat	Bit.

* Obsolete or provincial.

On this list we may make the following observations and statements.

1. That, with the exception of the word *slit*, the *i* is sounded as a diphthong.

2. That, with the exception of *bat* and *slat*, it is changed into *o* in the singular and into *ĭ* in the plural forms.

3. That, with the exception of *shone*, the *o* is always long (or independent).

4. That, even with the word *shone*, the *o* was originally long. This is known from the final *-e* mute, and from the Anglo-Saxon form *scéan*; Mœso-Gothic, *skáin*; Old Norse, *skein*.

5. That, the *o*, in English, represents an *á* in Anglo-Saxon.

6. That the statement last made shows that even *bat* and *slat* were once in the same condition with *arose* and *smote*, the Anglo-Saxon forms being *arás*, *smát*, *bát*, *slát*.

Twelfth Class.

In this class *i* is generally short; originally it was always so. In the singular form it becomes *ă*, in the plural, *ŭ*.

Present.	*Præt.—Sing. form.*	*Præt.—Plur. form.*
Swim	Swam	Swum.
Begin	Began	Begun.
Spin	*Span	Spun.
Win	*Wan	†Won.
Sing	Sang	Sung.
Swing	*Swang	Swung.
Spring	Sprang	Sprung.
Sting	*Stang	Stung.
Ring	Rang	Rung.
Wring	*Wrang	Wrung.
Fling	Flang	Flung.
Cling	—	Clung.
*Hing	Hang	Hung.
String	*Strang	Strung.
Sling	—	Slung.
Sink	Sank	Sunk.
Drink	Drank	Drunk.

* Obsolete or provincial.

† Sounded *won*.

Present.	*Præt.—Sing. form.*	*Præt.—Plur. form.*
Shrink	Shrank	Shrunk.
Stink	*Stank	Stunk.
Swink	—	—
Slink	—	Slunk.
Swell	Swoll	—
Melt	*Molt	—
Help	*Holp	—
Delve	*Dolv	—
Dig	—	Dug.
Stick	*Stack	Stuck.
Run	Ran	Run.
Burst	—	Burst.
Bind	Band	Bound.
Find	*Fand	Found.
Grind	—	Ground.
Wind	—	Wound.

Upon this list we make the following observations and statements :—

1. That, with the exceptions of *bind*, *find*, *grind*, and *wind*, the vowels are short (or dependent) throughout.

2. That, with the exception of *run* and *burst*, the vowel of the present tense is either *i* or *e*.

3. That *i* short changes into *a* for the singular, and into *u* for the plural forms.

4. That *e* changes into *o* in the singular forms; these being the only ones preserved.

5. That the *i* in *bind*, &c., changes into *ou* in the plural forms; the only ones current.

6. That the vowel before *m* or *n* is, with the single exception of *run*, always *i*.

7. That the vowel before *l* and *r* is, with the single exception of *burst*, always *e*.

8. That, where the *i* is sounded as in *bind*, the combination following is *-nd*.

9. That *ng* being considered as a modification of *k* (the Norse and Mœso-Gothic forms being *drecka* and *drikjan*), it

* Obsolete or provincial.

may be stated that *i* short, in the twelfth class, precedes either a liquid or a mute of series *k*.

From these observations, even on the English forms only, we find thus much regularity; and from these observations, even on the English forms only, we may lay down a rule like the following: viz. that *i* or *u*, short, before the consonants *m*, *n*, or *ck*, is changed into *a* for the singular, and into *u* for the plural forms; that *i* long, or diphthongal, becomes *ou*; that *e* before *l* becomes *o*; and that *u* before *r* remains unchanged.

This statement, however, is nothing like so general as the one that, after a comparison of the older forms and the allied languages, we are enabled to make. Here we are taught—

1. That in the words *bind*, &c., the *i* was once pronounced as in *till*, *fill*; in other words, that it was the simple short vowel, and not the diphthong *ey*; or at least that it was treated as such.

Mœso-Gothic.

Binda	Band	Bundum	Bundans.
Bivinda	Bivand	Bivundum	Bivundums.
Finþa	Fanþ	Fanþum	Funþans.

Anglo-Saxon.

Bind	Band	Bundon	Bunden.
Finde	Fand	Fundon	Funden.
Grinde	Grand	Grundon	Grunden.
Winde	Wand	Wundon	Wunden.

Old Norse.

Finn	Fann	Funðum	Funninn.
Bind	Batt	Bundum	Bundinn.
Vind	Vatt	Undum	Undinn.

When the vowel *ĭ* of the present took the sound of the *i* in *bite*, the *ŭ* in the præterite became the *ou* in *mouse*. From this we see that the words *bind*, &c., are naturally subject to the same changes with *spin*, &c., and that, *mutatis mutandis*, they are so still.

2. That the *e* in *swell*, &c., was once *ĭ*. This we collect from the following forms:—*hilpa*, Mœso-Gothic; *hilfu*, Old High-German; *hilpu*, Old Saxon; *hilpe*, Middle High-German; *hilpe*, Old Frisian. *Suillu* = *swell*, Old High-German. *Tilfu*

= *delve*, Old High-German; *dilbu*, Old Saxon. *Smilzu*, Old High-German = *smelt* or *melt*. This shows that originally the vowel *i* ran throughout, but that before *l* and *r* it was changed into *e*. This change took place at different periods in different dialects. The Old Saxon preserved the *i* longer than the Anglo-Saxon. It is found even in the *Middle* High-German; in the *New* it has become *e*, as *schwelle, schmelze*. In one word, *milk*, the original *i* is still preserved; although in Anglo-Saxon it was *e*; as *melce, mealc* = *milked, mulcon*. In the Norse the change from *i* to *e* took place full soon, as *svëll* = *swells*. The Norse language is in this respect important.

3. That the *o* in *swoll, holp*, was originally *a*; as

Hilpa	Halp	Hulpum . .	Mœso-Gothic.
Suillu	Sual	Suullumês . .	Old High-German.
Hilfu	Half	Hulfumês . .	Ditto.
Tilfu	Talf	Tulfumês . .	Ditto.
Hilpe	Halp	Hulpun . .	Middle High-German.
Dilbe	Dalp	Dulbun . .	Ditto.
Hilpe	Halp	Hulpon . .	Ditto.
Svëll	Svall	Sullum . .	Old Norse.
Melte	Mealt	Multon . .	Anglo-Saxon.
Helpe	Haelp	Hulpon . .	Ditto.
Delfe	Dealf	Dulfon . .	Ditto.

4. That a change between *a* and *o* took place betimes. The Anglo-Saxon præterite of *swelle* is *sweoll;* whilst *ongon, bond, song, gelomp*, are found in the same language for *ongan, band, sang, gelamp*.—Rask's *Anglo-Saxon Grammar*, p. 90.

5. That *run* is only an apparent exception, the older form being *rinn*.

> The rain *rinns* down through Merriland town;
> So doth it down the Pa.—*Old Ballad*.

The Anglo-Saxon form is *yrnan*; in the præterite, *arn, urnon*. A transposition has since taken place. The word *run* seems to have been originally no present, but a præterite form.

6. That *burst* is only an apparent exception. Before *r, ĕ, ĭ, ŭ*, are pronounced alike. We draw no distinction between the

vowels in *pert, flirt, hurt.* The Anglo-Saxon forms are; *berste, byrst, bærse, burston, borsten.*

Thirteenth Class.

Contains the single word *choose,* in the præterite *chose ;* in Anglo-Saxon, *ceóse, ceás.*

Attention is directed to the following list of verbs. In the present English they all form the præterite in *-d* or *-t ;* in Anglo-Saxon, they all formed it by a change of the vowel. In other words, they are *weak verbs that were once strong.*

Præterites.

ENGLISH.		ANGLO-SAXON.

Gripe	Griped.	Grípe	Gráp.
Span	Spanned.	Spanne	Spén.
Eke	Eked.	Eáce	Eóc.
Fare	Fared.	Fare	Fôr.

This list will be referred to in the chapter on Conjugation.

CHAPTER XXXVI.

ON THE WORDS *DID* (PROPERLY USED) AND *HIGHT*.

§ 417. *Did.*—*Did* from *do* = *facio*, is a *strong* verb. This we infer from the form of its participle *done*.

If so, the final *-d* is not the same as the *-d* in *moved*. What is it? There are good grounds for believing that in the word *did* we have a single instance of the old *reduplicate præterite*. If so, it is the latter *d* which is radical, and the former which is inflectional.

§ 418. *Hight.*—The following couplet from Dryden's Mac Flecnoe exhibits both a form and a construction which require explanation :—

> An ancient fabric, raised t' inform the sight,
> There stood of yore, and Barbican *it hight*.

Here the word *hight* = *was called*, and seems to present an instance of the participle being used in a passive sense without the so-called verb substantive. Yet it does no such thing. The word is no participle at all; but a simple præterite. Certain verbs are *naturally* either passive or active, as one of two allied meanings may predominate. *To be called* is passive; so is, *to be beaten*. But, *to bear as a name* is active; so is, *to take a beating*. The word *hight* is of the same class of verbs with the Latin *vapulo;* and it is the same as the Latin word, *cluo.*—*Barbican cluit* = *Barbican audivit* = *Barbican it hight*.

So much for the question as to the construction, which is properly a point of Syntax rather than Etymology.

In respect to the form, it must be observed that the *t* is no

sign of the præterite tense, but, on the contrary, a part of the original word, which is, in German, *heiss-en*, in Norse, *het-a*, and *hed-e*. In A. S. this præterite was *hêht*, and as the M. G. was *hái-háit*, the form has been looked upon as reduplicate.—(See Mr. Kemble's paper already quoted.)

Whatever may be its origin, the present spelling is inaccurate. The *g* has no business where it is; it being only the false analogy of the words *high* and *height* that has introduced it.

CHAPTER XXXVII.

ON THE WORDS *DID* AND *BECAME*, CATACHRESTIC.

§ 419. *Did, catachrestic.*—In the phrase *this will do* = *this will answer the purpose*, the word *do* is wholly different from the word *do*, meaning *to act*. In the first case it is equivalent to the Latin *valere*, in the second to the Latin *facere*. Of the first the Anglo-Saxon inflection is *deáh, dugon, dohte, dohtest*, &c. Of the second it is *dó, doð, dyde*, &c.

In the present Danish they write *duger*, but say *duer*: as *duger det noget?* = *Is it worth anything?* pronounced *dooer deh note?* This accounts for the ejection of the *g*. The Anglo-Saxon form *deáh* does the same.

We cannot, however, although we ought, say *that doed well enough*, though a Dane says *det dugede nok*.

§ 420. *Became, catachrestic.* — The *catachresis, abuse*, or confusion between *do* = *valeo* and *do* = *facio*, repeats itself with the verb *become*.

When *become* = *fio*, its original inflection is strong, and its præterite is *became*.

When *become* = *convenio* = *suit* (as in *that dress becomes you*), its original inflection is weak. Hence, though we cannot do so, we ought to say *that dress becomed him*.

Become = *convenio*, is from the same root as the German *bequem* = *convenient*.

Note.—There is another verb which has not yet gone wrong, but is going. I have seen such sentences as *a field overflows with water*. No one, however, has (I hope) brought himself to say the *water overflew the field*.

Nevertheless, the tendency to catachresis has set in.

CHAPTER XXXVIII.

ON CERTAIN APPARENTLY IRREGULAR PRESENTS.

§ 421. Let us draw our illustration of the principle which determines the forms of the present chapter from the classical languages—the Greek and Latin. In translating from those tongues, we find more words than one, which, although *perfect* in appearance, are generally and properly rendered as if there were *presents*. Of this kind are οἶδα in Greek, and *memini* in Latin. Few render these words *I knew*, or *I have known, I remember*, or *I have remembered*. On the contrary, they say *I know, I remember*. The reason hereof lies in the nature of the connection between the cause and effect in certain actions. A man who has collected his ideas *remembers*. A man who has seen (or got) his facts *knows*. Neither does it matter much after which of the two fashions he expresses himself. His *knowledge* and his *memory* belong to his present state: the preliminary processes of *getting his facts* and *calling up his reminiscences*, belong to a past one. The link, however, which connects the two is so short, that, for practical purposes, the action is one and indivisible. When language adapts itself to this phenomenon we have a present tense taking the power of a past one; or, *vice versâ*, a past tense used as a present. The words just quoted illustrate the latter alternative. When ἥκω is translated *I have come* (= *here I am*), we have the former. The latter, however, is the one which is at present before us.

In the English and the allied languages there are several præterites whose power is present; or (changing the expression) several presents which were originally præterites. Had

they not been so, their form and inflection would be different to what it is.

But the present out of which they were evolved is lost: so that it is only by inference that we can venture to say what it was.

More than this—they have secondary præterites of their own, formed from them, just as if they had been presents from the beginning.

Now, it is very evident that the præterites most likely to become present are those of the strong class. In the first place, the fact of their being præterite is less marked. The word *fell* carries with it fewer marks of its tense than the word *moved*. In the second place they can more conveniently give rise to secondary præterites. A weak præterite already ends in *-d* or *-t*. If this be used as a present, a second *-d* or *-t* must be appended.

Hence it is that all the transposed præterites in the Gothic tongues were, before they took the present sense, not weak, but strong. The word in question, *mind* (from whence *minded*), is only an apparent exception to this statement.

Respecting these præterite-presents, we have to consider—

Firstly—the words themselves;

Secondly—the forms they take as præterite-presents (or present-præterites); and—

Thirdly—the forms of the secondary præterites derived from them.

If we can do more than this, it is well and good.

Thus—it is well and good if we can succeed in arguing back from the existing forms to the ones that are lost, so reconstructing the original true presents; also—

If we can ascertain the original meaning as well, so much the better.

We begin, however, with the chief details of the words themselves; which are *dare, own, can, shall, may, mind, wot, aught, must.*

§ 422. *Dare, durst.*—The verb *dare* is both transitive and intransitive. We can say either *I dare do such a thing,* or *I dare* (*challenge*) *such a man to do it.* This, in the present tense, is unequivocally correct. In the præterite the double

power of the word *dare* is ambiguous; still it is, to my mind at least, allowable. We can certainly say *I dared him to accept my challenge;* and we can, perhaps, say *I dared not venture on the expedition.* In this last sentence, however, *durst* is the preferable expression.

Now, although a case can be made out in favour of *dare* being both transitive and intransitive, *durst* is only intransitive. It never agrees with the Latin word *provoco,* only with the Latin word *audeo;* inasmuch as, whatever may be the propriety or impropriety of such a sentence as *I dared not venture,* &c., it is quite certain that we cannot say *I durst him to accept my challenge.*

Again—*dare* can be used in the present tense only: *dared* in the præterite only.

Durst can be used in either. Thus—we can say *I durst not* in the sense *I* am *afraid to*—and in the sense *I* was *afraid to.* We can also say, *I durst not do it, although you ask me;* and *I durst not do it when you asked me.* In sense, then, *durst* is both a præterite and a present.

In form *dur-st* is peculiar. What is the import of the *-st?* In such an expression as *thou durst not,* it looks like the *-st* in call-*est;* viz. the sign of the second person singular.. But we say *I durst* and *he durst.* Hence, if the *-st* in dur-*st* be the *-st* in call-*est,* it is *that and something more.*

But it is something wholly different. In all probability the *-s* is part of the original root, of which the fuller and older form was *dars.* If so, the inflection would run—

PRESENT.		PRÆTERITE.	
Sing.	*Plur.*	*Sing.*	*Plur.*
1. Dars . .	Durs-on.	1. Durs-te . .	Durs-ton.
2. Durs-e . .	Durs-on.	2. Durs-t-est .	Durs-ton.
3. Dars . .	Durs-on.	3. Durs-te . .	Durs-t-on.

Let *-s-* be lost in the present, and let *a* become *ea,* and we have the actual A. S. forms—

PRESENT.		PRÆTERITE.	
Sing.	*Plur.*	*Sing.*	*Plur.*
1. Dear	Durr-on.	1. Durste	Durs-t-on.
2. { Durre? / Dear-st }	Durr-on.	2. { Durst (for / Durst-est) }	Durs-t-on.
3. Dear	Durr-on.	3. Durst	Durs-t-on.

The Mœso-Gothic forms are *dar, dart? dar, daúrum, daúruþ, daúrun,* for the persons of the present tense; and *daúrsta, daúrstés, daúrsta,* &c., for those of the præterite. The same is the case throughout the German languages. No *-s,* however, appears in the Scandinavian; the præterites being *þorði* and *törde,* Icelandic and Danish. The Anglo-Saxon is *dear* = *I dare, dearest* = *thou darest, durron* = *we dare.*

Observe the form which this root takes in the Greek—θαρρ-εῖν and θαρσ-εῖν (*tharr-ein* and *thars-ein*).

§ 423. *Own—owned from own* = *admit.* — The sentences "he *owned* to having done it = he *admitted* having done it." "I have *owned* to it = I have *admitted, conceded,* or *granted* it." This last word indicates the original and fundamental idea. It is that of *giving;* an idea allied to that of *concession* and *admission.* Notion for notion, this has but little to do with the word *own,* as applied to property. Indeed, it is necessary to bear in mind the fact that the two words are distinct. To express this difference, the word before us may be called the *own concedentis;* the other, the *own possedentis;* or the *concessive own,* and the *possessive own.*

The *own concedentis* is a word of the same class with *dare,* &c. It is a præterite in the garb of a present. Hence, *owned* is a secondary præterite, or a præterite derived from a præterite.

The A. S. forms are—

	Sing.	*Plur.*
1.	an	unnon.
2.	unne . . .	unnon.
3.	an	unnon.

Participle, ge-unnen.

Of these A. S. forms, *unne* deserves notice. It gives the form in *-e,* not the form in *-st;* in other words, it is the true second person of the præterite tense, as opposed to that of the present. It also gives us the change of the vowel; so that the word comes out the true præterite *unne,* instead of the present an-*est* (*own, own-est*). The plural forms are also præterite—*unn-on,* rather than *an-að.*

The præterite form is more important still.

	Sing.	*Plur.*
1.	uðe . . .	uð-on.
2.	uðest . . .	uð-on.
3.	uðe . . .	uð-on.

Truly præterite as was *an*, it still gave rise to the secondary form *uðe*.

Now *uðe* is to *an*, as *cuðe* is to *can*.

But compare it with the present word *own-ed*; and it will be seen that the peculiarities of the word increase. *Owned* is no modern form of *uðe*. It is a separate and independent formation.

Hence, its history is as follows:—

a. A certain present form, long ago obsolete, gave as its præterite *an*.

b. This præterite *an* passed as a present.

c. This præterite-present gave origin to the secondary præterite *úðe*.

d. The original præterite-present changed its form, and from *an* or *un* (*unne*) became *own*.

e. Meanwhile the form *uðe* became obsolete; and—

f. Own-*ed* became evolved as an ordinary præterite of *own*.

If *can* (*cuðe*) had followed the same line of change, its præterite would have been *cann-ed*, as it is in the present German—*kännte* from *können*.

§ 424. *Can*.—The form *could* has already been noticed; the remarks upon it being to the effect that as the *l* was a blunder (and that a blunder of spelling only), we may simplify the investigation by dealing with the word as if it were simply *coud*—*i. e.* cou*l*d *minus* the *l*.

The history of the word then comes to be that of the word *an* and *uðe*. This is what it is in the main. There are, however, a few points of difference.

PRESENT.

	Sing.	*Plur.*
1.	can . . .	cunn-on.
2.	{ can-st / cunn-e } . .	cunn-on.
3.	can . . .	cunn-on.

The form *can-st* constitutes the peculiarity. It is a truly present form co-existent with the truly præterite form *cunne*.

PRÆTERITE.

Sing.	*Plur.*
1. cuð-e . . .	cuð-on.
2. cuð-est . . .	cuð-on.
3. cuð-e . . .	cuð-on.

This is the form that has come down to it; spoilt by the cacography of the letter *l*.

Had the history of *can* been *exactly* that of *an*, the præterite would have been *canned*.

§ 425. *Shall and should.*—The latter word stands nearly in the same relation to *shall* as *coud* does to *can*, and *uðe* to *an*.

In A. S., however, the *u* of the plural of the present was long.

PRESENT.		PRÆTERITE.	
Sing.	*Plur.*	*Sing.*	*Plur.*
1. sceal . .	scul-on.	1. scul-de . .	scul-d-on.
2. { scealt / scule } .	scul-on.	2. scul-d-est .	scul-d-on.
3. sceal . .	scul-on.	3. scul-de . .	scul-d-on.

The most remarkable point connected with the inflection of *shall*, is its second person singular *shal-t*. This being a question of *person* rather than *tense*, is noticed in § 382.

§ 426. *Might, from may.*—The *-y* in *may* was originally *-g*; so that our inquiries may proceed as if the word before us were *mag*.

PRESENT.

Sing.	*Plur.*
1. mag . . .	mug-on.
2. { α. mag-est / β. mug-e } . .	mug-on.
3. mag . . .	mug-on.

This is what the inflection would be if the vowel changes were those of *skal* exactly. But this is not the case. The vowel conducts itself differently in the two words. In *skal* it becomes *-u* (*scul*), regularly and generally. In *mag* it generally remains unchanged.

In M. G. the singular is *mag;* the plural *magum.*

In O. H. G. the singular is *mac,* the plural *mak*-um, and *mug*-um as well.

A similar variation occurs in the O. H. G. præterite; which is found both as m*a*h-t-a and as m*o*h-t-a, the $h = g$.

§ 427. *Minded.*—This word is the præterite of *mind;* as A. *mind your business;* B. *I do mind it, and have minded it all along.*

As the præterite of *mind,* there is nothing particular in the word *minded.* But there is a great deal which is particular in the word.

Mind—The *-d* is no part of the root. On the contrary, it is the sign of the præterite tense; so that *minded* is a præterite formed from a præterite, just like *should, owned,* &c., &c.

But *minded* has the further peculiarity of being not only a præterite in *-d,* but a præterite in *-d* formed upon a præterite in *-d.* This is the case with none of the previous words. Secondary præterites as they are, their basis was always formed by a change of vowel; in other terms, it was a præterite like *swam* rather than one like *call-ed.* If it were not so, there would be two *d*'s in all the preceding words; just as there are two *d*'s in *min-d-ed.*

The A. S. forms are *ge-man, ge-manst, ge-munon.* Also *ge-munde, ge-mundon.*

Hence, the form *minded* (*he minded his business*) is a *tertiary* formation.

1st. There was the strong form *man* (*mun*) from *min* (?); for all practical purposes a present.

2nd. There was the A. S. præterite *ge-munde,* whence the English present *mind.*

3rd. There is *min-d-ed* from *mind.*

Let us again go over the A. S. forms, paying special attention to those in *u.*

PRESENT.		PRÆTERITE.	
Sing.	*Plur.*	*Sing.*	*Plur.*
1. ge-man . .	ge-m*u*n-on.	1. ge-m*u*n-d-e	ge-m*u*nd-on.
2. { ge-man-st / ge-mune }	ge-m*u*n-on.	2. ge-m*u*n-d-est	ge-m*u*n-d-on.
3. ge-man . .	ge-m*u*n-on.	3. ge-m*u*n-d-e	ge-m*u*n-d-on.

It is from (*ge*)-*munde* that *mind* has arisen. From *min-d* has arisen *min-d-ed*.

Another form still stands over. In more than one of our provincial dialects we find the word—

Mun—as in *I mun go;* at present, this = *I must go*. Originally, however, it must have been *I am minded to go* = *I have made up my mind to go*. It is a truly præterite form. In the Scandinavian tongue it reappears, with a somewhat different, though allied, power, as *mon* and *monne*.

§ 428. *Wot*.—This = *knew*. It is the perfect form of *wit*, as in *Middlesex to wit* = *Middlesex to know* (or *to be known**).

§ 429. *Ought*.—In this word the *gh* represents an A. S. *h*; an *h* which grew out of an older sound *g*.

PRESENT.		PRÆTERITE.	
Sing.	*Plur.*	*Sing.*	*Plur.*
1. áh . .	ág-on.	1. áh-te . .	ah-t-on.
2. agest, ahst .	ág-on.	2. áh-t-est .	ah-t-on.
3. ah . .	ág-on.	3. áh-te . .	ah-t-on.

Infinitive, ág-an.

Participle, ág-en.

In the present English the word *owe* = the A. S. *áh;* and *ought* = the A. S. *áhte*. The Latin *debeo* = both words; viz. the A. S. *áh*, and the English *owe*. But it has two senses—*I am under a moral obligation*, and *I am a debtor*.

Now the present form *owe* is limited to the latter of these senses; in the language of the nineteenth century, at least. We can say *I owe money;* but we cannot say *I owe to pay some*. On the other hand, we cannot say *I ought money;* though we can say *I ought to pay some*.

The effect of this twofold sense has been to separate the words *owe* and *ough-t;* by giving to the former the modern præterite *ow-ed*, which never came from *áhte*, any more than *owned* came from *uðe*.

It has also deprived *ought* of its present form, the equivalent to the A. S. *áh*. As a consequence of this, *ought* has two

* Just as we say *I am to blame*, or *I am to be blamed*.

powers. It is a present and a præterite as well. We can say—

He says *that I* ought *to go;* and
He said *that I* ought *to go*—

just as we say—

He says *that I* wish *to go;* and
He said *that I* wished *to go.*

Ought comes from *owe*—from *ow-* without any sound of *n.*

Own concedentis comes from *o-n,* where there is not only a sound of *n,* but where that sound of *n* is part and parcel of the root.

What does *own possidentis* come from ?

Not from the *own concedentis,* though it agrees with that word in having the sound of *n.*

Let us take the points of contrast.

1. The *-n* of the *own concedentis is radical.* The *-n* of the *own possidentis* is not so.

2. The *ow* of the *own concedentis* has grown out of *u.* The *w* of the *own possidentis* has grown out of an *h,* which has grown out of a *g, gh, k,* or *kh.*

Such are the points of contrast between the *own possidentis* and the *own concedentis.*

Let us now look to the relation between *own* and *owe* (whence *ought*).

1. *Owe* (whence *ought*) has no *n.* Neither had *own* (*possidentis*) until after the time of Elizabeth. Shakspere, for instance, always (or nearly always) writes *owe* rather than *own.*

See where he comes ; nor poppy nor mandragora,
Nor all the drowsy syrups of the world,
Can ever med'cine thee to that sweet sleep
Which thou *owe'dst* yesterday.

Othello.

2. The *w* in the *owe* (whence *ought*) represents an *h* (A. S. *ah*), representing a *g,* or *gh, k,* or *kh.*

Hence, the connections of *own possidentis* are with *owe* (whence *ought*).

Let us call the latter *owe debentis*, the former *owe possidentis*.

Doing this we give the latter word two forms, and look at it under a double aspect—one for comparison (or rather contrast) with *own concedentis*, and one for comparison with *owe debentis*.

Essentially, however, the word is *owe* without the *-n*. Briefly, as roots—

Own concedentis = *u* + *n*.

Owe possidentis = *a vowel* + *h*.

§ 430. *Must*.—I can only say of this form that it is common to all persons, numbers, and tenses; the powers of the *-s-* and *-t-* being, at present, unsusceptible of any satisfactory explanation.

The same (as I might have stated in § 428) is the case in the archaic forms *wiss* and *wist* (= *know* and *knew*).

§ 431. The class of words under notice is a natural one, one of their characteristics being their long standing in languages. This is shown by the large portion of the so-called Indo-European language over which they are spread; inasmuch as the greater part of their roots is classical as well as English—in some cases Sarmatian as well. Hence, their origin goes back to the time of that ancient mother language, which was, at one time, common to the ancestors of the Italians, Greeks, Slavonians, Lithuanians, Germans, and Scandinavians. Thus—

1. *C-n* (the root of *can*) = the γν, the root of γν-όω, γν-ώσκω, *gn-ovi* = *know*.

2. *D-rs* (the root of *durs-t*) = the θ-ρσ, the root of θαρσ-εῖν = *dare*.

3. *M-g* (the root of *may*) = (?) the *mac* in *macte*. *Macte* (*proceed, go on*) *tua virtute puer*, &c.

4. *-N-* (the root of *own concedentis*) = (?) the *-n-* in *nuo*, *annuo* (= *nod assent*).

5. *Ow-* (the root of *own possidentis* = the older form *eig-an*) = the ἐχ- in ἔ-χ-ειν = *to have*.

6. *W-t* (the root of *wit* and *wot*) = the -δ- in οἶδ-α (*I know* = *I have seen*) and *vid-i*.

7. *M-n* (the root of *mun* and *mind*) = the *m-n* in me-*min*-i = *remember*.

§ 432. The forms that have been dealt with are perfects, or præterites—perfects or præterites rather than presents. They presuppose, however, a previous present, out of which they originated. The reconstruction of this involves two considerations; viz. that of the original *form*, and that of the original meaning.

The reconstruction of the original *form* may safely be attempted with three words of the list, *own*, *can*, and *dare*, of which the primitive presents were probably *en*, *ken*, and *ders*, or (perhaps) *in*, *kin*, and *dirs*; this being the inference from the inflection of a large class of words like the A. S. *helpe*, and the M. G. *hilpa*.

	Present.	*Præt. Sing.*	*Præt. Plur.*
M. G.—	H*i*lp-a	Halp	Hulp-um.
A. S.—	H*e*lp-e	Healp	Hulp-on.
	Sw*i*mm-e	Swam	Swumm-on.

Hence, perhaps—

*E*n (*i*n)	*A*n	*U*nn-on.
K*e*n (c*i*n)	C*a*n	C*u*nn-on.
D*e*r (d*i*r)	D*a*r	D*u*rr-on.

The others are less reducible.

As contributions towards the reconstruction of the original *meaning*, the following powers are suggested.

1. *Can.*—Meaning *I have learned, I have got information;* the present sense is *I am able.*

2. *Dare.*—If this means *I have taken courage,* the present sense, *I am in a state to undertake,* = *dare.*

3. *May.*—If this mean *I have gotten the power,* it also means *I am free to act.*

4. *Owe* = *I have come under an obligation* = *I am bound to.*

5. *Own* = *I have gotten possession* = *I possess.*

6. *Wit, wot* = *I have perceived* = *I understand.*

CHAPTER XXXIX.

ON CONJUGATION.

§ 433. It is hoped that it is now equally superfluous to urge further arguments against the indiscriminate use of the word *irregular*, and to add to the evidence in favour of the strong class of verbs being a *natural*, rather than an *artificial* one. Let us, however, put the chief general statements that may be made concerning them together; remarking upon each, to say how far it is universal, or how far it is liable to exceptions.

I. No *new* word is ever strong. One of our earliest Norman-French words, a word introduced as early as A.D. 1085, is the word *adouber* = *dubb*. Its præterite is *dubbade*. — (*Phil. Mus.* ii. p. 387.)

Hence the strong processes are obsolete—obsolete and not vital.

II. All the *English* strong verbs are of *Angle*, none of *foreign* origin. This is a deduction from the preceding statement.

In the *allied* languages the root *scr-b* = *write*. It is certainly the Latin *scrib-* in *scrib-o*. Nevertheless, its inflection is strong, being, in German, *schrieb*, in Norse, *skrev*. Does this prove the word to be equally indigenous to the two classes of languages—the German and the Latin? I think not; though many good authorities think differently.

III. Strong words become weak. Weak words do *not* become strong.

Exceptions.—The words *did*, *became*, and *overflown*, catachrestic; and the words like them, if any. It is not difficult

to see that these have become strong under very peculiar and exceptional circumstances.

IV. The verbs which are strong in any one of the German languages are generally so in all the rest.

Take this along with No. III., and you come to the conclusion that the later the stage of a given language, the fewer are the strong forms. Then, as the provincial dialects retain many archaisms, it is only natural to expect that they will partially agree with the A. S. of the list of chapter xxxv., rather than the modern English. Hence, if we find (as we actually do), instead of (say) *leapt, slept, mowed, snowed,* &c., such forms as *lep, slep, mew, snew,* it is no more than what we expect.

V. Derived words are weak rather than strong. The intransitive forms *drink* and *lie,* are strong; the transitive forms *drench* and *lay,* are weak.—(See chapter xxii.)

It is safe, then, to say that the Strong Conjugation (so-called) is a *natural* one.

§ 434. Nevertheless, I have taken every opportunity to suggest the possibility of its being something other than natural, or (if not this) exceptionable in some respect or other. I have taken no ordinary pains to attach to the words *Strong* and Conjugation the qualifying participle *so-called*—writing of the *so-called Strong Conjugation,* or the *Strong Conjugation so-called.* Whether the reader has observed this or not, there is something implied by the qualification; an exception of some sort.

What does it lie against? Not against the *natural* character of the group.

Nor yet against the words *strong* and *weak*—though it may be doubtful whether they are the best words that could have been chosen.

It lies against the word *Conjugation.*

Two (or more) tenses, absolutely identical in power, and absolutely different in form, in one and the same conjugation, as original elements of a language, are a philological tautology, which a more advanced criticism will eliminate from the phenomena of speech, and relegate to the limbo of irregularities and similar concealments of our want of knowledge.

But two conjugations for one and the same tense, is a philological tautology also.

What, then, are such forms as *swoll* and *swelled*, *hung* and *hanged*, if, being regular, they are neither instances of two tenses to one conjugation, nor of one tense to two conjugations?

Can we make it matter of *transitive* and *intransitive*, and allow ourselves to suppose either an actually existent, or an once-existing difference of meaning between such forms as those of the pairs in question? Can *hung* = *pependit*, whilst *hanged* = *suspendit*? Can *swoll* = *tumuit*, whilst *swelled* = *tumefecit*? Should we cultivate such distinctions as the following?—

1. I *hanged* him up, and there he *hung*.

2. I *swelled* the number of his followers, which *swoll*, at last, to a thousand.

This view is suggested in a paper *on certain tenses attributed to the Greek verb* in the "Philological Museum;" and, it may be added, that there is something in favour of it. The two instances just given look likely. The forms like

Drink and *Drank* as opposed to *Drench* and *Drenched*,
Lie . *Lay* . . *Lay* . *Laid*,
Rise . *Rose* . . *Raise* . *Raised*,

are, more or less, confirmatory. Yet they are anything but conclusive. All that they tell us is, that *when we have two forms*, one primitive and intransitive, and the other derivative and transitive, it is the former which is strong rather than weak, and the latter which is weak rather than strong.

The real explanation is to be found in the chapters on *Tenses in general*, and upon the *Strong and Weak Præterites*.

a. Cut off from such a word as te-*tig*-i, the reduplicational *te*.

b. Replace the English forms in *d* (*mov-ed*) by the Latin forms in *-si* (vic-*si* = *vixi*).

When this is done, the history of such a pair of words as *drank* and *moved*, is the history of such a pair of words as *tetigi* and *vixi*.

Now the place of these is that of τέτυ-φα and ἔ-τυψα,

i. e. they both belong to one and the same conjugation—of which, however, they are different tenses, one a perfect, the other aorist.

If so, what are our Strong Præterites? Perfects modified in form by the loss of the reduplication, and changed in power by having adopted that of the aorist.

And what are our Weak Præterites? Aorists.

The *Conjugation* is really one.

The *Tense* is one in appearance only.

CHAPTER XL.

ADVERBS.

§ 435. *Adverbs.*—The adverbs are capable of being classified on a variety of principles.

1. Firstly, they may be divided according to their meaning. In this case we speak of the adverbs of time, place, number, manner. This division is logical rather than etymological.

A division, however, which although logical bears upon etymology, is the following :—

Well, better, ill, worse.—Here we have a class of adverbs expressive of degree, or intensity. Adverbs of this kind are capable of taking an inflection, viz. that of the comparative and superlative degrees.

Now, then, here, there.—In the idea expressed by these words there are no degrees of intensity. Adverbs of this kind are incapable of taking any inflection.

Words like *better* and *worse* are adjectives or adverbs as they are joined to nouns or verbs.

Adverbs differ from nouns and verbs in being susceptible of one sort of inflection only, viz. that of degree.

2. Secondly, adverbs may be divided according to their form and origin. This is truly an etymological classification.

a. Better, worse.—Here the combination of sounds gives equally an adjective and an adverb. *This book is better than that*—here *better* agrees with *book*, and is therefore adjectival. *This looks better than that*—here *better* qualifies *looks*, and is therefore adverbial. Again; *to do a thing with violence* is equivalent *to do a thing violently*. This shows how adverbs may arise out of cases. In words like the English *better*, the

Latin *vi* (= *violenter*), the Greek κάλον (= κάλως), we have adjectives in their degrees, and substantives in their cases, with adverbial powers. In other words, nouns are deflected from their natural sense to an adverbial one. Adverbs of this kind are adverbs of deflection.

b. Brightly, bravely.—Here an adjective is rendered adverbial by the addition of the derivative syllable *-ly*. Adverbs like *brightly*, &c., may (laxly speaking) be called adverbs of derivation.

c. Now.—This word has not satisfactorily been shown to have originated as any other part of speech than as an adverb. Words of this sort are adverbs absolute.

When, now, well, worse, better—here the adverbial expression consists in a single word, and is *simple*. *To-day, yesterday, not at all, somewhat*—here the adverbial expression consists of a compound word, or a phrase. This indicates the division of adverbs into simple and complex.

§ 436. The adverbs of deflection (of the chief importance in etymology) may be arranged after a variety of principles. I. According to the part of speech from whence they originate. This is often an adjective, often a substantive, at times a pronoun, occasionally a preposition, rarely a verb. II. According to the part of the inflection from whence they originate. This is often an ablative case, often a neuter accusative, often a dative, occasionally a genitive.

The following notices are miscellaneous rather than systematic.

Else, unawares, eftsoons.—These are the genitive forms of adjectives. *By rights* is a word of the same sort.

Once, twice, thrice.—These are the genitive forms of numerals.

Needs (as in *needs must go*) is the genitive case of a substantive.

Seldom.—The old dative (singular or plural) of the adjective *seld.*

Whilom.—The dative (singular or plural) of the substantive *while.*

Little, less, well.—Neuter accusatives of adjectives. *Bright,* in *the sun shines bright,* is a word of the same class. The

neuter accusative is a common source of adverbs in all tongues.

Athwart.—A neuter accusative, and a word exhibiting the Norse neuter in *-t.*

§ 437. *Darkling.*—This is no participle of a verb *darkle,* but an adverb of derivation, like *unwaringún* = *unawares,* Old High-German; *stillenge* = *secretly,* Middle High-German; *blindlings* = *blindly,* New High-German; *darnungo* = *secretly,* Old Saxon; *nichtinge* = *by night,* Middle Dutch; *blindeling* = *blindly,* New Dutch; *bæclinga* = *backwards, handlunga* = *hand to hand,* Anglo-Saxon; and, finally, *blindlins, backlins, darklins, middlins, scantlins, stridelins, stowlins,* in Lowland Scotch.—*Deutsche Grammatik,* iii. 236.

§ 438. "Adverbs like *brightly* may (*laxly speaking*) be called adverbs of derivation." Such is the assertion made a few paragraphs above. The first circumstance that strikes the reader is, that the termination *-ly* is common both to adjectives and to adverbs. This termination was once an independent word, viz. *leik.* Now, as *-ly* sprung out of the Anglo-Saxon *-lice,* and as words like *early, dearly,* &c., were originally *arlíce, deorlíce,* &c., and as *arlíce, deorlíce,* &c., were adjectives, the adverbs in *-ly* are (*strictly speaking*) adverbs, not of derivation, but of deflection.

It is highly probable that not only the adverbs of derivation, but that also the absolute adverbs, may eventually be reduced to adverbs of deflection. For *now,* see *Deutsche Grammatik,* iii. 249.

CHAPTER XLI.

ON CERTAIN ADVERBS OF PLACE.

§ 439. It is a common practice for languages to express by different modifications of the same root the three following ideas :—

1. The idea of rest *in* a place.
2. The idea of motion *towards* a place.
3. The idea of motion *from* a place.

This habit gives us three correlative adverbs—one of position, and two of direction.

It is also a common practice of language to depart from the original expression of each particular idea, and to interchange the signs by which they are expressed.

This may be seen in the following table, illustrative of the forms *here, hither, hence,* and taken from the *Deutsche Grammatik,* iii. 199 :—

Mœso-Gothic . .	þar, þaþ, þaþro,	*there, thither, thence.*
	hêr, hiþ, hidrô,	*here, hither, hence.*
Old High-German .	huâr, huara, huanana,	*where, whither, whence.*
	dâr, dara, danana,	*there, thither, thence.*
	hêr, hêra, hinana,	*here, hither, hence.*
Old Saxon . .	huar, huar, huanan,	*where, whither, whence.*
	thar, thar, thanan,	*there, thither, thence.*
	hêr, hêr, hênan,	*here, hither, hence.*
Anglo-Saxon . .	þar, þider, þonan,	*there, thither, thence.*
	hvar, hvider, hvonan,	*where, whither, whence.*
	hêr, hider, hënan,	*here, hither, hence.*
Old Norse . .	þar, þaðra, þaðan,	*there, thither, thence.*
	hvar, hvert, hvaðan,	*where, whither, whence.*
	hêr, hëðra, hëðan,	*here, hither, hence.*

Middle High-German	dâ, dan, dannen,	*there, thither, thence.*
	wâ, war, wannen,	*where, whither, whence.*
	hie, hër, hennen,	*here, hither, hence.*
Modern High-German	da, dar, dannen,	*there, thither, thence.*
	wo, wohin, wannen,	*where, whither, whence.*
	hier, her, hinnen,	*here, hither, hence.*

These local terminations were commoner in the earlier stages of language than at present. The following are from the Mœso-Gothic :—

Innaþrô	=	*from within.*
Ûtaþrô	=	*from without.*
Iupaþrô	=	*from above.*
Fáirraþrô	=	*from afar.*
Allaþrô	=	*from all quarters.*

Now a reason for the comparative frequency of these forms in Mœso-Gothic lies in the fact of the Gospel of Ulphilas being a translation from the Greek. The Greek forms in *-θεν, ἔσωθεν, ἔξωθεν, ἄνωθεν, πόῤῥωθεν, πάντοθεν,* were just the forms to encourage such a formation as that in *-þro.*—*Deutsche Grammatik,* iii. 199, &c.

§ 440. The *-ce* (= *es*) in *hen-ce, when-ce, then-ce,* has yet to be satisfactorily explained. The Old English is *whenn-es, thenn-es.* As far, therefore, as the spelling is concerned, they are in the same predicament with the word *once,* which is properly *on-es,* the genitive of *one.* This statement, however, explains only the peculiarity of their orthography; since it by no means follows, that, because the *-s* in *ones* and the *-s* in *whennes, thennes,* are equally replaced by *-ce* in orthography, they must equally have the same origin in etymology.

§ 441. *Yonder.*—In the Mœso-Gothic we have the following forms : *jáinar, jáina, jáinþró* = *illic, illuc, illinc.* They do not, however, explain the form *yon-d-er.* It is not clear whether the *d* = the *-d* in *jáind,* or the þ in *jáinþró.*

Anon, as used by Shakspere, in the sense of *presently.*—The probable history of this word is as follows :—the first syllable contains a root akin to the root *yon,* signifying *distance in place.* The second is a shortened form of the Old High-German and Middle High-German, *-nt,* a termination expres-

sive, 1, of removal in space; 2, of removal in time: Old High-German, *ënont, ënnont;* Middle High-German, *ënentlig, jenunt* = *beyond.* The transition from the idea of *place* to that of *time* is shown in the Old High-German, *nâhunt,* and the Middle High-German, *vërnent* = *lately;* the first from the root *nigh,* the latter from the root *far.*—See *Deutsche Grammatik,* iii. 215.

CHAPTER XLII.

ON WHEN, THEN, AND THAN.

§ 442. The Anglo-Saxon adverbs are *whenne* and *þenne* = *when, then.*

The masculine accusative cases of the relative and demonstrative pronoun are *hwæne* (*hwone*) and *þæne* (*þone*).

Notwithstanding the difference, the first form is a variety of the second; so that the adverbs *when* and *then* are pronominal in origin.

As to the word *than*, the conjunction of comparison, it is a variety of *then*; the notions of *order*, *sequence*, and *comparison* being allied.

This is good: then (or *next in order*) *that is good*, is an expression sufficiently similar to *this is better than that* to have given rise to it.

CHAPTER XLIII.

PREPOSITIONS AND CONJUNCTIONS.

§ 443. *Prepositions.*—Prepositions, as such, are wholly unsusceptible of inflection. Other parts of speech, in a state of inflection, may be used with a prepositional sense. This, however, is not an inflection of prepositions.

No word is ever made a preposition by the addition of a derivational* element. If it were not for this, the practical classification of the prepositions, in respect to their form, would coincide with that of the adverbs. As it is, there are only the prepositions of deflection, and the absolute prepositions. On another principle of division there are the simple prepositions (*in, on,* &c.), and the complex prepositions (*upon, roundabout, across*).

The prepositions of deflection, when simple, originate chiefly in adverbs, as *up, down, within, without,* unless, indeed, we change the assertion, and say that the words in point (and the others like them) are adverbs originating in prepositions. The absence of characteristic terminations renders these decisions difficult.

The prepositions of deflection, when complex, originate chiefly in nouns, accompanied by an absolute preposition; as *instead of* of substantival, *between* of adjectival origin.

The absolute prepositions, in the English language, are *in, on, of, at, up, by, to, for, from, till, with, through.*

§ 444. *Conjunctions.*—Conjunctions, like prepositions, are

* *Over, under, after.*—These, although derived forms, are not prepositions of derivation; since it is not by the affix *-er* that they are made prepositions. *He went over, he went under, he went after*—these sentences prove the forms to be as much adverbial as prepositional.

wholly unsusceptible of inflection. Like prepositions, they are never made by means of a derivational element. Like prepositions they are either simple (as *and*, *if*), or complex (as *also*, *nevertheless*).

The conjunctions of deflection originate chiefly in imperative moods (as *all* save *one*, *all* except *one*); participles used like the ablative absolute in Latin (as *all* saving *one*, *all* excepting *one*); adverbs (as *so*); prepositions (as *for*); and relative neuters (as *that*).

The absolute conjunctions in the English language are *and*, *or*, *but*, *if*.

§ 445. *Yes*, *no*.—Although *not* may be reduced to an adverb, *nor* to a conjunction, and *none* to a noun, these two words (the direct affirmative and the direct negative) are referable to none of the current parts of speech. Accurate grammar places them in a class by themselves.

§ 446. *Particles*.—The word particle is a collective term for all those parts of speech that are *naturally* unsusceptible of inflection; comprising, 1, interjections; 2, direct affirmatives; 3, direct negatives; 4, absolute conjunctions; 5, absolute prepositions; 6, adverbs unsusceptible of degrees of comparison; 7, inseparable prefixes.

PART V.

SYNTAX.

CHAPTER I.

ON SYNTAX IN GENERAL.

§ 447. The word *syntax* is derived from the Greek *syn* (*with* or *together*), and *taxis* (*arrangement*). It relates to the arrangement, or putting together of words. Two or more words must be used before there can be any application of the study of syntax.

Much that is considered by the generality of grammarians as syntax, can either be omitted altogether, or else be better studied under another name.

To reduce a sentence to its elements, and to show that these elements are, 1, the subject, 2, the predicate, 3, the copula; to distinguish between simple terms and complex terms,—this is the department of logic.

To show the difference in force of expression, between such a sentence as *great is Diana of the Ephesians*, and *Diana of the Ephesians is great*, wherein the natural order of the subject and predicate is reversed, is a point of rhetoric.

I am moving.—To state that such a combination as *I am moving* is grammatical, is undoubtedly a point of syntax. Nevertheless it is a point better explained in a separate treatise, than in a work upon any particular language. The expression proves its correctness by the simple fact of its universal intelligibility.

I speaks.—To state that such a combination as *I speaks*, admitting that *I* is exclusively the pronoun in the first person,

and that *speaks* is exclusively the verb in the third, is undoubtedly a point of syntax. Nevertheless, it is a point which is better explained in a separate treatise, than in a work upon any particular language. An expression so ungrammatical, involves a contradiction in terms, which unassisted common sense can deal with.

There is to me a father.—Here we have a circumlocution equivalent to *I have a father.* In the English language the circumlocution is unnatural. In the Latin it is common. To determine this, is a matter of idiom rather than of syntax.

I am speaking, I was reading.—There was a stage in the Gothic languages when these forms were either inadmissible, or rare. Instead thereof, we had the present tense, *I speak,* and the past, *I spoke.* The same is the case with the classical languages in the classical stage. To determine the difference in idea between these pairs of forms is a matter of metaphysics. To determine at what period each idea came to have a separate mode of expression is a matter of the *history* of language. For example, *vas láisands* appears in Ulphilas* (Matt. vii. 29). There, it appears as a rare form, and as a literal translation of the Greek ἦν διδασκών (*was teaching*). The Greek form itself was, however, an unclassical expression for ἐδίδασκε. In Anglo-Saxon this mode of speaking became common, and in English it is commoner still. This is a point of idiom involved with one of history.

Swear by your sword—swear on your sword.—Which of these two expressions is right? This depends on what the speaker means. If he mean *make your oath in the full remembrance of the trust you put in your sword, and with the imprecation, therein implied, that it shall fail you, or turn against you, if you speak falsely,* the former expression is the right one. But, if he mean swear *with your hand upon your sword,* it is the latter which expresses his meaning. To take a different view of this question, and to write as a rule that *verbs of swearing are followed by the preposition on* (or *by*) is to mistake the province of the grammarian. Grammar tells no

* See *Deutsche Grammatik,* iv. 5.

one what he should wish to say. It only tells him how what he wishes to say should be said.

Much of the criticism on the use of *will* and *shall* is faulty in this respect. *Will* expresses one idea of futurity, *shall* another. The syntax of the two words is very nearly that of any other two. That one of the words is oftenest used with a first person, and the other with a second, is a fact, as will be seen hereafter, connected with the nature of *things*, not of words.

§ 448. The following question now occurs. If the history of forms of speech be one thing, and the history of idioms another; if this question be a part of logic, and that question a part of rhetoric; and if such truly grammatical facts as government and concord are, as matters of common sense, to be left uninvestigated and unexplained, what remains as syntax? This is answered by the following distinction. There are two sorts of syntax; theoretical and practical, scientific and historical, pure and mixed. Of these, the first consists in the analysis and proof of those rules which common practice applies without investigation, and common sense appreciates, in a rough and gross manner, from an appreciation of the results. This is the syntax of government and concord, or of those points which find no place in the present work, for the following reason—*they are either too easy or too hard for it.* If explained scientifically, they are matters of close and minute reasoning; if exhibited empirically, they are mere rules for the memory. Besides this they are universal facts of languages in general, and not the particular facts of any one language. Like other universal facts, they are capable of being expressed symbolically. That the verb (A) agrees with its pronoun (B) is an immutable fact: or, changing the mode of expression, we may say that language can only fulfil its great primary object of intelligibility when $A = B$. And so on throughout. A formal syntax thus exhibited, and even devised *à priori*, is a philological possibility. And it is also the measure of philological anomalies.

Notwithstanding the previous limitations, there is still a considerable amount of syntax in the English, as in all other languages. If I undertook to indicate the essentials of mixed syntax, I should say that they consisted in the explanation of

combinations *apparently* ungrammatical; in other words, that they ascertained the results of those causes which disturb the regularity of the pure syntax; that they measured the extent of the deviation; and that they referred it to some principle of the human mind—so accounting for it.

I am going.—Pure syntax explains this.

I have gone.—Pure syntax will not explain this. Nevertheless, the expression is good English. The power, however, of both *have* and *gone* is different from the usual power of those words. This difference mixed syntax explains.

Mixed syntax requires two sorts of knowledge—metaphysical, and historical.

1. To account for such a fact in language as the expression *the man as rides to market,* instead of the usual expression *the man who rides to market,* is a question of what is commonly called metaphysics. The idea of comparison is the idea common to the words *as* and *who.*

2. To account for such a fact in language as the expression *I have ridden a horse* is a question of history. We must know that when there was a sign of an accusative case in English the words *horse* and *ridden* had that sign; in other words, that the expression was, originally, *I have a horse as a ridden thing.* These two views illustrate each other.

§ 449. In the English, as in all other languages, it is convenient to notice certain so-called figures of speech. They always furnish convenient modes of expression, and sometimes, as in the case of the one immediately about to be noticed, *account* for facts.

Personification.—The ideas of apposition and collectiveness account for the apparent violations of the concord of number. The idea of personification applies to the concord of gender. A masculine or feminine gender, characteristic of persons, may be substituted for the neuter gender, characteristic of things. In this case the term is said to be personified.

The cities who aspired to liberty.—A personification of the idea expressed by *cities* is here necessary to justify the expression.

It, the sign of the neuter gender, as applied to a male or female *child,* is the reverse of the process.

Ellipsis (from the Greek *elleipein* = *to fall short*), or a

falling short, occurs in sentences like *I sent to the bookseller's*. Here the word *shop* or *house* is understood. Expressions like *to go on all fours*, and *to eat of the fruit of the tree*, are reducible to ellipses.

Pleonasm (from the Greek *pleonazein* = *to be in excess*) occurs in sentences like *the king, he reigns*. Here the word *he* is superabundant. In many *pleonastic* expressions we may suppose an interruption of the sentence, and afterwards an abrupt renewal of it; as *the king—he reigns*.

The fact of the word *he* neither qualifying nor explaining the word *king*, distinguishes pleonasm from apposition.

Pleonasm, as far as the view above is applicable, is reduced to what is, apparently, its opposite, viz. ellipsis.

My banks, they are furnished,—the most straitest sect,—these are pleonastic expressions. In *the king, he reigns*, the word *king* is in the same predicament as in *the king, God bless him*.

The double negative, allowed in Greek and Anglo-Saxon, but not admissible in English, is pleonastic.

The verb *do*, in *I do speak*, is *not* pleonastic. In respect to the sense it adds intensity. In respect to the construction it is not in apposition, but in the same predicament with verbs like *must* and *should*, as in *I must go*, &c.; *i. e.* it is a verb followed by an infinitive. This we know from its power in those languages where the infinitive has a characteristic sign; as in German—

Die Augen *thaten* ihm winken.—GOETHE.

Besides this, *make* is similarly used in Old English.—*But men make draw the branch thereof, and beren him to be graffed at Babyloyne*.—Sir J. MANDEVILLE.

The figure zeugma.—They wear a garment like that of the Scythians, but a language peculiar to themselves.—The verb, naturally applying to *garment* only, is here used to govern *language*. This is called, in Greek, *zeugma* (junction).

My paternal home was made desolate, and he himself was sacrificed.—The sense of this is plain; *he* means *my father*. Yet no such substantive as *father* has gone before. It is supplied, however, from the word *paternal*. The sense indi-

cated by *paternal* gives us a subject to which *he* can refer. In other words, the word *he* is understood, according to what is indicated, rather than according to what is expressed. This figure, in Greek, is called *pros to semainomenon* (*according to the thing indicated*).

§ 450. *Apposition.* — *Cæsar, the Roman emperor, invades Britain.*—Here the words *Roman emperor* explain, or define, the word *Cæsar;* and the sentence, filled up, might stand, *Cæsar, that is, the Roman emperor,* &c. Again, the word *Roman emperor* might be wholly ejected; or, if not ejected, they might be thrown into a parenthesis. The practical bearing of this fact is exhibited by changing the form of the sentence, and inserting the conjunction *and*. In this case, instead of one person, two are spoken of, and the verb *invades* must be changed from the singular to the plural.

Now the words *Roman emperor* are said to be in apposition to *Cæsar*. They constitute, not an additional idea, but an explanation of the original one. They are, as it were, *laid alongside* (*appositi*) *of* the word *Cæsar*. Cases of doubtful number, wherein two substantives precede a verb, and wherein it is uncertain whether the verb should be singular or plural, are decided by determining whether the substantives be in apposition or the contrary. No matter how many nouns there may be, as long as it can be shown that they are in apposition, the verb is in the singular number.

§ 451. *Collectiveness as opposed to plurality.*—In sentences like *the meeting* was *large, the multitude* pursue *pleasure, meeting* and *multitude* are each collective nouns; that is, although they present the idea of a single object, that object consists of a plurality of individuals. Hence, *pursue* is put in the plural number. To say, however, *the meeting were large* would sound improper. The number of the verb that shall accompany a collective noun depends upon whether the idea of the multiplicity of individuals, or that of the unity of the aggregate, shall predominate.

Sand and salt and a mass of iron is *easier to bear than a man without understanding.*—Let *sand and salt and a mass of iron* be dealt with as a series of things the aggregate of which forms a mixture, and the expression is allowable.

The king and the lords and commons forms *an excellent frame of government.* Here the expression is doubtful. Substitute *with* for the first *and,* and there is no doubt as to the propriety of the singular form *is.*

§ 452. *The reduction of complex forms to simple ones.*—Take, for instance, a current illustration, viz. *the-king-of-Saxony's army.*—Here the assertion is, not that the army belongs to *Saxony,* but that it belongs to the *king of Saxony;* which words must, for the sake of taking a true view of the construction, be dealt with as a single word in the possessive case. Here two cases are dealt with as one; and a complex term is treated as a single word.

The same reasoning applies to phrases like *the two king Williams.* If we say *the two kings William,* we must account for the phrase by apposition.

§ 453. *True notion of the part of speech in use.*—In *he is gone,* the word *gone* must be considered as equivalent to *absent;* that is, as an adjective. Otherwise the expression is as incorrect as the expression *she is eloped.* Strong participles are adjectival oftener than weak ones; their form being common to many adjectives.

True notion of the original form.—In the phrase *I must speak,* the word *speak* is an infinitive. In the phrase *I am forced to speak,* the word *speak* is (in the present English) an infinitive also. In one case, however, it is preceded by *to;* whilst in the other, the participle *to* is absent. The reason for this lies in the original difference of form. *Speak*—*to* = the Anglo-Saxon *sprécan,* a simple infinitive; *to speak,* or *speak* + *to* = the Anglo-Saxon *to sprécanne,* an infinitive in the dative case.

§ 454. *Convertibility.*—In the English language, the greater part of the words may, as far as their form is concerned, be one part of speech as well as another. Thus the combinations *s-a-n-th,* or *f-r-e-n-k,* if they existed at all, might exist as either nouns or verbs, as either substantives or adjectives, as conjunctions, adverbs, or prepositions. This is not the case in the Greek language. There, if a word be a substantive, it will probably end in *-s,* if an infinitive verb, in *-ein,* &c. The

bearings of this difference between languages like the English and languages like the Greek will soon appear.

At present, it is sufficient to say that a word, originally one part of speech (*e. g.* a noun), may become another (*e. g.* a verb). This may be called the convertibility of words.

There is an etymological convertibility, and a syntactic convertibility; and although, in some cases, the line of demarcation is not easily drawn between them, the distinction is intelligible and convenient.

Etymological convertibility.—The words *then* and *than*, now adverbs or conjunctions, were once cases: in other words, they have been converted from one part of speech to another. Or, they may even be said to be cases, at the present moment; although only in an historical point of view. For the practice of language, they are not only adverbs or conjunctions, but they are adverbs or conjunctions exclusively.

Syntactic convertibility.—The combination *to err*, is at this moment an infinitive verb. Nevertheless it can be used as the equivalent to the substantive *error*.

To err is human = *error is human.* Now this is an instance of syntactic conversion. Of the two meanings, there is no doubt as to which is the primary one; which primary meaning is part and parcel of the language at this moment.

The infinitive, when used as a substantive, can be used in a singular form only.

To err = *error;* but we have no such form as *to errs* = *errors.* Nor is it wanted. The infinitive, in a substantival sense, always conveys a general statement, so that even when singular, it has a plural power; just as *man is mortal* = *men are mortal.*

The adjective used as a substantive.—Of these, we have examples in expressions like the *blacks of Africa—the bitters and sweets of life—all fours were put to the ground.* These are true instances of conversion, and are proved to be so by the fact of their taking a plural form.

Let the blind lead the blind is not an instance of conversion. The word *blind* in both instances remains an adjective, and is shown to remain so by its being uninflected.

Uninflected parts of speech, used as substantives.—When King Richard III. says, *none of your ifs*, he uses the word *if* as a substantive = *expressions of doubt*.

So in the expression *one long now*, the word *now* = *present time*.

The convertibility of words in English is very great; and it is so because the structure of the language favours it. As few words have any peculiar signs expressive of their being particular parts of speech, interchange is easy, and conversion follows the logical association of ideas unimpeded.

The convertibility of words is in the inverse ratio to the amount of their inflection.

CHAPTER II.

SYNTAX OF SUBSTANTIVES.

§ 455. The phenomena of convertibility have been already explained.

The remaining points connected with the syntax of substantives, are chiefly points of either ellipsis, or apposition.

Ellipsis of substantives.—The historical view of phrases, like *Rundell and Bridge's, St. Paul's,* &c., shows that this ellipsis is common to the English and the other Gothic languages. Furthermore, it shows that it is met with in languages not of the Gothic stock; and, finally, that the class of words to which it applies, is, there or thereabouts, the same generally.

A. 1. The words most commonly understood, are *house* and *family,* or words, reducible to them. In Latin, *Dianæ* = *ædem Dianæ.*—*Deutsche Grammatik,* iv. 262.

2. *Country, retinue.*—*Deutsche Grammatik,* iv. 262.

3. *Son, daughter, wife, widow.*—*Deutsche Grammatik,* iv. 262.—Νηλεὺς Κόδρου, Greek.

B. The following phrases are referable to a different class of relations—

1. *Right and left*—supply *hand.* This is, probably, a real ellipsis. The words *right* and *left,* have not yet become true substantives; inasmuch as they have no plural forms. In this respect, they stand in contrast with *bitter* and *sweet;* inasmuch as we can say *he has tasted both the bitters and sweets of life.* Nevertheless, the expression can be refined on.

2. *All fours.*—*To go on all fours.* No ellipsis. The word *fours* is a true substantive, as proved by its existence as a plural.

From expressions like ποτήριον ψυχροῦ (Matt. xiv. 51),

from the Greek, and *perfundit gelido* (understand *latice*), from the Latin, we find that the present ellipsis was used with greater latitude in the classical languages than our own.

§ 456. *Proper names can only be used in the singular number.*—This is a rule of logic, rather than of grammar. When we say *the four Georges, the Pitts and Camdens*, &c., the words that thus take a plural form, have ceased to be proper names. They either mean—

1. The persons called *George*, &c.

2. Or, persons so like *George*, that they may be considered as identical.

§ 457. *Collocation.*—In the present English, the genitive case always precedes the noun by which it is governed—*the man's hat = hominis pileus;* never *the hat man's = pileus hominis.*

CHAPTER III.

SYNTAX OF ADJECTIVES.

§ 458. *Pleonasm.*—Pleonasm can take place with adjectives only in the expression of the degrees of comparison. Over and above the etymological signs of the comparative and superlative degrees, there may be used the superlative words *more* and *most.*

And this pleonasm really occurs—

The more serener *spirit.*
The most straitest *sect.*

These are instances of pleonasm in the strictest sense of the term.

§ 459. *Collocation.*—As a general rule, the adjective precedes the substantive—*a good man,* not *a man good.*

When, however, the adjective is qualified by either the expression of its degree, or accompanied by another adjective, it may follow the substantive—

A man *just and good.*
A woman *wise and fair.*
A hero *devoted to his country.*
A patriot *disinterested to a great degree.*

Single simple adjectives thus placed after their substantive, belong to the poetry of England, and especially to the ballad poetry—*sighs profound—the leaves green.*

§ 460. *Government.*—The only adjective that governs a case, is the word *like.* In the expression, *this is like him,* &c., the original power of the dative remains. This we infer—

1. From the fact that in most languages which have inflections to a sufficient extent, the word meaning *like* governs a dative case.

2. From the fact that if ever we use in English any preposition at all to express similitude, it is the preposition *to—like to me, like to death*, &c.

Expressions like *full of meat, good for John*, are by no means instances of the government of adjectives; the really governing words being the prepositions *to* and *for* respectively.

The most that can be said, in cases like these, is that particular adjectives determine the use of particular prepositions—thus the preposition *of* generally follows the adjective *full*, &c.

§ 461. The positive degree preceded by the adjective *more*, is equivalent to the comparative form—*e. g. more wise = wiser*.

The reasons for employing one expression in preference to the other, depend upon the nature of the particular word used.

When the word is, at one and the same time, of Anglo-Saxon origin and monosyllabic, there is no doubt about the preference to be given to the form in *-er*. Thus, *wis-er* is preferable to *more wise*.

When, however, the word is compound, or trisyllabic, the combination with the word *more* is preferable—

more fruitful being better than *fruitfuller*.
more villanous . . . *villanouser*.

Between these two extremes, there are several intermediate forms wherein the use of one rather than another, will depend upon the taste of the writer. The question, however, is a question of euphony, rather than of aught else. It is also illustrated by the principle of not multiplying secondary elements. In such a word as *fruit-full-er*, there are two additions to the root. The same is the case with the superlative, *fruit-full-est*.

Section 356 should be read carefully. There, there is indicated a refinement upon the current notions as to the power of the comparative degree, and reasons are given for believing that the fundamental notion expressed by the comparative inflection is the idea of comparison or contrast between *two* objects.

In this case, it is better, in speaking of only two objects, to use the comparative degree rather than the superlative—even when we use the definite article *the*. Thus—

This is *the better* of the two,

is preferable to

This is *the best* of the two.

This principle is capable of an application more extensive than our habits of speaking and writing will verify. Thus, to go to other parts of speech, we should logically say—

Whether of the two,

rather than

Which of the two.

Either the father or the son,

but not

Either the father, the son, or the daughter.

This statement may be refined on. It is chiefly made for the sake of giving fresh prominence to the idea of duality expressed by the terminations *-er* and *-ter*.

The absence of inflection simplifies the syntax of adjectives. Violations of concord are impossible where there are no concords to violate. We could not make an adjective disagree with its substantive if we wished.

CHAPTER IV.

SYNTAX OF PRONOUNS.

§ 462. The syntax of substantives is, in English, simple, from the paucity of its inflections, a condition which is unfavourable towards the evolution of constructional complexities; the most remarkable exception being the phenomenon of convertibility noticed above.

The same is the case with adjectives. The want of inflection simplifies their syntax equally with that of the substantives.

But with the pronouns this is not the case. Here we have—

1. Signs of gender; 2. Signs of case; 3. Signs of number, to a greater extent, and with more peculiarities, than elsewhere.

Furthermore, the pronouns exhibit in a great degree the phenomena of conversion indicated in § 454.

Pleonasm in the syntax of pronouns.—In the following sentences the words in italics are pleonastic.

1. The king, *he* is just.
2. I saw *her*, the queen.
3. The *men*, they were there.
4. The king, *his* crown.

Of these forms, the first is more common than the second and third, and the fourth more common than the first.

The fourth has another element of importance. It has given rise to the absurd notion that the genitive case in *-s* (*father-s*) is a contraction from *his* (*father his*).

To say nothing about the inapplicability of this rule to

feminine genders, and plural numbers, the whole history of the Indo-Germanic language is against it.

1. We cannot reduce *the queen's majesty* to *the queen his majesty*.

2. We cannot reduce *the children's bread* to *the children his bread*.

3. The Anglo-Saxon forms are in *-es*, not in *his*.

4. The word *his* itself must be accounted for; and that cannot be done by assuming *his* to be *he* + *his*.

5. The *-s* in *father's* is the *-is* in *patris*, and the *-ος* in *πατέρος*.

The preceding examples illustrate an apparent paradox, viz. the fact of pleonasm and ellipsis being closely allied. *The king, he is just*, dealt with as a single sentence, is undoubtedly pleonastic. But it is not necessarily to be considered as a mere simple sentence. *The king* may represent a first sentence incomplete, whilst *he is just* represents a second sentence in full. What is pleonasm in a single sentence, is ellipsis in a double one.

CHAPTER V.

THE TRUE PERSONAL PRONOUNS.

§ 463. *Personal pronouns.*—The use of the second person plural instead of the second singular has already been noticed. This use of one number for another is current throughout the Gothic languages. A pronoun so used is conveniently called the *pronomen reverentiæ.*

In English, however, there is a second change over and above the change of number, viz. that of case. We not only say *ye* instead of *thou,* but *you* instead of *ye.*

Mr. Guest remarks, "that at one time the two forms *ye* and *you* seemed to have been nearly changing place in our language.

> As I have made *ye* one, Lords, one remain;
> So I grow stronger *you* more honour gain.
>
> *Henry VIII.* iv. 2.
>
> What gain *you* by forbidding it to teaze *ye,*
> It now can neither trouble you nor please *ye.*
>
> Dryden."

In German and the Danish the *pronomen reverentiæ* is got at by a change, not of number, but of person—in other words, the pronoun of the *third* person is used instead of that of the *second;* just as if, in the English, we said *will they walk* = *will you walk, will ye walk, wilt thou walk.*

§ 464. *Dativus ethicus.*—In the phrase

> Rob me the exchequer.—*Henry IV.*

the *me* is expletive, and is equivalent to *for me.* This expletive use of the dative is conveniently called the *dativus*

ethicus. It occurs more frequently in the Latin than in the English, and more frequently in the Greek than in the Latin.

§ 465. *The reflected personal pronoun.* — In the English language there is no equivalent to the Latin *se*, the German *sich*, and the Scandinavian *sik*, and *sig*.

It follows from this that the word *self* is used to a greater extent than would otherwise be the case.

I strike me is awkward, but not ambiguous.

Thou strikest thee is awkward, but not ambiguous.

He strikes him is ambiguous; inasmuch as *him* may mean either the *person who strikes* or some one else. In order to be clear we add the word *self* when the idea is reflective. *He strikes himself* is, at once, idiomatic, and unequivocal.

So it is with the plural persons.

We strike us is awkward, but not ambiguous.

Ye strike you is the same.

They strike them is ambiguous.

This shows the value of a reflective pronoun for the third person.

As a general rule, therefore, whenever we use a verb reflectively we use the word *self* in combination with the personal pronoun.

Yet this was not always the case. The use of the simple personal pronoun was current in Anglo-Saxon, and that, not only for the two first persons, but for the third as well.

The exceptions to this rule are either poetical expressions, or imperative modes.

> He sat *him* down at a pillar's base.—BYRON.
>
> Sit *thee* down.

Reflective neuters.—In the phrase *I strike me* the verb *strike* is transitive; in other words, the word *me* expresses the object of an action, and the meaning is different from the meaning of the simple expression *I strike*.

In the phrase *I fear me* (used by Lord Campbell in his "Lives of the Chancellors"), the verb *fear* is intransitive or neuter; in other words, the word *me* (unless, indeed, *fear* mean

terrify) expresses no object of any action at all; whilst the meaning is the same as in the simple expression *I fear*.

Here the reflective pronoun appears out of place, *i. e.* after a neuter or intransitive verb.

Such a use, however, is but the fragment of an extensive system of reflective verbs thus formed, developed in different degrees in the different Gothic languages; but in all more than in the English.

Equivocal reflectives.—The proper place of the reflective is *after* the verb.

The proper place of the governing pronoun is, in the indicative and subjunctive moods, *before* the verb.

Hence in expressions like the preceding there is no doubt as to the power of the pronoun.

The imperative mood, however, sometimes presents a complication. Here the governing person may follow the verb.

Mount ye = either *be mounted* or *mount yourselves*. In phrases like this, and in phrases

Busk ye, busk ye, my bonny, bonny bride,
Busk ye, busk ye, my winsome marrow,

the construction is ambiguous. *Ye* may either be a nominative case governing the verb *busk*, or an accusative case governed by it.

This is an instance of what may be called the *equivocal reflective*.

CHAPTER VI.

ON THE SYNTAX OF THE DEMONSTRATIVE PRONOUNS, AND THE PRONOUNS OF THE THIRD PERSON.

§ 466. REASONS have been given in § 366, for considering the so-called pronouns of the third person (*he, she, it, they*) demonstrative rather than truly personal.

As *his*, and *her*, are genitive cases (and not adjectives), there is no need of explaining such combinations as *his mother*, *her father*, inasmuch as no concord of gender is expected. The expressions are respectively equivalent to

mater ejus, not *mater sua;*
pater ejus, . *pater suus.*

From § 366, it may be seen that *its* is a secondary genitive, and it may be added, that it is of late origin in the language. The Anglo-Saxon form was *his*, the genitive of *he* for the neuter and masculine equally. Hence, when, in the old writers, we meet *his*, where we expect *its*, we must not suppose that any personification takes place, but simply that the old genitive common to the two genders is used in preference to the modern one limited to the neuter, and irregularly formed. This has been illustrated by Mr. Guest.

The following instances are the latest specimens of its use:—

"The apoplexy is, as I take it, a kind of lethargy. I have read the cause of *his* effects in Galen; *it* is a kind of deafness."—2 *Henry IV.* i. 2.

"If the salt have lost *his* savour, wherewith shall it be seasoned? *It* is neither fit for the land nor yet for the dunghill; but men cast *it* out."—*Luke* xiv. 34, 35.

"Some affirm that every plant has *his* particular fly or caterpillar, which it breeds and feeds."—WALTON'S *Angler*.

"This rule is not so general, but that *it* admitteth of *his* exceptions."—CAREW.

"The genitive *its* is of late introduction into our language. Though used by our dramatists and many of their contemporaries, it does not occur in the versions of our Bible, the substitute being *his* or the compound term *thereof*."—*Phil. Trans.* No. 25.

For the archaic and provincial use of *him* and *he* for *it* see *ibid.*; remembering that the two cases are different. *His* for *its* is an old form retained: *him* and *he* for *it* are really changes of gender.

§ 467. *Take them things away.*—Here we have *them* for *those*. The expression, although not to be imitated, is explained by the originally demonstrative power of *them*.

Sometimes the expression is still more anomalous, and we hear the so-called nominative case used instead of the accusative. In the expression *take they things away*, the use of *they* for *them* (itself for *those*) is similarly capable of being, down to a certain period of our language, explained as an archaism. The original accusative was *þa*, and *þo*: the form in *-m* being dative.

§ 468. *This* and *that*.—The remarks upon the use of these words in certain expressions is brought at once to the Latin scholar by the quotation of the two following lines from Ovid, and the suggestion of a well-known rule in the Eton Latin Grammar:—

Quocunque aspicies nihil est nisi pontus et aer;
Nubibus hic tumidus, fluctibus ille minax.

Here *hic* (= *this* or *the one*) refers to the antecedent last named (the *air*); whilst *ille* (= *that* or *the other*) refers to the antecedent first named (the *sea*).

Now on the strength of this example, combined with others, it is laid down as a rule in Latin that *hic* (*this*) refers to the last-named antecedent, *ille* to the first-named.

What is the rule in English?

Suppose we say *John's is a good sword and so is Charles's;*

this cut through a thick rope, the other cut through an iron rod. Or, instead of saying *this* and *that*, we may say *the one* and *the other*. It is clear that, in determining to which of the two swords the respective demonstratives refer, the meaning will not help us at all, so that our only recourse is to the rules of grammar; and it is the opinion of the present writer that the rules of grammar will help us just as little. The Latin rule is adopted by scholars, but still it is a Latin rule rather than an English one.

The truth is, that it is a question which no authority can settle; and all that grammar can tell us is (what we know without it), that *this* refers to the name of the idea which is logically the most close at hand, and *that* to the idea which is logically the most distant.

What constitutes nearness or distance of ideas—in other words, what determines the sequence of ideas—is another question. That the idea, however, of sequence, and, consequently, of logical proximity and logical distance, is the fundamental idea in regard to the expressions in question, is evident from the very use of the words *this* and *that*.

Now the sequence of ideas is capable of being determined by two tests.

1. The idea to which the name was last given, or (changing the expression) the name of the last idea, may be the nearest idea in the order of sequence, and, consequently, the idea referred to by the pronoun of proximity. In this case the idea closest at hand to the writer of the second line of the couplet quoted above was the idea of the *atmosphere* (*aer*), and it was, consequently, expressed by *this* (*hic*).

2. Or the idea to which the name was first given, or (changing the expression) the name of the first idea, may be the nearest idea in the order of sequence, and consequently the idea referred to it by the pronoun of proximity; inasmuch as the idea which occurs first is the most prominent one, and what is prominent appears near. In this case, the idea closest at hand to the writer of the second line of the couplet quoted above would have been the idea of the *sea* (*pontus*), and it would, consequently, have been the idea expressed by *this* (*hic*).

As Ovid, however, considered the idea at the end of the last half of one sentence to be the idea nearest to the beginning of the next, we have him expressing himself as he does. On the other hand, it is easy to conceive a writer with whom the nearest idea is the idea that led the way to the others.

As I believe that one and the same individual may measure the sequence of his ideas sometimes according to one of these principles, and sometimes according to another, I believe that all rules about the relations of *this* and *that* are arbitrary.

It is just a matter of chance whether a thinker take up his line of ideas by the end or by the beginning. The analogies of such expressions as the following are in favour of *this*, in English, applying to the *first* subject, *that* to the *second;* since the word *attorney* takes the place of *this*, and applies to the first name of the two, *i. e.* to *Thurlow* :—

"It was a proud day for the bar when Lord North made Thurlow (1) and (2) Wedderburn (1) Attorney (2) and Solicitor General."—*Mathias, from* LORD CAMPBELL'S *Lives of the Chancellors.*

CHAPTER VII.

ON THE CONSTRUCTION OF THE WORD *SELF*.

§ 469. The undoubted constructions of the word *self*, in the present state of the cultivated English, are threefold.

1. *Government.*—In *my-self*, *thy-self*, *our-selves*, and *your-selves*, the construction is that of a common substantive with an adjective or genitive case. *My-self* = *my individuality*, and is similarly construed—*mea individualitas* (or *persona*), or *mei individualitas* (or *persona*).

2. *Apposition.*—In *him-self* and *them-selves*, when accusative, the construction is that of a substantive in apposition with a pronoun. *Him-self* = *him, the individual.*

3. *Composition.*—It is only, however, when *himself* and *themselves* are in the accusative case, that the construction is appositional. When they are used as nominatives, it must be explained on another principle. In phrases like

He himself was present,

They themselves were present,

there is neither apposition nor government; *him* and *them*, being neither related to *my* and *thy*, so as to be governed, nor yet to *he* and *they*, so as to form an apposition. In order to come under one of these conditions, the phrases should be either *he his self* (*they their selves*), or else *he he self* (*they they selves*). In this difficulty, the only logical view that can be taken of the matter, is to consider the words *himself* and *themselves*, not as two words, but as a single word compounded; and even then, the compound will be of an irregular kind; inasmuch as the inflectional element *-m*, is dealt with as part and parcel of the root.

Her-self.—The construction here is ambiguous. It is one of

the preceding constructions. Which, however, it is, is uncertain; since *her* may be either a so-called genitive, like *my*, or an accusative, like *him*.

Itself—is also ambiguous. The *s* may represent the *-s* in *its*, as well as the *s-* in *self*.

This inconsistency is as old as the Anglo-Saxon stage of the English language.

In the exhibition of the second construction of the word *self*, it was assumed that the case was a case of apposition, and that *self* was substantival in character. Nevertheless, this is by no means a necessary phenomenon. *Self* might, as far as its power is determined by its construction alone, in words like *himself*, as easily be an adjective as a substantive. In which case the construction would be a matter, not of apposition, but of *agreement*. To illustrate this by the Latin language, *himself* might equal either *eum personam* (*him, the person*), or *eum personalem* (*him personal*). The evidence, however, of the forms like *myself*, as well as other facts adducible from comparative philology, prove the substantival character of *self*. On the other hand, it ought not to be concealed that another word, whereof the preponderance of the adjectival over the substantival power is undoubted, is found in the Old English, with just the same inconsistency as the word *self; i. e.* sometimes in government (like a substantive), and sometimes in either concord or apposition, like a word which may be *either* substantive or adjective. This word is *one;* the following illustrations of which are from Mr. Guest.—*Phil. Trans.* No. 22.

In this world wote I no knight,
Who durst *his one* with hym fight.

Ipomedon, 1690.

þah ha *hire ane* were
Ayein so kene keisere and al his kine riche.

St. Catherine, 90.

Though she *alone* were
Against so fierce a kaiser, and all his kingdom.

Here *his one, her one,* mean *his singleness, her single ness.*

He made his mone
Within a garden all *him one.*

Gower, *Confess. Amant.*

Here *him one* = *himself* in respect to its construction.

§ 470. As to the inflection of the word *-self*, all its compounds are substantives; inasmuch as they all take plural forms as far as certain logical limitations will allow them to do so—*ourselves, yourselves, themselves.*

Myself, thyself, himself, itself, and *herself,* are naturally singular, and under no circumstances can become plural.

Themselves is naturally plural, and under no circumstances can become singular.

Ourselves and *yourselves* are naturally plural; yet under certain circumstances they become singular.

a. Just as men say *we* for *I,* so may they say *our* for *my.*

b. Just as men say *you* for *thou,* so may they say *your* for *thy.*

In respect to the inflection in the way of case, there are no logical limitations whatever. There is nothing against the existence of a genitive form *self's* except the habit of the English language not using one, founded on the little necessity for so doing.—*Are you sure this is your own? Yes, I am sure it is my own self's.* Such an expression is both logic and grammar.

When an adjective intervenes between *self* and its personal pronoun the construction is always in the way of government; in other words, the personal pronoun is always put in the genitive case.

His own self, *not* him own self.

Their own selves, *not* them own selves.

§ 471. The construction of *self* and a personal pronoun with a verb may be noticed in this place. It is only in the case of the two pronouns of the singular number that any doubt can arise.

1. When *myself* or *thyself* stands alone, the verb that follows is in the third person—*myself is* (not *am*) *weak, thyself is* (not *art*) *weak.* Here the construction is just the same as in the proposition *my body is weak.*

2. When *myself* or *thyself* is preceded by *I* or *thou,* the verb that follows is in the first person—*I, myself am* (not *is*) *weak; thou, thyself, art* (not *is*) *weak.*

CHAPTER VIII.

ON THE POSSESSIVE PRONOUNS.

§ 472. THE possessive pronouns fall into two classes. The first class contains the forms connected, partially in their etymology and wholly in their syntax, with *my* and *thy*, &c. The second class contains the forms connected, partially in their etymology and wholly in their syntax, with *mine* and *thine*, &c.

The first class is the class of what may be called the *oblique* possessives; the name being founded upon the etymological fact of their being connected with the oblique cases of the pronominal inflection.—*My, thy, his* (as in *his book*), *her, its* (as in *its book*), *our, your, their*. These are conveniently considered as the equivalents to the Latin forms, *mei, tui, ejus, nostrum, vestrum, eorum*.

The second class is the class of what may be called the *absolute* possessives; the name being founded upon the syntactic fact of their being able to form the term of a proposition by themselves; as *whose is this? Mine* (not *my*).—*Mine, thine, his* (as in *the book is his*), *hers, ours, yours, theirs*, are conveniently considered as the equivalents to the Latin forms *meus, mea, meum; tuus, tua, tuum; suus, sua, suum; noster, nostra, nostrum; vester, vestra, vestrum*.

How far either or both of these two classes of pronouns are cases, or adjectives, is a point of etymology that has already been noticed (Part IV. chap. xx.).

How far both or either are cases or adjectives is, in syntax, a matter of indifference.

There is, however, a palpable difference between the con-

struction of *my* and *mine*. We cannot say *this is mine hat*, and we cannot say *this hat is my*. Nevertheless, this difference is not explained by any change of construction from that of adjectives to that of cases. As far as the syntax is concerned, the construction of *my* and *mine* is equally that of an adjective *agreeing* with a substantive, and of a genitive (or possessive) case *governed* by a substantive.

Now a common genitive case can be used in two ways; either as part of a term, or as a whole term (*i. e.* absolutely).—1. As part of a term—*this is John's hat*. 2. As a whole term —*this hat is John's*.

And a common adjective can be used in two ways; either as part of a term, or as a whole term (*i. e.* absolutely).—1. As part of a term—*these are good hats*. 2. As a whole term—*these hats are good*.

Now whether we consider *my*, and the words like it, as adjectives or cases, they possess only *one* of the properties just illustrated, *i. e.* they can only be used as part of a term —*this is my hat*; not *this hat is my*.

And whether we consider *mine*, and the words like it, as adjectives or cases, they possess only *one* of the properties just illustrated, *i. e.* they can only be used as whole terms, or absolutely—*this hat is mine*; not *this is mine hat*.

For a full and perfect construction, whether of an adjective or a genitive case, the possessive pronouns present the phenomenon of being, singly, incomplete, but, nevertheless, complementary to each other when taken in their two forms.

In the absolute construction of a genitive case, the term is formed by the single word only so far as the *expression* is concerned. A substantive is always *understood* from what has preceded.—*This discovery is Newton's = this discovery is Newton's discovery*.

The same with adjectives.—*This weather is fine = this weather is fine weather*.

And the same with absolute pronouns.—*This hat is mine = this hat is my hat*; and *this is a hat of mine = this is a hat of my hats*.

In respect to all matters of syntax considered exclusively, it is so thoroughly a matter of indifference whether a word be an

adjective or a genitive case, that Wallis considers the forms in *-'s*, like *father's*, not as genitive cases, but as adjectives. Looking to the logic of the question alone, he is right, and, looking to the practical syntax of the question, he is right also. He is only wrong on the etymological side of the question.

"Nomina substantiva apud nos nullum vel generum vel casuum discrimen sortiuntur."—P. 76.

"Duo sunt adjectivorum genera, a substantivis immediate descendentia, quæ semper substantivis suis præponuntur. Primum quidem adjectivum possessivum libet appellare. Fit autem a quovis substantivo, sive singulari sive plurali, addito *-s*.—Ut *man's nature*, *the nature of man*, natura humana vel hominis; *men's nature*, natura humana vel hominum; *Virgil's poems*, *the poems of Virgil*, poemata Virgilii vel Virgiliana."—P. 89.

CHAPTER IX.

THE RELATIVE PRONOUNS.

§ 473. The word *that*, although originally, when a demonstrative pronoun, a neuter singular, is now used as a relative for all genders, and both numbers.

1. He *that* spoke.—*Masculine gender.*
2. She *that* spoke.—*Feminine gender.*
3. They *that* fought.—*Plural number.*
4. The man *that* I struck:—*Objective case.*

§ 474. Etymologically, *which* is no true neuter of *who*, but a compound word. It is used, however, with less latitude than *that*. The beginning of the Lord's Prayer exhibits it in combination with a masculine noun. Generally, however, it is confined to the neuter gender; in which it is common to both numbers.

1. The dagger *which* stabbed Cæsar.—*Nominative singular.*
2. The daggers *which* stabbed Cæsar.—*Nominative plural.*
3. The dagger *which* I grasp.—*Objective singular.*
4. The daggers *which* I grasp.—*Objective Plural.*

Which has so nearly replaced *what* that the general use of this last word with its proper power, as a neuter relative, is, in the present English, vulgar, *e. g.*—

1. The dagger *what* stabbed Cæsar.
2. The dagger *what* I grasp.

In one case, however, *what* is used as a true relative, viz. when the antecedent is either *this* or *that*.

This is *what* I mean; *not*, this is *which* I mean.
That is *what* I mean; *not*, that is *which* I mean.

§ 475. The word *as*, properly a conjunction, is occasionally used as a relative—*the man* as *rides to market*.

This expression is not to be imitated. It ought, however, to be explained. *As* is a conjunction denoting comparison. The ideas of comparison and equivalence are allied. The relative is, *ex vi termini*, the equivalent, in one part of a sentence, to the antecedent in another.

(1) The man—(2) who speaks.

Here *who* = *man*.

(1) As white—(2) as snow.

Here *snow* = *white*.

§ 476. It is necessary that the relative be in the same *gender* as the antecedent—*the man who—the woman who—the thing which*.

It is necessary that the relative be in the same *number* with the antecedent.

It is *not* necessary for the relative to be in the same *case* with its antecedent.

1. John, *who* trusts me, comes here.
2. John, *whom* I trust, comes here.
3. John, *whose* confidence I possess, comes here.
4. I trust John, *who* trusts me.

The reason why the relative must agree with its antecedent in both number and gender, whilst it need not agree with it in case, is found in the following observations.

1. All sentences containing a relative contain two verbs—*John who* (1) *trusts me* (2) *comes here*.

2. Two verbs express two actions—(1) *trust*, (2) *come*.

3. Whilst, however, the actions are two in number, the person or thing which does, or suffers them is single—*John*.

4. *He* (*she* or *it*) is singular, *ex vi termini*. The relative expresses the *identity* between the subjects (or objects) of the two actions. Thus *who* = *John*, or is another name for John.

5. Things and persons that are one and the same, are of

one and the same gender. The *John* who *trusts* is necessarily of the same gender with the *John* who *comes*.

6. Things and persons that are one and the same, are of one and the same number. The number of *Johns* who *trust*, is the same as the number of *Johns* who *come*. Both these elements of concord are immutable.

7. But a third element of concord is not immutable. The person or thing that is an agent in the one part of the sentence, may be the object of an action in the other. The *John* whom I *trust* may *trust* me also. Hence—

a. I trust John—*John* the object.
b. John trusts me—*John* the agent.

As the relative is only the antecedent in another form, it may change its case according to the construction.

1. I trust John—(2) *John* trusts me.
2. I trust John—(2) *He* trusts me.
3. I trust John—(2) *Who* trusts me.
4. John trusts me—(2) I trust *John*.
5. John trusts me—(2) I trust *him*.
6. John trusts me—(2) I trust *whom*.
7. John trusts me—(2) *Whom* I trust.
8. John—(2) *Whom* I trust trusts me.

§ 477. *The books I want are here.*—This is a specimen of a true ellipsis. In all such phrases in *full*, there are *three* essential elements.

1. The first proposition; as *the books are here*.

2. The second proposition; as *I want*.

3. The word which connects the two propositions, and without which they naturally make separate, independent, unconnected statements.

Now, although true and unequivocal ellipses are scarce, the preceding is one of the most unequivocal kind—the word which connects the two propositions being wanting.

§ 478. One or two points connected with the construction of those sentences wherein relative pronouns occur, are necessary to be familiarly understood in order for us to see our way clearly to certain real and apparent anomalies in the syntax of this class of words.

1. Every sentence wherein a relative occurs, is complex, *i. e.* it consists of two propositions—*the man who rides is come* = (1) *the man is come;* (2) *who rides.* Here the relative *who* has no meaning in itself, but takes a meaning from the noun of the preceding clause.

2. *The relative is the demonstrative or personal pronoun under another form.*—The two propositions (1) *the man is come;* (2) *who rides* = (1) *the man is come;* (2) *he rides.*

3. *The demonstrative or personal pronoun is the substantive in another form.*—The two propositions (1) *the man is come;* (2) *he rides* = (1) *the man is come;* (2) *the man rides.*

4. Hence the relative is the equivalent to a demonstrative pronoun, or to a substantive, indifferently.

5. But the relative is the equivalent to the pronoun and substantive, and *something more.* In sentences like

The man is come—he rides—
The man is come—the man rides.

The identity between the person mentioned in the two propositions is implied, not expressed. This the relative *expresses;* and hence its use in languages.

6. From these observations we get a practical rule for determining doubful constructions.

a. Reduce the sentence to the several propositions (which are never less than two) which it contains.

b. Replace the relative by its equivalent personal or demonstrative pronoun, or by its equivalent substantive.

c. The case of the demonstrative or substantive, is the case of the relative also.

By applying this rule to such expressions as

Satan, than *whom*
None higher sat, thus spake,

we find them, *according to the current etymology,* incorrect—

Satan spake—none sat higher than he sat.
Satan spake—none sat higher than Satan sat.

Hence the expression should be—

Satan than *who*
None higher sat.

Observe.—The words, *according to the current etymology*, indicate an explanation which, rightly or wrongly, has been urged in favour of expressions like the one in question, and which will be noticed in a future chapter.

Observe.—That three circumstances complicate the syntax of the relative pronoun.

1. The elliptic form of the generality of the sentences wherein it follows the word *than*.

2. The influence of the oblique interrogation.

3. The influence of an omitted relative.

This last finds place in the present chapter.

When the relative and antecedent are in different cases, and the relative is omitted, the antecedent is sometimes put in the case of the relative.

He whom I accuse has entered.

Contracted according to § 477—

He I accuse has entered.

Changed, according to the present section—

Him I accuse has entered.

And so (as shown by Mr. Guest, *Philological Transactions*), Shakspere has really written,—

Him I accuse,
The city gates by this has entered.
Coriolanus, v. 5.

Better leave undone, than by our deeds acquire
Too high a fame, when *him* we serve 's away.
Antony and Cleopatra, iii. 1.

The reason of this is clear. The verb that determines the case of the relative is brought in contact with the antecedent, and the case of the antecedent is accommodated to the case of the relative.

The Greek phrase, χρῶμαι βιβλίοις οἷς ἔχω, is an instance of the converse process.

§ 479. *When there are two words in a clause, each capable of being an antecedent, the relative refers to the latter.*

1. *Solomon the son of David who slew Goliah.* This is unexceptionable.

2. *Solomon the son of David who built the temple.* This is exceptionable.

Nevertheless, it is defensible, on the supposition that *Solomon-the-son-of-David* is a single many-worded name.

The inference, that *David* built the temple, wrong as it would be in history, would be but a legitimate deduction from this text, otherwise interpreted.

This rule is much neglected.

CHAPTER X.

ON THE INTERROGATIVE PRONOUN.

§ 480. QUESTIONS are of two sorts, direct and oblique.

Direct.—Who is he?

Oblique.—Who do you say that he is?

All difficulties about the cases of the interrogative pronoun may be determined by framing an answer, and observing the case of the word with which the interrogative coincides. Whatever be the case of this word will also be the case of the interrogative.

DIRECT.

Qu. *Who* is this?—*Ans.* *I.*
Qu. *Whose* is this?—*Ans.* *His.*
Qu. *Whom* do you seek?—*Ans.* *Him.*

OBLIQUE.

Qu. *Who* do you say that it is?—*Ans.* *He.*
Qu. *Whose* do you say that it is?—*Ans.* *His.*
Qu. *Whom* do you say that they seek?—*Ans.* *Him.*

Note.—The answer should always be made by means of a pronoun, as, by so doing, we distinguish the accusative case from the nominative.

Note.—And, if necessary, it should be made in full. Thus the full answer to *whom do you say that they seek?* is, *I say that they seek him.*

Nevertheless, such expressions as *whom do they say that it is?* are common, especially in oblique questions. The following examples are Mr. Guest's,—*Philological Transactions*:—

"And he axed hem and seide, *whom* seien the people that I am?

Thei answereden and seiden, Jon Baptist—and he seide to hem, But *whom* seien ye that I am?"—WYCLIFFE, Luke ix.

"Tell me in sadness *whom* she is you love."
Romeo and Juliet, i. 1.

"And as John fulfilled his course, he said, *whom* think ye that I am?"—Acts xiii. 25.

§ 481. Two circumstances encourage this confusion. 1. The presence of a second verb, which takes the appearance of a governing verb. 2. The omission of a really oblique antecedent or relative. 3. The use of accusative for nominative forms in the case of personal pronouns.

The presence of a second verb, &c.—*Tell* me *whom* she *is*. Here *tell* is made to govern *whom*, instead of *whom* being left, as *who*, to agree with *she*.

The omission, &c.—Tell me *whom* she is you *love*. Here the full construction requires a second pronoun—tell me *who* she is *whom* you *love*; or else, Tell me *her whom* you love.

§ 482. To the question, *who is* this? many would answer not *I*, but *me*. This confusion of the case in the answer favours a confusion of case in the question.

It is clear that much of this reasoning applies to the relative powers of *who*, as well as to the interrogative.

But, it is possible that there may be no incorrectness at all: insomuch as *whom* may have become a true nominative. Mr. Guest has truly remarked that such is the case in the Scandinavian language, where *hve-m* = *who* = *qui*.

This view, if true, justifies the use of *whom* after the conjunctions *than* and *as*; so that the expression,—

Satan than *whom*
None higher sat,

may be right.

Nevertheless, it does not justify such expressions as—

None sits higher than *me*.
None sits higher than *thee*.
None sits higher than *us*.
None sits higher than *her*.

The reason of this is clear. *Whom* is supposed to be admissible, not because the sentence admits an accusative case, but because custom has converted it into a nominative. For my own part, I doubt the application of the Danish rule to the English language. Things may be going that way, but they have not, as yet, gone far enough.

CHAPTER XI.

THE RECIPROCAL CONSTRUCTION.

§ 483. In all sentences containing the statement of a reciprocal or mutual action there are in reality two assertions, viz. the assertion that A. *strikes* (or *loves*) B., and the assertion that B. *strikes* (or *loves*) A.; the action forming one, the reaction another. Hence, if the expressions exactly coincided with the fact signified, there would always be two propositions. This, however, is not the habit of language. Hence arises a more compendious form of expression, giving origin to an ellipsis of a peculiar kind. Phrases like *Eteocles and Polynices killed each other* are elliptical, for *Eteocles and Polynices killed—each the other*. Here the second proposition expands and explains the first, whilst the first supplies the verb to the second. Each, however, is elliptic. The first is without the object, the second without the verb. That the verb must be in the plural (or dual) number, that one of the nouns must be in the nominative case, and that the other must be objective, is self-evident from the structure of the sentence; such being the conditions of the expression of the idea. An aposiopesis takes place after a plural verb, and then there follows a clause wherein the verb is supplied from what went before.

§ 484. This is the syntax. As to the power of the words *each* and *one* in the expression (*each other* and *one another*), I am not prepared to say that in the common practice of the English language there is any distinction between them. A distinction, however, if it existed, would give strength to our language. Where *two* persons performed a reciprocal action, the expression might be *one another*; as *Eteocles and Polynices*

killed one another. Where *more than two* persons were engaged on each side of a reciprocal action the expression might be *each other;* as, *the ten champions praised each other.*

This amount of perspicuity is attained, by different processes, in the French, Spanish, and Scandinavian languages.

1. French.—*Ils* (*i. e.* A. and B.) *se battaient—l'un l'autre. Ils* (A. B. C.) *se battaient—les uns les autres.* In Spanish, *uno* otro = *l'un l'autre,* and *unos otros* = *les uns les autres.*

2. Danish. — *Hin*ander = the French *l'un l'autre;* whilst *hverandre* = *les uns les autres.*

CHAPTER XII.

THE INDETERMINATE PRONOUNS.

§ 485. DIFFERENT nations have different methods of expressing indeterminate propositions.

Sometimes it is by the use of the passive voice. This is the common method in Latin and Greek, and is also current in English—*dicitur*, λέγεται, *it is said.*

Sometimes the verb is reflective—*si dice* = *it says itself*, Italian.

Sometimes the plural pronoun of the third person is used. This also is an English locution—*they say* = *the world at large says.*

Finally, the use of some word = *man* is a common indeterminate expression.

The word *man* has an indeterminate sense in the Modern German; as, *man sagt* = *they say.*

The word *man* was also used indeterminately in the Old English, although it is not so used in the modern.—*Deutsche Grammatik.*

In the Old English, the form *man* often lost the *-n*, and became *me.* This form is also extinct.

The present indeterminate pronoun is *one*; as, *one says* = *they say* = *it is said* = *man sagt*, German = *on dit*, French = *si dice*, Italian.

It has been stated in pp. 216, 205, that the indeterminate pronoun *one* has no etymological connection with the numeral *one*; but that it is derived from the French *on* = *homme* = *homo* = *man*; and that it has replaced the Old English *man* or *me.*

§ 486. Two other pronouns, or, to speak more in accord-

ance with the present habit of the English language, one pronoun, and one adverb of pronominal origin, are also used indeterminately, viz. *it* and *there*.

It can be either the subject or the predicate of a sentence,—*it is this, this is it, I am it, it is I.* When *it* is the subject of a proposition, the verb necessarily agrees with it, and can be of the singular number only; no matter what be the number of the predicate—*it is this, it is these.*

When *it* is the predicate of a proposition, the number of the verb depends upon the number of the subject. These points of universal syntax are mentioned here for the sake of illustrating some anomalous forms.

There can only be the predicate of a subject. It differs from *it* in this respect. It follows also that it must differ from *it* in never affecting the number of the verb. This is determined by the nature of the subject—*there is this, there are these.*

When we say *there is these,* the analogy between the words *these* and *it* misleads us; the expression being illogical.

Furthermore, although a predicate, *there* always stands in the beginning of propositions, *i. e.* in the place of the subject. This also misleads.

Although *it,* when the subject, being itself singular, absolutely requires that its verb should be singular also, there is a tendency to use it incorrectly, and to treat it as a plural. Thus, in German, when the predicate is plural, the verb joined to the singular form *es* (= *it*) is plural—*es sind menschen,* literally translated = *it are men;* which, though bad English, is good German.

CHAPTER XIII.

THE ARTICLES.

§ 487. The rule of most practical importance about the articles, is the rule that determines when the article shall be repeated as often as there is a fresh substantive, and when it shall not.

When two or more substantives following each other denote the same object, the article precedes the first only. We say *the secretary and treasurer* (or, *a secretary and treasurer*), when the two offices are held by one person.

When two or more substantives following each other denote different objects, the article is repeated, and precedes each. We say *the* (or *a*) *secretary and the* (or *a*) *treasurer*, when the two offices are held by different persons.

This rule is much neglected.

CHAPTER XIV.

THE NUMERALS.

§ 488. The numeral *one* is naturally singular. All the rest are naturally plural.

Nevertheless such expressions—*one two* (= *one collection of two*), *two threes* (= *two collections of three*), are legitimate. These are so because the sense of the word is changed. We may talk of several *ones* just as we may talk of several *aces*; and of *one two* just as of *one pair*.

Expressions like *the thousandth-and-first* are incorrect. They mean neither one thing nor another; 1001st being expressed by *the thousand-and-first*, and 1000th + 1st being expressed by *the thousandth and the first*.

Here it may be noticed that, although I never found it to do so, the word *odd* is capable of taking an ordinal form. The *thousand-and-odd-th* is as good an expression as the *thousand-and-eight-th*.

The construction of phrases like the *thousand-and-first* is the same construction as we find in the *king-of-Saxony's army*.

It is by no means a matter of indifference whether we say the *two first* or the *first two*.

The captains of two different classes at school should be called the *two first boys*. The first and second boys of the same class should be called the *first two boys*.

CHAPTER XV.

ON VERBS IN GENERAL.

§ 489. For the purposes of syntax, it is necessary to divide verbs into the five following divisions: transitive, intransitive, auxiliary, substantive, and impersonal.

Transitive verbs.—In transitive verbs the action is never a simple action. It always affects some object or other,—*I move my limbs; I strike my enemy.* The presence of a transitive verb implies also the presence of a noun; which noun is the name of the object affected. A transitive verb, unaccompanied by a noun, either expressed or understood, is a contradiction in terms. The absence of the nouns, in and of itself, makes it intransitive. *I move* means, simply, *I am in a state of moving.* *I strike* means, simply, *I am in the act of striking.* Verbs like *move* and *strike* are naturally transitive.

Intransitive verbs.—An act may take place, and yet no object be affected by it. *To hunger, to thirst, to sleep, to wake,* are verbs that indicate states of being, rather than actions affecting objects. Verbs like *hunger,* and *sleep,* are naturally intransitive.

Many verbs, naturally transitive, may be used as intransitive,—*e. g. I move, I strike,* &c.

Many verbs, naturally intransitive, may be used as transitives,—*e. g. I walked the horse = I made the horse walk.*

This variation in the use of one and the same verb is of much importance in the question of the government of verbs.

1. Transitive verbs are naturally followed by some noun or other; and that noun is *always* the name of something affected by them *as an object.*

2. Intransitive verbs are not naturally followed by any noun

at all; and when they are so followed, the noun is *never* the name of anything affected by them *as an object*.

Nevertheless, intransitive verbs may be followed by nouns denoting the manner, degree, or instrumentality of their action, —*I walk with my feet = incedo pedibus*.

The verb *substantive* has this peculiarity, viz. that for all purposes of syntax it is no verb at all. *I speak* may, logically, be reduced to *I am speaking;* in which case it is only the *part* of a verb. Etymologically, indeed, the verb substantive is a verb; inasmuch as it is inflected as such: but for the purposes of construction, it is a copula only, *i. e.* it merely denotes the agreement or disagreement between the subject and the predicate.

This does not apply to the infinitive mood. The infinitive mood of the so-called verb substantive is a noun; not, however, because it is a verb substantive, but because it is an infinitive mood.

The auxiliary and impersonal verbs will be considered separately.

CHAPTER XVI.

THE CONCORD OF VERBS.

§ 490. THE verb must agree with its subject in person,—*I walk*, not *I walks; he walks*, not *he walk*.

It must also agree with it in number,—*we walk*, not *we walks; he walks*, not *he walk*.

Clear as these rules are, they require some expansion before they become sufficient to solve all the doubtful points of English syntax connected with the concord of the verb.

1. *It is I, your master, who command you.* Query? would *it is I, your master, who commands you*, be correct? This is an example of a disputed point of concord in respect to the person of the verb.

2. *The wages of sin is death.* Query? would *the wages of sin* are *death*, be correct? This is an example of a disputed point of concord in respect to the number of the verb.

§ 491. In respect to the concord of person the following rules will carry us through a portion of the difficulties.

Rule.—In sentences, where there is but one proposition, when a noun and a pronoun of different persons are in apposition, the verb agrees with the first of them,—*I, your master, command you* (not *commands*): *your master, I, commands you* (not *command*).

To understand the nature of the difficulty, it is necessary to remember that subjects may be extremely complex as well as perfectly simple; and that a complex subject may contain, at one and the same time, a noun-substantive and a pronoun,—*I, the keeper; he, the merchant*, &c.

Now all noun-substantives are naturally of the third person —*John speaks, the men run, the commander gives orders*. Consequently the verb is of the third person also.

But the pronoun with which such a noun-substantive may be placed in apposition, may be a pronoun of either person, the first or second: *I* or *thou—I the commander—thou the commander*.—In this case the construction requires consideration. With which does the verb agree? with the substantive which requires a third person? or with the pronoun which requires a first or second?

Undoubtedly the idea which comes first is the leading idea; and undoubtedly, the idea which explains, qualifies, or defines it, is the subordinate idea: and, undoubtedly, it is the leading idea which determines the construction of the verb. We may illustrate this from the analogy of a similar construction in respect to number—*a man with a horse and a gig meets me on the road.* Here the ideas are three; nevertheless the verb is singular. No addition of subordinate elements interferes with the construction that is determined by the leading idea. In the expression *I, your master*, the ideas are two; viz. the idea expressed by *I*, and the idea expressed by *master*. Nevertheless, as the one only explains or defines the other, the construction is the same as if the idea were single. *Your master, I,* is in the same condition. The general statement is made concerning the *master*, and it is intended to say what *he* does. The word *I* merely defines the expression by stating who the master is. Of the two expressions the latter is the awkwardest. The construction, however, is the same for both.

From the analysis of the structure of complex subjects of the kind in question, combined with a rule concerning the position of the subject, which will soon be laid down, I believe that, for all single propositions, the foregoing rule is absolute.

Rule.—In all single propositions the verb agrees in person with the noun (whether substantive or pronoun) which comes first.

But the expression *it is I, your master, who command* (or *commands*) *you,* is not a single proposition. It is a sentence containing two propositions.

1. *It is I.*
2. *Who commands you.*

Here, the word *master* is, so to say, undistributed. It may belong to either clause of the sentence, *i. e.* the whole sentence may be divided into—

Either—*it is I your master*—
Or—*your master who commands you.*

This is the first point to observe. The next is, that the verb in the second clause (*command* or *commands*) is governed, not by either the personal pronoun or the substantive, but by the relative, *i. e.* in the particular case before us, not by either *I* or *master*, but by *who*.

And this brings us to the following question:—with which of the two antecedents does the *relative* agree? with *I* or with *master?*

This may be answered by the two following rules:—

Rule 1.—When the two antecedents are in the same proposition, the relative agrees with the first. Thus—

1. It is *I* your *master*—
2. Who *command* you.

Rule 2.—When the two antecedents are in different propositions, the relative agrees with the second. Thus—

1. It is *I*—
2. Your *master* who *commands* you.

This, however, is not all. What determines whether the two antecedents shall be in the same or in different propositions? I believe that the following rules for what may be called *the distribution of the substantive antecedent* will bear criticism.

Rule 1. That when there is any natural connection between the substantive antecedent and the verb governed by the relative, the antecedent belongs to the second clause. Thus, in the expression just quoted, the word *master* is logically connected with the word *command;* and this fact makes the expression, *It is I your master who commands you,* the better of the two.

Rule 2. That when there is no natural connection between the substantive antecedent and the verb governed by the rela-

tive, the antecedent belongs to the first clause. *It is I, John, who command* (not *commands*) *you.*

To recapitulate, the train of reasoning has been as follows:—

1. The person of the second verb is the person of the relative.

2. The person of the relative is that of one of two antecedents.

3. Of such two antecedents the relative agrees with the one which stands in the same proposition with itself.

4. Which position is determined by the connection or want of connection between the substantive antecedent and the verb governed by the relative.

Respecting the person of the verb in the *first* proposition of a complex sentence there is no doubt. *I, your master, who commands you to make haste, am* (not *is*) *in a hurry.* Here, *I am in a hurry* is the first proposition; *who commands you to make haste,* the second.

It is not difficult to see why the construction of sentences consisting of two propositions is open to an amount of latitude which is not admissible in the construction of single propositions. As long as the different parts of a complex idea are contained within the limits of a single proposition, their subordinate character is easily discerned. When, however, they amount to whole propositions, they take the appearance of being independent members of the sentence.

§ 492. *The concord of number.*—It is believed that the following three rules will carry us through all difficulties of the kind just exhibited.

Rule 1. That the verb agrees with the subject, and with nothing but the subject. The only way to justify such an expression as *the wages of sin is death,* is to consider *death* not as the subject, but as the predicate; in other words, to consider the construction to be, *death is the wages of sin.*

Rule 2. That, except in the case of the word *there* (§ 486), the word which comes first is always the subject, until the contrary be proved.

Rule 3. That no number of connected singular nouns can govern a plural verb, unless they be connected by a copulative

conjunction. *The sun* and *moon shine,—the sun* in conjunction with *the moon shines.*

Plural subjects with singular predicates.—The wages of sin *are* death.—Honest men *are* the salt of the earth.

Singular subjects with plural predicates.—These constructions are rarer than the preceding : inasmuch as two or more persons (or things) are oftener spoken of as being equivalent to one, than one person (or thing) is spoken of as being equivalent to two or more.

Sixpence *is* twelve halfpennies.
He *is* all head and shoulders.
Vulnera totus *erat.*
Tu *es* deliciæ meæ.

Ἕκτωρ, ἀτὰρ σύ μοι ἔσσι πατὴρ καὶ πότνια μήτηρ,
Ἦδε κασίγνητος, σὺ δέ μοι θαλερὸς παρακοίτης.

CHAPTER XVII.

ON THE GOVERNMENT OF VERBS.

§ 493. The government of verbs is of two sorts, (1.) *objective*, and (2.) *modal*.

It is objective where the noun which follows the verb is the name of some object affected by the action of the verb,—as *he strikes me; he wounds the enemy*.

It is modal when the noun which follows the verb is not the name of any object affected by the verb, but the name of some object explaining the manner in which the action of the verb takes place, the instrument with which it is done, the end for which it is done, &c.

The government of all transitive verbs is necessarily objective. It may also be modal,—*I strike the enemy with the sword = ferio hostem gladio*.

The government of all intransitive verbs can only be modal, —*I walk with the stick*. When we say, *I walk the horse*, the word *walk* has changed its meaning, and signifies *make to walk*, and is, by the very fact of its being followed by the name of an object, converted from an intransitive into a transitive verb.

The modal construction may also be called the *adverbial construction*; because the effect of the noun is akin to that of an adverb,—*I fight with bravery = I fight bravely; he walks a king = he walks regally*. The modal (or adverbial) construction (or government) sometimes takes the appearance of the objective: inasmuch as intransitive verbs are frequently followed by a substantive; which substantive is in the objective

case. Nevertheless, this is no proof of government. For a verb to be capable of governing an objective case, it must be a verb signifying an action affecting an object: and if there be no such object, there is no room for any objective government. *To break the sleep of the righteous* is *to affect, by breaking, the sleep of the righteous:* but, *to sleep the sleep of the righteous,* is not *to affect by sleeping the sleep of the righteous;* since the act of sleeping is an act that affects no object whatever. It is a *state.* We may, indeed, give it the appearance of a transitive verb, as we do when we say, *the opiate slept the patient,* meaning thereby, *lulled to sleep;* but the transitive character is only apparent.

To sleep the sleep of the righteous is *to sleep in agreement with* —or *according to*—or *after the manner of*—*the sleep of the righteous,* and the construction is adverbial.

In the grammars of the classical languages, the following rule is exceptionable — *Quodvis verbum admittit accusativum nominis sibi cognati.* It does so; but it governs the accusative case not objectively but modally.

Modal verbs may be divided into a multiplicity of divisions. Of such, it is not necessary in English to give more than the following four :—

1. *Appositional.*—As, *she walks a queen: you consider me safe.* The appositional construction is, in reality, a matter of concord rather than of gender. It will be considered more fully in the following section.

2. *Traditive.*—As, *I give the book to you = do librum tibi. I teach you the lesson = διδάσκω σὲ τὴν διδασκάλιαν.* In all traditive expression, there are three ideas: (1.) an agent, (2.) an object, (3.) a person, or thing, to which the object is made over, or transferred, by the agent. For this idea the term dative is too restricted: since in Greek and some other languages, both the name of the object conveyed, and the name of the person to whom it is conveyed are, frequently, put in the accusative case.

3. *Instrumental.*—As, *I fight with a sword = pugno ense = feohte sweorde,*—Anglo-Saxon.

4. *Emphatic.*—As, *he sleeps the sleep of the righteous.*

§ 494. *Verb and nominative case.*—No verb governs a nominative case. The appositional construction *seems* to require such a form of government; but the form is only apparent.

It is I.
It is thou.
It is he, &c.

Here, although the word *is* is *followed* by a nominative case, it by no means governs one—at least not as a verb.

It has been stated above that the so-called verb-substantive is only a verb for the purposes of etymology. In syntax, it is only a part of a verb, *i. e.* the copula.

Now this fact changes the question of the construction in expressions like *it is I*, &c., from a point of government to one of concord. In the previous examples the words *it*, *is*, and *I*, were, respectively, *subject*, *copula*, and *predicate*; and, as it is the function of the copula to denote the agreement between the predicate and the subject, the real point to investigate is the nature of the concord between these two parts of a proposition.

Now the predicate need agree with the subject in case only.

1. It has no necessary concord in gender—*she is a man in courage—he is a woman in effeminacy—it is a girl.*

2. It has no necessary concord in number—*sin is the wages of death—it is these that do the mischief.*

3. It has no necessary concord in person—*I am he whom you mean.*

4. It *has*, however, a necessary concord in case. Nothing but a nominative case can, by itself, constitute a term of either kind—subject or predicate. Hence, both terms must be in the nominative, and, consequently, both in the same case. Expressions like *this is for me* are elliptic. The logical expression is *this is a thing for me.*

Rule.—The predicate must be of the same case with its subject.

Hence—The copula, instead of determining a case, expresses a concord.

Rule 1.—All words connected with a nominative case by the

copula (*i. e.* the so-called verb-substantive) must be nominative. —*It is I; I am safe.*

Rule 2.—All words in apposition with a word so connected must be nominative.—It is difficult to illustrate this from the English language, from our want of inflections. In Latin, however, we say *vocor Johannes = I am called John*, not *vocor Johannem.* Here the logical equivalent is *ego sum vocatus Johannes*—where—

1. *Ego,* is nominative because it is the subject.

2. *Vocatus* is nominative because it is the predicate, agreeing with the subject.

3. *Johannes* is nominative because it is part of the predicate, and in apposition with *vocatus.*

N.B. Although in precise language *Johannes* is said to agree with *vocatus* rather than to be in apposition with it, the expression, as it stands, is correct. Apposition is the agreement of substantives, agreement the apposition of adjectives.

Rule 3.—All verbs which, when resolved into a copula and participle, have their participle in apposition (or agreeing) with the noun, are in the same condition as simple copulas—*she walks a queen = she is walking a queen = illa est incedens regina.*

Rule 4.—The construction of a subject and copula preceded by the conjunction *that,* is the same in respect to the predicate by which they are followed as if the sentence were an isolated proposition.

This rule determines the propriety of the expression—*I believe that it is he* as opposed to the expression *I believe that it is him.*

I believe = I am believing, and forms one proposition.

It is he, forms a second.

That, connects the two; but belongs to neither.

Now, as the relation between the subject and predicate of a proposition cannot be affected by a word which does not belong to it, the construction is the same as if the propositions were wholly separate.

N.B. The question (in cases where the conjunction *that* is not used) as to the greater propriety of the two expressions—

I believe it to be him—I believe it to be he—has yet to be considered.

§ 495. *The verb and genitive case.*—No verb in the present English governs a genitive case. In Anglo-Saxon certain verbs did: *e. g. verbs of ruling* and others—*weolde thises middangeardes* = *he ruled* (*wealded*) *this earth's.* Genitive cases, too, governed by a verb are common both in Latin and Greek. *To eat of the fruit of the tree* is no genitive construction, however much it may be equivalent to one. *Fruit* is in the objective case, and is governed not by the verb, but by the preposition *of.*

§ 496. *The verb and accusative.*—All transitive verbs govern an accusative case,—*he strikes me, thee, him, her, it, us, you, them.*

The verb and dative case.—The word *give,* and a few others, govern a dative case. Phrases like *give it him, whom shall I give it?* are perfectly correct, and have been explained above. The prepositional construction *give it* to *him,—to whom shall I give it?* is unnecessary. The evidence of this is the same as in the construction of the adjective *like.*

§ 497. *The partitive construction.*—Certain transitive verbs, the action whereof is extended not to the whole, but only to a part of their object, are followed by the preposition *of* and an objective case. *To eat of the fruit of the tree* = *to eat a part* (or *some*) *of the fruit of the tree: to drink of the water of the well* = *to drink a part* (or *some*) *of the water of the well.* It is not necessary, here, to suppose the ellipsis of the word *part* (or *some*). The construction is a construction that has grown out of the partitive power of the genitive case; for which case the preposition *of,* followed by the objective, serves as an equivalent.

§ 498. It has been already stated that forms like *I believe it to be him,* and forms like *I believe it to be he,* had not been investigated. Of these, the former is, logically, correct.

Here, the word, *to be,* is, in respect to its power, a noun.

As such, it is in the accusative case after the verb *believe.*

With this accusative infinitive, *it* agrees, as being part of the same complex idea. And *him* does the same.

In English we have two methods of expressing one idea; the method in question, and the method by means of the conjunction *that*.

1. *I believe it to be him.*
2. *I believe that it is he.*

In the first example, *it* is the object; and *it-to-be-him* forms one complex term.

In the second, *he* agrees with *it;* and *it* is the subject of a separate, though connected, proposition.

Of these two forms the Latin language adopts but one, viz. the former,—*credo eum esse*, not *credo quod illud est ille.*

§ 499. *The expression* ob differentiam.—The classical languages, although having but one of the two previous forms, are enabled to effect a variation in the application of it, which, although perhaps illogical, is convenient. When the speaker means himself, the noun that follows *esse*, or *εἶναι*, is nominative,—*φημὶ εἶναι δεσπότης = I say that I am the master : ait fuisse celerrimus = he says that he himself was the swiftest*—but, *φημὶ εἶναι δεσπότην = I say that he* (some one else) *is the master;* and *ait fuisse celerrimum = he says that he* (some one else) *is the swiftest.* This, though not adopted in English, is capable of being adopted,—*He believes it to be he* (*i. e.* the speaker) *who invented the machine;* but, *he believes it to be him* (that is, another person) *who invented it.*

§ 500. When the substantive infinitive, *to be*, is preceded by a passive participle, combined with the verb substantive, the construction is nominative—*it is believed to be he who spoke*, not *it is believed to be him.*—Here there are two propositions :—

1. It is believed.—
2. Who spoke.

Now, here, *it* is the subject, and, as such, nominative. But it is also the equivalent to *to be he*, which must be nominative as well. *To be he is believed = esse-ille creditur*,—or, changing the mode of proof,—

1. *It* is the subject and nominative.
2. *Believed* is part of the predicate; and, consequently, nominative also.

3. *To be he* is a subordinate part of the predicate, in apposition with *believed—est creditum, nempe entitas ejus.* Or, *to be he is believed = esse-ille est creditum.*

As a general expression for the syntax of copulas and appositional constructions, the current rule, that *copulas and appositional verbs must be followed by the same case by which they are preceded,* stands good.

CHAPTER XVIII.

THE IMPERSONAL VERBS.

§ 501. *Meseems.*—Equivalent to *it seems to me; mihi videtur, φαίνεταί μοι.* The verb *seems* is intransitive; consequently the pronoun *me* has the power of a dative case. The pronoun *it* is not required to accompany the verb.

Methinks.—In Anglo-Saxon there are two forms; *þencan* = *to think*, and *þincan* = *to seem.* It is from the latter form that the verb in *methinks* comes. Such being the case, it is intransitive, and consequently the pronoun *me* has the power of a dative case. The pronoun *it* is not required to accompany the verb.

Of this word we have also the past form *methought.*

> Methought I saw my late espoused wife
> Brought to me, like Alcestis, from the grave.
>
> MILTON.

Me listeth, or *me lists.*—Equivalent to *it pleases me* = *me juvat.* Anglo-Saxon *lystan* = *to wish, to choose*, also *to please, to delight;* Norse, *lysta.* Unlike the other two, the verb is transitive, so that the pronoun *me* has the power of an accusative case. The pronoun *it* is not required to accompany the verb.

These three are the only true impersonal verbs in the English language. They form a class by themselves, because no pronoun accompanies them, as is the case with the equivalent expressions *it appears, it pleases*, and with all the other verbs in the language.

CHAPTER XIX.

ON THE PARTICIPLES.

§ 502. The present participle, or the participle in *-ing*, must be considered in respect to its relations with the substantive in *-ing*. *Dying-day* is, probably, no more a participle than *morning-walk*. In respect to the syntax of such expressions as the forthcoming, I consider that they are *either* participles or substantives.

1. When substantives, they are in regimen, and govern a genitive case—*What is the meaning of the lady's holding up her train?* Here the word *holding* = *the act of holding*.—*Quid est significatio elevationis pallæ de parte fœminæ?*

2. When participles, they are in apposition or concord, and would, if inflected, appear in the same case with the substantive, or pronoun, preceding them—*What is the meaning of the lady holding up her train?* Here the word *holding* = *in the act of holding*, and answers to the Latin *fœminæ elevantis*.—*Quid est significatio fœminæ elevantis pallam?*

§ 503. The past participle corresponds not with the Greek form τυπτόμενος, but with the form τετυμμένος. *I am beaten* is essentially a combination, expressive not of present but of past time, just like the Latin *sum verberatus*. Its Greek equivalent is not εἰμὶ τυπτόμενος = *I am a man in the act of being beaten*, but εἰμὶ τετυμμένος = *I am a man who has been beaten*. It is past in respect to the action, though present in respect to the state brought about by the action. This essentially past element in the so-called present expression, *I am beaten*, will be again referred to.

CHAPTER XX.

ON THE MOODS.

§ 504. THE infinitive mood is a noun. The current rule—that *when two verbs come together the latter is placed in the infinitive mood*—means that one verb can govern another only by converting it into a noun—*I begin to move = I begin the act of moving*. Verbs, *as verbs*, can only come together in the way of apposition—*I irritate, I beat, I talk at him, I call him names*, &c.

The construction, however, of English infinitives is twofold. (1.) Objective. (2.) Gerundial.

When one verb is followed by another without the preposition *to*, the construction must be considered to have grown out of the objective case, or from the form in *-an*.

This is the case with the following words, and, probably, with others:—

I may go,	*not* I may *to* go.
I might go,	. I might *to* go.
I can move,	. I can *to* move.
I could move,	. I could *to* move.
I will speak,	. I will *to* speak.
I would speak,	. I would *to* speak.
I shall wait,	. I shall *to* wait.
I should wait,	. I should *to* wait.
Let me go,	. Let me *to* go.
He let me go,	. He let me *to* go.
I do speak,	. I do *to* speak.
I did speak,	. I did *to* speak.
I dare go,	. I dare *to* go.
I durst go,	. I durst *to* go.

Thou shalt not *see* thy brother's ox or his ass *fall* down by the way.

We *heard* him *say*, I will destroy the temple.

I *feel* the pain *abate*.

He *bid* her *alight*.

I would fain *have* any one *name* to me that tongue that any one can speak as he should do by the rules of grammar.

This, in the present English, is the rarer of the two constructions.

When a verb is followed by another, preceded by the preposition *to*, the construction must be considered to have grown out of the so-called gerund, *i. e.* the form in *-nne*, *i. e.* the dative case—*I begin to move*. This is the case with the great majority of English verbs.

The following examples, from the Old English, of the gerundial construction where we have, at present, the objective, are Mr. Guest's :—

1. Eilrid *myght nought to stand* þam ageyn.
R. Br.

2. Whether feith schall *mowe to save* him?
WYCLIFFE, James ii.

3. My woful child what flight *maist thou to take?*
HIGGINS, *Lady Sabrine*, 4.

4. Never to retourne no more,
Except he *would* his life *to loose* therfore.
HIGGINS, *King Albanaet*, 6.

5. He said he *could not to forsake* my love.
HIGGINS, *Queen Elstride*, 20.

6. The mayster *lette* X men and mo
To wende.
Octavian, 381.

7. And though we owe the fall of Troy requite,
Yet *let* revenge thereof from gods *to* lighte.
HIGGINS, *King Albanaet*, 16.

8. *I durst*, my lord, *to wager* she is honest.
Othello, iv. 2.

9. Whom, when on ground, she grovelling *saw to roll*,
She ran in haste, &c.
F. Q. iv. 7, 32.

§ 505. Imperatives have three peculiarities. (1.) They can only, in English, be used in the second person: (2.) They take pronouns after, instead of before, them: (3.) They often omit the pronoun altogether.

§ 506. For the syntax of subjunctives, see the chapter on Conjunctions.

CHAPTER XXI.

ON THE TENSES.

§ 507. NOTWITHSTANDING its name, the present tense in English, does not express a strictly *present* action. It rather expresses an habitual one. *He speaks well = he is a good speaker.* If a man means to say that he is in the act of speaking, he says *I am speaking.*

It has also, especially when combined with a subjunctive mood, a future power—*I beat you* (= *I will beat you*) *if you don't leave off.*

The English præterite is the equivalent, not to the Greek perfect, but the Greek aorist. *I beat* = ἔτυψα, not τέτυφα. The true perfect is expressed, in English, by the auxiliary *have* + the past participle.

CHAPTER XXII.

SYNTAX OF THE PERSONS OF VERBS.

§ 508. *The concord of persons.*—A difficulty that occurs frequently in the Latin language is rare in English. In expressions like *ego et ille* followed by a verb, there arises a question as to the person in which that verb should be used. Is it to be in the first person in order to agree with *ego*, or in the *third* in order to agree with *ille?* For the sake of laying down a rule upon these and similar points, the classical grammarians arrange the persons (as they do the genders) according to their *dignity*, making the verb (or adjective if it be a question of gender) agree with the most *worthy*. In respect to persons, the first is more worthy than the second, and the second more worthy than the third. Hence, the Latins said—

Ego et *Balbus sustulimus* manus.
Tu et *Balbus sustulistis* manus.

Now, in English, the plural form is the same for all three persons. Hence we say *I and you are friends, you and I are friends, I and he are friends,* &c., so that, for the practice of language, the question as to the relative dignity of the three persons is a matter of indifference.

Nevertheless, it *may* occur even in English. Whenever two or more pronouns of different persons, and of the *singular* number, follow each other *disjunctively*, the question of concord arises. *I or you,—you or he,—he or I.* I believe that, in these cases, the rule is as follows:—

1. Whenever the words *either* or *neither* precede the pro-

nouns, the verb is in the third person. *Either you or I is in the wrong; neither you nor I is in the wrong.*

2. Whenever the disjunctive is simple (*i. e.* unaccompanied with the word *either* or *neither*) the verb agrees with the *first* of the two pronouns.

I or *he am* in the wrong.
He or *I is* in the wrong.
Thou or *he art* in the wrong.
He or *thou is* in the wrong.

The reasons for these rules will appear in the chapter on Conjunctions.

Now, provided that they are correct, it is clear that the English language knows nothing about the relative degrees of dignity between these three pronouns; since its habit is to make the verb agree with the one which is placed first—whatever may be the person. I am strongly inclined to believe that the same is the case in Latin; in which case (in the sentence *ego et Balbus sustulimus manus*) *sustulimus* agrees, in person, with *ego*, not because the first person is the worthiest, but because it comes first in the proposition. That the greater supposed worth of the first person may be a reason for putting it first in the proposition is likely enough.

CHAPTER XXIII.

ON THE AUXILIARY VERBS.

§ 509. The auxiliary verbs, in English, play a most important part in the syntax of the language. They may be classified upon a variety of principles. The following, however, are all that need here be applied.

I. *Classification of auxiliaries according to their inflectional or non-inflectional powers.*—Inflectional auxiliaries are those that may either replace or be replaced by an inflection. Thus —*I am struck* = the Latin *ferior*, and the Greek *τύπτομαι*. These auxiliaries are in the same relation to verbs that prepositions are to nouns. The inflectional auxiliaries are,—

1. *Have;* equivalent to an inflection in the way of tense—*I have bitten* = *mo-mordi.*

2. *Shall;* ditto. *I shall call* = *voc-abo.*

3. *Will;* ditto. *I will call* = *voc-abo.*

4. *May;* equivalent to an inflection in the way of mood. *I am come that I may see* = *venio ut vid-eam.*

5. *Be;* equivalent to an inflection in the way of voice. *To be beaten* = *verberari, τύπτεσθαι.*

6. *Am, art, is, are;* ditto. Also equivalent to an inflection in the way of tense. *I am moving* = *move-o.*

7. *Was, were;* ditto, ditto. *I was beaten* = *ἐ-τύφθην. I was moving* = *move-bam.*

Do, can, must, and *let,* are non-inflectional auxiliaries.

II. *Classification of auxiliaries according to their non-auxiliary significations.*—The power of the word *have* in the combination *I have a horse,* is clear enough. It means possession. The power of the same word in the combination *I have been,* is not so clear; nevertheless, it is a power which has

grown out of the idea of possession. This shows that the power of a verb as an auxiliary may be a modification of its original power; *i. e.* of the power it has in non-auxiliary constructions. Sometimes the difference is very little: the word *let*, in *let us go*, has its natural sense of permission unimpaired. Sometimes it is lost altogether. *Can* and *may* exist only as auxiliaries.

1. Auxiliaries derived from the idea of possession—*have*.

2. Auxiliaries derived from the idea of existence—*be, is, was*.

3. Auxiliary derived from the idea of future destination, dependent upon circumstances external to the agent—*shall*. There are etymological reasons for believing that *shall* is no present tense, but a perfect.

4. Auxiliary derived from the idea of future destination, dependent upon the volition of the agent—*will*. *Shall* is simply predictive; *will* is predictive and promissive as well.

5. Auxiliary derived from the idea of power, dependent upon circumstances external to the agent—*may*.

6. Auxiliary derived from the idea of power, dependent upon circumstances internal to the agent—*can*. *May* is simply permissive; *can* is potential. In respect to the idea of power residing in the agent being the cause which determines a contingent action, *can* is in the same relation to *may* as *will* is to *shall*.

"*May* et *can*, cum eorum præteritis imperfectis, *might* et *could*, potentiam innuunt: cum hoc tamen discrimine: *may* et *might* vel de jure vel saltem de rei possibilitate dicuntur, at *can* et *could* de viribus agentis."—Wallis, p. 107.

7. Auxiliary derived from the idea of sufferance—*let*.

8. Auxiliary derived from the idea of necessity—*must*.

"*Must* necessitatem innuit. Debeo, oportet, necesse est urere, *I must burn*. Aliquando sed rarius in præterito dicitur *must* (quasi ex *must'd* seu *must't* contractum). Sic, si de præterito dicatur, *he must* (seu *must't*) *be burnt*, oportebat uri seu necesse habuit ut ureretur."—Wallis, p. 107.

9. Auxiliary derived from the idea of action—*do*.

III. *Classification of auxiliary verbs in respect to their mode*

of construction.—Auxiliary verbs combine with others in two ways.

1. *With participles.*—*a*) With the present or active participle—*I am speaking*: *b*) With the past, or passive, participle —*I am beaten, I have beaten.*

2. *With infinitives.* — *a*) With the objective infinitive — *I can speak*: *b*) With the gerundial infinitive—*I have to speak.*

Caution.—Such expressions as *I shall have done,* and *I mean to have done,* &c., are *mixed, i. e.* they give us the combination of the auxiliar and infinitive (*shall have*), followed by that of the auxiliar and participle (*have done*).

IV. *Auxiliary verbs may be classified according to their effect.*—Thus—*have* makes the combination in which it appears equivalent to a tense: *be* to a passive form; *may* to a sign of mood, &c.

This sketch of the different lights under which auxiliary verbs may be viewed, has been written for the sake of illustrating, rather than exhausting, the subject.

§ 510. The following is an exhibition of some of the *times* in which an action may take place, as found in either the English or other languages, expressed by the use of either an inflection or a combination.

Time considered in one point only—

1. *Present.*—An action taking place at the time of speaking, and incomplete.—*I am beating, I am being beaten. Not* expressed, in English, by the simple present tense; since *I beat* means *I am in the habit of beating.*

2. *Aorist.*—An action that took place in past time, or previous to the time of speaking, and which has no connection with the time of speaking,—*I struck, I was stricken.* Expressed, in English, by the præterite, in Greek by the aorist. The term aorist, from the Greek *ἀ-ὁριστος* = *undefined,* is a convenient name for this sort of time.

3. *Future.*—An action that has neither taken place, nor is taking place at the time of speaking, but which is stated as one which *will* take place.—Expressed, in English, by the combination of *will* or *shall* with an infinitive mood. In Latin and Greek by an inflection. *I shall* (or *will*) *speak,* *λέκ-σω, dica-m.*

None of these expressions imply more than a single action; in other words, they have no relation to any second action occurring simultaneously with them, before them, or after them.—*I am speaking now, I spoke yesterday, I shall speak to-morrow.* Of course, the act of mentioning them is not considered as an action related to them in the sense here meant.

By considering past, present, or future actions not only by themselves, but as related to other past, present, or future actions, we get fresh varieties of expression. Thus, an act may have been going on, when some other act, itself an act of past time, interrupted it. Here the action agrees with a present action, in being incomplete; but it differs from it in having been rendered incomplete by an action that has past. This is exactly the case with the—

4. *Imperfect.—I was reading when he entered.* Here we have two acts; the act of *reading* and the act of *entering*. Both are past as regards the time of speaking, but both are present as regards each other. This is expressed, in English, by the past tense of the verb-substantive and the present participle, *I was speaking;* and in Latin and Greek by the imperfect tense, *dicebam*, ἔτυπτον.

5. *Perfect.*—Action past, but connected with the present by its effects or consequences.—*I* have *written, and here is the letter.* Expressed in English by the auxiliary verb *have*, followed by the *participle passive in the accusative case and neuter gender of the singular number.* The Greek expresses this by the reduplicate perfect: τέ-τυφα = *I have beaten.*

6. *Pluperfect.*—Action past, but connected with a second action, subsequent to it, *which is also past—I* had *written when he came in.*

7. *Future present.*—Action future as regards the time of speaking, present as regards some future time.—*I shall* be speaking *about this time to-morrow.*

8. *Future præterite.*—Action future as regards the time of speaking, past as regards some future time.—*I shall* have spoken *by this time to-morrow.*

These are the chief expressions which are simply determined by the relations of actions to each other, and to the time of speaking, either in the English or any other language. But

over and above the simple idea of *time*, there may be others superadded: thus, the phrase, *I do speak*, means, not only that *I am in the habit of speaking*, but that I also *insist* upon it being understood that I am so.

Again, an action that is mentioned as either taking place, or as having taken place at a given time, may take place again and again. Hence the idea of *habit* may arise out of the idea of either present time or aorist time.

a. In English, the present form expresses *habit*.

b. In Greek the aorist expresses habit.

Again, one tense, or one combination, may be used for another. *I was speaking when he enters.*

The results of these facts may now be noticed:

1. *The emphatic present and præterite.*—Expressed by *do* (or *did*), as stated above. A man says *I do* (or *did*) *speak, read,* &c., when, either directly or by implication, it is asserted or implied that he does not. As a question implies doubt, *do* is used in interrogations.

"*Do* et *did* indicant emphatice tempus præsens, et præteritum imperfectum. *Uro, urebam; I burn, I burned:* vel (emphatice) *I do burn, I did burn.*"—WALLIS, p. 106.

2. *The predictive future.—I shall be there to-morrow.* This means simply that the speaker will be present. It gives no clue to the circumstances that will determine his being so.

3. *The promissive future.—I will be there to-morrow.*—This means not only that the speaker will be present, but that he *intends* being so. For further observations on *shall* and *will*, see chapter xxiv.

4. That the power of the present tense is, in English, not present, but habitual, has already been twice stated.

§ 511. *The representative expression of past and future time.*—An action may be past; yet, for the sake of bringing it more vividly before the hearers, we may make it present. *He walks* (for *walked*) *up to him, and knocks* (for *knocked*) *him down.* This denotes a single action; and is by no means the natural habitual power of the English present. So, in respect to a future, *I beat you if you don't leave off*, for *I will beat you.* This use of the present tense is sometimes called the *historic*

use of the present tense. I find it more convenient to call it the representative use: inasmuch as it is used more after the principles of painting than of history; the former of which, necessarily, *represents* things as present, the latter, more naturally, describes them as *past*.

The use of the representative present to express simple actions is unequivocally correct. To the expression, however, of complex actions it gives an illogical character,—*As I was doing this he enters* (for *entered*). Nevertheless, such a use of the present is a fact in language, and we must take it as it occurs.

§ 512. The present tense can be used instead of the future; and that on the principle of representation. Can a future be used for a present? No.

The present tense can be used instead of the aorist; and that on the principle of representation. Can a past tense, or combination, be used for a present?

In respect to the perfect tense there is no doubt. The answer is in the affirmative. For all purposes of syntax a perfect tense, or a combination equivalent to one, is a present tense. Contrast the expression, *I come that I may see;* with the expression, *I came that I might see; i. e.* the present construction with the aorist. Then, bring in the perfect construction, *I have come.* It differs with the aorist, and agrees with the present. *I have come that I may see.* The reason for this is clear. There is not only a present element in all perfects, but for the purposes of syntax, the present element predominates. Hence expressions like *I shall go,* need give us no trouble; even though *shall* be considered as a perfect tense. Suppose the root, *sk-ll* to mean *to be destined* (or *fated*). Provided we consider the effects of the action to be continued up to the time of speaking, we may say *I* have been *destined to go,* just as well as we can say *I* am *destined to go.*

The use of the aorist as a present (except so far as both the tenses agree in their power of expressing *habitual* actions) is a more difficult investigation. It bears upon such expressions as *I ought to go,* &c., and will be taken up in the Syntax.

§ 513. Certain adverbs, *i. e.* those of time, require certain tenses. *I am then, I was now, I was hereafter,* &c., are con-

tradictory expressions. They are not so much bad grammar as impossible nonsense. Nevertheless, we have in Latin such expressions as

"*Ut sumus* in ponto ter frigore constitit Ister."

Here the connection of the present and perfect ideas explains the apparent contradiction. The present state may be the result of a previous one; so that a præterite element may be involved in a present expression. *Ut sumus = since I have been where I am.*

It is hardly necessary to remark that such expressions as *since I am here* (where *since = inasmuch as*) do not come under this class.

§ 514. Two fresh varieties in the use of tenses and auxiliary verbs may be arrived at by considering the following ideas, which may be superadded to that of simple time.

1. *Continuance in case of future actions.*—A future action may not only take place, but continue: thus, a man may, on a given day, not only be called by a particular name, but may *keep* that name. When Hesiod says that, notwithstanding certain changes which shall have taken place, good shall *continue* to be mixed with bad, he does not say, ἐσθλὰ μιχθήσεται κακοῖσιν, but,

Ἀλλ' ἔμπης καὶ τοῖσι μεμίξεται ἐσθλὰ κακοῖσιν.

Opera et Dies.

Again,—

Ἔπειθ' ὁ πολίτης ἐντεθεὶς ἐν καταλόγῳ
Οὐδεὶς κατὰ σπουδὰς μετεγγραφήσεται,
Ἀλλ ὥσπερ ἦν τὸ πρῶτον ἐγγεγράψεται.

ARISTOPH. *Equites*, 1366.

Here μετεγγραφήσεται means *change from one class to another*, ἐγγεγράψεται *continuance in the same.*—See Mathiæ, ii. § 498.

Upon the lines—

Ὅθεν πρὸς ἀνδρῶν ὑστέρων κεκλήσεται
Δούρειος ἵππος.

Troades, 13, 14.

Seidler remarks that κληθήσεται, est *nomen accipiet*; κεκλήσεται, *nomen geret.*

Now it is quite true that this Greek tense, the so-called *paulo-post-futurum,* "bears the same relation to the other futures as, among the tenses of past time, the perfectum does to the aorist."—(Mathiæ.) And it is also true that it by no means answers to the English *shall have been.* Yet the logical elements of both are the same. In the English expression, the *past* power of the perfect predominates, in the Greek its *present* power.

2. *Habit in the case of past actions.—I had dined when I rode out.* This may apply to a particular dinner, followed by a particular ride. But it may also mean that when the speaker *had dined, according to habit, he rode out according to habit also.* This gives us a variety of pluperfect; which is, in the French language, represented by separate combination—*j'avais diné, j'eus diné.*

§ 515. It is necessary to remember that the connection between the present and the past time, which is involved in the idea of a perfect tense (τέτυφα), or perfect combination (*I have beaten*), is of several sorts.

It may consist in the *present proof* of the *past* fact,—*I have written, and here is the evidence.*

It may consist in the *present effects* of the *past* fact,—*I have written, and here is the answer.*

Without either enumerating or classifying these different kinds of connection, it is necessary to indicate two sorts of *inference* to which they may give origin.

1. *The inference of continuance.*—When a person says, *I have learned my lesson,* we presume that he can say it, *i. e.* that *he has a present knowledge of it.* Upon this principle κέκτημαι = *I have earned* = *I possess.* The past action is assumed to be continued in its effects.

2. *The inference of contrast.*—When a person says, *I have been young,* we presume that he is so no longer. The action is past, but it is continued up to the time of speaking by the contrast which it supplies. Upon this principle, *fuit Ilium* means *Ilium is no more.*

In speaking, this difference can be expressed by a difference of accent. *I* have *learned my lesson,* implies that *I don't mean to learn it again. I have* learned *my lesson,* implies that *I can say it.*

§ 516. The construction of the auxiliary, *may*, will be considered in the chapter on Conjunctions; that of *can*, *must*, and *let*, offer nothing remarkable. The combination of the auxiliary *have*, with the past participle, requires notice. It is, here, advisable to make the following classifications:—

1. The combination with the participle of a *transitive verb*. —*I have ridden the horse; thou hast broken the sword; he has smitten the enemy.*

2. The combination with the participle of an *intransitive* verb,—*I have waited; thou hast hungered; he has slept.*

3. The combination with the participle of the verb-substantive,—*I have been; thou hast been; he has been.*

It is by examples of the first of these three divisions that the true construction is to be shown.

For an object of any sort to be in the possession of a person, it must previously have existed. If I possess a horse, that horse must have had a previous existence.

Hence, in all expressions like *I have ridden a horse*, there are two ideas,—a past idea in the participle, and a present idea in the word denoting possession.

For an object of any sort, affected in a particular manner, to be in the possession of a person, it must previously have been affected in the manner required. If I possess a horse that has been ridden, the riding must have taken place before I mention the fact of the ridden horse being in my possession; inasmuch as I speak of it as a thing already done,—the participle, *ridden*, being in the past tense.

I have ridden a horse = *I have a horse ridden* = *I have a horse as a ridden horse*, or (changing the gender and dealing with the word *horse* as a thing) = *I have a horse as a ridden thing.*

In this case the syntax is of the usual sort. (1.) *Have* = *own* = *habeo* = *teneo;* (2.) *horse* is the accusative case = *equum;* (3.) *ridden* is a past participle agreeing either with *horse*, or *with a word in apposition with it understood.*

Mark the words in italics. The word *ridden* does not agree with *horse*, since it is of the neuter gender. Neither if we said *I have ridden the horses*, would it agree with *horses;* since it is of the singular number.

The true construction is arrived at by supplying the word *thing*. *I have a horse as a ridden thing = habeo equum equitatum* (neuter). Here the construction is the same as *triste lupus stabulis.*

I have horses as a ridden thing = habeo equos equitatum (singular, neuter). Here the construction is—

> "Triste . . . . . maturis frugibus imbres,
> Arboribus venti, nobis Amaryllides iræ."

or in Greek—

> Δεινὸν γυναιξὶν αἱ δὶ ὠδίνων γοναί.

The classical writers supply instances of this use of *have*. *Compertum habeo*, milites, verba viris virtutem non addere = *I have discovered = I am in possession of the discovery*. Quæ cum ita sint, satis de Cæsare hoc *dictum habeo*.

2. The combination of *have* with an intransitive verb is irreducible to the idea of possession: indeed, it is illogical. In *I have waited*, we cannot make the idea expressed by the word *waited* the object of the verb *have* or *possess*. The expression has become a part of language by means of the extension of a false analogy. It is an instance of an illegitimate imitation.

3. The combination of *have* with *been* is more illogical still, and is a stronger instance of the influence of an illegitimate imitation. In German and Italian, where even *intransitive* verbs are combined with the equivalents to the English *have* (*haben* and *avere*), the verb-substantive is not so combined. On the contrary, the combinations are, in—

Italian	.	.	io *sono* stato	= I *am* been,
German	.	.	ich *bin* geweson	= *Ditto*,

which is logical.

§ 517. *I am to speak.*—Two facts explain this idiom.

1. The idea of direction *towards* an object conveyed by the sign *to*.

2. The connection between the ideas of necessity, obligation, and intention, with that of *something to be done*, or *something towards which* some action has a tendency.

The A. S. form *to sprecanne*, called a gerund, is really a dative case of an infinitive mood.

I am to blame = I am to be blamed, is one degree more complex. It is clear, however, that *an object to be blamed = an object for some one to blame.*

In A. S., *he is to lufigenne* equalled not *he is to love,* but *he is to be loved.*

To say, as good writers have done, that *blame* and *love,* in such expressions as these, are substantives, is right or wrong according to the kind of substantive intended. They are *not* such substantives as *culpa* and *amor.* They *are* such substantives as *culpare* and *ad culpandum.*

§ 518. *Syntax of the Verb-Substantive in the present tense with the past participle passive.*—In propositions like *I am moved, he is beaten, we are struck, it is given,* the verb-substantive is joined to the participle passive; and so there arise phrases which have the power of a verb in the passive voice. It is well known that in some languages these ideas are expressed, not by the combination of the verb substantive and participle, but by a single word: *e. g.* in Latin, *moveor = I am moved; percutimur = we are struck; datur = it is given.* In the circumstance that the phrases above have the power of passive forms, there is nothing peculiar. Beyond this there *is,* however, a peculiarity. The participles *moved, beaten, struck, given,* are participles not of a present, but of a *past* tense; and hence the proper meaning of the phrases given above (and of all others like them) should be very different from what it really is. *I am moved,* should mean, not *I am in the act of being moved,* but *I am a person who has been moved;*—*he is beaten,* should mean, not *he is a person who is in the act of suffering a beating,* but *one who has suffered a beating;* in other words, the sense of the combination should be *past,* and not *present.* By a comparison between the English and Latin languages in respect to this combination of the verb-substantive and participle, this anomaly on the part of the English becomes very apparent. The Latin word *motus* is exactly equivalent to the English word *moved.* Each is a participle of the passive voice, and of the past tense. Besides this, *sum* in Latin equals *I am* in English. Now, the Latin phrase *motus sum* is equivalent, not to the English combination *I am moved,*

but to the combination *I have been moved, i. e.* it has a past and not a present sense. In Greek the difference is plainer still, because in Greek there are two participles passive, one for the present, and another for the past tense; *e. g.* τυπτόμενος εἰμὶ (*typtomenos eimi*) = *I am one in the act of undergoing a beating*; τετυμμένος εἰμὶ = *I am one who has undergone a beating.* The reason for this confusion in English, lies in the absence of a passive form for the present. In Mœso-Gothic there existed the forms *slahada* = *he,* (*she* or *it*) *is beaten* (*percutitur*, τύπτεται), and *slahanda* = *they are beaten* (*percutiuntur*, τύπτονται) (*typtontai*). These were true passive forms. In like manner there occurred *gibada* = *he* (*she* or *it*) *is given* (*datur*), &c. Now, as long as there was a proper form for the present, like those in Mœso-Gothic, the combination of the present tense of the verb-substantive with the participle past passive had the same sense as in Latin and Greek; that is, it indicated past time: *e. g. ga-bundan-s im* = *I* have been *bound* (not *I* am *bound*), *gibans ist* = *he* (*she* or *it*) has been *given* (not *is given*), &c. When the passive form, however, was lost, the combination took the sense of a present tense.

The extent to which this difference has engendered, in the various languages of the Gothic stock, a variety of expedients, may be seen from the following tables taken from the *D. G.* iv. 19.

The equivalents to the Latin *datur* are in—

Mœso-Gothic	gib-ada.
Old High-German . . .	ist kep-an.
„ „ . . .	wirdit kep-an.
„ „ of Notker .	wirt keb-en.
Middle High-German . .	wirt geb-en.
New High-German . . .	wird ge-geb-en.
Old Saxon	is gebh-an.
„	wirtheth gebh-an.
Middle Dutch	es ge-ghev-en.
„ „	bleft ge-ghev-en.
New Dutch	wordt ge-gev-en.
Old Frisian	werth e-jev-en.
Anglo-Saxon	weorde$\eth$ gif-en.
English	is giv-en.

Old Norse	er gef-inn.
Swedish	gifv-es.
Danish	bliver giv-en.
„	vorder giv-en.

To the Latin *datus est* the equivalents are in—

Mœso-Gothic	ist gib-ans.
„	vas gib-ans.
„	varth gib-ans.
Old High-German . . .	was kep-an.
„ „ . . .	warth kep-an.
„ „ of Notker .	ist kep-an.
Middle High-German . .	ist geb-an.
New High-German . .	*ist ge-geb-en worden.
Old Saxon	was gebhan.
„	warth gebh-an.
Middle Dutch . . .	waert ghe-gev-en.
„ „ . . .	blef ghe-gev-en.
New Dutch	*es ghe-gev-en worden.
Old Frisian	is ejeven.
Anglo-Saxon	is gif-en.
English	has been giv-en.
Old Norse	hefr verit gef-inn.
Swedish	har varit gifv-en.
Danish	har varet giv-en.

D. G. iv. 19.

§ 519. *Ought, would, &c., used as presents.*—These words are not in the predicament of *shall.*

They are *present* in power, and *past* in form. So is *shall.*

But they are not, like *shall,* perfect forms; *i. e.* they have no natural present element in them.

They are *aorist* præterites. Nevertheless, they have a present sense.

So had their equivalents in Greek: ἐχρῆν = χρὴ; ἔδει = δεῖ; προσῆκεν = προσὴκει.

In Latin, too, *would* was often not represented by either *volo* or *volebam,* but by *velim.*

I believe that the *usus ethicus* is at the bottom of this construction.

* *Is become given,* or *is given become.*

The assertion of *duty* or *obligation* is one of those assertions of which men like to soften the expression: *should, ought.*

So is the expression of *power*, as denoted by *may* or *can*—*might, could.*

Very often when we say *you should* (or *ought to*) *do this*, we leave to be added by implication—*but you do not.*

Very often when we say *I could* (or *might*) *do this*, we leave to be added by implication—*but I do not exert my power.*

Now, what is left undone by the *present* element in this assertion, viz. the duty to do it, or the power of doing it, constitutes a past element in it; since the power (or duty) is, in relation to the performance, a cause—insufficient, indeed, but still antecedent. This hypothesis is suggested, rather than asserted.

By substituting the words *I am bound*, for *I ought*, we may see the expedients to which this present use of the præterite forces us.

I am bound *to do this* now = *I* owe *to do this* now. However, we do not say *owe*, but *ought*.

Hence, when we wish to say *I* was bound *to do this* two years ago, we cannot say *I ought* (*owed*) *to do this*, &c., since *ought* is already used in a present sense.

We therefore say, instead, *I* ought to have done *this* two years ago; which has a similar, but by no means an identical meaning.

I was bound to pay two years ago, means *two years ago I was under an obligation to make a payment, either then or at some future time.*

I was bound to have paid, &c., means *I was under an obligation to have made a payment.*

If we use the word *ought*, this difference cannot be expressed.

Common people sometimes say, *you had not ought to do so and so;* and they have a reason for saying it.

The Latin language is more logical. It says not *debet factum fuisse*, but *debuit fieri.*

CHAPTER XXIV.

SHALL AND WILL.

§ 520. The niceties connected with the use of these two words are well known. They are sufficiently numerous and complicated to demand a special notice.

1. The first point to bear in mind is the fact, that although such phrases as *I shall speak*, and *I will speak*, are called *future tenses*, they are, in reality, no such thing. They are combinations of a present tense and an infinitive mood—*speak* being the infinitive mood, and *shall* and *will* the present tenses of *should* and *would*. The act that is to be done is *future*. The state of things on the part of the person who is to do it is *present*.

2. The next point is one of less importance in the way of Syntax, than it has been in the way of Etymology; being also, a point which has already been elucidated. It is the difference between the two words *will* and *shall* as present tenses. The former is a present tense, absolutely and completely, having always been one. The latter was originally a perfect, and *is* what we have called a præterite-present, or (changing the prefix) a perfect-present.

For the chief purposes, however, of the present chapter (*i. e.* for the chief purposes of Syntax), they are both equally present. Nevertheless, the original difference requires remembering.

3. The construction of the two words in their relations to the infinitive which follows them is the same, being also the same as those of the words *can*, *may*, *must*, and a few others. They are never found except in connection with other verbs. Hence, whilst we say—

I *can* do this — We *can* do this.
Thou *mayest* do this — Ye *may* do this.
He *must* do this — They *must* do this.
He *shall* do this — They *shall* do this.
She *will* do this — They *will* do this.

we cannot say—

I begin to *can* — They begin to *can*.
Thou beginnest to *may* — Ye begin to *may*.
He begins to *must* — They begin to *must*.
He begins to *shall* — They begin to *shall*.
She begins to *will** — They begin to *will*.

nor yet—

I am *canning* — Thou art *maying*.
He is *musting* — We are *shalling*.
He is *willing*.*

4. This creates difficulties when we come to the important investigation of their meaning as separate and independent words.

§ 521. The difficulties, however, are fewer with *will* than they are with *shall*.

a. *Will*.—Two facts help us here. We have the same combination of sounds in the word *will* = *volition*. We may say, indeed, that we have the same word; the same word used both as a substantive and as a verb.—*He has so strong a* will *that whatsoever he* wills *he* will *do*.

The classical languages give us the roots *vol* (in *vol-o*) and βουλ (*búl*) in βουλ-ομαι (*búlomai*). Hence, whatever may be the case with *shall*, its fellow-word *will* denotes not only the fact that something is predicted to take place, but that the cause by which it will be brought about is an act of *volition on the part of the agent who effects it*; such an agent being itself the originator of the action rather than the mere instrument through which certain external influences operate.

b. *Shall*.—Our aids here are inconsiderable. All that either comparative philology, or the search for collateral meanings leads to, *as a certainty*, is an approximate reconstruction of the original form. And here, without going beyond the pale of

* Not, at least, in the senses we say, *He will be burnt*.

the German family of languages, we learn that the older form was *skal*—the present *h* representing, and having grown out of an original *k*. That the vowel of the original present was *i* is not so certain. Probably, however, it was so.

Let us deal with the word as if this were certain; the primitive form being *skil-*. Now—

Let its opposition, or contrast, to *will* lead us towards an inkling of its meaning. If *will* mean agency determined by the *volition* of the agent, *skil* may mean agency determined by causes acting from without upon and through the *agent;* the agent who may more properly be considered as an *instrument*.

Let us say that *will* means *having the intention to do so and so,* whilst *shall* means *being in the condition to do so and so.*

Can we go further? I think we can. The only *certainty* that comparative philology gives us in the case of *shall* is the consonant *k* as the second letter of the root (*skal* for *shall*).

But it is highly probable that the substantive *skill* is as truly a derivative from the same root as *shall,* as *will* = *volo,* is the same word as *will* in *I will speak* = *loquar.*

Now, such expressions as the *condition to do so and so,* and the *bias to do so and so,* are by no means widely separated in meaning, inasmuch as the term *bias* implies external influence rather than internal resolve. These bring us to the participle *determined,* a word which, at first, suggests ideas akin to *will* rather than to *shall.* At *first,* I say it does this, because when we use such a phrase as *a determined fellow,* we raise the idea of a man of a strong *will*—of a wilful man who will have his own way, or, at least, of a man not easily diverted from his purpose by external accidents. On the other hand, however, the connection between *bias* and *determination* is close. Often as we use the word *determined* to express the moral quality of *strong-willed,* we fully as often use it to denote the effect of external agencies. We do this (for instance) when we talk of the conduct of a weak man being *determined by circumstances.*

The ideas of *determination* and *decision* are visibly allied to each other. A *decided* man is (in the first instance) one whom

events have brought to a *decision*, just as a *determined* man is one whom events have brought to a *determination*. To *keep* in this state shows firmness of character, and hence the ordinary power of the word—

Decide, distinguish, differ.—I submit that the sequence of ideas here is transparently clear.

Now *sk-l* = *differ, distinguish, separate*. It is the Norse word *skilja* so translated. It is also the English word in the phrase *what skills it?* = *what difference does it make?*

Let *shall* be called the *predictive*, whilst *will* is the *promissive*, future.

The former simply states that a thing which has not yet happened, will happen hereafter; the forces that are to bring it about being indefinite.

The latter states not only that a thing which has not yet happened will happen hereafter, but also implies a certain amount of definitude in respect to the forces which will effect it. They are, by no means, forces brought from the whole universe of possibilities indefinitely, but forces of a specific character. They are engendered in the moral constitution (real or supposed) of the agent—real, when the agent is an actual rational being, supposed, when, without being actually rational, it has a certain amount of rationality attributed to it, in the way of personification on the part of the speaker, either conscious or unconscious.

This is what the two words denote. *Prediction* is the *genus*, *promise* the *species*. All future things may be predicted; a portion of them only can be promised.

Promise implies a *promiser*, and a *promise* is a *prediction* fulfilling its own accomplishment. *Will* (*volition*) is an element in all such ideas.

I do not say that these two words are the best that can be applied. I only add that they are words already used; and that by Wallis, as will soon be seen.

Such are the preliminaries. What is their application?

The ordinary rule of the language of South (though not of North) Britain, the ordinary rule of the English (though not of the Scotch) is as follows:—

When simple prediction is intended, the predictive *shall* is used in the first person only, the auxiliary of the two other persons being the promissive *will*. Thus—

If three persons are in a house, and the house is on fire, although the conditions under which all the three are likely to be burnt are the same, the manner of expressing them is different. A, for instance, says of himself—

I *shall* be burnt.

But of B and C, he says—

You *will* be burnt, and
He *will* be burnt.

He also says of B and C collectively—

They *will* be burnt.

Meanwhile—
A and B say of themselves—

We *shall* be burnt.

This is the way that A and B speak when the burning depends upon causes external to themselves. To say the least of such a mode of expression as this, it is an inconsistent one.

But the inconsistency does not stop here, as we may see by an examination of the promissive forms of parlance, where the process is reversed.

If one out of three persons, choosing, for himself and fellows, between the stake and some other alternative, prefer to be burnt, the locution varies. A, for instance, says of himself—

I *will* be burnt.

But of B and C he says—

You *shall* be burnt, and
He *shall* be burnt.

He also says of B and C collectively—

They *shall* be burnt, or else
Ye *shall* be burnt.

Changing the expression—*shall* is predictive, and *will* is

promissive in the first person only; whereas, in the second and third, *will* is predictive, and *shall* promissive.

In the words of Wallis—"In primis personis *shall* simpliciter *prædicentis* est; *will*, quasi *promittentis* aut minantis.

"In secundis et tertiis personis, *shall promittentis* est aut minantis: *will* simpliciter *prædicentis*.

"Uram = *I shall burn.*	Uremus = *We shall burn.*
Ures = *Thou wilt burn.*	Uretis = *Ye will burn.*
Uret = *He will burn.*	Urent = *They will burn.*

nempe, hoc futurum *prædico*.

"*I will burn.*	*We will burn.*
Thou shalt burn.	*Ye shall burn.*
He shall burn.	*They shall burn.*

nempe, hoc futurum *spondeo*, vel faxo ut sit."

Again—"*would* et *should* illud indicant quod erat vel esset futurum: cum hoc tantum discrimine: *would* voluntatem innuit, seu agentis propensionem: *should* simpliciter *futuritionem*."—Wallis, p. 107.

Two extracts are now submitted to the reader, in the hope that they will lead him towards an approximate solution of these difficult complications—the first from a philologue, the second from a logician and mathematician.

The first is from Archdeacon Hare, who explains the locutions by a *usus ethicus*:—"There is an awful, irrepressible, and almost instinctive consciousness of the uncertainty of the future, and of our own powerlessness over it, which, in all cultivated languages, has silently and imperceptibly modified the modes of expression with regard to it: and from a double kind of *litotes*, the one belonging to human nature generally, the other imposed by good-breeding on the individual, and urging him to veil the manifestations of his will, we are induced to frame all sorts of shifts for the sake of speaking with becoming modesty. This is the only way of accounting for the singular mixture of the two verbs *shall* and *will*, by which, as we have no auxiliary answering to the German *werde*, we express the future tense. Our future, or at least

what answers to it, is, *I shall, thou wilt, he will.* When speaking in the first person, we speak submissively: when speaking to or of another, we speak courteously. In our older writers—for instance, in our translation of the Bible—*shall* is applied to all three persons: we had not then reacht that stage of politeness which shrinks from the appearance even of speaking compulsorily of another. On the other hand, the Scotch use *will* in the first person; that is, as a nation, they have not acquired that particular shade of good-breeding which shrinks from thrusting itself forward."

The second is from Professor De Morgan, writing with Archdeacon Hare's doctrine under his special consideration:—

"The matter to be explained is the synonymous character of *will* in the first person with *shall* in the second and third; and of *shall* in the first person with *will* in the second and third: *shall* (1) and *will* (2, 3) are called *predictive*; *shall* (2, 3) and *will* (1) *promissive.* The suggestion now proposed will require four distinctive names.

"Archdeacon Hare's *usus ethicus* is taken from the brighter side of human nature:—'When speaking in the first person we speak submissively; when speaking to or of another, we speak courteously.' This explains *I shall, thou wilt*; but I cannot think it explains *I will, thou shalt.* It often happens that *you will*, with a persuasive tone, is used courteously for something next to, if not quite, *you shall.* The present explanation is taken from the darker side; and it is to be feared that the *à priori* probabilities are in its favour.

"In introducing the common mode of stating the future tenses, grammar has proceeded as if she were more than a formal science. She has no more business to collect together *I shall, thou wilt, he will,* than to do the same with *I rule, thou art ruled, he is ruled.*

"It seems to be the natural disposition of man to think of his own volition in two of the following categories, and of another man's in the other two:

"Compelling, non-compelling; restrained, non-restrained.

"The *ego*, with reference to the *non-ego*, is apt, thinking of himself, to propound the alternative, 'Shall I compel, or shall

I leave him to do as he likes?' so that, thinking of the other, the alternative is, 'shall he be restrained, or shall he be left to his own will?' Accordingly, the express introduction of his own will is likely to have reference to compulsion, in case of opposition: the express introduction of the will of another, is likely to mean no more than the gracious permission of the *ego* to let *non-ego* do as he likes. Correlatively, the suppression of reference to his own will, and the adoption of a simply predictive form on the part of the *ego*, is likely to be the mode with which, when the person is changed, he will associate the idea of another having his own way; while the suppression of reference to the will of the *non-ego* is likely to infer restraint produced by the predominant will of the *ego*.

"Occasionally, the will of the *non-ego* is referred to as under restraint in modern times. To *I will not*, the answer is sometimes *you shall*, meaning, in spite of the will—sometimes *you will*, meaning that the *will* will be changed by fear or sense of the inutility of resistance."

Adopting the limitation suggested in respect to the functions of the grammarian, I would remark that the words *ego*, and *non-ego*, do not exactly denote the *will of the speaker*, and the *will of some one else*, inasmuch as in many of the locutions there is no notion of *will* at all. *Ego* rather means *action arising from an internal impulse*, whilst *non-ego* implies *action arising from circumstances external to the agent*. With *ego* the *willer* is the *primum mobile*, with *non-ego* the actor is *an instrument rather than an original and spontaneous agent*.

According, then, as one of these two ideas predominate, the use of *will* or *shall* is determined. In subordinating the *will* to the *shall* the *usus ethicus* has an influence. When the agency of external influences is subordinated to the *will* of the actor, the converse takes place, and the speaker expresses himself according to his feeling of power over them. This may be called the *usus potentialis*.

Between these two there is a debatable ground, of which it is likely enough that the Scotch and early English writers may have apportioned a full share in the way of potentiality, the later English authors inclining to the *usus ethicus*.

How far this is done on either side I cannot say. I doubt

whether the current rule is so absolute as it is said to be. The very extreme instance of "I *will* be drowned, no one *shall* pull me out," may or may not be a real one. At any rate it is generally given to an Irishman. How a Scotchman would analyse certain expressions I cannot say. I can only say that Englishmen sometimes speak and write *more Scotico*. Of this I can give an instance out of my own writings. If the reader will turn to the 310th page of my first volume (lines 20 and 21) he will find the following sentence:— "An extract from Mr. Hallam shall close the present section and introduce the next."

This is from the pen of an Englishman, of Lincolnshire, South Bucks, and Cambridge, who, at the date of the extract, had never been north of the Humber, not, at least, in Great Britain. As such, we must take it as we find it—as a sample of English. It was written unconsciously and *currente calamo*. It expressed the state of mind in which he was in. I have seen it, however, quoted as an instance of bad English. Coming as it did from a professor of the English language, it was a well-chosen example, *if a true one*. But the more I have looked at the context the more satisfied I am that it is an accurate expression. All that it violates is a rule ill-drawn up. Had the sentence been the first in the work, the first in the chapter, or the first on the subject, *will* would have been the proper word. It would denote what I, as the *primum mobile*, meant to do. But it refers to what precedes rather than to what follows. By these *pre*-cedents it is (so to say) conditioned. It formed a part of an argument, to which argument I, the writer, was so far bound as to be an instrument rather than an originator. I was not R. G. Latham doing as I thought fit with my own, but the servant of my premises. The more I analyse the text and context the more I am satisfied this is the case. At any rate I am an Englishman, writing English.

I will now (here I say *will* because the forthcoming remarks are additions to my previous argument rather than necessary parts of it, and I am comparatively free to either insert or omit them) make another extract from a professor (and, I may add, a master) of the English language. But he is a North Briton, Mr. Masson. He writes, "I could count up and name at this moment, some four or five men to whose personal

influence, experienced as a student, I owe more than to any books, and of whom, while life lasts, I will always think with gratitude."* Assuredly, an Englishman would have written "*shall* always think." Why would he? Not because he wrote more correctly, but because he expressed a different idea. Mr. Masson speaks direct from the feelings engendered by the kindness and services of the former teachers. He speaks from his own mind, so that he not only gives us their action on himself but his own reaction on them. He might, however, have done differently. He might have spoken from the simple action of them, keeping the reaction of his own mind in the background. An English writer would have done so, and have said *shall* accordingly. The grammar of both is good—for grammar only tells us how to express our thoughts in language. It does not tell us what to think. Now the Englishman and Scotchman in the matter of *shall* and *will* think differently. Why they do so is another matter. The Englishman subordinates himself to the circumstances that determine his actions. The Scotchman subordinates the circumstances to himself. The one carries the line of causality through his own mind before he takes it up. The other takes it up before his mind has re-acted on it.

Without asking whether *will* or *shall* be the better reading in the following extract, let us ask what each means.

> Pity, kind gentlefolks, friends of humanity!
> Keen blows the wind and the night 's coming on,
> Give me some food for my mother and charity;
> Give me some food and then I { will / shall } be gone.

Here—
Will be gone means *I will trouble you no more.*
Shall be gone means *You will get rid of me.*

* Lecture delivered at University College, London.—October, 1854.

CHAPTER XXV.

THE SYNTAX OF ADVERBS.

§ 522. THE syntax of the adverb is comparatively simple. Adverbs have no concord.

Neither have they any government. They *seem*, indeed, to have it, when they are in the comparative or superlative degree; but it is merely apparent. In *this is better than that*, the word *that* is governed neither by *better* nor by *than*. It is not governed at all. It is a nominative case; the subject of a separate proposition. *This is better* (*i. e. more good*) *than that is good.* Even if we admit such an expression as *he is stronger than me* to be good English, there is no adverbial government. *Than*, if it govern *me* at all, governs it as a preposition.

The position of an adverb is, in respect to matters of syntax, pre-eminently parenthetic; *i. e.* it may be omitted without injuring the construction. *He is fighting—now; he was fighting—then; he fights—bravely; I am—almost—tired*, &c.

By referring to the chapter on the Adverbs, we shall find that the neuter adjective is frequently converted into an adverb by deflection. As any neuter adjective may be so deflected, we may justify such expressions as *full* (for *fully*) *as conspicuous*, and *peculiar* (for *peculiarly*) *bad grace*, &c. We are not, however, bound to imitate everything that we can justify.

§ 523. The termination *-ly* was originally adjectival. At present it is a derivational syllable by which we can convert an adjective into an adverb: *brave, brave-ly*. When, however, the adjective ends in *-ly* already, the formation is awkward. *I eat my daily bread* is unexceptionable English; *I eat my*

bread daily is exceptionable. One of two things must here take place: the two syllables *-ly* are packed into one (the full expression being *dai-li-ly*) or else the construction is that of a neuter adjective deflected.

Adverbs are convertible. *The then men* = *οἱ νῦν βρότοι*, &c.

§ 524. *From whence, from thence.*—This is an expression which, if it have not taken root in our language, is likely to do so. It is an instance of excess of expression in the way of syntax; inasmuch as the *-ce* denotes direction *from* a place, and the preposition does the same. It is not so important to determine what this construction *is*, as to suggest what it is *not*. It is *not* an instance of an adverb governed by a preposition. If the two words be dealt with as logically separate, *whence* (or *thence*) must be a noun = *which place* (or *that place*); just as *from then till now* = *from that time to this.* But if the two words be dealt with as one, the preposition *from* has lost its natural power, and become the element of an adverb.

This latter view is the better; in which case the construction gives us an improper compound.

CHAPTER XXVI.

ON PREPOSITIONS.

§ 525. ALL prepositions govern an oblique case. If a word cease to do this, it ceases to be a preposition. In the first of the two following sentences the word *up* is a preposition, in the second an adverb.

1. *I climbed up the tree.*
2. *I climbed up.*

All prepositions in English precede the noun which they govern. *I climbed up the tree*, never *I climbed the tree up*. This is a matter not of government, but of collocation. It is the case in most languages; and, from the frequency of its occurrence, the term *pre-position* (or *prefix*) has originated. Nevertheless, it is by no means a philological necessity. In many languages the prepositions are *post-positive*, following their noun.

No preposition, in the present English, governs a genitive case. This remark is made, because expressions like the *part of the body = pars corporis*,—*a piece of the bread = portio panis*, make it appear as if the preposition *of* did so. The true expression is, that the preposition *of*, followed by an objective case, is equivalent, in many instances, to the genitive case of the classical languages.

The writer, however, of a paper on English præterites and genitives, in the "Philological Museum" (vol. ii. p. 261) objects to the current doctrine concerning such constructions as, *this is a picture of the king's*. Instead of considering the sentence elliptic, and equivalent to *this is a picture of the king's pictures*, he confesses that he feels "some doubt whether this phrase is

indeed to be regarded as elliptical, that is, whether the phrase in room of which it is said to stand, was ever actually in use. It has sometimes struck me," he continues, "that this may be a relict of the old practice of using the genitive after nouns as well as before them, only with the insertion of the preposition *of*. One of the passages quoted above from 'Arnold's Chronicle,' supplies an instance of a genitive so situated; and one cannot help thinking that it was the notion that *of* governed the genitive, that led the old translators of Virgil to call his poem *The Booke of Eneidos*, as it is termed by Phaer, and Gawin Douglas, and in the translation printed by Caxton. Hence it may be that we put the genitive after the noun in such cases, in order to express those relations which are most appropriately expressed by the genitive preceding it. *A picture of the king's* is something very different from *the king's picture*: and so many other relations are designated by *of* with the objective noun, that if we wish to denote possession thereby, it leaves an ambiguity: so, for this purpose, when we want to subjoin the name of the possessor to the thing possest, we have recourse to the genitive, by prefixing which we are wont to express the same idea. At all events as, if we were askt whose castle Alnwick is, we should answer, *The Duke of Northumberland's*; so we should also say, *What a grand castle that is of the Duke of Northumberland's!* without at all taking into account whether he had other castles besides: and our expression would be equally appropriate, whether he had or not."

Again, Mr. Guest quotes, amongst other passages, the following:—

> Suffice this hill *of ours*—
> They fought two houres *of the nightes*—

Yet neither class of examples is conclusive.

Ours does not necessarily mean *of us*. It may also mean of *our hills*, *i. e.* of *the hills of our choice*. *Nightes* may mean *of the night's hours*. In the expression, *what a grand castle*, &c., it is submitted to the reader that we *do* take into our account other castles, which the Duke of Northumberland may or may not have. *The Booke of Eneidos* is a mistaken Latinism. As

it does not seem to have been sufficiently considered that the real case governed by *of* (as by *de* in Latin) is the ablative, it is the opinion of the present writer that no instance has yet been produced of *of* either governing, or having governed a genitive case.

§ 526. It is not so safe to say in the present English, that no preposition governs a dative. The expression *give it him* is good English; and it is also equivalent to the Latin *da ei*. But we may also say *give it to him*. Now the German *zu* = *to* governs a dative case, and in Anglo-Saxon, the preposition *to*, when prefixed to the infinitive mood, required the case that followed it to be a dative.

§ 527. When the infinitive mood is used as the subject of a proposition, *i. e.* as a nominative case, it is impossible to allow to the preposition *to*, by which it is preceded, any separate existence whatever,—*to rise* = *rising*; *to err* = *error*. Here the preposition must, for the purposes of syntax, be considered as incorporated with the noun, just like an inseparable inflection. As such it may be preceded by another preposition. The following example, although a Grecism, illustrates this :—

> Yet not to have been dipt in Lethe's lake,
> Could save the son of Thetis *from to die*.

§ 528. Akin to this, but not the same, is the so-called vulgarism, consisting of the use of the preposition *for*. *I am ready to go* = *I am ready for going* = the so-called vulgarism, *I am ready* for *to go*. Now, this expression differs from the last in exhibiting, not only a *verbal* accumulation of prepositions, but a *logical* accumulation as well: inasmuch as *for* and *to* express like ideas.

§ 529. Composition converts prepositions into adverbs. Whether we say *upstanding* or *standing-up*, we express the *manner* in which an action takes place, and not the relation between two substantives. The so-called prepositional compounds in Greek (*ἀναβαίνω ἀποθνήσκω*, &c.) are all adverbial.

CHAPTER XXVII.

ON CONJUNCTIONS.

§ 530. A conjunction is a part of speech which connects either *terms* or *propositions*.

In such a sentence as *all men are black or white*, the *terms* are connected, the proposition being only one.

The *terminal* conjunctions, as they may be called, are rarer than the *propositional*.

The day is bright, is one proposition. *The sun shines*, is another. *The day is bright because the sun shines* is a pair of prepositions connected by the conjunction, *because*.

From this it follows, that whenever there is a propositional conjunction, there are two subjects, two copulas, and two predicates : *i. e.* two propositions in all their parts.

But these may be expressed compendiously. *The sun shines, and the moon shines*, may be expressed by the *sun and moon shine*.

Nevertheless, however compendious may be the expression, there are always two propositions wherever there is one conjunction. A part of speech that merely combines two words is a preposition,—*the sun along with the moon shines*.

It is highly important to remember that conjunctions connect propositions.

It is also highly important to remember that many double propositions may be expressed so compendiously as to look like one. When this takes place, and any question arises as to the construction, they must be exhibited in their fully-expanded form ; *i. e.* the second subject, the second predicate, and the second copula must be supplied. This can always be

done from the first proposition,—*he likes you better than me* = *he likes you better than he likes me.*

Most conjunctions have been developed out of some other part of speech. Thus—

The conjunction of comparison, *than*, is derived from the adverb of time, *then*. This, in its turn, is derived from the accusative singular of the demonstrative pronoun.

The conjunction, *that*, is derived also from a demonstrative pronoun.

The conjunction, *therefore*, is a demonstrative pronoun + a preposition.

The conjunction, *because*, is a substantive governed by a preposition.

One and the same word, in one and the same sentence, is a conjunction or preposition, as the case may be.

All fled but John.—If this mean *all fled except John*, the word *but* is a preposition, the word *John* is an accusative case, and the proposition is single. We may see this by remembering that if, instead of *John*, we had a personal pronoun, we should say *all fled but him.*

All fled but John.—If this mean *all fled, but John did not fly*, the word *but* is a conjunction, the word *John* is a nominative case, and the propositions are two in number. We may see this by remembering that if, instead of *John*, we had a personal pronoun, we should say, *all fled but he.*

From facts of this kind it is often necessary to determine whether a word be a conjunction or not.

If it be a conjunction it cannot govern a case.

If it govern a case, it is no conjunction but a preposition.

A conjunction cannot govern a case, for the following reason,—the word that follows it *must* be the subject of the second proposition, and, as such, a nominative case.

§ 531. The third point to determine in the syntax of conjunctions is, the certainty or uncertainty in the mind of the speaker as to the facts expressed by the propositions which they serve to connect.

1. Each proposition may contain a certain, definite, absolute fact—*the day is clear because the sun shines.* Here there is neither doubt nor contingency of either the *day being clear*, or of the *sun shining.*

2. Of two propositions one may be the condititon of the other—*the day will be clear if the sun shine.* Here, although it is certain that *if the sun shine the day will be clear,* there is no certainty of *the sun shining.* Of the two propositions one only embodies a certain fact.

Now an action, wherein there enters any notion of uncertainty, or indefinitude, and is at the same time connected with another action, should be expressed, not by the indicative mood, but by the subjunctive,—*if the sun shine the day will be clear.* To say *shines* would be exceptionable.

Simple uncertainty will not constitute a subjunctive construction,—*I am, perhaps, in the wrong.*

Neither will simple connection,—*I am wrong because you are right.*

But the two combined constitute the construction in question,—*if I be wrong, you are right.*

Now, a conjunction that connects two certain propositions, may be said to govern an indicative mood.

And a conjunction that connects an uncertain proposition with a certain one, may be said to govern a subjunctive mood.

The government of mood is the only form of government of which conjunctions are capable.

§ 532. Previous to the question of the government of conjunctions in the way of mood, it is necessary to notice certain points of agreement between them and the relative pronouns; inasmuch as, in many cases, the relative pronoun exerts the same government, in the way of determining the mood of the verb, as the conjunction.

Between the relative pronouns and conjunctions in general, there is this point of connection,—both join propositions. Wherever there is a relative, there is a second proposition. So there is wherever there is a conjunction.

Between certain relative pronouns and those particular conjunctions that govern a subjunctive mood there is also a point of connection. Both suggest an element of uncertainty or indefinitude. This the relative pronouns do, through the logical elements common to them and to the interrogatives: these latter essentially suggesting the idea of doubt. Wherever the person, or thing, connected with an action, and expressed

by a relative be indefinite, there is room for the use of a subjunctive mood. *He that troubled you shall bear his judgment, whosoever he be.*

§ 533. By considering the nature of such words as *when*, their origin as relatives on the one hand, and their conjunctional character on the other hand, we are prepared for finding a relative element in words like *till, until, before, as long as*, &c. These can all be expanded into expressions like *until the time when, during the time when*, &c. Hence, in an expression like *seek out his wickedness till thou find none*, the principle of the construction is nearly the same as in *he that troubled you*, &c., or *vice versâ*.*

§ 534. In most conditional expressions the subjunctive mood should follow the conjunction. All the following expressions are conditional.

1. *Except* I *be* by Silvia in the night,
There is no music in the nightingale.

SHAKSPERE.

2. Let us go and sacrifice to the Lord our God, *lest* he *fall* upon us with pestilence.—*Old Testament.*

3. ——Revenge back on itself recoils,
Let it. I reck not, *so* it *light* well aimed.

J. MILTON.

4. *If* this *be* the case.

5. *Although* my house *be* not so with God.—*Old Testament.*

6. He shall not eat of the holy thing *unless* he *wash* his flesh with water.—*Old Testament.*

Expressions like *except* and *unless* are equally conditional with words like *if* and *provided that*, since they are equivalent to *if—not*.

Expressions like *though* and *although* are peculiar. They

* Notwithstanding the extent to which a relative may take the appearance of conjunction, there is always one unequivocal method of deciding its true nature. The relative is always a *part* of the second proposition. A conjunction is, generally, *no part* of either.

join propositions, of which the one is a *primâ facie* reason against the other. In the sentence, *if the children be so badly brought up, they are not to be trusted,* the *bad bringing-up* is the reason for their *being unfit to be trusted;* and, as far as the expression is concerned, *is admitted to be so.* The only uncertainty lies in the question as to the degree of the badness of the education. The inference from it is unequivocal.

But if, instead of saying *if,* we say *although,* and omit the word *not,* so that the sentence run, *although the children be so badly brought up they are to be trusted,* we do two things: we indicate the general relation of cause and effect that exists between *bad bringing-up* and *unfitness for being trusted,* but we also, at the same time, take an exception to it in the particular instance before us. These remarks have been made for the sake of showing the extent to which words like *though,* &c., are conditional.

It must be remembered, however, that conjunctions, like the ones lately quoted, do not govern subjunctive moods because they are conditional, but because, in the particular condition which they accompany, there is an element of uncertainty.

§ 535. This introduces a fresh question. Conditional conjunctions are of two sorts:—

1. Those which express a condition as an actual fact, and one admitted as such by the speaker.

2. Those which express a condition as a possible fact, and one which the speaker either does not admit, or admits only in a qualified manner.

Since the children are so badly brought up, &c.—This is an instance of the first construction. The speaker admits as an actual fact the *bad bringing-up of the children.*

If the children be so badly brought-up, &c.—This is an instance of the second construction. The speaker admits as a possible fact the *bad bringing-up of the children;* but he does not adopt it as an indubitable one.

§ 536. Now, if every conjunction had a fixed unvariable meaning, there would be no difficulty in determining whether a condition was absolute and beyond doubt, or possible and liable to doubt. But such is not the case.

Although may precede a proposition which is admitted as well as one which is doubted.

a. Although *the children* are, &c.
b. Although *the children* be, &c.

If, too, may precede propositions wherein there is no doubt whatever implied: in other words, it may be used instead of *since*.

In some languages this interchange goes further than in others; in the Greek, for instance, such is the case with εἰ, to a very great extent indeed.

Hence we must look to the meaning of the sentence in general, rather than to the particular conjunction used.

It is a philological fact (probably referable to the *usus ethicus*) that *if* may stand instead of *since*.

It is also a philological fact that when it does so it should be followed by the indicative mood.

This is written in the way of illustration. What applies to *if* applies to other conjunctions as well.

§ 537. As a point of practice, the following method of determining the amount of doubt expressed in a conditional proposition is useful:—

Insert, immediately after the conjunction, one of the two following phrases,—(1.) *as is the case*; (2.) *as may or may not be the case*. By ascertaining which of these two supplements expresses the meaning of the speaker, we ascertain the mood of the verb which follows.

When the first formula is the one required, there is no element of doubt, and the verb should be in the indicative mood. *If* (*as is the case*), *he* is *gone, I must follow him.* Here *if* = *since*.

When the second formula is the one required, there *is* an element of doubt, and the verb should be in the subjunctive mood. *If* (*as may or may not be the case*) *he* be *gone, I must follow him.* *May* and *might* are tenses which combined with an infinitive serve as equivalents to a true mood; just as the preposition *of* + a substantive = a case.

§ 538. The use of the word *that* in expressions like *I eat that I may live*, &c., is a modification of the subjunctive con-

struction, that is conveniently called *potential*. It denotes that one act is done for the sake of supplying the *power* or opportunity for the performance of another.

In English the word *that*, so used, cannot be said to govern a mood, although generally followed by either *may* or *might*. It should rather be said to require a certain combination to follow it. The most important point connected with the powers of *that* is the so-called *succession of tenses*.

§ 539. *The succession of tenses.*—Whenever the conjunction *that* expresses intention, and consequently connects two verbs, the second of which denotes an action which takes place *after* the action denoted by the first, the verbs in question must be in the same tense.

I *do* this *that* I *may* gain by it.
I *did* this *that* I *might* gain by it.

In the Greek language this is expressed by a difference of mood; the subjunctive giving the construction equivalent to *may*, the optative to *might*.

A little consideration will show that this rule is absolute. For a man *to be doing* one action (in present time) in order that some other action may *follow* it (in past time) is to reverse the order of cause and effect. To do anything in A.D. 1851, that something may result from it in 1850 is a contradiction; and so it is to say *I* do *this* that *I* might *gain by it*.

The reasons against the converse construction are nearly, if not equally, cogent. To have done anything at any *previous* time in order that a *present* effect may follow, is, *ipso facto*, to convert a past act into a present one, or, to speak in the language of the grammarian, to convert an aorist into a perfect. To say *I* did *this* that *I may gain by it* is to make, by the very effect of the expression, either *may* equivalent to *might*, or *did* equivalent to *have done*.

I did *this* that *I* might *gain*.
I have done *this* that *I* may *gain*.

A clear perception of the logical necessity of the law of the succession of tenses, is necessary for understanding the nature

of several anomalous passages in the classical writers. In the following, an aorist is followed not by an optative, but by a subjunctive.

Οὐκ ἀγαθὸν πολυκοιρανίη· εἷς κοίρανος ἔστω,
Εἷς βασιλεὺς, ᾧ ἔδωκε Κρόνου παῖς ἀγκυλομήτεω
Σκῆπτρόν τ' ἠδὲ θέμιστας, ἵνα σφίσιν ἐμβασιλεύῃ.

Here it is necessary to construe ἔδωκε, *has given and continues to allow,* which is to construe it like a *perfect** tense. Upon similar passages Mathiæ writes, "but frequently the conjunctive is used, although the preceding word be in the time past, viz. when the verb which depends upon the conjunction shows an action continued to the present time." That means when the verb is really a perfect.

In Latin, when the same form is both aorist and perfect, the succession of tenses is a means of determining which of the two meanings it conveys. *Veni ut videam* = *I have come that I may see. Veni ut viderem* = *I came that I might see.*

Arnold states, from Krüger and Zumpt, that even where the præterite was clearly a perfect (*i.e.* = *to have* with the participle), the Roman ear was so accustomed to the *imperfect* subjunctive, that it preferred such an expression as *diu dubitavi num melius esset* to *diu dubitavi num melius sit.* The latter part of the statement is sure enough; but it is by no means so sure that *dubitavi,* and similar forms in similar constructions are perfects. There is no reason for considering this to be the case in the present instance. It seems to be so, because it is connected with *diu;* but an action may last a long

* Unless another view be taken of the construction, and it be argued that ἔδωκε is, etymologically speaking, no aorist but a perfect. In form it is almost as much one tense as another. If it wants the reduplication of the perfect, it has the perfect characteristic κ, to the exclusion of the aorist σ; and thus far the evidence is equal. The persons, however, are more aorist than perfect. For one of Mathiæ's aorists (μεθῆκε) a still better case might be made, showing it to be, even in etymology, more perfect than aorist.

Κτείνει με χρυσοῦ, τὸν ταλαίπωρον, χάριν
Ξένος πατρῴος, καὶ κτανὼν ἐς οἶδμ' ἁλὸς
Μεθῆχ', ἵν' αὐτὸς χρυσὸν ἐν δόμοις ἔχῃ.
Κεῖμαι δ' ἐπ' ἀκταῖς. EUR. *Hec.*

time, and yet not last up to the time of speaking. *Diu dubitavi* probably expresses, *I doubted a long time*, and leaves it to be inferred that *now I do not doubt*.

§ 540. It has been stated above that whilst the Latin and English have a succession of *tenses*, the Greek language exhibits what may be called a succession of *moods*. This suggests inquiry. Is the difference real? If so, how is it explained? If not, which of the two grammatical systems is right?—the English and Latin on the one side, or the Greek on the other? Should τύπτοιμι be reduced to a past tense, or *verberarem* be considered an optative mood?

The present writer has no hesitation in stating his belief, that all the phænomena explicable by the assumption of an optative mood are equally explicable by an expansion of the subjunctive, and a different distribution of its tenses.

1. Let τύψω be considered a subjunctive *future* instead of a subjunctive aorist.

2. Let τύπτοιμι be considered an *imperfect subjunctive*.

3. Let τετύφοιμι be considered a *pluperfect subjunctive*.

4. Let τετύψαιμι be considered an aorist *subjunctive*.

Against this view there are two reasons:

1. The double forms τύψαιμι and τύψοιμι, one of which would remain unplaced.

2. The use of the optative and conjunctive in simple propositions, as—

ὦ παῖ, γένοιο πατρὸς εὐτυχέστερος.

The first reason I am not prepared to impugn. *Valeat quantum*, &c. The second indicates a class of expressions which tense will *not* explain, and which mood *will*. Yet this is not conclusive. *Would that thou wert* is thoroughly optative: yet it is expressed by a tense.

The *form* of the so-called optatives proves nothing. Neither the subjunctive nor the optative has any signs of *mood* at all, except the negative one of the absence of the augment. Their signs are the signs of *tense*.

In favour of the view are the following reasons:—

1. The analogy of other languages. The imperfect has a subjunctive in Latin. So has the future.

2. The undoubtedly future character of the so-called aorist imperative. To give an order to do a thing in *past* time is a philological contradiction. Forms like *βλέψον must* be future. Though *θὲς* and *τίθει* differ in power, they both mean an action subsequent to, or, at any rate, simultaneous with the order given; certainly not one anterior to it.

§ 541. *Be* may stand for *may be*. In this case the præterite is not *were* but *might be*. The sentence, *what* care *I how fair the lady* be, *if she be not fair to her admirer?* is accurate. Here *be* = *may be*. But, *what* cared *I how fair the lady* were, *if she were not fair to her admirer?* is inaccurate. It ought to run thus,—*what* cared *I how fair the lady* might be, *if she were not fair to her admirer?**

§ 542. *Disjunctives.*—Disjunctives (*or, nor*) are of two sorts, real and nominal.

A king or queen always rules in England. Here the disjunction is real; *king* or *queen* being different names for different objects. In all *real* disjunctions the inference is, that if one out of two (or more) individuals (or classes) do not perform a certain action, the other does.

A sovereign or supreme ruler always rules in England. Here the disjunction is nominal; *sovereign* and *supreme governor* being different names for the same object. In all nominal disjunctives the inference is, that if an agent (or agents) do not perform a certain action under one name, he does (or they do) it under another.

Nominal disjunctives are called by Harris, *sub*disjunctives.

* It is almost unnecessary to state that the sentence quoted in the text is really a beautiful couplet of Wither's poetry *transprosed*. It was advisable to do this, for the sake of guarding against the effect of the rhyme. To have written

What care I how fair she *is*
If she be not fair to me?

would have made the grammar seem worse than it really was, by disappointing the reader of a rhyme. On the other hand, to have written

What care I how fair she *were*,
If she were not kind as *fair?*

would have made the grammar seem better than it really was, by supplying one.

In the English language there is no separate word to distinguish the nominal from the real disjùnctive. In Latin, *vel* is considered by Harris to be disjunctive, *sive* subdisjunctive. As a periphrasis the combination *in other words* is subdisjunctive.

Both nominal and real disjunctives agree in this,—whatever may be the number of nouns which they connect, the construction of the verb is the same as if there were but one—Henry *or* John, *or* Thomas, *walks* (not *walk*); the sun, *or* solar luminary, *shines* (not *shine*). The disjunctive *isolates* the subject, however much it may be placed in juxtaposition with other nouns.

§ 543. *Either, neither.*—Many disjunctives imply an alternative. If it be not this person (or thing) that performs a certain action (or exists in a certain state) it is some other. If a person (or thing) do not perform a certain action (or exist in a certain state), under one name, he (or it) does so under another. This alternative is expressed by the word *either*.

When the word *either* is connected immediately with the copula of a proposition, it is, if not a true conjunction, at least *a part of a conjunctional periphrasis.—This either is or is not so.*

When it belongs more to one of the terms of a proposition than to the copula, it is a pronoun,—*Either I or you is in the wrong. It is either you or I.*

I use the words, *part of a conjunctional periphrasis*, because the full conjunction is *either* + *or* (or *neither* + *nor*); the essential conjunctions being the latter words. To these, *either* (or *neither*) is superadded, indicating the *manner* in which the disjunction expressed by *or* (or *nor*) takes place; *i. e.* they show that it takes place in the manner of an alternative. Now, this superadded power is rather adverbial than conjunctional.

§ 544. From the pronominal character of the word *either*, when it forms part of a term, and from the power of the disjunctive, *or*, in *isolating* the subject of the verb, combined with an assumption which will be explained hereafter, we get at the principle of certain rules for doubtful constructions.

In expressions like *either you or I is in the wrong*, we must consider *either* not only as *a* pronoun, but as *the leading* pronoun of the proposition; a pronoun of which *or I* is an explanation; and, finally, as the pronoun which determines the person of the verb. *Either you or I is wrong = one of us* (*you or I*) *is wrong*.

Then, as to expressions like *I, or you, am in the wrong*. Here, *I* is the leading pronoun, which determines the person of the verbs; the words, *or you*, being parenthetic, and subordinate.

§ 545. Will this principle justify such expressions as *either they or we is in the wrong?*

Or will it justify such expressions as *either he or they is in the wrong?*

Or will it justify such expressions as *I or they am in the wrong?* In all which sentences one pronoun is plural.

Perhaps not. The assumption that has been just alluded to, as helping to explain certain doubtful constructions, is the following, viz. that in cases of apposition, disjunction, and complex terms, the *first* word is the one which determines the character of the sentence wherein it occurs. This is a practice of the English language, which, in the opinion of the present writer, nothing but a very decided preponderance of a difference in person, gender, or number, can overrule. Such may fairly be considered to be the case in the three examples just adduced; especially as there is also the secondary influence of the conjunctional character of the word *either*. Thus, although we say,—

One of two parties, they or we, is in the wrong.

We also say,—

Either they or we are in the wrong.

As for the other two expressions, they are in the same predicament, with an additional reason for the use of the plural. It *contains* the singular. The chief object of the present remarks has been less to explain details than to give due prominence to the following leading principles.

1. That *either* (or *neither*) is essentially singular in number.
2. That it is, like any common noun, of the third person.

3. That it is pronominal where it is in apposition with another noun.

4. That when it is the first word of the proposition it determines the concord of the verb, unless its character of a noun of the singular number and third person be disguised by the prominence of some plural form, or some pronoun of the first or second person in the latter part of the term.

5. That in a simple disjunctive proposition (*i. e.* one where *either* does not occur) all nouns are subordinate to the first.

§ 546. I believe that the use of *either* is limited to *real* disjunctives; in other words, that we can say *either a king or a queen always reigns in England*, but that we cannot say *either a sovereign or a supreme ruler always reigns in England.*

CHAPTER XXVIII.

THE SYNTAX OF THE NEGATIVE.

§ 547. WHEN the verb is in the infinitive mood, the negative precedes it.—*Not to advance is to retreat.*

When the verb is not in the infinitive mood, the negative follows it.—*He advanced not. I cannot.*

This rule is absolute. It only *seems* to precede the verb in such expressions as *I do not advance, I cannot advance, I have not advanced,* &c. However, the words *do, can,* and *have,* are no infinitives; and it consequently follows them. The word *advance* is an infinitive, and it consequently precedes it. Wallis's rule makes an equivalent statement, although differently. "Adverbium negandi *not* (non) verbo postponitur (nempe auxiliari primo si adsit; aut si non adsit auxiliare, verbo principali): aliis tamen orationis partibus præfigi solet."—P. 113.

That the negative is rarely used, except with an auxiliary—in other words, that the presence of a negative converts a simple form like *it burneth not* into the circumlocution it *does not burn*—is a fact in the practice of the English language. The syntax is the same in either expression.

§ 548. What may be called the *distribution* of the negative is pretty regular in English. Thus, when the word *not* comes between an indicative, imperative, or subjunctive mood and an infinitive verb, it almost always is taken with the word which it follows—*I can not eat* may mean either *I can—not eat* (*i. e. I can abstain*), or *I can not—eat* (*i. e. I am unable to eat*); but, as stated above, it *almost* always has the latter signification.

But not *always*. In Byron's "Deformed Transformed" we find the following lines:—

Clay! not dead but soulless,
Though no mortal man would choose thee,
An immortal no less
Deigns *not to refuse* thee.

Here *not to refuse = to accept;* and is probably a Grecism. *To not refuse* would, perhaps, be better.

The next expression is still more foreign to the English idiom:—

For *not* to have been dipped in Lethe's lake
Could save the son of Thetis from to die.

Here *not* is to be taken with *could.*

§ 549. In the present English, two negatives make an affirmative. *I have not not seen him = I have seen him.* In Greek this was not the case. *Duæ aut plures negativæ apud Græcos vehementius negant* is a well-known rule. The Anglo-Saxon idiom differed from the English and coincided with the Greek. The French negative is only apparently double; words like *point, pas,* mean not *not,* but *at all. Je ne parle pas = I not speak at all,* not *I not speak no.*

§ 550. *Questions of appeal.*—All questions imply want of information; want of information may then imply doubt; doubt, perplexity; and perplexity the absence of an alternative. In this way, what are called, by Mr. Arnold,* *questions of appeal,* are, practically speaking, negatives. *What should I do?* when asked in extreme perplexity, means that nothing can well be done. In the following passage we have the presence of a question instead of a negative:—

Or hear'st thou (*cluis,* Lat.) rather pure ætherial stream,
Whose fountain who (*no one*) shall tell?

Paradise Lost.

§ 551. The following extract from the "Philological Museum" (vol. ii.) illustrates a curious and minute distinction, which the author shows to have been current when Wycliffe wrote, but which was becoming obsolete when Sir Thomas

* *Latin Prose Composition,* p. 123.

More wrote. It is an extract from that writer against Tyndall :—

"I would not here note by the way that Tyndall here translated *no* for *nay*, for it is but a trifle and mistaking of the Englishe worde: saving that ye shoulde see that he whych in two so plain Englishe wordes, and so common as in *naye* and *no* can not tell when he should take the one and when the tother, is not for translating into Englishe a man very mete. For the use of these two wordes in aunswering a question is this. *No* aunswereth the question framed by the affirmative. As for ensample if a manne should aske Tindall himselfe: ys an heretike meete to translate Holy Scripture into Englishe? lo to thys question if he will aunswere trew Englishe, he must aunswere *nay* and not *no*. But and if the question be asked hym thus lo: is not an heretike mete to translate Holy Scripture into Englishe? To this question if he will aunswere trewe Englishe, he must aunswere *no* and not *nay*. And a lyke difference is there betwene these two adverbs *ye* and *yes*. For if the question bee framed unto Tindall by the affirmative in thys fashion: If an heretique falsely translate the New Testament into Englishe, to make his false heresyes seem the word of Godde, be his bokes worthy to be burned? To this questyon asked in thys wyse, yf he will aunswere true Englishe, he must aunswere *ye* and not *yes*. But now if the question be asked him thus lo; by the negative: If an heretike falsely translate the Newe Testament into Englishe to make his false heresyes seme the word of God, be not hys bokes well worthy to be burned? To thys question in thys fashion framed if he will aunswere trewe Englishe, he may not aunswere *ye* but he must aunswere *yes*, and say, yes marry be they, bothe the translation and the translatour, and al that wyll hold wyth them."

CHAPTER XXIX.

THE CASE ABSOLUTE.

§ 552. NOUNS standing absolutely are of two sorts: 1. Those originating in an Accusative case. 2. Those originating in a Dative case.

In expressing *distance* or *duration*, either in *time* or *space*, we use the noun absolutely: as *he walked* ten miles (*i. e. the space of ten miles*); *he stood* three hours (*i. e. the space of three hours*). Here the words *stood* and *walk* are intransitive; so that it is not by them that the words *miles* and *hours* are governed. They stand absolutely. Although not distinguished in form from the nominative case, these words are not nominatives. They are naturally accusatives; and when, in an older stage of the Gothic languages, the accusative *was* distinguished from the nominative, they appeared in the form of the accusative.

§ 553. The door being open, *the steed was stolen*—the sun having arisen, *the labourers proceeded to work*.—In these sentences the words *door* and *sun* stand absolutely; and as the words *being open*, and *having arisen*, agree with them, they also do the same. In English *substantives*, where there is no distinction between the nominative and the objective cases, it is of no practical importance to inquire as to the particular case in which the words like *door* and *sun* stand.

In the English *pronouns*, where there is a distinction between the nominative and objective cases, it *is* of practical importance to inquire in what particular case words like *door* and *sun* stand.

1. *He made the best proverbs of any one*, him *only excepted*.

2. *He made the best proverbs of any one*, he *only excepted*.

Which of these two expressions is correct? This we can decide only by determining what case nouns standing absolutely in the way that *door*, *sun*, and *him* (or *he*), now stand, were found in that stage of our language when the Nominative and Objective cases were distinguished by separate forms.

In Anglo-Saxon this case was the *dative*; as *up-a-sprungenre sunnan* = *the sun having arisen*.

In Anglo-Saxon, also, *him* was a dative case, so that the case out of which expressions like the ones in question originated, was dative. Hence, of the two phrases, *him excepted* and *he excepted*, the former is the one which is *historically* correct.

It is also the form which is *logically* correct. Almost all absolute expressions of this kind have a reference, more or less direct, to the *cause* of the action denoted. In sentences like *the stable door being open, the horse was stolen*,—*the sun having arisen, the labourers got up to work*, this idea of either a cause, or a coincidence like a cause, is pretty clear.

In the sentence, *he made the best proverbs of any one, him only excepted*, the idea of cause is less plain. Still it exists. The existence of *him* (*i. e.* the particular person mentioned as pre-eminent in proverb-making) is the cause or reason why he (*i. e.* the person spoken of as the second-best proverb-maker) was not the very best of proverb-makers.

Now the practice of language in general teaches us this, viz. that where there is no proper Instrumental case expressive of cause or agency, the Ablative is the case that generally supplies its place, and where there is no Ablative, the Dative. Hence the Latins had their Ablative, the Anglo-Saxons their Dative Absolute. The Genitive Absolute in Greek is explicable upon other principles.

In spite, however, both of history and logic, the so-called best authorities are in favour of the use of the Nominative case in the absolute construction.

Obs.—In all absolute constructions of the kind in question, one of the words is either a Substantive or a Pronoun, the other a *Participle.* The reason of this is in the fact of all such absolute constructions indicating either an *action* or a *state.*

PART V.

PROSODY.

CHAPTER I.

GENERAL VIEW OF METRE.

§ 554. The word *Prosody* is derived from a Greek word (*Prosodia*) signifying *accent*. It is used by Latin and English grammarians in a wider sense, and includes not only the doctrines of accent and quantity, but also the laws of metre and versification.

Take the sentence last written, count the syllables, and note those that are accented.

The notation will be as follows:—The wórd Prósody is deríved from a Greék wórd sígnifying áccent. It is úsed by Látin and E'nglish grammárians ín a wíder sénse, and ínclúdes nót only the dóctrines of áccent and quántity, but álso the láws of métre and vérsificátion.—Here the accented syllables are the 2nd, 3rd, 8th, 11th, 12th, 13th, 16th, 20th, 22nd, 26th, 27th, &c.; that is, between two accented syllables there are sometimes three, sometimes two, and sometimes no unaccented syllables intervening. In other words, there is no regularity in the recurrence of the accent.

Proceed in the same way with the following stanzas, numbering each syllable, and observing upon which the accent occurs.

Then fáre thee wéll, mine ówn dear lóve,
The wórld hath nów for ús
No greáter griéf, no paín abóve
The paín of pártiug thús.—Moore.

Here the syllables accented are the 2nd, 4th, 6th, 8th, 10th, 12th, 14th, 16th, 18th, 20th, 22nd, 24th, 26th, 28th; that is, every other syllable. Again—

At the clóse of the dáy, when the hámlet is stíll,
And the mórtals the sweéts of forgétfulness próve,
And when nóught but the tórrent is heárd on the híll,
And there 's nóught but the níghtingale's sóng in the gróve.
BEATTIE.

Here the syllables accented are the 3rd, 6th, 9th, 12th, 15th, 18th, 21st, 24th, 27th, 30th, 33rd, 36th, 39th, 42nd, 45th, 48th; that is, every third syllable.

Now, the extract where there was no regularity in the recurrence of the accent was prose; and the extracts where the accent recurred at regular intervals formed metre. *Metre is a general term for the recurrence within certain intervals of syllables similarly affected.* The syllables that have just been numbered are similarly affected, being similarly accented.

So are the following:—

Abbot.—And whý not líve and áct with óther men?
Manfred.—Becaúse my náture wás averse from lífe;
And yét not crúel, fór I wóuld not máke,
But fínd a désolátion:—líke the wínd,
The réd-hot breáth of the most lóne simoóm,
Which dwélls but ín the desert, ánd sweeps o'ér
The bárren sánds which beár no shrúbs to blást,
And révels o'er their wíld and árid wáves,
And seéketh nót so thát it ís not soúght,
But béing mét is deádly: súch hath beén
The páth of mý exístence.—BYRON.

§ 555. Accent is not the only quality of a syllable which, by its periodic return can constitute metre, although it is the one upon which English metre depends. Indeed, it may be doubted whether *any* metre whatever exist in which it is not the fundamental element, however much the phraseology of grammarians may run to the contrary. The classical grammarians, however, determine the character of their metres not by accent, but by *quantity*. The evidence of the importance

of accent even in the metres dependent upon quantity will be given in the sequel.

Again—there are certain metres wherein the syllables that occur at the proper periodic intervals either end or begin with the same *articulate sounds*.

In such cases we may say that the similarity of affection between the periodic syllables consists in their *articulations*. If so, our view of metre is as follows:—

a. Metre is a general term for the recurrence within certain intervals of syllables similarly affected.

b. Syllables may be similarly affected in respect to (1) their accents, (2) their quantities, (3) their articulations.

1.

Pălāi kŷnægĕtoūntă kāi mĕtroūmĕnōn.

Πᾰλᾱ͂ι κῠνηγῐτοῦντᾰ̀ κᾰ̀ι μῐτροῦμῐ́νῶν.

Here there is the recurrence of similar quantities.

2.

The wáy was lóng, the wínd was cóld.

Here there is the recurrence of similar accents.

3.

A.

The way was long, the wind was *cold*,
The minstrel was infirm and *old*.

Here, besides the recurrence of similar accents, there is a recurrence of the same articulate sounds; viz. of *o* + *ld*, these articulations being at the *end* of the word, or *final*.

In the following they are at the beginning, or *initial*—

B.

In *C*aines *c*ynne
*þ*one *c*wealm gewræc.

All metre goes by the name of poetry, although all poetry is not metrical. The Hebrew poetry is characterised by the recurrence of similar *ideas*.

CHAPTER II.

QUANTITY.

§ 556. The metres wherein quantity plays its chief part are those of the Latin and Greek languages.

Specimen.

Phăsēlŭs īllĕ quēm vĭdētĭs hōspĭtēs
Aīt fŭīssĕ nāvĭūm cĕlērrĭmūs
Nĕq' ūllĭūs nătāntĭs īmpĕtūm trăbīs
Nĕquīssĕ prætĕrīrĕ, sīvĕ pālmŭlīs
Opūs fŏrēt vŏlārĕ sīvĕ līntĕīs.

As we read this according to our pronunciation, the accentuation of this passage is as follows:—

Phasélus ílle quém vidétis hóspites
A'ït fuísse návium celérrimus
Neq' úllius natántis ímpetum trábis
Nequísse præ'teríre, síve pálmulis
O'pus forét voláre síve línteis.

There is certainly accent as well as quantity here. As certainly do those accents recur with a certain amount of regularity, though not with regularity of the quantities. Attention is directed to this.

So it is to the following:—

Jām sătīs tērrīs nĭvĭs ātquĕ dīræ
Grāndĭnīs mīsīt pătĕr ĕt rŭbēntĕ
Dĕxtĕrā sācrās jăcŭlātŭs ārcĕs
Tērrŭĭt ūrbēm.

Here the quantities return with a very imperfect degree of regularity—*the quantities considered singly*. But what if,

instead of considering them singly, we arrange them *in groups*; thus:—

- ⏑ - | - - | ⏑ ⏑ | - ⏑ | - ⏑

or,

- ⏑ | - - - | ⏑ ⏑ | - ⏑ | - ⏑

or,

- - ⏑ | - - | - ⏑ ⏑ | - ⏑ | - ⏑

or any other way? In such a case the groups of quantities recur with absolute regularity.

The accents of the lines last quoted run thus:—

Jám sátis térris nívis átque díræ
Grándinis mísit páter ét rubénte
Déxtera sácras jáculátus árces
Térruit urbem.

Here the accents recur more regularly than the quantities *taken by themselves*, but less regularly than the quantities taken *in groups*.

The extent to which Accent plays a part in metres, which are generally considered to be based on quantity, will be further noticed in the sequel.

At present it is only necessary to notice the two different ways in which quantities may be measured.

§ 557. There is a difference between the length of *vowels* and the length of *syllables*.

The vowel in the syllable *see-* is long; and long it remains, whether it stand as it is, or be followed by a consonant, as in *seen*, or by a vowel, as in *see-ing*.

The vowel in the word *sit* is short. Followed by a *second* consonant, it still retains its shortness, *e. g. sits*. Whatever the comparative length of the *syllables, see* and *seen, sit* and *sits*, may be, the length of their respective *vowels* is the same.

Now, if we determine the character of the syllable by the character of the vowel, all syllables are short wherein there is a short vowel, and all are long wherein there is a long one. Measured by the quantity of the vowel the word *sits* is short, and the syllable *see-* in *seeing* is long.

But it is well known that this view is not the view commonly taken of the syllables *see* (in *seeing*) and *sits*. It is well known, that, in the eyes of a classical scholar, the *see* (in *seeing*) is short, and that in the word *sits* the *i* is long. The classic differs from the Englishman thus,—*He measures his quantity, not by the length of the vowel, but by the length of the syllable taken altogether.* The perception of this distinction enables us to comprehend the following statements.

I. That vowels long by nature may *appear* to become short by position, and *vice versâ*.

II. That, by a laxity of language, the *vowel* may be said to have changed its quantity, whilst it is the *syllable* alone that has been altered.

III. That, if one person measures his quantities by the vowels, and another by the syllables, what is short to the one, shall be long to the other, and *vice versâ*. The same is the case with nations.

IV. That one of the most essential differences between the English and the classical languages is that the quantities (as far as they go) of the first are measured by the vowel, those of the latter by the syllable. To a Roman the word *monument* consists of two short syllables and one long one; to an Englishman it contains three short syllables.

CHAPTER III.

ALLITERATIVE METRES.

§ 558. The following is an extract from a poem in the Swedish, written according to the alliterative system of the old Norse literature. It is foreign to the language as now spoken, but it is given because it is more truly alliterative than any older specimen. It is given as an extreme form, in order to serve as an illustration.

FRITHIOF'S SAGA.

Canto XXI.

1.	2.
Sitter i högen	Nu rider rike
högättad höfding,	Ring öfver Bifrost,
slagsvärd vid sidan,	svigtar för bördan
skölden på arm.	bågiga bron.
Gångaren gode	Upp springa Valhalls
gnäggar derinne,	hvalfdörrar vida;
skrapar med gullhof	Asarnas händer
grundmurad graf.	hänga i hans.

Without comparing the recurrence of the accent with the recurrence of the alliteration so closely as we have done in the previous chapter, we may remark that *all the alliterative syllables are also accentuate*,—this being another proof of the extent to which accent plays a part in metres generally considered to be based on alliteration.

The following are samples of the alliterative metre as it was actually written in (1) the Anglo-Saxon, (2) the Old Saxon, (3) the Old Norse, (4) the Old High-German. The alliteration is more obscure here. It loses, however, much of this obscurity when we know,—

1. That the number of alliterative syllables within a certain space need not be more than *two*.

2. That all the vowels are considered, for the purposes of alliteration, as a single letter.

1.

ANGLO-SAXON.

OPENING OF BEOWULF.

Edited and translated by J. M. Kemble.

HWÆT we Gár-Dena,
in gear-dagum,
þeód-cýninga,
þrým ge-frunon—
hú ðа æþelingas
ellen fremedon—
oft Scýld Scefing,
sceaþen(a) þreátum,
monegū mægþum,
meodo-setla of-teáh—
egsode eorl—
syððan æ'rest wearð
feá-sceaft funden;
he þæs frófre ge-bá(d),
weóx under wolcnum,
weorð-mýndum þáh;
oð þ him æ'g-hwlýc
þára ymb-sittendra,
oſer hron-ráde,
hýran scolde,
gomban gýldan—
þ wæ's gód cýning—
ðæm eafera wæ's
æfer cenned,
geong in geardum,
þone gód sende
folce to frófre;
fýren-þearfe on-geat,
þ híe æ'r drugon,
aldor-(le)áse.
lange hwíle,
him þæs líf-freá,
wuldres wealdend,
worold-áre for-geaf—
Beó-wulf wæ's breme,
blæ'd wíde sprang,
Scýldes eafera,
Scede-landum in.

2.

OLD SAXON.

FROM THE HILDEBRAND AND HATHUBRAND.

"IH gihorta that seggen, that sie urhetton ænon muotin
Hildibraht enti Hathubrant untar heriuntuem,
Sunu fatar ungo; iro saro rihtun,
Garutun se iro guthhamun, gurtun sih iro suert ana,
Helidos, ubar ringa, do sie to dero hiltu ritun.
Hiltibraht gimahalta, Heribrantes sunu, her was heroro man,
Ferahes frotoro, her fragen gistuont,
Fohem wortum: wer sin fater wari;
Fires in folche, eddo weliches cnuosles du sis?
Ibu du mi aenan sages, ik mideo are-wet,
Chind in chuninchriche, chud ist min al irmindeot.

Hadubraht gimahalti Hiltibrantes sunu: Dat sagetun mi
Usere liuti alte anti frote, dea, erhina warun,
Dat Hilbrant haetti min fater ïh heittu Hadubrant.
Forn her ostar gihueit, floh her Otachres nid
Hina miti Theotriche enti sinero degano filu;
Her furlach in lante luttila sitten
Prut in bure; barn unwahsan,
Arbeolosa heraet, ostar hina det,
Sid delriche darba gistuontum, fatereres mines,
Dat was so friuntlaos man her was Otachre ummettirri,
Degano dechisto, unti Deotriche darba gistontum;
Her was eo folches at ente, imo was eo feheta ti leop.
Chud was her chonnem mannuma, ni wanin ih, in lib habbe.

3.

OLD NORSE.

FROM THE EDDA.

Völuspá, stanzas 1—6.

1.

Hljóðs bið ek allar
helgar kindir,
meiri ok minni,
mögu Heimdallar:
vildu at ek Valföðrs
vél framtelja,
fornspjöll fíra,
þau er ek fremst um man.

2.

Ek man jötna
ár um borna,
þá er forðum
mik fædda höfðu;
niu man ek heima,
níu íviðjur,
mjötvið mæran
fyr mold neðan.

3.

Á'r var alda
þar er Y'mir bygði,
vara sandr né sær
né svalar unnir,
jörð fannsk æva
né upphiminn,
gap var ginnunga,
en gras hvergi.

4.

Áðr Burs synir
bjóðum um yþðu,
þeir er miðgarð
mœran skópu:
sól skein sunnan
á salar steina,
þá var grund gróin
grœnum lauki.

5.

Sól varp sunnan,
sinni mána,
hendi inni hœgri
um himinjódýr;
sól þat ne vissi
hvar hon sali átti,
máni þat ne vissi
hvat hann megins átti,

stjörnur þat nu vissu
hvar þær staði áttu.

6.

þá géngu regin öll
á rökstóla,
ginnheilög goð,
ok um þat gættusk:
nótt ok niðjum
nöfn um gáfu,
morgin hétu
ok miðjan dag,
undorn ok aptan,
árum at telja.

4.

OLD HIGH-GERMAN.

Daz hôrt ih rahhon
Dia werolt-rehtwîson,
Daz sculi der Antichristo
Mit Eliase pâgan.
Der warch ist kiwâfanit;
Dennewirdit untar in wîk arhapan;
Khensun sind so kreftic,
Diri kosa ist so mihhil.
Elias strîtît
Pî den ewigon lîp,
Wili den rehtkernon
Daz rîhhi kistarkan;
Pidiu scal imo halfan
Der himiles kiwaltit.
Der Anticristo stêt
Pî dem Altfiante
Stêt pî demo Satanase,
Der inan farsenkan scal;
Pidiu scal er in der wîcsteti
Wunt pivallan,
Enti in demo sinde
Sigalos werdan.
Doh wânit des vila gotmanno,
Daz Elias in demo wîge arwartit (werdit).
Sâr so ‚daz Eliases pluot
In erda kitruifit,
So imprinnant die perga,

Suilizot lougui der himil
Mâno vallit,
Prinnit mittilagart,
Stein ni kistentit einik in erdu.
Verit denne stuatago in lant,
Verit mit din viuriu
Viriho wîsôn,
Dar ni mai denne mâk andremo.

§ 559. The system of alliteration has hitherto been explained in the most general way possible; all that has been attempted being the exhibition of the principle upon which such extracts as the preceding can be understood to be metrical; and that this their metrical character is by no means transparently clear, may be collected from the fact that many of the old alliterational compositions were treated by the earlier scholars as prose.

As a general rule all early German poetry is alliterative; though it by no means follows that alliteration was equally general in all the German forms of speech.

Alliteration preceded rhyme. Rhyme followed alliteration. Hence, whenever we have no specimens of a given form of speech anterior to the evolution of rhyme, we have no alliterational compositions. This is the case with the Frisian, the Batavian, and the Platt-Deutsch dialects. Indeed, for the High-German the poem of Muspilli is a solitary, or nearly solitary, instance. The two languages wherein there is the most of it are the English during the Anglo-Saxon and early English periods, and the Norse. In the latter we not only get numerous specimens, but we also get the rules of its Prosody. These are, perhaps, more artificial than actual practice requires. They are also more stringent and elaborate than those of Anglo-Saxon and High-German.

Thus, the alliterative syllables take names, one being the *head*-stave and the other two the *by*-staves.

The *head*-stave has its place at the beginning of the second line, or (if we throw the two into one) immediately after a break, cæsura, pause, or *quasi*-division.

The *by*-staves belong to the first line out of two, or to the first member of a single one. This is a rule that gives stringency to the system. Others give licence. Thus,—

An unaccented syllable at the beginning of the second line (or member) counts as nothing.

Again, the vowels which collectively are dealt with as a single letter not only *may* but *must* be different. This goes far to enable anything and everything to be metre—inasmuch as all that is wanted to constitute either one long or two short lines is the occurrence of three words beginning with a vowel, and accented on their initial syllable. The following is from Thorlakson's Translation of "Paradise Lost:"—

> "Of Man's first disobedience, and the fruit
> Of that forbidden tree, whose mortal taste
> Brought death into the world, and all our woe,
> With loss of Eden, till one greater Man
> Restore us, and regain the blissful seat,
> Sing, heavenly Muse, that on the secret top
> Of Oreb, or of Sinai, didst inspire
> That shepherd, who first taught the chosen seed,
> In the beginning how the Heavens and Earth

Rose out of Chaos: or if Sion hill
Delight thee more, and Siloa's brook that flow'd
Fast by the oracle of God."

" Um fyrsta manns
felda hlýðni
ok átlystíng
af epli forboðnu,
hvaðan óvægr
upp kom dauði,
Edens missir,.
ok allt böl manna ;

" þartil annarr einn,
æðri maðr,
aptr fær
oss viðreista,
ok afrekar nýan
oss til handa
fullsælustað
fögrum sigri ;

" Sýng þú, Menta-
móðir himneska !
þú sem Hórebs fyrr
á huldum toppi,
eða Sínaí,
sauðaverði
innblèst fræðanda
útvalit sæði,
hve alheimr skópst
af alls samblandi ;

" Eða lysti þik
lángtum heldr
at Zíons hæð
ok Síló a brunni,
sem framstreymdi
hjá Frètt guðligri !"

The full details of the Norse alliterative system may be found in Rask on the Icelandic Prosody.

CHAPTER IV.

RHYME AND ASSONANCE.

§ 560. In an *Alliteration* the likeness between the articulate sounds which constitute it occurs at the *beginning* of words. In *rhyme* it occurs at the end.

Observe in each of the following couplets the last syllable of each line. They are said to *rhyme* to each other.

O'er the glad waters of the dark blue *sea*,
Our thoughts as boundless, and our souls as *free*.
Far as the breeze can bear the billow's *foam*,
Survey our empire and behold our *home*.
These are our realms, no limits to our *sway*—
Our flag the sceptre all who meet *obey*.

The next extract is a stanza of Gray's Elegy, where, instead of following one another in succession, the rhyming lines come alternately.

Full many a gem of purest ray se*rene*
The dark, unfathom'd depths of ocean *bear;*
Full many a flower is born to blush un*seen*,
And waste its sweetness on the desert *air*.—Gray.

In other stanzas the rhyming lines are sometimes continuous, and sometimes separated from each other by an interval.

And yet how lovely in thine age of *woe*,
Land of lost gods and godlike men, art *thou!*
Thy vales of evergreen, thy hills of *snow*,
Proclaim thee Nature's varied favourite *now:*

Thy fanes, thy temples to thy surface *bow*,
Commingling slowly with heroic *earth*,
Broke by the share of every rustic *plough*:
So perish monuments of mortal *birth*,
So perish all in turn, save well-recorded *worth*.—BYRON.

It is not difficult to see, in a general way, in what rhyme consists. The syllables *see* and *free*, *foam*, *home*, &c., are syllables of similar sound; and lines that end in syllables of similar sound are lines that rhyme.

By substituting in a line or stanza, instead of the final syllable, some word different in sound, although similarly accented and equally capable of making sense, we may arrive at a general view of the nature and influence of rhyme as an ornament of metre. In the following stanza we may spoil the effect by substituting the word *glen* for *vale*, and *light* for *ray*.

Turn, gentle hermit of the *vale*,
And guide thy lonely *way*
To where yon taper cheers the *dale*
With hospitable *ray*.—GOLDSMITH.

With this contrast—

Turn, gentle hermit of the glen,
And guide thy lonely way
To where yon taper cheers the dale
With hospitable light.

§ 561. Syllables may be similar in their sound, and yet fail in furnishing full, true, and perfect rhymes. In each of the forthcoming couplets there is evidently a similarity of sound, and there is equally evidently an imperfection in the rhyme.

1.

The soft-flowing outline that steals from the eye,
Who threw o'er the surface,—did you or did I?

WHITEHEAD.

2.

'T is with our judgments as our watches; none
Go just alike, yet each believes his own.—POPE.

3.

Soft o'er the shrouds aërial whispers breathe,
That seem'd but zephyrs to the train beneath.—POPE.

The first of these three pairs of verses was altered into—

The soft-flowing outline that steals from the view,
Who threw o'er the surface,—did I or did you?

and that solely on account of the imperfectness of the original endings, *eye* and *I*.

These are samples of what passes for a rhyme without being one.

Neither are the syllables *high* and *-ly*, in the following, rhymes.

The wítch she héld the haír in her hánd,
The réd flame blázed hígh;
And roúnd aboút the cáldron stoút,
They dánced right mérri*ly*.—KIRKE WHITE.

§ 562. *Varieties of imperfect Rhymes.*—*None* and *own* are better ryhmes than *none* and *man;* because there are degrees in the amount to which vowels differ from one another, and the sounds of the *o* in *none* and the *o* in *own* are more alike than the sounds of the *o* in *none* and the *a* in *man*. In like manner *breathe* and *teeth* are nearer to rhymes than *breathe* and *teaze;* and *breathe* and *teaze* are more alike in sound than *breathe* and *teal*. All this is because the sound of the *th* in *teeth* is more allied to that of the *th* in *breathe* than that of the *z* in *teaze*, and to the *z* in *teaze* more than to the *l* in *teal*. This shows that in imperfect rhymes there are degrees, and that some approach the nature of true ones more than others.

High and *I*, *hair* and *air*, are imperfect rhymes.

Whose generous children narrow'd not their hearts
With commerce, giv'n alone to arms and arts.—BYRON.

Words where the letters coincide, but the sounds differ, are only rhymes to the eye. *Breathe* and *beneath* are in this predicament; so also are *cease* and *ease* (*eaze*).

In the fat age of pleasure, wealth, and ease,
Sprang the rank weed, and thrived with large increase.
POPE.

If the sounds coincide, the difference of the letters is unimportant.

> Bold in the practice of mistaken rules,
> Prescribe, apply, and call their masters fools.
>
> They talk of principles, but notions prize,
> And all to one loved folly sacrifice.

§ 563. *Analysis of a rhyming syllable.*—Let the syllable *told* be taken to pieces. For metrical purposes it consists of three parts or elements: 1, the vowel (*o*); 2, the part preceding the vowel (*t*); 3, the part following the vowel (*ld*). The same may be done with the word *bold*. The two words can now be compared with each other. The comparison shows that the vowel is in each the same (*o*); that the part following the vowel (*ld*) is the same; and, finally, that the part preceding the vowel is *different* (*t* and *b*). This difference between the part preceding the vowel is essential.

Told, compared with itself (*told*), is no rhyme, but an *homœoteleuton* (ὁμοῖος, *homoios* = *like*, and τελεύτη, *teleutæ* = *end*) or *like-ending*. It differs from a rhyme in having the parts preceding the vowel alike. Absolute identity of termination is not recognised in English poetry, except so far as it is mistaken for rhyme.

> The soft-flowing outline that steals from the *eye*,
> Who threw o'er the surface? did you or did *I*?
>
> WHITEHEAD.

Here the difference in spelling simulates a difference in sound, and a *homœoteleuton* takes the appearance of a rhyme.

Bold and *note*.—As compared with each other, these words have two of the elements of a rhyme: viz. the identity of the vowel, and the difference of the parts preceding it. They want, however, the third essential, or the identity of the parts following; *ld* being different from *t*. The coincidence, however, as far as it goes, constitutes a point in metre, as will soon be seen.

Bold and *mild*.—Here also are two of the elements of a rhyme, viz. the identity of the parts following the vowel (*ld*), and the difference of the parts preceding (*b* and *m*). The

identity of the vowel (*o* being different from *i*) is, however, wanting.

Rhymes may consist of a single syllable, as *told, bold;* of two syllables, as *water, daughter;* of three, as *cheerily, wearily.* Now, the rhyme begins where the dissimilarity of parts immediately before the main vowel begins. Then follows the vowel; and, lastly, the parts after the vowel. All the parts after the vowel must be absolutely identical. Mere similarity is insufficient.

Then come ere a *minute*'*s* gone,
For the long summer day
Puts its wings, swift as *linnets*' on,
For flying away.—CLARE.

In the lines just quoted there is no rhyme, but an assonance. The identity of the parts after the main syllable is destroyed by the single sound of the *g* in *gone.*

A rhyme, to be perfect, must fall on syllables equally accented.—To make *sky* and the last syllable of merri*ly* serve as rhymes, is to couple an accented syllable with an unaccented one.

A rhyme, to be perfect, must fall upon syllables absolutely accented.—To make the last syllables of words like flight*y* and merri*ly* serve as rhymes, is to couple together two unaccented syllables.

A rhyme consists in the combination of like and unlike *sounds.*—Words like *I* and *eye* (*homœoteleuta*), *ease* and *cease* (vowel assonances), *love* and *grove* (consonantal assonances), are printers' rhymes; or mere combinations of like and unlike letters.

A rhyme, moreover, consists in the combination of like and unlike *articulate* sounds—*Hit* and *it* are not rhymes, but identical endings; the *h* being no articulation. To my ear, at least, the pair of words, *hit* and *it,* comes under a different class from the pair *hit* (or *it*) and *pit.* Hence—

A full and perfect rhyme (the term being stringently defined) consists in *the recurrence of one or more final syllables equally and absolutely accented, wherein the vowels and the parts*

following the vowel shall be identical, whilst the parts preceding the vowel shall be articulately different.

To this definition, words like *old* and *bold* form no exception. At the first view it may be objected that in words like *old* there is no part preceding the vowel. Compared, however, with *bold*, the negation of that part constitutes a difference. The same applies to words like *go* and *lo*, where the negation of a part following the vowel is a point of identity. Furthermore, I may observe, that the word *part* is used in the singular number. The assertion is not that every individual sound preceding the vowel must be different, but that the aggregate of them must be so. Hence, *pray* and *bray* (where the *r* is common to both forms) form as true a rhyme as *bray* and *play*, where all the sounds preceding *a* differ.

§ 564. *Single Rhymes.*—An accented syllable standing by itself, and coming under the conditions given above, constitutes a single rhyme.

> 'T is hard to say if greater want of *skill*
> Appear in writing or in judging *ill;*
> But, of the two, less dangerous is the o*ffence*
> To tire the patience than mislead the *sense.*
> Some few in that, but thousands err in *this;*
> Ten censure wrong, for one that writes a*miss.*—POPE.

Double Rhymes.—An accented syllable followed by an unaccented one, and coming under the conditions given above, constitutes a double rhyme.

> The meeting points the sacred hair dis*sever*
> From her fair head for ever and for *ever.*—POPE.
>
> Prove and explain a thing till all men *doubt it,*
> And write about it, Goddess, and a*bout it.*—POPE.

Treble Rhymes.—An accented syllable followed by two unaccented ones, and coming under the conditions given above, constitutes a treble rhyme.

> Beware that its fatal as*céndancy*
> Do not tempt thee to mope and repine;
> With a humble and hopeful de*péndency*
> Still await the good pleasure divine.

Success in a higher be*atitude*
Is the end of what 's under the pole.
A philosopher takes it with *gratitude*,
And believes it the best in the whole.—BYROM.

§ 565. *Constant and inconstant parts of a rhyme.* Of the three parts, or elements, of a rhyme, the vowel and the part which follows the vowel are *constant*, *i. e.* they cannot be changed without changing or destroying the rhyme. In *told* and *bold*, *plunder*, *blunder*, both the *o* or *u* on one side, and the *-ld* or *-nder* on the other are immutable.

Of the three parts, or elements, of a rhyme the part which precedes the vowel is *inconstant*, *i. e.* it must be changed in order to effect the rhyme. Thus, *old* and *old*, *told* and *told*, *bold* and *bold*, do *not* rhyme with each other; although *old*, *bold*, *told*, *scold*, &c., do. Hence—

Rule 1. In two or more syllables that rhyme with each other, neither the vowel nor the sounds which *follow* it can be *different*.

Rule 2. In two or more syllables that rhyme with each other, the sounds which *precede* the vowel cannot be *alike*.

Now the number of sounds which can precede a vowel is limited: it is that of the consonants and consonantal combinations; of which a list can be made *à priori*.

p	*pl*	*pr*	*b*	*bl*	*br*
f	*fl*	*fr*	*v*	*vl*	*vr*
t	*tl*	*tr*	*d*	*dl*	*dr*
th	*thl*	*thr*	*dh*	*dhl*	*dhr*
k	*kl*	*kr*	*g*	*gl*	*gr*
s	*sp*	*sf*	*st*	*sth*,	*&c.*

and so on, the combinations of *s* being the most complex.

This gives us the following method (or receipt) for the discovery of rhymes:—

1. Divide the word to which a rhyme is required, into its *constant* and *inconstant* elements.

2. Make up the inconstant element by the different consonants and consonantal combinations until they are exhausted.

3. In the list of words so formed, mark off those which have an existence in the language. These will all rhyme with

each other; and if the list of combinations be exhaustive, there are no other words which will do so.

Example.—From the word *told*, separate the *o* and *-ld*, which are constant.

Instead of the inconstant element *t*, write successively *p*, *pl*, *pr*, *b*, *bl*, *br*, &c.: so that you have the following list:— *t-old*, *p-old*, *pl-old*, *pr-old*, *b-old*, *bl-old*, *br-old*, &c.

Of these the words like *plold*, *blold*, and *brold*, that have no existence in the language, are only possible, not actual, rhymes.

All words have the same number of possible, but not the same number of actual rhymes. Thus, *silver* is a word amenable to the same process as *told—pilver*, *plilver*, *prilver*, *bilver*, &c.; yet *silver* is a word without a corresponding rhyme. This is because the combinations which answer to it do not constitute words, or combinations of words in the English language.

§ 566. *Assonances.* — Approximate rhymes, wherein the vowels only, or the consonants only, or vowels and consonants, coincide, are called *assonances*.

In the Spanish and Scandinavian literature assonant metres are important, numerous, and prominent.

The following is assonant — Irish, however, rather than English:—

O the groves of Bl*a*rney
They are so ch*a*rming,
All by the purling of soft silent br*oo*ks;
With banks of r*o*ses,
That spontaneous gr*ow* there,
All standing in order by the sweet rock cl*o*se.

CHAPTER V.

METRICAL NOTATION AND SCANSION.

§ 567. TAKE a line. For every accented syllable invent a symbol. Thus—

Let + denote the accent, — the absence of it. Or—

Let ′ denote the accent, ″ the absence of it. Or—

Let *a* and *ẋ* do the same respectively.

These last symbols are the most convenient. Hence—

What we write in full, thus—

The wáy was lóng, the wínd was cóld,

we may express symbolically, thus—

x a x a x a x a,

Or, dividing the syllables into groups,

x a, x a, x a, x a.

A group of syllables thus taken together is called a *Measure;* the symbolical expression of the same being called *Metrical Notation.*

Measure is a term which applies to syllables only, when they are thrown into groups according to their *accent.*

When thrown into groups according to their *quantities,* the groups thus constituted are called *feet.*

For the groups formed by the combination of alliterative and non-alliterative syllables, *stave* is a convenient name. Hence—

The Classical Metres consist of *feet,* the English (and others) of *measures,* the Old Norse, &c., of *staves.*

I should add, however, that this nomenclature is a suggestion, rather than a generally acknowledged fact. Neither is it unexceptionable. In a *stave* or a *foot* the syllables are as truly *measured* as in a *measure* in the limited sense of the term. Hence it is far from impossible that the word, like so many others, may have to bear two meanings, one general and one special. In this case a *measure* is the name of a group of syllables similarly affected, whether by quantity or by accent. If by the former, the result is a *foot;* if by the latter, the result is a *measure, in the limited sense of the term.*

Whatever may be the result of this suggestion, it is highly important to keep the metres based upon quantity different from the metres based upon accent. Hence, if we call (as we *do* call) measures based upon quantity by the name of *feet,* we must ever remember that we have no *feet* in the English metres; since in English we determine our measures by *accent* only.

The classical grammarians express their feet by symbols; – denoting length, ˘ shortness. Forms like ˘– –˘ –˘˘ ˘–˘ ˘˘– &c. are the symbolical representations of the classical feet.

The classical grammarians have *names* for their feet; *e.g. iambic* is the name of ˘–, *trochee* of –˘, *dactyle* of –˘˘, *amphibrachys* of ˘–˘, *anapæst* of ˘˘–, &c.

The English grammarians have, hitherto, had no symbols for their measures: since those that have been submitted to the reader are only suggested or proposed.

Neither have the English grammarians names for their measures. Sometimes, they borrow the classical terms *iambic, trochee,* &c.

As *symbols* I have suggested *a* and *x*.

As *names* for the English measures I have nothing to offer except the remark that the classical names are never used with impunity. Their adoption invariably engenders confusion. It is very true that, *mutatis mutandis* (*i.e.* accent being substituted for quantity), words like *týrant* and *presúme* are trochees and iambics; but it is also true that, with the common nomenclature, the full extent of the change is rarely appreciated.

Symbolically expressed, the following forms denote the following measures:—

1. *a x* = *týrant.*
2. *x a* = *presúme.*
3. *a x x* = *mérrily.*
4. *x a x* = *disáble.*
5. *x x a* = *cavaliér.*

I have stated that as *names* of the English metres I have nothing to offer. I have only said what they should *not* be called. They should not be called *feet*, and they should not bear the names borne by *feet*, *e.g.* the names *trochee*, *iambic*, &c.

Notwithstanding, however, the want of appropriate denominations for the English measures, the practical inconvenience that arises from their absence is inconsiderable; inasmuch as the number of our primary combinations is limited, and their order natural. Thus—

Feet consisting of a single syllable, and feet consisting of four syllables, are of such extreme rarity that the only practical combinations are the *dissyllabic* and the *trisyllabic*—(1) *a x* and *xa*, (2) *a x x*, *x a x*, and *x x a*.

Of these let the shorter take precedence; so that *a x* and *x a* form the former of two divisions.

Within each of these divisions, let those combinations come first whose accent shows itself the soonest—thus let *a x* precede *x a*, and *a x x* precede *x a x*.

The result is—

A. Dissyllabic Measures
1. *a x* — *týrant.*
2. *x a* — *presúme.*

B. Trisyllabic Measures
3. *a x x* — *mérrily.*
4. *x a x* — *disáble.*
5. *x x a* — *cavaliér.*

As this order is natural, it may be adopted as permanent also; in which case our measures are the *first*, *second*, *third*, *fourth*, and *fifth*.

On these measures the following general assertions may be made; viz.—

That the dissyllabic measures are, in English, commoner than the trisyllabic.

That, of the dissyllabic measures, the second is commoner than the first.

§ 568. *Scansion.*—Grouped together according to certain rules, measures constitute lines or verses; and grouped together according to certain rules, lines constitute couplets, triplets, stanzas, &c.

The absence or the presence of rhyme constitutes blank verse or rhyming verse, as the case may be.

The succession, or periodic return, of rhymes constitutes stanzas, or continuous metre, as the case may be.

The quantity of rhymes in succession constitutes couplets, or triplets.

The investigation of the measures of a line, verse, &c., is called *Scansion.*

In taking the length of a line, we may measure by either the *accents* or the *syllables;* so that with four measures of the formulas *a x* or *x a,* we may take our choice between saying that the verse has *four accents,* or saying that it has *eight syllables.*

For all scientific purposes we count by *accents* rather than syllables — in other words, the accent determines the measure, and the measure the verse. At the same time we have, in common language, such terms as *octosyllabic,* applied to lines like—

The wáy was lóng, the wínd was cóld.

§ 569. Accent is essential to English metre. Rhyme, on the other hand, is only an ornament. Of all the ornaments of English versification it is undoubtedly the most important. Still it is not essential. Metres where there is no rhyme are called Blank Metres.

Of man's first disobedience and the fruit
Of that forbidden tree, whose mortal taste
Brought death into the world and all our woe,
With loss of Eden, till one greater Man
Restore us, and regain the blissful seat,
Sing, Heavenly Muse!—MILTON.

The quality of mercy is not strained.
It droppeth as the gentle dew from heaven
Upon the place beneath; it is twice bless'd,
It blesseth him that gives, and him that takes;
'T is mightiest of the mighty, it becomes
The throned monarch better than his crown.
His sceptre shows the force of temporal power,
The attribute of awe and majesty,
Wherein doth sit the dread and fear of kings:
But mercy is above this sceptred sway;
It is enthroned in the hearts of kings:
It is an attribute to God himself;
And earthly power doth then show likest God's,
When mercy seasons justice.—SHAKSPERE.

§ 570. *The last measure in a line or verse is indifferent as to its length.*—By referring to the notice of single rhymes, we shall find that the number of syllables is just double the number of accents; that is, to each accented there is one unaccented syllable, and no more. Hence, with five accents, there are to each line ten syllables. This, however, is not the case where the rhymes are double. Here, with five accents, there are to each line eleven syllables. Now it is in the last measure that this supernumerary unaccented syllable appears; and it is a general rule, that, in the last measure of any verse, supernumerary unaccented syllables can be admitted without destroying the original character of the measure. Hence it is, that, up to a certain point, we may say that the length of the concluding measure of a line or verse is a matter of indifference.

In the lines

The meeting points the sacred hair dissever
From her fair head, for ever and for ever.

x a appears to be converted into *x a x*. A different view, however, is the more correct one. *Dissever*, and *for ever*, are are rather *x a* with a syllable over. This extra syllable may be expressed by the sign *plus* (+), so that the words in point may be expressed by *x a* +, rather than by *x a x*.

It is very clear that measures whereof the last syllable is accented (that is, measures like *x a, presúme,* or *x x a, cavalíer*) can only vary from their original character on the side of excess; that is, they can only be altered by the addition of fresh syllables. To subtract a syllable from such feet is impossible; since it is only the last syllable that is capable of being subtracted. If that last syllable, however, be the accented syllable of the measure, the whole measure is annihilated. Nothing remains but the unaccented syllable preceding; and this, as no measure can subsist without an accent, must be counted as a supernumerary part of the preceding measure.

With the measures *a x, a x x, x a x,* the case is different. Here there is room for a syllable or syllables to be subtracted.

Queén and húntress, cháste and faír,
  Nów the sún is laíd to sleép,
Seáted ín thy sílver chaír,
  Státe in wónted spléndour keép:
Hésperús invókes thy líght,
Góddess, éxquisítely bríght.—Ben Jonson.

In all these lines the last measure is deficient in a syllable, yet the deficiency is allowable, because each measure is the last one of the line. The formula for expressing *faír, sléep, chaír,* &c., is not *a,* but rather *a x* followed by the *minus* sign (—), or *a x* —.

A little consideration will show, that, amongst the English measures, *x a* and *x x a* naturally form single, *a x* and *x a x* double, and *a x x* treble rhymes.

Let a line consist of five measures, each measure being *x a.* This we may express thus:

x a x a x a x a x a.

The presence of a supernumerary syllable may be denoted by the sign +.

x a x a x a x a x a +.

On the other hand, the sign — indicates the absence of a syllable: so that the line

Queén and húntress, cháste and faír,

runs

a x a x a x a x—.

These forms may be rendered more compendious by the introduction of the arithmetical sign × signifying multiplication, by means of which we may write, instead of

a x a x a x a x—,

the shorter form

a x × 4 —.

SPECIMENS.

1. (*a x.*)

Lines wherein the accent falls on the first, third, and fifth syllables, &c., *i. e.* upon every second syllable, beginning with the *first*.

Só she stróve agaínst her weákness,
  Thoúgh at tímes her spírits sánk;
Sháped her heárt with wóman's meékness
  Tó all dúties óf her ránk.
A'nd a géntle cónsort máde he;
  A'nd her géntle mínd was súch,
Thát she gréw a nóble lády,
  A'nd the peóple lóved her múch.
Bút a troúble weígh'd upón her,
  A'nd perpléx'd her níght and mórn
Wíth the búrden óf an hónour
  U'nto whích she wás not bórn.—Tennyson.

Láy thy bów of peárl apárt,
  A'nd thy sílver shíning quíver;
Gíve untó the flýing hárt
  Tíme to breáthe, how shórt soéver;
Thoú that mák'st a day of night,
  Góddess éxquisítely bríght.—Ben Jonson.

2. (*x a.*)

Lines wherein the accent falls on the second, fourth, and sixth syllables, *i. e.* upon every second syllable, beginning from the *second.*

A.

On, ón he hásten'd, and he drέw
My gáze of wónder ás he flέw.
Though like a démon of the níght
He páss'd and vánish'd from my síght,
His áspect ánd his aír imprést
A tróubled mémory ón my breást;
And lóng upón my stártled eár
Rung his dark coúrser's hóofs of féar.—BYRON.

B.

The wár, that fór a spáce did faíl,
Now trέbly thúnder'd ón the gále,
And Stánley wás the crý;
A líght on Mármion's vísage shéd,
And fíred his glázing eye:
With dýing hánd abóve his heád
He shoók the frágments of his bláde,
And shoúted víctory!—SCOTT.

C.

On what foundation stands the warrior's pride?
How just his hopes, let Swedish Charles decide.
A frame of adamant, a soul of fire,
No dangers fright him, no misfortunes tire;
O'er Love, o'er Fear extends his wide domain,
Unconquered lord of pleasure and of pain.
No joy to him pacific sceptres yield,
War sounds the trump, he rushes to the field;
Behold auxiliar kings their powers combine;
And one capitulate, and one resign.
Peace courts his hand, but spreads her charms in vain.
"Think nothing gain'd," he cries, "till nought remain,
On Moscow's walls till Swedish banners fly,
And all be mine beneath the polar sky!"
The march begins in military state,
And nations on his eye suspended wait.

Stern Famine guards the solitary coast,
And Winter barricades the realms of frost.
He comes! nor toil nor want his course delay:
Hide blushing Glory, hide Pultowa's day.
* * * * * *
His fall was destined to a barren strand,
A petty fortress, and a dubious hand.
He left a name at which the world grew pale,
To point a moral and adorn a tale.—JOHNSON.

3. (*a x x.*)

Lines wherein the accent falls on the first and fourth syllables, *i. e.* upon every *third* syllable, beginning with the *first*.

A.

Píbroch o' Dónuil Dhu!
Píbroch o' Dónuil!
Wáke thy shrill voíce anew,
Súmmon Clan Cónnuil.
Cóme away, cóme away,
Hárk to the súmmons!
Cóme in your wár array,
Géntles and cómmons.—
Cóme ev'ry híll-plaid, and
Trúe heart that wéars one;
Cóme ev'ry steél blade, and
Stróng hand that beárs one.—
Leáve the deer, leáve the steer,
Leáve nets and bárges:
Cóme with your fíghting-gear,
Broádswords and tárges.
Cóme as the wínds come, when
Fórests are rénded;
Cóme as the wáves come, when
Návies are stránded;
Fáster come, fáster come,
Fáster and fáster,
Chiéf, vassal, págе, and groom,
Ténant and máster.
Fást they come, fást they come,
Seé how they gáther!

Wídė waves the eágle plume,
Blénded with heáther.
Cást your plaids, dráw your blades,
Fórward each mán set!
Píbroch of Dónuil Dhu,
Knéll for the ónset.—Scott.

4. (*x a x.*)

Lines wherein the accent falls on the second and fifth syllables; *i. e.* upon every third syllable, beginning with the *second.*

The bláck bands came óver
Thé A'lps and their snów;
With Boúrbon, the róver,
They páss'd the broad Pó.
We [have] beáten all [our] foémen,
We [have] cáptured a kíng,
We [have] túrn'd back on nó men,
And só let us síng,
"The Boúrbon for éver!
Though pénniless áll.
We 'll [have] óne more endeávour
At yónder old wall.
With [the] Boúrbon we 'll gáther
At dáy-dawn befóre
The gátes, and togéther
Or breák or climb ó'er
The wáll: on the ládder
As moúnts each firm foót,
Our shoút shall be gládder,
[And] death ónly be múte.—
The Boúrbon! the Boúrbon!
Sans coúntry or hóme,
We 'll fóllow the Boúrbon
To plúnder old Róme."—Byron.

5. (*x x a.*)

Lines wherein the accent falls on the third and sixth syllables; *i. e.* upon every *third* syllable, beginning with the *third.*

The metres of this measure are rarely regular, *x x a* being frequently replaced by *x a x* and *a x x*.

1.

The Assýrian came dówn like a wólf on the fóld,
And his cóhorts were gleáming in púrple and góld:
And the sheén of the speárs was like stárs on the séa,
When the blúe wave rolls níghtly on deép Galileé.

2.

Like the leáves of the fórest when súmmer is greén,
That hóst with their bánners at súnset were seén:
Like the leáves of the fórest when aútumn is blówn,
That hóst on the mórrow lay wíther'd and strówn.

3.

For the A'ngel of Deáth spread his wíngs on the blást,
And breáthed in the fáce of the fóe as he páss'd;
And the éyes of the sleépers wax'd deádly and chíll,
And their heárts but once heáved, and for éver grew stíll.

4.

And thére lay the steéd with his nóstril all wíde;
But throúgh it there roll'd not the breáth of his príde:
And the foám of his gásping lay whíte on the túrf,
And cóld as the spráy of the róck-beating súrf.

5.

And thére lay the ríder distórted and pále,
With the déw on his brów, and the rúst on his maíl;
And the ténts were all sílent, the bánners alóne,
The lánces unlífted, the trúmpet unblówn.

6.

And the wídows of A'shur are loúd in their waíl,
And the ídols are bróke in the témple of Báal,
And the míght of the Géntile unsmóte by the swórd
Hath mélted like snów in the glánce of the Lórd.—Byron.

Know ye the land where the cypress and * myrtle
Are emblems of deeds that are done in their clime,
Where the rage of the vulture, the love of the turtle,
Now melt into sorrow, now madden to crime?

* The formula *x x a* appears most in the middle and concluding lines of this extract.

Know ye the land of the cedar and vine,
Where the flowers ever blossom, the beams ever shine;
Where the light wings of Zephyr, oppressed with perfume,
Wax faint o'er the gardens of Gúl in her bloom;
Where the citron and olive are fairest of fruit,
And the voice of the nightingale never is mute:
Where the tints of the earth, and the hues of the sky,
In colour though varied, in beauty may vie,
And the purple of Ocean is deepest in dye;
Where the virgins are soft as the roses they twine,
And all, save the spirit of man, is divine?
'T is the clime of the East; 't is the land of the Sun—
Can he smile on such deeds as his children have done?
Oh! wild as the accents of lover's farewell
Are the hearts which they bear, and the tales which they tell.

BYRON (*Bride of Abydos*).

§ 571. It is not always easy to tell where certain lines end, and where certain others begin. Thus, we may read—

1.

The Lord descended from above,
And bowed the heavens most high;
And underneath his feet He cast
The darkness of the sky.

2.

On Cherubs and on Seraphim,
Full royally He rode,
And on the wings of mighty winds
Came flying all abroad.

But we may also read—

The Lord descended from above, and bowed the heavens most high,
And underneath his feet He cast the darkness of the sky.
On Cherubs and on Seraphim full royally He rode,
And on the wings of mighty winds came flying all abroad.

In this matter the following distinction is convenient. When the last syllable of the fourth measure (*i. e.* the eighth syllable in the line) in the one verse *rhymes* with the corresponding syllable in the other, the long verse should be looked

upon as broken up into two short ones; in other words, the couplets should be dealt with as a stanza. Where there is no rhyme except at the seventh measure, the verse should remain undivided. Thus—

> Turn, gentle hermit of the glen, and guide thy lonely way
> To where yon taper cheers the vale with hospitable ray—

constitute a single couplet of two lines, the number of rhymes being two. But—

> Turn, gentle hermit of the dale,
> And guide thy lonely way
> To where yon taper cheers the vale
> With hospitable ray.—GOLDSMITH.

constitute a stanza of four lines, the number of rhymes being four.

To carry this principle throughout our metres may, perhaps, be inconvenient. Lines as short as—

> It screamed and *growled*, and cracked and *howled*,

it would divide into two.

On the other hand, lines as long as—

> Where Virtue wants and Vice abounds,
> And wealth is but a baited hook,

it would make one of.

Thus the former would run—

> It screamed and growled,
> And cracked and howled, &c.;

whereas the second would be—

> Where Virtue wants and Vice abounds, and wealth is but a baited hook, &c.

Nevertheless, the principle is suggested.

CHAPTER VI.

CHIEF ENGLISH METRES.

§ 572. *Verses formed by the First Measure* or *a x*.—1. A verse so short as to consist of a single accented syllable can be conceived to exist. Its formula would be *a x* —. I know of no actual specimens. The next in point of brevity would be *a x*. This also is either non-existent, or too rare to be of practical importance.

2. Verses of Two Measures. Formula *a x a x*, or *a x* × 2.

Rích the treásure,
Sweét the pleásure.—DRYDEN.

Verses of Formula *a x a x* —, or *a x* × 2 —.

Túmult ceáse,
Sínk to peáce.

3. Three Measures. Formula *a x* × 3.

E'very dróp we sprínkle,
Smoóthes awáy a wrínkle.

Formula *a x* × 3 —.

Fíll the búmper faír—
O'n the brów of cáre.

The two varieties of this formula, rhyming alternately, constitute the following stanza :—

Fíll the búmper faír;
E'very dróp we sprínkle,
O'n the brów of cáre,
Smoóthes awáy a wrínkle.

Ságes cán, they sáy,
Seíze the líghtning's pínion,
A'nd bring dówn its ráy
Fróm the stárr'd domínion.—MOORE.

4. Four Measures. Formula $a\ x \times 4$.

Thén her coúntenánce all óver—
Bút he clásp'd her líke a lóver.

Formula $a\ x \times 4 —$.

Pále agaín as deáth did próve—
A'nd he cheér'd her soúl with lóve.

These two varieties alternating, and with rhyme, constitute one of the commonest metres of which $a\ x$ is the basis.

Thén her coúntenánce all óver
Pále agaín as deáth did próve;
Bút he clásp'd her líke a lóver,
A'nd he cheér'd her soul with lóve.—TENNYSON.

5. Five measures. Formula $a\ x \times 5$.

Nárrowing ín to whére they sát asséembled,
Lów volúptuous músic wínding trémbled.

Formula $a\ x \times 5 —$.

Thén methoúght I heárd a hóllow soúnd,
Gáth'ring úp from áll the lówer groúnd.

The two varieties mixed:—

Then methought I heard a hollow sound,
Gath'ring up from all the lower ground.
Narrowing in to where they sat assembled,
Low voluptuous music winding trembled,
Wov'n in circles: they that heard it sigh'd,
Panted, hand in hand, with faces pale,
Swung themselves, and in low tones replied;
Till the fountain spouted, showering wide
Sleet of diamond-drift and pearly hail:
Then the music touch'd the gates and died.

TENNYSON.

6. Six measures. Formula $a\ x \times 6$, or $a\ x \times 6 —$.

O'n a moúntain, strétch'd beneáth a hoáry willow,
Láy a shépherd swaín, and viéw'd the rólling bíllow.

7. Seven measures. Formula $a\ x \times 7$, or $a\ x \times 7\ —$.

Wé have hád enoúgh of áction ánd of mótion; wé—
Lét us sweár an oáth, and keép it, wíth an équal mínd—

8. Eight measures. Formula $a\ x \times 8$, or $a\ x \times 8\ —$.

Cómrades, leáve me hére a líttle, whíle as yét 'tis eárly mórn:
Leáve me hére; and, whén you wánt me, soúnd upón the búgle hórn.

Lines of this formula occur sometimes unmixed, and constituting whole poems; as—

Here about the beach I wander'd, nourishing a youth sublime
With the fairy tales of science, and the long results of Time;

When the centuries behind me, like a fruitful land reposed;
When I clung to all the Present for the promise that it closed;

When I dipp'd into the Future, far as human eye could see,
Saw the vision of the world, and all the wonder that would be—

In the spring a fuller crimson comes upon the robin's breast;
In the spring the wanton lapwing gets himself another crest:

In the spring a livelier iris changes on the burnish'd dove;
In the spring a young man's fancy lightly turns to thoughts of love.

Then her cheek was pale and thinner than should be for one so young,
And her eyes on all my motions with a mute observance hung.

And I said, "My cousin Amy, speak, and speak the truth to me;
Trust me, cousin, all the current of my being sets to thee."

TENNYSON (*Lockesley Hall*).

Sometimes mixed with other measures (as with lines of formula $a\ x \times 7$):—

We have had enough of action and of motion; we
Roll'd to larboard, roll'd to starboard, when the surge was seething free,
Where the wallowing monster spouted his foam-fountains in the sea.
Let us swear an oath, and keep it with an equal mind,
In the hollow lotos-land to live and lie reclined
On the hills, like gods together, careless of mankind:

For they lie beside their nectar, and their bolts are hurl'd
Far below them in the valleys, and the clouds are lightly curl'd
Round their golden houses, girdled with the gleaming world;
Where they smile in secret, looking over wasted lands,
Blight and famine, plague and earthquake, roaring deeps and fiery sands,
Clanging fights, and flaming towns, and sinking ships, and praying hands.—
Surely, surely slumber is more sweet than toil; the shore,
Than labour in the deep mid-ocean, wind, and wave, and oar.
Oh! rest ye, brother mariners, we will not wander more.

TENNYSON (*The Lotos Eaters*).

Lines based upon *a x* are rarely without rhymes; in other words, they rarely constitute blank verse.

§ 573. *Verses formed by the Second Measure,* or *x a.*—1. Lines so short as to be reducible to *x a* are of too rare an occurrence to demand special notice.

Formula *x a* +.

Thou Béing
All-seéing,
Oh hear my fervent prayer;
Still táke her,
And máke her
Thy most peculiar care.—BURNS.

Generally two lines of this formula are arranged as single verses. Such is the case with those just quoted, that are printed—

Thou Being, all-seeing,
Oh hear my fervent prayer;
Still take her, and make her
Thy most peculiar care.

2. Two-measures. Formula *x a* × 2.

Unheárd, unknówn,
He makes his moán—

What sounds were heard!
What scenes appear'd—

The strains decay,
And melt away.—POPE.

Formula $x\ a \times 2+$.

Upón a moúntain,
Besíde a foúntain.

3. Three measures. Formula $x\ a \times 3$.

With hóllow blásts of wínd—
All ón a róck reclíned.

Formula $x\ a \times 3+$.

'Twas whén the seás were roáring—
A dámsel láy déploring.

The alternation of the two varieties of $x\ a \times 3$ constitutes what may be called Gay's stanza.

'Twas when the seas were roaring
With hollow blasts of wind,
A damsel lay deploring,
All on a rock reclined.
Wide o'er the foaming billows
She cast a wistful look;
Her head was crown'd with willows,
That trembled o'er the brook.—GAY.

Cold sweat is plashing o'er them,
Their breasts are beating slow:
The sands and shelves before them
Flash fire at every blow.
Their fellows stand in fear of
The upshot of the fray;
The child unborn shall hear of
The wrestling of that day.

4. Four measures. Formula $x\ a \times 4$.

On, on he hasten'd, and he drew
My gaze of wonder as he flew.

5. Five measures. Formula $x\ a \times 5$.

Fond fool! six feet of earth is all thy store,
And he that seeks for all shall have no more.—HALL.

Formula $x\ a \times 5+$.

The meeting points the sacred hair dissever,
From her fair head for ever and for ever.—POPE.

This last is the standard metre of the English language. In point of time it is one of our earliest forms of verse. It was written by Chaucer in the fourteenth century, is written by the poets of the present generation, and has been used by most writers of the intermediate period. Its chief cultivators have been Chaucer, Dryden, Pope, Cowper, and Byron, in rhyme; and Milton and the dramatists in blank verse. In character it has every variety. For serious poetry (except in the drama) it is considered that the admission of an extra syllable at the end of the line (*i. e.* formula $x\ a \times 5 +$) is exceptionable. Whenever it occurs in Milton, it is found fault with by Johnson; and the same author asserts, that, with one exception, it always appears disadvantageously in Pope. In the drama, where the language of common life is more especially imitated, the formula $x\ a \times 5 +$ is not only admissible but necessary.

The general term for metres of the form in question is Heroic. The first division into which the heroic metres fall is into, *a*. Blank heroics, *b*. Rhyming heroics.

Blank Heroics.—Blank heroics, or blank verse, as it is generally called, falls into two varieties, determined by the nature of the subject-matter: *a*. Dramatic blank verse; *b*. Narrative blank verse.

Dramatic Blank Verse.—With the exception of the earliest dramas in the language, and some rhyming tragedies written in imitation of the French about the time of Charles II., the writings for the English stage consist chiefly of either prose or blank verse. It is in blank verse that most tragedies and many comedies are either wholly or partially written. Dramatic blank verse not only admits, but calls for, the formula $x\ a \times 5 +$. Often there are two supernumerary syllables. In rhyming metres these would constitute double rhymes.

OTHELLO'S SPEECH BEFORE THE SENATORS.

Most potent, grave, and reverend seigniors,
My very noble and approv'd good *masters*,—
That I have ta'en away this old man's *daughter*,
It is most true: true, I have married her;
The very head and front of my of*fending*
Hath this extent, no more. Rude I 'm in speech,
And little bless'd with the set phrase of peace;

For since these arms of mine had seven years' pith
Till now some nine moons wasted, they have us'd
Their dearest action in the tented field,
And little of this great world can I speak,
More than pertains to feats of broil and *battle;*
And therefore little shall I grace my cause
In speaking of myself: yet by your *patience*
I will a round unvarnish'd tale deliver
Of my whole course of love: what drugs, what charms,
What conjuration, and what mighty *magic,*
(For such proceedings am I charg'd withal,)
I won his daughter.—SHAKSPERE.

Narrative Blank Verse.—The metre of "Paradise Lost," "Paradise Regained," Young's "Night Thoughts," Cowper's "Task," Cowper's "Homer," &c.

Nine times the space that measures day and night
To mortal men, he, with his horrid crew,
Lay vanquish'd, rolling in the fiery gulf
Confounded, though immortal: but his doom
Preserved him to more wrath, for now the thought
Both of lost happiness and lasting pain
Torments him.

Here the admission of a supernumerary final syllable is rare. Lines of *eleven* syllables like the following are uncommon.

Of sovran power with awful ceremo*ny*.
Paradise Lost, b. i.

Rhyming Heroics.—In proportion as the subject is serious and dignified, the use of double and treble rhymes is avoided.

6. Six measures. Formulas $x\ a \times 6$, and $x\ a \times 6+$.

He lífted úp his hánd that báck agaín did stárt.—SPENSER.

Ye sácred bárds that tó your hárps' melódious strings
Sung th' áncient héroes' deéds, the mónuménts of kíngs;
If, ás those Drúids taúght who képt the Brítish rítes,
And dwélt in dárksome gróves, there coúnselling with sprítes,
When thése our soúls by deáth our bódies dó forsáke,
They ínstantly agaín to óther bódies take,
I coúld have wísh'd your soúls redoúbled ín my breást,
To gíve my vérse applaúse to time's etérnal rést.—DRAYTON.

7. Seven measures. Formulas $x\ a \times 7$, and $x\ a \times 7+$.

But one request I make to Him that sits the skies above,
That I were freely out of debt as I were out of love;
Oh, then to dance and sing and play I should be very willing,
I 'd never owe a maid a kiss, and ne'er a knave a shilling.
SUCKLING.

8. Eight measures. Formulas $x\ a \times 8$, and $x\ a \times 8+$.

Where virtue wants, and vice abounds, and wealth is but a baited hook
Wherewith men swallow down the bane before on danger dark they look.

§ 574. *Verses formed upon the Third Measure, or a x x.*— Verses formed upon measure *a x x* are neither frequent nor regular. Generally there is the deficiency of some unaccented syllable, in which the formula is reduced to *a x x*—, which may be confounded with the first measure, or *a x*. The point to determine is, whether the general character of the verse be trisyllabic or dissyllabic.

1. Two measures. Formulas $a\ x\ x \times 2$, and $a\ x\ x \times 2$—. Of these the latter is most common. Not only one of the unaccented syllables, but even both of them are frequently wanting at the end of lines.

Whére shall the lóver rest,
Whóm the Fates séver,
Fróm his true maíden's breast,
Párted for ever?
Whére through gróves deép and high,
Sóunds the far bíllow;
Whére early víolets die
U'nder the wíllow.—SCOTT.

O'ft have I seén the sun,
To do her hónour,
Fíx himself át his noon
Tó look upón her,
And hath gilt év'ry grove
E'v'ry hill near her,
Wíth his flames fróm above,
Stríving to cheér her.

A'nd when she fróm his sight
Háth herself túrned,
Hé, as it hád been night,
I'n clouds hath moúrned.—DRAYTON.

2. Three measures. Formulas *a x x* × 3, and *a x x* × 3—.

Peáce to thee, ísle of the ócean,
Peáce to thy breézes and bíllows!—BYRON.

3. Four measures. Formulas *a x x* × 4, and *a x x* × 4—.

Mérrily, mérrily sháll I live nów,
U'nder the blóssom that hángs on the boúgh.—SHAKSPERE.

1.

Wárriors or chiéfs, should the sháft or the swórd
Piérce me in leáding the hóst of the Lórd,
Heéd not the córpse, though a kíng 's in your páth,
Bury your steél in the bósoms of Gáth.

2.

Thóu, who art beáring my búckler and bów,
Should the soldiers of Saul look away from the foe,
Láy me that móment in bloód at thy feét,
Míne be the doóm that they dáre not to meét.

3.

Fárewell to óthers, but néver we párt,
Heír to my róyalty, són of my heárt;
Bríght be the díadem, boúndless the swáy,
Or kíngly the deáth that awaíts us to-dáy.—BYRON.

§ 575. *Verses formed upon the Fourth Measure, or x a x.*— Verses of a single measure are equivocal, since *x a x* cannot be distinguished from *x a* +, and *x a x* — is identical in form with *x a*. The general character of the verses in the neighbourhood determine, whether measures of this sort shall be looked upon as dissyllabic or trisyllabic.

1. Two measures. Formulas *x a x* × 2, and *x a x* × 2—.

Besíde her are laíd
Her máttock and spáde—
Alóne she is thére,
Her shoúlders are báre—

E'ver alóne
She máketh her moán.—TENNYSON.

But vaínly thou wárrest;
For thís is alóne in
Thy pówer to déclare,
That, ín the dim fórest,
Thou heárd'st a low moáning.—COLERIDGE.

2. Three measures. Formulas *x a x* × 3, and *x a x* × 3—.

I 've foúnd out a gíft for my fáir;
I 've foúnd where the woód-pigeons breéd:
But lét me that plúnder forbeár;
She 'll sáy 't was a bárbarous deed.
He né'er could be trúe, she avérr'd,
Who [would] rób a poor bírd of its yóung;
[And] I lóved her the móre when I heárd
Such ténderness fáll from her tóngue.—SHENSTONE.

A cónquest how hárd and how glórious;
Though fáte had fast boúnd her,
With Stýx nine times roúnd her,
Yet músic and lóve were victórious.—POPE.

3. Four measures. Formulas *x a x* × 4, and *x a x* × 4—.

The wórld will not chánge, and her heárt will not breák.
TENNYSON.

Remémber the glóries of Brían the bráve.—MOORE.

Oh húsh thee, my bábie, thy síre was a knight,
Thy móther a lády both lóvely and bright:
The woóds, and the gléns, and the tówers which we seé,
They áll are belónging, dear bábie, to theé.—SCOTT.

I ask not the pleasures that riches supply,
My sabre must win what the weaker must buy:
[It] shall win the fair bride with her long flowing hair,
And many a maid from her mother shall tear.

I love the fair face of the maid in her youth,
[Her] caresses shall lull me, her music shall soothe.
[Let] her bring to my chamber the many-toned lyre,
And sing me a song on the fall of her sire.—BYRON.

Oh! yoúng Lochinvár is come oút of the wést:
Through áll the wide bórder his steéds are the bést;
And, sáve his good broádsword, he weápons had nóne,
He róde all unárm'd, and he róde all alóne.
So faíthful in lóve, and so gállant in wár,
[Did] ye e'ér hear of brídegroom like yoúng Lochinvár?

SCOTT.

[Thanks,] my Lórd, for your vén'son; for fíner nor fátter
Ne'er ránged in the fórest nor smóked on the plátter:
The flésh was a pícture for paínters to stúdy,
The fát was so whíte, and the leán was so rúddy.
[Though] my stómach was shárp, I could scárce help regrétting
To spoíl such a délicate pícture by eáting.—GOLDSMITH.

§ 576. *Verses formed upon the Fifth Measure, or x x a.*

1. Formula *x x a.*

As ye sweép
Through the deép.—CAMPBELL.

Usually—

As ye sweép, through the deép.

2. Formula *x x a* × 2.

In my rágе shall be seén
The revénge of a queén.—ADDISON.

3. Formula *x x a* × 3.
Mixed with 2.

See the snákes how they reár,
How they híss in the aír,
And the spárkles they flásh from their éyes.—DRYDEN.

4. Formula *x x a* × 4.

And the kíng seized a flámbeau with zéal to destróy.—DRYDEN.

5. Formula *x x a* × 5.
6. Formula *x x a* × 6.

} Rare, if real.

7. Formula *x x a* × 7—.

Now he róde on the wáves of the wíde rolling séa, and he fórayed aróund like a háwk.

It is only the postulate of *p.* 452 in respect to the effect of

a rhyme or its absence that makes this a single line rather than two.

§ 577. *Nomenclature of English metres.*—It is only a few of the English metres that are known by fixed names. They are as follows:—

1. *Gay's Stanza.*—Lines of three measures, *x a*, with alternate rhymes. The odd (*i. e.* the 1st and 3rd) rhymes double.

'T was when the seas were roaring
With hollow blasts of wind,
A damsel lay deploring,
All on a rock reclined.

2. *Common Octosyllabics.*—Four measures, *x a*, with rhyme, and (unless the rhymes be double) eight syllables (*octo syllabæ*). —Butler's "Hudibras," Scott's poems, "The Giaour," and other poems of Lord Byron.

3. *Elegiac Octosyllabics.*—Same as the last, except that the rhymes are regularly alternate, and the verses arranged in stanzas.

And on her lover's arm she leant,
And round her waist she felt it fold,
And far across the hills they went,
In that new world which now is old:
Across the hills and far away,
Beyond their utmost purple rim,
And deep into the dying day
The happy princess follow'd him.—TENNYSON.

4. *Octosyllabic Triplets.*—Three rhymes in succession. Generally arranged as stanzas.

I blest them, and they wander'd on;
I spoke, but answer came there none:
The dull and bitter voice was gone.—TENNYSON.

5. *Blank Verse.*—Five measures, *x a*, without rhyme. "Paradise Lost," Young's "Night Thoughts," Cowper's "Task."

6. *Heroic Couplets.*—Five measures, *x a*, with pairs of rhymes. Chaucer, Denham, Dryden, Waller, Pope, Goldsmith, Cowper, Byron, Moore, Shelley, &c. This is the common metre for narrative, didactic, and descriptive poetry.

7. *Heroic Triplets.*—Five measures, *x a.* Three rhymes in succession. Arranged in stanzas. This metre is sometimes interposed among heroic couplets.

8. *Elegiacs.*—Five measures, *x a*, with regularly-alternate rhymes, and arranged in stanzas.

> The curfew tolls the knell of parting day,
> The lowing herds wind slowly o'er the lea,
> The ploughman homeward plods his weary way,
> And leaves the world to darkness and to me.—GRAY.

9. *Rhymes Royal.*—Seven lines of heroics, with the last two rhymes in succession, and the first five recurring at intervals.

> This Troilus, in gift of curtesie,
> With hauk on hond, and with a huge rout
> Of knightes, rode, and did her company,
> Passing all through the valley far about;
> And further would have ridden out of doubt.
> Full faine and woe was him to gone so sone;
> But turn he must, and it was eke to doen.—CHAUCER.

This metre was common with the writers of the earlier part of Queen Elizabeth's reign. It admits of varieties according to the distribution of the first five rhymes.

10. *Ottava Rima.*—A metre with an Italian name, and borrowed from Italy, where it is used generally for narrative poetry. The "Morgante Maggiore" of Pulci, the "Orlando Innamorato" of Bojardo, the "Orlando Furioso" of Ariosto, the "Gierusalemme Liberata" of Tasso, are all written in this metre. Besides this, the two chief epics of Spain and Portugal respectively (the "Araucana" and the "Os Lusiados") are thus composed. Hence it is a form of poetry which is Continental rather than English, and naturalized rather than indigenous. The stanza consists of eight lines of heroics, the six first rhyming alternately, the last two in succession.

> Arrived there, a prodigious noise he hears,
> Which suddenly along the forest spread;
> Whereat from out his quiver he prepares
> An arrow for his bow, and lifts his head;

And, lo! a monstrous herd of swine appears,
  And onward rushes with tempestuous tread,
And to the fountain's brink precisely pours,
So that the giant 's join'd by all the boars.
  Morgante Maggiore (LORD BYRON'S *Translation*).

11. *Terza Rima.*—Like the last, borrowed both in name and nature from the Italian, and scarcely yet naturalized in England.

The Spirit of the fervent days of old,
  When words were things that came to pass, and Thought
  Flash'd o'er the future, bidding men behold
Their children's children's doom already brought
  Forth from the abyss of Time which is to be,
  The Chaos of events where lie half-wrought
Shapes that must undergo mortality:
  What the great seers of Israel wore within,
  That Spirit was on them and is on me;
And if, Cassandra-like, amidst the din
  Of conflicts, none will hear, or hearing heed
  This voice from out the Wilderness, the sin
Be theirs, and my own feelings be my meed,
  The only guerdon I have ever known.

12. *Alexandrines.*—Six measures, *x a*, generally (perhaps always) with rhyme. The name is said to be taken from the fact that early romances upon the deeds of Alexander of Macedon, of great popularity, were written in this metre. One of the longest poems in the English language is in Alexandrines, viz. Drayton's "Poly-olbion."

13. *Spenserian Stanza.*—A stanza consisting of nine lines, the eight first heroics, the last an Alexandrine.

It hath been through all ages ever seen,
That with the prize of arms and chivalrie
The prize of beauty still hath joined been,
And that for reason's special privitie;
For either doth on other much rely.
For he meseems most fit the fair to serve
That can her best defend from villanie;
And she most fit his service doth deserve,
That fairest is, and from her faith will never swerve.
  SPENSER.

"Childe Harold" and other important poems are composed in the Spenserian stanza.

14. *Service Metre.*—Couplets of seven measures, *x a*. This is the common metre of the Psalm versions. It is also called Common Measure, or Long Measure.

15. *Ballad Stanza.*—Service metre broken up in the way suggested in *p*. 452. Goldsmith's "Edwin and Angelina," &c.

16. *Poulterer's Measure.*—Alexandrines and service metre alternately. Found in the poetry of Henry the Eighth's time.

No other amongst the numerous English metres have hitherto received names.

CHAPTER VII.

SYMMETRICAL, UNSYMMETRICAL, AND CONVERTIBLE METRES. —RHYTHM.

§ 578. *Latitude in respect to the periodicity of the recurrence of similarly-accented syllables in English.*—Metre is the recurrence, within certain intervals, of syllables similarly affected.

The particular way in which syllables are *affected* in English metres is that of *accent*.

The more regular the period at which similar accents recur the more typical the metre.

Nevertheless absolute regularity is not requisite.

This leads to the difference between symmetrical and unsymmetrical metres.

Symmetric Metres.—Allowing for indifference of the number of syllables in the last measure, it is evident that in all lines where the measures are dissyllabic the syllables will be a multiple of the accents, *i. e.* they will be twice as numerous. Hence, with three accents there are six syllables; with four accents, eight syllables, &c.

Similarly, in all lines where the measures are trisyllabic the syllable will also be multiples of the accents, *i. e.* they will be thrice as numerous. Hence, with three accents there will be nine syllables, with four accents, twelve syllables, and with seven accents, twenty-one syllables.

Lines of this sort may be called symmetrical.

Unsymmetric Metres.—Lines, where the syllables are *not* a multiple of the accents, may be called unsymmetric. Occasional specimens of such lines occur interspersed amongst others of symmetrical character. Where this occurs the

general character of the versification may be considered as symmetrical also.

The case, however, is different where the whole character of the versification is unsymmetrical, as it is in the greater part of Coleridge's "Christabel," and Byron's "Siege of Corinth."

In the yéar since Jésus diéd for mén,
Eighteen húndred yeárs and tén,
Wé were a gállant cómpany',
Ríding o'er láand and sáiling o'er séa.
O'h! but wé went mérrily'!
We fórded the ríver, and clómb the high híll,
Néver our steéds for a dáy stood stíll.
Whéther we láy in the cáve or the shéd,
Our sleép fell sóft on the hárdest béd;
Whéther we cóuch'd on our róugh capóte,
Or the róugher plánk of our glíding bóat;
Or strétch'd on the beách or our sáddles spréad
As a píllow beneáth the résting héad,
Frésh we wóke upón the mórrow.
A'll our thóughts and wórds had scópe,
Wé had héalth and wé had hópe,
Tóil and trável, bút no sórrow.

Here the formula is—

x x a x a x a x a
a x a x a x a
a x x a x a x a
a x x a x a x x a
a x a x a x x
x a x x a x x a x x a
a x x a x x a x a
a x x a x x a x x a
x a x a x x a x a
a x x a x x a x a
x x a x a x x a x a
x a x x a x x a x a
x x a x x a x a x a
a x a x a x a x
a x a x a x a
a x a x a x a
a x a x a x a x

These lines are naturally trisyllabic; from any measure of which one of the unaccented syllables may be ejected. Where they are symmetrical they are so by accident.

A metrical fiction, that conveniently illustrates their structure, is the doctrine that they are *lines formed upon measure x a x, for which either x x a or a x x may be substituted, and from which either a x or x a may be formed by ejection of either the first or last unaccented syllable.*

§ 579. *Convertible Metres.*—Such a line as

Ere her faithless sons betray'd her

may be read in two ways. We may either lay full stress upon the word *ere*, and read

E're her faíthless sóns betráy'd her;

or we may lay little or no stress upon either *ere* or *her*, reserving the full accentuation for the syllable *faith-* in *faithless*, in which case the reading would be

Ere her faíthless sóns betráy'd her.

Lines of this sort may be called examples of *convertible metres*, since, by changing the accent, a dissyllabic line may be converted into one partially trisyllabic, and *vice versâ*.

This property of convertibility is explained by the fact of accentuation being *a relative quality*. In the example before us *ere* is sufficiently strongly accented to stand in contrast to *her*, but it is not sufficiently strongly accented to stand upon a par with the *faith-* in *faithless* if decidedly pronounced.

The real character of convertible lines is determined from the character of the lines with which they are associated. That the second mode of reading the line in question is the proper one, may be shown by reference to the stanza wherein it occurs.

Let E'rin remémber her dáys of óld,
Ere her faíthless sóns betráy'd her,
When Málachi wóre the cóllar of góld,
Which he wón from the próud inváder.

Again, such a line as

For the glory I have lost,

although it may be read

For the glóry I have lóst,

would be read improperly. The stanza wherein it occurs is essentially dissyllabic (*a x*).

Heéd, oh heéd my fátal stóry!
I' am Hósier's injured ghóst,
Cóme to seék for fáme and glóry—
Fór the glóry I' have lóst.

§ 580. *Metrical and Grammatical Combinations.*—Words, or parts of words, that are combined as measures, are words, or parts of words, combined *metrically*, or in *metrical combination*.

Syllables combined as words, or words combined as portions of a sentence, are syllables and words *grammatically combined*, or in *grammatical combination*.

The syllables *ere her faith-* form a metrical combination.

The words *her faithless sons* form a grammatical combination.

When the syllables contained in the same measure (or connected metrically) are also contained in the same construction (or connected grammatically), the metrical and the grammatical combinations coincide. Such is the case with the line

Remémber | the glóries | of Brían | the Bráve;

where the same division separates both the measure and the subdivisions of the sense, inasmuch as the word *the* is connected with the word *glories* equally in grammar and in metre, in syntax and in prosody. So is *of* with *Brian*, and *the* with *Brave*.

Contrast with this such a line as

A chieftain to the Highlands bound.

Here the metrical division is one thing, the grammatical division another, and there is no coincidence.

Metrical,

A chíef | tain tó | the Hígh | lands bóund.

Grammatical,

A chieftain | to the Highlands | bound.

In the following stanza the coincidence of the metrical and grammatical combination is nearly complete:—

To árms! to árms! The sérfs, they róam
O'ér híll, and dále, and glén:
The kíng is deád, and tíme is cóme
To choóse a chiéf agáin.

In

Wárriors or chiéfs, should the shâft or the swórd
Piérce me in léading the hóst of the Lórd,
Heéd not the córpse, though a kíng's in your páth,
Búry your steél in the bósoms of Gáth.—BYRON.

there is a non-coincidence equally complete.

§ 581. *Rhythm.*—The character of a metre is marked and prominent in proportion as the metrical and the grammatical combinations coincide. The extent to which the measure *a x x* is the basis of the stanza last quoted is concealed by the antagonism of the metre and the construction. If it were not for the axiom, that *every metre is to be considered uniform until there is proof to the contrary*, the lines might be divided thus:—

a x x a x x a x x a
a x x a x x a x x a
a x x a x x a x x a
a x x a x a x x a

The variety which arises in versification from the different degrees between the coincidence and the non-coincidence between the metrical and grammatical combinations may be called *Rhythm.*

§ 582. The majority of English *words* are of the form *a x*; that is, words like *týrant* are commoner than words like *presúme.*

The majority of English *metres* are of the form *x a*; that is, lines like

The wáy was lóng, the wínd was cóld,

are commoner than lines like

Qúeen and húntress cháste and fáir.

The multitude of unaccentuated words like *the, from,* &c., taken along with the fact that they *precede* the words with which they agree, or which they govern, accounts for the apparent antagonism between the formulæ of our *words* and the formulæ of our *metres*. The contrast between a Swedish line of the form *a x*, and its literal English version in *x a*, shows this.

In Swedish the secondary part of the construction *follows*, in English it *precedes* the main word.

Swedish.

Vár*en* kómm*er*, fúgl*en* quíttr*ar*, skóv*en* lö'fv*as*, sól*en* lér.

English.

The spring *is* come, *the* bird *is* blythe, *the* wood *is* green, *the* sun *is* bright.

In this way Syntax affects Prosody.

CHAPTER VIII.

ENGLISH IMITATIONS OF THE CLASSICAL METRES.

§ 583. *The Classical Metres as read by Englishmen.*—The metres of the classical languages consist essentially in the recurrence of similar quantities; *accent playing a part.*—Now there are reasons for investigating the facts involved in this statement more closely than has hitherto been done; since the following circumstances make some inquiry into the extent of the differences between the English and the classical systems of metre, an appropriate element of a work upon the English language.

1. The classical poets are authors pre-eminently familiarized to the educated English reader.

2. The notions imbibed from a study of the classical prosodies have been unduly mixed up with those which should have been derived more especially from the poetry of the German nations.

3. The attempt to introduce (so-called) Latin and Greek metres into the German tongues, has been partially successful on the Continent, and not unattempted in Great Britain.

The first of these statements requires no comment.

The second will bear some illustration. The English grammarians sometimes borrow the classical terms, *iambic, trochee,* &c., and apply them to their own metres.

How is this done? In two ways, one of which is wholly incorrect, the other partially correct, but inconvenient.

To imagine that we have in English, for the practical purposes of prosody, syllables *long in quantity* or *short in quantity,* syllables capable of being arranged in groups constituting feet, and feet adapted for the construction of hexa-

metres, pentametres, sapphics, and alcaics, just as the Latins and Greeks had, is wholly incorrect. The English system of versification is founded, not upon the periodic recurrence of similar *quantities*, but upon the periodic recurrence of similar accents.

The less incorrect method consists in giving up all ideas of the existence of *quantity*, in the proper sense of the word, as an essential element in English metre; whilst we admit *accent* as its equivalent; in which case the presence of an accent is supposed to have the same import as the lengthening, and the absence of one, as the shortening, of a syllable; so that, *mutatis mutandis*, *a* is the equivalent to ¯, and *x* to ˘.

In this case the metrical notation for—

The wáy was lóng, the wínd was cóld—
Mérrily, mérrily, sháll I live nów—

would be, not—

x a, *x a*, *x a*, *x a*,
a x x, *a x x*, *a x x*, *a*

respectively, but—

˘ ¯ ˘ ¯ ˘ ¯ ˘ ¯
¯ ˘ ˘ ¯ ˘ ˘ ¯ ˘ ˘ ¯

Again—

As they splásh in the blóod of the slíppery streét,

is not—

x x a, *x x a*, *x x a*, *x x a*,

but—

˘ ˘ ¯ ˘ ˘ ¯ ˘ ˘ ¯ ˘ ˘ ¯

With this view there are a certain number of classical *feet*, with their syllables affected in the way of *quantity*, to which there are equivalent English *measures* with their syllables affected in the way of *accent*. Thus if the formula

A, ¯˘ be a classical, the formula *a x* is an English *trochee*.
B, ˘¯ „ „ *x a* „ *iambus*.
C, ¯˘˘ „ „ *a x x* „ *dactyle*.
D, ˘¯˘ „ „ *x a x* „ *amphibrachys*.
E, ˘˘¯ „ „ *x x a* „ *anapæst*.

And so on in respect to the larger groups of similarly-affected syllables which constitute whole lines and stanzas; verses like

A. Cóme to séek for fáme and glóry—
B. The wáy was lóng, the wínd was cóld—
C. Mérrily, mérrily sháll I live nów—
D. But váinly thou wárrest—
E. At the clóse of the dáy when the hámlet is stíll—

are (*a*), trochaic; (*b*), iambic; (*c*), dactylic; (*d*), amphibrachych; and (*e*), anapæstic, respectively.

And so, with the exception of the word *amphibrachych* (which I do not remember to have seen), the terms have been used. And so, with the same exception, systems of versification have been classified.

§ 584. *Reasons against the classical nomenclature as applied to English metres.*—These lie in the two following facts:—

1. Certain English metres have often a very different character from their supposed classical analogues.

2. Certain classical *feet* have no English equivalents.

Certain English metres have often a very different metrical character, &c.—Compare such a so-called English anapæst as—

As they splásh in the blóod of the slíppery streét—

with

Δεκατον μεν ετος τοδ' επει Πριαμου.

For the latter line to have the same movement as the former, it must be read thus—

Dekatón men etós to d' epéi Priamóu.

Now we well know that, whatever may be an English scholar's notions of the Greek accents, this is not the way in which he reads Greek anapæsts.

Again the *trochaic* movement of the *iambic* senarius is a point upon which the most exclusive Greek metrists have insisted; urging the necessity of reading (for example) the first line in the Hecuba—

Hæ'ko nékron keuthmóna kai skótou pýlas.

rather than—

Hækó nekrón keuthmóua kai skotóu pylás.

I have said that *certain English metres have* often *a very different metrical character*, &c. I can strengthen the reasons against the use of classical terms in English prosody, by enlarging upon the word *often*. The frequency of the occurrence of a difference of character between classical and English metres similarly named is not a matter of *accident*, but is, in many cases, a necessity arising out of the structure of the English language as compared with that of the Greek and Latin—especially the Greek.

With the exception of the so-called second futures, there is no word in Greek whereof the *last* syllable is accented. Hence, no English line ending with an accented syllable can have a Greek equivalent. Accent for accent—

GREEK.	LATIN.		ENGLISH.
Týpto,	*Vóco,*	=	*Týrant,*
Týptomen,	*Scríbere*	=	*Mérrily,*
Keuthmóna,	*Vidístis*	=	*Disáble,*

but no Greek word (with the exception of the so-called second futures like *νεμῶ* = *nemó*), and (probably) no Latin word at all, is accented like *presúme* and *cavalíer*.

From this it follows that although the first three measures of such so-called English anapæsts as—

As they splásh in the blóod of the slíppery streét,

may be represented by Greek equivalents (*i. e.* equivalents in the way of accent)—

Ep' omóisi feróusi ta kleína—

a parallel to the last measure (*-ery streét*) can only be got at by one of two methods; *i. e.* by making the verse end in a so-called second future, or else in a vowel preceded by an accented syllable, and cut off—

Ep' omóisi feróusi ta kleína nemó—

or,

Ep' omóisi feróusi tá kleína prosóp'.*

* For *prosópa.* The Greek has been transliterated into English for the sake of showing the effect of the accents more conveniently.

Now it is clear that when, over and above the fact of certain Greek metres having a different movement from their supposed English equivalents, there is the additional circumstance of such an incompatibility being less an accident than a necessary effect of difference of character in the two languages, the use of terms suggestive of a closer likeness than either does or ever can exist is to be condemned; and this is the case with the words *dactylic*, *trochaic*, *iambic*, *anapæstic*, as applied to English versification.

Certain classical feet have no English equivalents.—Whoever has considered the principles of English prosody, must have realized the important fact that, *ex vi termini, no English measure can have either more or less than* one *accented syllable.*

On the other hand, the classical metrists have several measures wherein there is more than one long syllable. Thus, to go no farther than the trisyllabic feet, we have the pyrrhic (⏑⏑) and tribrach (⏑⏑⏑) without a long syllable at all, and the spondee (– –), amphimacer (–⏑–), and molossus (– – –) with more than one. It follows, then, that (even *mutatis mutandis*, *i. e.* with the accent considered as the equivalent to the long syllable) English pyrrhics, English tribrachs, English amphimacers, English spondees, and English molossi are, each and all, prosodial impossibilities.

It is submitted to the reader that the latter reason (based wholly upon the limitations that arise out of the structure of language) strengthens the objections of the previous section.

§ 585. *The classical metres metrical even to English readers.*—The attention of the reader is directed to the difficulty involved in the following (apparently or partially) contradictory facts.

1. Accent and quantity differ; and the metrical systems founded upon them differ also.

2. The classical systems are founded upon quantity.

3. The English upon accent.

4. Nevertheless, notwithstanding the difference of the principle upon which they are constructed, the classical metres,

even as read by Englishmen, and read *accentually*, are metrical to English ears.

Preliminary to the investigation of the problem in question it is necessary to remark—

1. That the correctness or incorrectness of the English pronunciation of the dead languages has nothing to do with the matter. Whether we read Homer exactly as Homer would read his own immortal poems, or whether we read them in such a way as would be unintelligible to Homer reappearing upon earth, is perfectly indifferent.

2. That whether we pronounce the anapæst *pătŭlæ*, precisely as we pronounce the dactyle *Tĭtўrĕ*, or draw a distinction between them, is also indifferent. However much, as is done in some of the schools, we may say *scri-bere* rather than *scrib-ere*, or *am-or*, rather than *a-mor*, under the notion that we are lengthening or shortening certain syllables, one unsurmountable dilemma still remains, viz. that the shorter we pronounce the vowel, the more we suggest the notion of the consonant which follows it being doubled; whilst double consonants *lengthen* the vowel which precedes them. Hence, whilst it is certain that *patulæ* and *Tityre* may be pronounced (and that without hurting the metre) so as to be both of the same *quantity*, it is doubtful what that *quantity* is. Sound for sound, *Tĭtyre* may be as short as *pătulæ*. Sound for sound, *pāttulæ* may be as long as *Tĭttyre*.

Hence, the only assumptions requisite are—

a. That Englishmen do *not* read the classical metres according to their quantities.

b. That, nevertheless, they find metre in them.

§ 586. *Why are the classical metres metrical to English readers?* — Notwithstanding the extent to which quantity differs from accent, there is no metre so exclusively founded upon the former as to be without a certain amount of the latter; and in the majority (at least) of the classical (and probably other) metres *there is a sufficient amount of accentual elements to constitute metre; even independent of the quantitative ones.*

Many (perhaps all) classical metres on a level with the un-

symmetrical English ones.—The following is the notation of the extract from the "Siege of Corinth" in the preceding chapter:—

x x a x a x a x a
a x a x a x a
a x x a x a x a
a x x a x a x x a
a x a x a x x
x a x x a x x a x x a
a x x a x x a x a
a x x a x x a x x a
x a x a x x a x a
a x x a x x a x a
x x a x a x x a x a
x a x x a x x a x a
x x a x x a x a x a
a x a x a x a x
a x a x a x a
a x a x a x a
a x a x a x a x

Now many Latin metres present a recurrence of accent little more irregular than the quotation just analysed. The following is the accentual formula of the first two stanzas of the second ode of the first Book of Horace.

1.

Accentual Formula of the Latin Sapphic.

a a x a x | a x a x a x
a x x a x | a x a x a x
a x x a x | a x a x a x
a x x a x x | a x a x

a x x a x | a x a x a x
a x x a x | a x a x a x
a x x a x | a x a x a x
a x x a x x | a x a x

2.

Latin Asclepiad.

Horace, Od. I. 1. 1—6.

x a x a x x | a x x a x x

a x x a x x	*a x a x a x*
a x a x a x	*a x x a x x*
a x a x a x	*a x x a x x*
a x a x a x	*a x x a x x*
x a x a x x	*a x x a x a x*

3.

Latin Hexameter.

Æn. I. 1—5.

a x x a x a x a x x a x x a x
x a x x a x a x x x a x x a x
a x x x a x a x x x a x x a x
x a x x a x a x x x a x x a x

A longer list of examples would show us that, throughout the whole of the classical metres, the same accents recur, sometimes with less, and sometimes with but very little more irregularity than they recur in the *unsymmetrical* metres of our own language; and this in a prosody based upon *quantity*.

§ 587. *Conversion of English into classical metres.*—In the preface to his Translation of Aristophanes, Mr. Walsh has shown, that, by a different distribution of lines, very fair hexameters may be made out of the well-known lines on the Burial of Sir John Moore:—

Not a drum was
Heard, not a funeral note, as his corse to the rampart we hurried,
Not a soldier dis-
Charged his farewell shot o'er the grave where our hero we buried.

We buried him
Darkly at dead of night, the sods with our bayonets turning;
By the struggling
Moonbeam's misty light and the lantern dimly burning.

Lightly they 'll
Talk of the spirit that 's gone, and o'er his cold ashes upbraid him,
But little he 'll
Reck if they let him sleep on in the grave where a Briton has laid him.

Again, such lines as Coleridge's—

1. Make réady my gráve clothes to-mórrow;

or Shelley's—

2. Liquid Péneus was flówing,

are the exact analogues of lines like—

1. Jam lácte depúlsum leónem,

and—

2. Gráto Py'rrha sub ántro.

The rationale of so remarkable a phænomenon as *regularity of accent in verses considered to have been composed with a view to quantity only* has yet to be investigated. That it was necessary to the structure of the metres in question is certain; a fact which lead us to the consideration of the *Cæsura*.

§ 588. *Cæsura*.—The *cæsura* of the classical metrists is the result of—

1. The necessity in the classical metres of an accented syllable in certain parts of the verses.

2. The nearly total absence in the classical languages of words with an accent on the last syllable.

From the joint effect of these two causes, it follows that in certain parts of a verse no final syllable can occur, or no word can terminate.

Thus, in a language consisting chiefly of dissyllables, of which the first alone was accented, and in a metre which required the sixth syllable to be accented, the fifth and seventh would each be at the end of words, and that simply because the sixth was not.

Whilst in a language consisting chiefly of either dissyllables or trisyllables, and in a metre of the same sort as before, if the fifth were not final, the seventh would be so, or *vice versâ*.

Cæsura means *cutting*. In a language destitute of words accented on the last syllable, and in a metre requiring the sixth syllable to be accented, a measure (foot) of either the formula $x\ a$, or $x\ x\ a$ (*i. e.* a measure with the accent at the end), except in the case of words of four or more syllables, must always be either itself divided, or else cause the division of the following measures—*division* meaning the distribution of the syllables of the measure (foot) over two or more words. Thus—

a. If the accented syllable (the sixth) be the first of a word

of any length, the preceding one (the fifth) must be the final one of the word which went before; in which case the first and last parts belong to different words, and the measure (foot) is divided or *cut*.

b. If the accented syllable (the sixth) be the second of a word of three syllables, the succeeding one, which is at the end of the word, is the first part of the measure which follows; in which case the first and last parts of the measure (foot) which follows the accented syllable are divided or *cut*.

As the *cæsura*, or the necessity for dividing certain measures between two words, arises out of the structure of language, it only occurs in tongues where there is a notable absence of words accented on the last syllable. Consequently there is no cæsura in the English.

§ 589. As far as accent is concerned, the classical poets write in *measures* rather than *feet*.

Although the idea of writing English hexameters, &c., on the principle of an accent in a measure taking the place of the long syllables in a foot, is chimerical; it is perfectly practicable to write English verses upon the same principle which the classics themselves have written on, *i. e.* with accents recurring within certain limits; in which case the so-called classical metre is merely an unsymmetrical verse of a new kind. This may be either blank verse or rhyme.

The chief reason against the naturalization of metres of the sort in question (over and above the practical one of our having another kind in use already), lies in the fact of their being perplexing to the readers who have *not* been trained to classical cadences, whilst they suggest and violate the idea of *quantity* to those who have.

§ 590. *Synapheia*.—Of all metres that of English blank verse is the simplest. Perhaps, throughout the whole range of literature and art, no style of composition equally simple and severe can be found, the *paucity of rules* being the measure of the simplicity and severity.

A single rule gives the form of a noble metre—this rule being that *on every even syllable there shall be an accent*.

More than this is unnecessary. With this a poem of the magnitude of the "Paradise Lost" may be written—the licences

and accessory ornament that lie beyond being unnecessary and unimportant. This will become clearer when we have realized the fact that in English blank verse, even the division into lines is unnecessary, except so far as it is required for the division of words, and breaks in the sense.

With these the ends of lines should coincide.

If it were not so, the whole of such a poem as the "Paradise Lost" might form one line of indefinite length.

Certain Greek metres are thus framed; *e. g.* the Acatalectic Anapæstic Dimetre.

So complete is each part in itself, that the metre may be taken up anywhere, and all the lines cohere together—this cohesion being called *Synapheia* (= *connection*).

Now, English blank verse is as capable of a Synapheia as the Acatalectic Anapæstic.

For the sake of showing the extent to which the *accentual element* must be recognised in the classical metres, I reprint the following paper On the Doctrine of the Cæsura in the Greek Senarius, from the "Transactions of the Philological Society," June 23, 1843 :—

In respect to the cæsura of the Greek tragic senarius, the rules, as laid down by Porson in the Supplement to his Preface to the Hecuba, and as recognised, more or less, by the English school of critics, seem capable of a more general expression, and, at the same time, liable to certain limitations in regard to fact. This becomes apparent when we investigate the principle that serves as the foundation to these rules; in other words, when we exhibit the *rationale*, or doctrine, of the cæsura in question. At this we can arrive by taking cognizance of a second element of metre beyond that of quantity.

It is assumed that the element in metre which goes, in works of different writers, under the name of ictus metricus, or of arsis, is the same as accent, *in the sense of that word in English*. It is this that constitutes the difference between words like *týrant* and *resúme*, or *súrvey* and *survéy*; or (to take more convenient examples) between the word *Aúgust*, used as the name of a month, and *augúst* used as an adjective.

Without inquiring how far this coincides with the accent and accentuation of the classical grammarians, it may be stated that, in the forthcoming pages, arsis, ictus metricus, and accent (*in the English sense of the word*), mean one and the same thing. With this view of the arsis, or ictus, we may ask how far, in each particular foot of the senarius, it coincides with the quantity.

First Foot.—In the first place of a tragic senarius it is a matter of indifference whether the arsis fall on the first or second syllable; that is, it is a matter of indifference whether the foot be sounded as *týrant* or as *resúme*, as *Aúgust* or as *augúst*. In the following lines the words ἡκω, παλαι, εἰπερ, τινας, may be pronounced either as ἥ′κω, πα′λαι, εἰ′περ, τί′νας, or as ἡκω′, παλαι′, ειπερ′, τινα′ς, without any detriment to the character of the line wherein they occur.

Ἥ′κω νεκρων κευθμωνα και σκοτου πυλας.
Πα′λαι κυνηγετουντα και μετρουμενον.
Εἰ′περ δίκαιος εσθ᾽ εμος τα πατροθεν.
Τί′νας ποθ᾽ ἑδρας τασδε μοι θοαζετε.

or,

Ἡκω′ νεκρων κευθμωνα και σκοτου πυλας.
Παλαι′ κυνηγετουντα και μετρουμενον.
Ειπερ′ δικαιος εσθ᾽ εμος τα πατροθεν.
Τινα′ς ποθ᾽ ἑδρας τασδε μοι θοαζετε.

Second Foot.—In the second place, it is also matter of indifference whether the foot be sounded as *Aúgust* or as *augúst*. In the first of the four lines quoted above we may say either νε′κρων or νεκρω′ν, without violating the rhythm of the verse.

Third Foot.—In this part of the senarius it is no longer a matter of indifference whether the foot be sounded as *Aúgust* or as *augúst*; that is, it is no longer a matter of indifference whether the arsis and the quantity coincide. In the circumstance that the last syllable of the third foot *must* be accented (in the English sense of the word), taken along with a second fact, soon about to be exhibited, lies the doctrine of the penthimimer and hepthimimer cæsuras.

The proof of the coincidence between the arsis and the quantity in the third foot is derived partly from *à posteriori*, partly from *à priori* evidence.

1. In the Supplices of Æschylus, the Persæ, and the Bacchæ, three dramas where licences in regard to metre are pre-eminently common, the number of lines wherein the sixth syllable (*i. e.* the last half of the third foot) is without an arsis, is at the highest sixteen, at the lowest five; whilst in the remainder of the extant dramas the proportion is undoubtedly smaller.

2. In all lines where the sixth syllable is destitute of ictus, the iambic character is violated: as—

Θρηκην περασα'ντες μογις πολλῳ πονῳ.
Δυοιν γεροντοι'ν δε στρατηγειται φυγη.

These are facts which may be verified either by referring to the tragedians, or by constructing senarii like the lines last quoted. The only difficulty that occurs arises in determining, in a dead language like the Greek, the absence or presence of the arsis. In this matter the writer had satisfied himself of the truth of the two following propositions:—1. That the accentuation of the grammarians denotes some modification of pronunciation other than that which constitutes the difference between *Aúgust* and *augúst*; since, if it were not so, the word ἄγγελον would be sounded like *mérrily*, and the word ἀγγέλων like *disáble*; which is improbable. 2. That the arsis lies upon radical rather than inflectional syllables, and out of two inflectional syllables upon the first rather than the second; as βλε'π-ω, βλεψ-α'σ-α, not βλεπ-ω', βλεψ-ασ-α'. The evidence upon these points is derived from the structure of language in general. The *onus probandi* lies with the author who presumes an arsis (accent in the English sense) on a *non*-radical syllable.

Doubts, however, as to the pronunciation of certain words, leave the precise number of lines violating the rule given above undetermined. It is considered sufficient to show that wherever they occur the iambic character is violated.

The circumstance, however, of the last half of the third foot requiring an arsis, brings us only half way towards the doctrine of the cæsura. With this must be combined a second

fact arising out of the constitution of the Greek language in respect to its accent. In accordance with the views just exhibited, the author conceives that no Greek word has an arsis upon the last syllable, except in the three following cases :—

1. Monosyllables, not enclitic; as σφών, πάς, χθών, δμώς, νών, νύ́ν, &c.

2. Circumflex futures; as νεμώ, τεμώ, &c.

3. Words abbreviated by apocope; in which case the penultimate is converted into a final syllable; δώμ', φειδεσ́θ' κεντεί́τ', εγώγ', &c.

Now the fact of a syllable with an arsis being, in Greek, rarely final, taken along with that of the sixth syllable requiring, in the senarius, an arsis, gives, as a matter of necessity, the circumstance that, in the Greek drama, the sixth syllable shall occur anywhere rather than at the end of a word; and this is only another way of saying, that, in a tragic senarius, the syllable in question shall generally be followed by other syllables in the same word. All this the author considers as so truly a matter of necessity, that the objection to his view of the Greek cæsura must lie either against his idea of the nature of the accents, or nowhere; since, that being admitted, the rest follows of course.

As the sixth syllable must not be final, it must be followed in the same word by one syllable, or by more than one.

1. *The sixth syllable followed by one syllable in the same word.*—This is only another name for the seventh syllable occurring at the end of a word, and it gives at once the hephthimimer cæsura: as—

Ἧκω νεκρων κευθμώνα και σκοτου πυλας.
Ἰκτηριοις κλαδοί́σιν εξεστεμμενοι.
Ὁμου τε παιανών τε και στεναγματων.

2. *The sixth syllable followed by two* (*or more*) *syllables in the same word.*—This is only another name for the eighth (or some syllable after the eighth) syllable occurring at the end of a word; as—

Οδμη βροτειων αί́ματων με προσγελα.
Λαμπρους δυναστας εμ́πρεποντας αιθερι.

Now this arrangement of syllables, taken by itself, gives anything rather than a hepthimimer; so that if it were at this point that our investigations terminated, little would be done towards the evolution of the *rationale* of the cæsura. It will appear, however, that in those cases where the circumstance of the sixth syllable being followed by two others in the same words, causes the eighth (or some syllable after the eighth) to be final, either a penthimimer cæsura, or an equivalent, will, with but few exceptions, be the result. This we may prove by taking the eighth syllable and counting back from it. What *follows* this syllable is immaterial: it is the number of syllables in the same word that *precedes* it that demands attention.

1. *The eighth syllable preceded in the same word by nothing.*—This is equivalent to the seventh syllable at the end of the preceding word: a state of things which, as noticed above, gives the hepthimimer cæsura.

Αριθμον γελα'σμα παμ|μητορ δε γη.

2. *The eighth syllable preceded in the same word by one syllable.*—This is equivalent to the sixth syllable at the end of the word preceding; a state of things which, as noticed above, rarely occurs. When, however, it does occur, one of the three conditions under which a final syllable can take an arsis must accompany it. Each of these conditions requires notice.

α). With a non-enclitic *mono*-syllable the result is a penthimimer cæsura; since the syllable preceding a monosyllable is necessarily final.

Ἠκω σεβίζων σό'ν Κλυ'ται|μνηστρα κρατος.

No remark has been made by critics upon lines constructed in this manner, since the cæsura is a penthimimer, and consequently their rules are undisturbed.

β). With *poly*-syllabic circumflex futures constituting the third foot, there would be a violation of the current rules respecting the cæsura. Notwithstanding this, if the views of the present paper be true, there would be no violation of the iambic character of the senarius. Against such a line as

Κἀγω το σον νεμω' ποθει|νον αυλιον

there is no argument *à priori* on the score of the iambic character being violated; whilst in respect to objections derived from evidence *à posteriori*, there is sufficient reason for such lines being rare.

γ). With *poly*-syllables abbreviated by apocope, we have the state of things which the metrists have recognised under the name of quasi-cæsura; as—

Κεντειτε μη φειδε'σθ' εγω | 'τεκον Παριν.

3.—*The eighth syllable preceded in the same word by two syllables.*—This is equivalent to the fifth syllable occurring at the end of the word preceding: a state of things which gives the penthimimer cæsura; as—

Οδμη βροτειων αι'ματῶν | με προσγελα.
Λαμπρους δυναστας εμ'πριπτον|τας αιθερι.
Αψυχον εικω προ'σγελω|σα σωματος.

4. *The eighth syllable preceded in the same word by three or more than three syllables.*—This is equivalent to the fourth (or some syllable preceding the fourth) syllable occurring at the end of the word preceding; a state of things which would include the third and fourth feet in one and the same word. This concurrence is denounced in the Supplement to the Preface to the Hecuba, where, however, the rule, as in the case of the quasi-cæsura, from being based upon merely empirical evidence, requires limitation. In lines like—

Και τἀλλα πολλ' επει'χασαι | δικαιον ην,

or (an imaginary example),

Τοις σοισιν ασπιδη'στροφοισ|ιν ανδρασι,

there is no violation of the iambic character, and consequently no reason against similar lines having been written; although from the average proportion of Greek words like *επεικασαι* and *ασπιδηστροφοισιν*, there is every reason for their being rare.

After the details just given the recapitulation is brief.

1. It was essential to the character of the senarius that the sixth syllable, or latter half of the third foot, should have an arsis, ictus metricus, or accent in the English sense. To this

condition of the iambic rhythm the Greek tragedians, either consciously or unconsciously, adhered.

2. It was the character of the Greek language to admit an arsis on the last syllable of a word only under circumstances comparatively rare.

3. These two facts, taken together, caused the sixth syllable of a line to be anywhere rather than at the end of a word.

4. If followed by a single syllable in the same word, the result was a hepthimimer cæsura.

5. If followed by more syllables than one, some syllable in an earlier part of the line ended the word preceding, and so caused either a penthimimer, a quasi-cæsura, or the occurrence of the third and fourth foot in the same word.

6. As these two last-mentioned circumstances were rare, the general phenomenon presented in the Greek senarius was the occurrence of either the penthimimer or hepthimimer.

7. Respecting these two sorts of cæsura, the rules, instead of being exhibited in detail, may be replaced by the simple assertion that there should be an arsis on the sixth syllable. From this the rest follows.

8. Respecting the non-occurrence of the third and fourth feet in the same word, the assertion may be withdrawn entirely.

9. Respecting the quasi-cæsura, the rules, if not altogether withdrawn, may be extended to the admission of the last syllable of circumflex futures (or to any other polysyllables with an equal claim to be considered accented on the last syllable) in the latter half of the third foot.

LOGIC

IN ITS

APPLICATION TO LANGUAGE.

BY

R. G. LATHAM, M.A., M.D., F.R.S.,

LATE FELLOW OF KING'S COLLEGE, CAMBRIDGE; LATE PROFESSOR OF THE ENGLISH LANGUAGE IN UNIVERSITY COLLEGE, LONDON.

ANREL COURT, SKINNER STREET.

PREFACE.

THE title of the present work is by no means unexceptionable. So sensible, indeed, is the Author of the objections that lie against it, that he is the first to take notice of them.

Instead of passing for a work upon Logic as Applied to the Study of Language, the following pages should be considered as an exposition of that amount of Grammar and Philology which applies to Logic. In other words, the view suggested by the term should be reversed. The Language should lead to the Logic, and not the Logic to the Language. The true relations of the two subjects to each other make a certain amount of the one a preliminary or introduction to the other. This preliminary, however, lies in the phenomena of Speech. These lead to Logic, but not *vice versâ*.

Why, then, does the present treatise give us, as far, at least, as its title goes, precisely the reverse of this doctrine? Why does it treat Logic as the preliminary and Language as the subject to which it conducts us?

"So much must be known of the elements of

Logic, in order that the common terms of Grammar may be understood."—So runs the import of our title-page.

"So much of the elementary facts of Language must be known before the study of Logic commences."—So runs the real fact.

So runs the real fact—at least, in the eyes of the present writer, and many like him who hold that, in strict language, Logic begins with the syllogism, and that the structure of *single* and *unconnected* propositions is no portion of that science—that science dealing less with propositions themselves than with the relations which, under certain circumstances, and with certain combinations, they bear to each other.

The nature of the single, or unconnected proposition must, of course, be known. It is submitted, however, that the knowledge of this is to be got from the study of Language as applied to Logic.

To this, however (as has been stated), the import of the present title-page runs directly contrary. Nor is the opposition difficult of explanation, provided the commonplace and practical character of the treatise be borne in mind. It is the wish of the writer to avail himself of an old name for a somewhat new study—the old name being *Logic*.

Now Grammar being taught early, and Logic (if taught at all) late, the effect of such a title as Language applied to Logic, would be to engender the notion that the work wherein the application was exhibited was for adults rather than boys and youths. Its real object is the reverse of this. Its real object is to get certain so-called points of Logic studied as early as the elements of Grammar.

If the term *Logic* be a misnomer, the reason for its use lies in the contrast between the practice of the ordinary grammarians and the logicians. Of the former, many admit that the nature of terms and copulas, along with the structure of the proposition, is a matter which lies within their own jurisdiction. On the other hand, there are plenty of logicians who treat everything anterior to the syllogism as phenomena, not of Logic, but of Language. The practice, however, nowhere, or but rarely, coincides with the theory. Look in an ordinary grammar for anything about propositions, and, in ninety-nine cases out of a hundred, you will look in vain. It is in the books upon Logic that you will find them. At the present moment I remember but one grammar written in English, and written for the practical purpose of teaching a foreign language rather than with a strictly scientific view, wherein the truly grammatical phenomena of the structure of propositions are exhibited. This is Dr. Lee's Hebrew Grammar; and even here the notice is short, and appears no earlier than the first page of the Syntax. Throughout the Etymology no word about propositions is spoken. I repeat, however, that in thus limiting the grammars that treat of a proper grammatical Logic, I speak from memory. There may be many others. Nevertheless—whether many or few, they bear but a small proportion to those which relegate the subject to the domain of the logician.

And *he* always supplies them. Yet they are not his own wares; and he would manifestly and advantageously disencumber his subject of more than one unnecessary appendage if, presuming the gram-

marians to have cultivated their own domain up to its true boundary, he supposed, on the part of his reader, a knowledge of Terms, Copulas, Propositions, Names, and the like, and began his own subject where the preliminaries supplied by another ended.

Enough, however, of the remarks upon the title of the work. The work itself is by no means an ambitious one. Saving the sections upon the convertibility of the pronoun, and those wherein the connotation of Names is quantified, it contains next to nothing of original matter. The importance, however, of these I place high, especially as elements in the Natural History of Language.

This is a sea upon which, if I consulted my inclinations only, I would willingly launch. But the mass of detail is enormous, whilst the principles of criticism that should regulate its construction are but faintly foreshadowed. Nevertheless, whenever such a Natural History is attempted, the remarks just alluded to will find their place.

So far as they do this the present treatise contains materials connected with the advancement rather than the mere diffusion of knowledge. In all other respects, however, it is educational rather than scientific, advertising and promulgating what is known rather than investigating and illustrating the unknown.

The line of study to which it is more especially preparatory, so far as it deals with Logic *per se*, is easily seen, inasmuch as it manifests itself transparently through the names of the authors most especially quoted, and the nature of the (perhaps) over-abundant extracts. These point to the writers

who, above all others, have within the last few years carried Logic beyond the point where its revivers (by whom I mean the school to which Archbishop Whately has been the Coryphæus) left it—Mill, in his *System of Logic;* De Morgan, in his *Formal Logic;* Boole, in his *Laws of Thought;* and Sir William Hamilton, in his *Discussions on Philosophy* and his edition of the Works of Reid.

I repeat the statement that the present treatise is written for young students. And here the title *Logic* has its disadvantage. To many it conveys the idea of something subtle, metaphysical, difficult, sophistical, and the like; something useless, or worse; something quite as difficult as profitable —difficult, at least, to students of an early age and uncultivated understandings. To those who think loosely enough to think thus, the idea of boys being employed upon what they may choose to call *chopping* Logic must be ridiculous.

Be it so. I wish the name were more popular. Popular, however, or unpopular, it is one with which even the unlearned are acquainted. That Logic is neither nonsense nor sophistry I shall not attempt to show. I shall only ask how far it is *difficult* —difficult for young students, too difficult for being taught in schools.

Many of the studies of youth are held to be adapted to the youthful capacities not so much because they are more or less easy, but because they happen to be taught. When such is the case, the particular branch of education is not taught because it is easy but is easy because it is taught. Where there are many teachers, methods of instruction improve, simply from the practice of

communicating knowledge being general. Opinions upon points connected with it become interchanged. Errors have a tendency to become exploded. Ideas are ventilated; the result being that subjects lose much of their difficulty when they lose their novelty.

This is not the case with Logic and its allied subjects. There is no trained body of teachers, no series of explanatory books, no *Logic made easy*.

The exact time of life for the study of elementary Logic is not to be given in years and months. The age, however, at which ordinary grammar, as it is usually taught, is *understood* is the time of life at which anything conveyed by the forthcoming pages can be understood also. How far the meaning of such words as Substantive, Adjective, Noun, Concord, and the like, along with the so-called rules of Orthography, Etymology, Syntax, and Prosody, is actually understood, teachers in schools and classes know better than I. They have, doubtless, too good reasons for teaching them, even when *not* understood; as is too often the case.

Now what I hold respecting the logical part of Language as compared with Grammar as usually taught is this—

1. That, as far as the thing taught is to be understood, Terms and Copulas are no whit more unintelligible or difficult than Nouns and Verbs.

2. That if the memory is to be appealed to without the understanding, the appeal may as well be made for Logic as for Grammar.

This means that where Grammar can be taught, Logic can be taught also, the one subject being in

reality no harder or more inaccessible than the other.

The real amount of thought is much the same on both sides; indeed, the thought is of the same kind. It results in the analysis of what we say or write, and the observation of what we think. The terminology certainly is the easier in Logic. The logical terms remarkable for either their length or exotic origin are only three in number—Categorematic, Syncategorematic, and Hypercategorematic; and these may (at first), by a little management on the part of the teacher, be dispensed with. Of the remainder, the list is but short. It consists of—

Subject,	Concrete,
Predicate,	Abstract,
Copula,	Denotation,
Term,	Connotation,
Proposition,	Summum Genus,
Substance,	Infima Species,
Attribute,	Subaltern,

and a few others less distantly removed from the language of common life. Will any one say that these are more difficult of either explanation on the part of the teacher, or remembrance on the part of the learner, than the longer and more technical list, consisting of names like—

Article,	Adverb,
Substantive,	Preposition,
Adjective,	Conjunction,
Noun,	Interjection,
Pronoun,	Copulative,
Verb,	Disjunctive,
Participle,	Indicative,

Imperative, Potential,
Infinitive, Conjunctive,

and the like?

If Logic be too difficult for beginners, Grammar is too difficult also.

It is submitted, however, that the real difficulties lie in the facts already alluded to, viz. the slight extent to which the subject has been made a branch of *early* education; the intrinsic difficulties of the subject being but small.

The sections whereof the numbers stand in parentheses (56), need not be attended to at the first reading.

CONTENTS.

PART I.

PROPOSITIONS.

PAGE

§ 1. Statements, Assertions, Declarations, or Propositions 1
§ 2. Two parts, members, or constituent elements necessary to the structure of Propositions.—The two SOMETHINGS 6
§ 3. The third Part, Member, Element, or Constituent of Propositions—the word IS 9
§ 4. IT is coming 10
§ 5. LOAVES ARE dear, &c. 11
§ 6. I AM coming, &c. 11
§ 7. A Proposition consists of three Parts, and no fewer 12
§ 8. Apparent exceptions 13
§ 9. A Proposition consists of Three Parts, and no more.—Apparent exceptions 15
§ 10. Propositions Affirmative or Negative . . . 16
§ 11. Special names of the three Parts, Members, Elements, or Constituents of a Statement, Assertion, Declaration, or Proposition—Subject, Predicate, Copula 18
§ 12. Order of the three Parts, Members, or Elements, of a Proposition—Copula in the middle . . . 19
§ 13. General name for Subject and Predicate—Term . 21
§ (14.) Remarks on the Copula.—Apparent absence of a Predicate 22
§ (15.) Remarks on the Copula.—Division between the several Parts of a Proposition.—Incidence of the Negative Element.—Negative Predicates (?) . 23
§ (16.) Differences between the logical and philological view of Propositions 27
§ 17. Questions 31

PAGE

§ 18. Questions of appeal 33
§ 19. Commands 34
§ 20. Grammatical Propositions of three kinds—declaratory, interrogative, and imperative . . . 35
§ 21. Practice in columns.—Words capable of forming, by themselves, Terms 35
§ 22. Practice in columns.—Words capable of forming Predicates, but not capable of forming Subjects 37
§ 23. Practice in columns.—Words capable of forming both Subjects and Predicates 39
§ 24. Practice in columns.—Words capable of forming both Predicates and Copulas 40
§ 25. Practice in columns.—Words capable of forming only parts of Terms 42
§ 26. Propositions Universal or Particular . . . 46
§ 27. Many-worded Terms 49
§ 28. Many-worded Copulas.—Negative element compound 57
§ 29. Propositions isolate or connected—THEREFORE . 57
§ 30. Propositions isolate or connected—BECAUSE . . 60
§ 31. Propositions isolate or connected—IF—AND . . 60
§ 32. Propositions isolate or connected—AS (or SINCE), FOR, THEN 61
§ 33. Propositions isolate or connected—BUT . . 62
§ (34.) Sketch of the structure of the Ordinary Syllogism—its mechanism 62
§ (35.) Structure of the Ordinary Syllogism.—Combination of Propositions.—Mood 71
§ (36.) Structure of the Ordinary Syllogism.—Combinations of Terms.—Figure 75
§ (37.) Structure of the Ordinary Syllogism.—Combinations of Propositions and of Terms considered together.—Mood and Figure 77
§ (38.) Structure of the Ordinary Syllogism.—White.—Socrates.—Some 80
§ (39.) Structure of the Ordinary Syllogism.—Quantity or Extent of the Predicate 83
§ (40.) Operations on the Ordinary Syllogism—Strengthening and Weakening 85
§ (41.) Operations on the Ordinary Syllogism—Conversion and Reduction 86

LOGIC AND PHILOLOGY.

PART I.

PROPOSITIONS.

1.

Statements, Assertions, Declarations, or Propositions.

§ The first subject that requires to be considered is the nature of statements, assertions, declarations, or *propositions*.

In order to understand what is meant by a *proposition*, let us suppose that two persons are talking together.

They talk about something. Let us suppose that they talk about *bread*.

Bread being the something concerning which they talk, what is it that they say about it?

Let us suppose that they say that it is *dear*.

They then make the statement, declaration, or assertion, that *bread is dear*, and this statement, declaration, or assertion, is, in the language of logicians and grammarians, a *proposition*.

Let us now suppose their conversation to have been heard by some third person, and reported to a fourth, and that the two, on their part, talk it over after the following fashion:—

DIALOGUE.

A. What was said by the two men you saw just now?

B. A great deal. They talked together more than an hour.

A. What did they say?

B. More than I can remember. I only know that they talked about something or other. One of them talked about *bread.*

A. What did he say?

B. Something that I did not quite understand, but which was contradicted by the other.

A. What did *he* say?

B. Something that the other disapproved of.

A. So all that you can tell me is, that they talked about *something?*

B. Aye! and *that* something was bread.

A. And that they said *something* about it?

B. They said a good deal about it; and as fast as one said something one way, the other said something another way.

A. Did either of them say that it was *dear?*

B. Yes.

A. And did the other say that it was *cheap?*

B. He did.

So end the two conversations which four imaginary speakers have made for the sake of illustrating the nature of a proposition. We might have made two serve our purpose. Four, however, make the matter somewhat clearer. We might, indeed, have done with only one, for it

requires no great stretch of the imagination to suppose a single person talking to himself or writing; in either of which cases he would be in a condition to form propositions. For the sake, however, of giving all the prominence possible to the essential and fundamental character of the proposition, the Dramatis Personæ were raised to the number of four.

Which of these speakers is right, and which wrong? The one whose statement, assertion, declaration, or proposition, is true, is right; and the one whose statement, assertion, declaration, or proposition, is untrue, is wrong. Common sense tells us this. There is a reason, however, for asking the question. It suggests the fact that propositions are, at least, of two kinds, either true or false; the men who make them being right or wrong accordingly.

Which, then, of the two statements, assertions, declarations, or propositions, is true, and which untrue? This is a question which we cannot answer, inasmuch as we do not know what particular bread is talked about, and, even if we did, we might not, ourselves, know the price of it. All we know is, that two persons, speaking about *bread*, make different statements.

But these statements are opposite, and contradictory to one another. Hence, we may fairly say, that, as both cannot be true, one of them must be the contrary, or untrue. Even this, however, is more than we are justified in asserting; inasmuch as we are by no means certain that they both talk about the *same* bread. We have a notion that they do; nevertheless, this notion is very far from

being a certainty. We have only learnt a part of the conversation, whereas, if we had had the whole, the result might have been that the bread which was declared *cheap* was the bread of one year, the bread which was declared *dear*, the bread of another.

We need not, however, go further in this question; for it is not the price of bread that we are investigating, neither have we any interest in the comparative merits of the statements of our two speakers. Both may be right, inasmuch as they may be talking of different *breads;* or both may be wrong, inasmuch as *bread* may have been neither *dear* nor *cheap*, but *moderate* in price; or one may have been wrong, and the other right. We do not, however, care which of the two it was. Yet the price of bread is seldom or never a matter of indifference to either us or any one else. We may not, perhaps, either make or sell, but the chances are strongly in favour of our either buying it, or consuming it. Besides this, the political economists tell us, that the price of bread enters into the price of everything else. So that the question is anything but an indifferent one.

The fact, however, is, that the case before us is not one of either domestic or social economy at all; but merely an illustration drawn from those departments of inquiry for another and a very different investigation; an investigation which we have undertaken, not as millers, or bakers, or buyers of bread, or economists of any kind, but as *grammarians;* and it is only with the eye of a *grammarian* that we look upon such sentences as the one under notice.

All propositions must be either spoken or

written by some one. They cannot make themselves; neither are they self-existent. They are made in words by some one who uses language.

What do they convey? At the first view of this question, we are inclined to answer that they convey a *fact*. Yet this is not the case. A speaker may as easily put an incorrect statement in the shape of a proposition as a correct one. He may as easily say *gold is not yellow*, which is contrary to fact, as *gold is yellow*, which is a true and real fact.

Propositions, then, by no means convey facts: that is, they by no means necessarily and essentially do so. They *may* do so, but they do not do so on the strength of their being propositions.

Do they convey the belief, on the part of the speaker, that what he asserts is a fact? Not exactly; though something like it. The same person who has said *gold is yellow*, may, immediately afterwards, and in the very next breath or sentence, say *gold is not yellow*. He cannot be said to believe *both* these assertions.

What a proposition conveys is this. It conveys what the speaker chooses to pass off as his belief; so that it may give us something in which he really believes, or it may give us something that he does not believe in at all.

EXAMPLES.

1. *Man is mortal.*—This is true.
2. *Man is five-headed.*—This is false.
3. *Man is man.*—This is true, and something more. It is so true that it is unnecessary to be stated. It is a truism.

4. *Somebody is nobody.*—This is not only false, but impossible.

5. *Bread is dear.*—This, in the mouth of a person who believes, when he utters it, that bread is actually dear, is a real belief, and, if the price be actually high, it is a true fact. Again—

6. *Bread is dear.*—This, in the mouth of a person who believes, when he utters it, that bread is really cheap, is a simulated, or pretended belief, even if it be true as a statement.

All which instances serve to show that truths, falsehoods, truisms, wilful perversions of fact, mistakes, and, even, impossibilities, may form equally unimpeachable propositions; the proposition being considered only in respect to its grammatical character.

2.

Two parts, members, or constituent elements necessary to the structure of Propositions.—The two SOMETHINGS.

§ If we have clearly seen what is *not* essential to the structure of a proposition, we shall all the better understand what *is* essential to it.

There must be *two somethings*—the *something we speak about*, and the *something we say concerning it.*

In order to form an estimate of the value of these *two somethings*, let us try to form a judgment, or express some act of belief by a sentence (if so it can be called) in which one of them is

wanting. We shall find that it is no easy operation.

Suppose, for instance, that I say *the sun*. Here there is a distinct object before me, and before the person whom I address. But here the matter ends. We have a conception, an idea—each of us; but we have nothing more. What about the sun? What about its properties or its powers? Nothing whatever. What is said about it? Nothing. What is believed about it? Nothing. What is disbelieved about it? Nothing. There is no assertion made concerning it—nothing affirmative, nothing negative, nothing false, nothing true, nothing that I maintain, nothing that I deny, nothing that I pretend to believe in, nothing that I pretend to disbelieve in. How can there be? What can I say of it? What can I compare it to? What can I say it is? What can I say it is not? Suppose I make one of the simplest of all possible assertions, and say *the sun is existing*, or *the sun exists*. Even here there are two elements, or parts, one denoting *sun* and the other denoting *existence*. Suppose I say *the sun is the sun*. There are two somethings even here. Both (it is true) are expressed by the same word; and that makes the proposition a truism. Nevertheless, the parts, members, elements, or constituents of the sentence are two, and the sentence itself is a statement, assertion, declaration or proposition, consisting of *two somethings*, though not of two *different* somethings.

A truism, however, is the rarest kind of proposition. It will be well for the world when mistakes and untruths are equally so. In these, as well as in the ordinary statements of fact, the

two somethings are *different*. Contrast with sentences like—

Bread is bread,
Water is water,
Man is man, &c.,

such propositions as—

Bread is dear,
Bread is cheap,
Water is scarce,
Water is abundant,
Man is mortal,
Man is immortal,
Summer is coming,
Summer is departing,
Winter is cold,
Life is short,
Life is long,
Life is uncertain.

In each of all these sentences, and in each and all of the thousands that could be framed like them, the two questions that suggest themselves have different answers.

Thus :—

Q. *What do you talk about ?*

A. *Bread.*

Q. *What do you say that bread is ?*

A. *Dear*, *cheap*, *food*, or anything else as the case may be.

Should any doubts remain as to the absolute necessity of there being, at least, two parts, members, or elements to a statement, assertion, or proposition, they will disappear as we proceed.

3.

The third Part, Member, Element, or Constituent of Propositions—the word IS.

§ It now remains for us to ask whether these same parts, members, or elements of a proposition are *more* than two.

It is by no means impossible to frame an intelligible sentence out of the *two* elements which have been the subject of the foregoing remarks *alone*. Indeed, children do so very often. The child says *sun bright*, or *fire burn*, and is understood. So are the up-grown men of more countries than one, in the languages of which the third part, member, or element of a proposition is omitted.

It is not, however, the business of the men and women who use language to make propositions that are simply intelligible, or capable of being understood. It is their business to make propositions which cannot be misunderstood. And to do this, they must use something more than the words expressive of our two somethings.

No man can conclude to a certainty that, because he sees certain words in juxtaposition, they are in a given relation to each other. No man can conclude to a certainty that they are in any relation at all. He may, indeed, make a good guess; but he can do no more.

There is, then, a third part, member, or element, generally found in most propositions, and without which (as will be seen hereafter) many propositions cannot be constructed. This expresses, over and above the *two somethings* already men-

tioned, an intervening link *between them*. In all the previous examples, this part, member, or element, has been the word *is*.

4.

It *is coming*.

§ In all the examples hitherto given, the author has taken care to use words of which the meaning lies on the surface and is transparently clear and visible. There can be no doubt as to the meaning of such words as *bread*, *water*, *man*, *summer*, *winter*, &c.

Suppose, however, that, instead of expressing himself thus, he had written—

It is coming,
It is dear,
It is scarce, &c.,

what would have been the effect? No one would have known what *it* meant. Nevertheless, it would have denoted something, and that something would have been the thing spoken about; and the several sentences would have been propositions. They would have been propositions of which one of the parts, members, elements, or constituents, was unknown. Still, in form, at least, the sentences would have been propositions.

And a very little more would have made them clear and intelligible ones. Supposing, that, immediately before I said

It is coming—

I had been talking about *summer*, or immediately before I said

It is dear—

I had been talking about *bread*, all would, in that case, have been transparently clear, and the word *it* would have had a meaning—*bread* or *summer*, as the case might be.

5.

LOAVES ARE *dear, &c.*

§ In all the examples hitherto given, the author has used the word *is*, but he has done so only for the sake of clearness. He has chosen that the two *somethings* he said *something* about, should, each, be single objects. He might, however, have said—

Loaves are dear ;

or, he might, after speaking about loaves, have added—

They are dear.

6.

I AM *coming, &c.*

§ In all the examples hitherto given, the author has taken care to use the words *is* or *are;* but he has done it only for the sake of clearness and simplicity. Instead of using such examples as

Summer *is* coming,
Winter *is* departing,
Loaves *are* dear,

he might have said—

I *am* coming, wet, dry, &c.,
Thou *art* departing, tired, &c.

In both of these instances, the two somethings are in the same condition as they were before; the word, however, which connects them, is different.

7.

A Proposition consists of three Parts and no fewer.

§ In every proposition, there are *three* parts, members, or constituent elements:—

(1.) (2.) (3.)
Summer is pleasant.
(1.) (2.) (3.)
Winter is cold.
(1.) (2.) (3.)
Life is short, &c.

To say *summer is—winter is—life is*—&c., is to combine words to no purpose. The combinations convey no meaning.

To say *is pleasant—is cold—is short*—&c., is also to combine words to no purpose. The combinations convey no meaning.

But, further, to say *summer—pleasant, winter—cold, life—short*, is to combine words to no purpose. The combinations convey no meaning; at least, no clear, unequivocal, and necessarily intelligible meaning.

Each of the above-mentioned expressions is imperfect, and it may be seen *how* it is imperfect.

In the expression *summer is*, we have the name (*summer*) denoting the something concerning which we assert something; and we have also the word denoting the existence of an assertion (*is*). What, however, that assertion *is*, is unexplained.

In the expression *is pleasant*, we find what was wanted in the previous one, viz., an assertion concerning something. The name, however, of this *something*, is unexplained.

Lastly, in the expression *summer—pleasant*, although we find both the name of the thing spoken of (*summer*), and the word which tells us what was said about it (*pleasant*), we find no word or sign by which we can tell whether this property, quality, or attribute of *pleasantness* belong or do not belong to *summer*; in other words, there is nothing to show whether the idea expressed by the word *pleasant* apply to the word *summer* at all.

What are we to call these incomplete and imperfect combinations? There is no very convenient name for them.

They scarcely rise to the rank of *sentences*. They are rather *utterances*, or *ejaculations*. At any rate, they are but imperfect sentences.

8.

Apparent exceptions.

§ In all the examples hitherto given, the author has taken care, that, whilst the number of parts in a proposition is not less than three, the number of *words* by which the proposition is ex-

pressed should be three also; neither less nor more. But he has done this only for the sake of clearness; only in order that the number of *words* and *parts* should agree. In the first three of his examples, the number of words might easily have been no more than *two*, and instead of

Summer is coming,
Winter is departing,
He is calling,

the propositions might have run thus:—

Summer comes,
Winter departs,
He calls.

Nay more, if instead of writing English, he had been writing Latin, the whole of the third and fourth propositions might each have been packed up in a single word. The Latin for

He calls, is *Vocat*.

The Latin for

He is called, is *Vocatur*.

Hence, although no proposition can consist of less than three parts, members, or elements, many propositions may be expressed by less than three words, viz. by two, and in some cases by only one. In the English language, however, this extreme abbreviation in the expression of a proposition is uncommon. We generally in English require at least *two* words for our propositions.

9.

A Proposition consists of three Parts and no more. Apparent exceptions.

§ In all the previous examples, the author took care that, whilst the number of the parts, members, or elements of the propositions was no *more* than three, the number of the words by which the proposition was expressed should also be no more than three. He did this, however, only for the sake of clearness and simplicity; for it is very evident that the number of words in every one of his examples might have been increased, and that without violating the idiom of the English language. How easily, for instance, might some of them have begun with the word *the*:—

The summer is coming,
The winter is departing.

How little would the other propositions have been affected, if, instead of simply saying,

Bread is cheap,
Life is short, &c.,

we had said,

Some bread is cheap,
Human life is short,
All iron is useful, &c.;

or (adding somewhat more to the complexity of the proposition),

Some bread is very cheap,
Human life is comparatively short,
Iron is always useful for some purpose,

An axe of good strong iron is useful in the backwoods of America.

And so on, with other examples easily framed.

10.

Propositions Affirmative or Negative.

§ In all the previous examples, we have had a statement of a very clear and definite kind; and we have not only had a very clear and definite statement or assertion, but that statement or assertion has been what is called *affirmative*. The supposed speaker has said

Bread is dear,
Water is scarce, &c.

But it by no means follows that, because he says so, the fact should agree with his statement; still less that all the world should agree with him. On the contrary, we are at liberty to bring another speaker on the stage, and to make him express a series of statements or assertions diametrically opposite to those of our first *dramatis persona*. Thus, when *A* says,

Bread is dear,
Water is scarce, &c.,

let *B* say,

Bread is cheap,
Water is abundant, &c.

What takes place when this happens? We get two opposition statements or assertions, declarations or propositions.

Now, although these statements or assertions are antagonistic or contradictory to each other, they are

both equally affirmative. They are both equally affirmative, though the one actually denies what the other states. The denial, however, is anything but direct. On the contrary, it is got at in a somewhat roundabout way. It is got at by making an affirmative assertion incompatible with the one to which it stands in opposition.

The man who says that *bread is cheap* leaves his hearer to infer that *bread is not dear;* and his hearer draws this inference without much difficulty, because he knows at once that a thing cannot be cheap and dear at the same time. It cannot, at one and the same time, be something and its opposite. And, *vice versâ*, the speaker who commits himself to the doctrine that *bread is cheap*, means to say that it is *not dear* on the same principle. It cannot be two things at once. Thus, whilst one denies that bread is *dear*, and another that it is *cheap*, neither of them expresses his denial in the form of a negative. They only leave a negative to be inferred.

But what if, instead of thus meeting one affirmation by another, they had recourse to the little word *not?* In this case, one of the two words *dear* and *cheap* could be dispensed with; for it would be sufficient to say,

Bread is *not* cheap,

instead of

Bread is dear;

or,

Bread is *not* dear,

instead of

Bread is cheap.

In this case, too, we should have a truly *negative* assertion.

By changing *is* into *is not*, *are* into *are not*, *am* into *am not*, &c., we can convert an affirmative into a negative proposition; and, *vice versâ*, by ejecting the word *not* in such combinations as *is not*, *am not*, *are not*, &c., we can make a negative proposition affirmative.

Now *is* or *is not*, be it remembered, is the element which connects the two *somethings* that constitute, on one side, the subject of our discourse, and, on the other, the something said concerning it.

What, then, is its function? It shows whether the two somethings are conformable or unconformable with each other; whether they coincide or differ, agree or disagree.

11.

Special names of the three Parts, Members, Elements, or Constituents of a Statement, Assertion, Declaration, or Proposition—Subject, Predicate, Copula.

§ The something concerning which we make the statement, assertion, declaration, or proposition is called the *Subject*. Words like *man*, *summer*, *winter*, &c., are subjects, and we can assert of them that they are *mortal*, or *warm*, or *cold*, &c., or else the contrary, *i. e.* that they are *not mortal*, *not warm*, &c.

The assertion made concerning the subject, is called the *Predicate*; so that *mortal*, *warm*, *cold*, &c., are predicates, and we can speak of certain things as being *mortal*, *warm*, *cold*, or the contrary.

The element which connects the subject and predicate is called the *Copula*. If the copula stand by itself, the preposition is affirmative; if it be accompanied by the word *not*, it is negative.

12.

Order of the three Parts, Members, or Elements, of a Proposition—Copula in the middle.

§ Enough has now been written concerning the *number* of the parts, members, or elements of propositions; enough, and perhaps more than enough, so ample has been the exposition of a question that, at first sight, seems sufficiently simple to be explained in a few words. Such importance, too, has been given to the number *three*, that it almost looks as if, after the fashion of the old cabalist philosophers, we found something mystic in it. Nevertheless, there are good reasons for the prominence that this number has assumed.

The question of *order* comes next.

In all the examples hitherto given, the subject has come first, the copula next, and the predicate last, just as if the sequence were invariable. Thus—

1. *Bread* (or *water*) . *Subject.*
2. *Is* . . . *Copula.*
3. *Dear* (or *scarce*) . *Predicate.*

Such is the usual course in the English language, as well as in many others. In the English it is much more natural to say—

Water is scarce,

than

Scarce is water,

though the latter expression is by no means either unintelligible or impossible. Even such a phrase as

Scarce water is

is imaginable.

There is no need, however, of going to these extreme and artificial forms in order to show that the usual sequence is by no means the only one. Even in English, it often suits the purpose of the rhetorician to transpose the predicate and the subject. Plain prose would say—

Diana of the Ephesians is great ;

but it is only the very plainest prose that would do so. Our fine translation of the Scriptures (as is well known) gives us—

Great is Diana of the Ephesians.

In Latin, even the copula may be final: *e. g. vocatus sum = I am called.* So it does in our own language, in such phrases as,

Proud I am.

As far, then, as the *ordinary* practice of the English language is concerned, the order of the parts, members, or elements of a proposition is regular ; so regular that we should not be far wrong if we talked of the *first*, *second*, or *third* propositional elements, instead of talking of *subjects*, *copulas*, or *predicates*. On the other hand, however, the *extra*-ordinary cases within the pale of our own language, along with the practice of many other tongues, imply that the sequence is really a matter of indifference.

But, although the order of the *words* may be indifferent, the order of the *ideas* that they express may be regular.

Again, although the order of the ideas may be indifferent, the inventors of the words Subject, Copula, and Predicate, may not have thought them so. More than this, they may have framed their phraseology accordingly. Now this seems to have been the case. Whatever were the places of the subject and predicate, the copula stood between them; for the meaning of the word copula is *link*, *union*, *tie*, or *connection*.

13.

General name for Subject and Predicate—Term.

§ The question of the order or sequence of the parts of a proposition brings us towards the introduction of a new word.

Terminus is the Latin for a *boundary*, *limit*, or *end*.

As the copulas stood between the subjects and the predicates of a proposition, the subjects and the predicates themselves must have stood at its two ends, limits, or boundaries. Which stood first and which stood last, which began the proposition and which ended, was a matter of indifference. It was enough that between them they gave it its limits; that each was *non*-medial, final, or *terminal*.

And now we get a new word, in the shape of a general name for subject and predicate collectively —the word *term*; a word of which we have

hitherto eschewed the use, writing *name* or *word* instead. Now, however, that its meaning has been explained, it will appear in almost every page of our treatise, and that frequently.

(14.)

Remarks on the Copula.—Apparent absence of a Predicate.

§ We have seen that a predicate, under certain conditions, can be something more than a predicate; *i.e.* a predicate and copula as well.

Can a copula, under any condition or modification, be anything more than a copula? Especially can it be a copula and predicate also? To this question many logicians say *Yes*. They say that *is* = *is existing* = *is an existence* = *is a being* = *is an entity*, or something of this kind, and that when the predicate implies simple *existence*, it can be expressed by the copula alone. Such is the case in the sentence *God is*, which is considered to consist of a subject and copula alone. To this view, several writers (Mill amongst them) object, and that very decidedly; arguing that a copula, as a copula, is merely a sign of predication, and nothing more. The instances, therefore, in question are merely instances of the ambiguity of the word by which the copula is expressed. The word *is*—a word which not only performs the function of a copula, but has a meaning of its own, by virtue of which it may itself be made a predicate—is not a copula which has enlarged its powers,

but thé *sign* of the copula which has a double function.

Such an error as the one before us is best guarded against by bearing in mind the essentially *relative* character of the copula. All that it expresses, in any proposition, is agreement or disagreement between the two terms.

Let A stand for the Subject,
„ B „ „ Predicate,
„ = „ „ Affirmative Copula,
„ ≠ „ „ Negative Copula,
and all such errors are avoided.

(15.)

Remarks on the Copula.—Division between the several Parts of a Proposition.—Incidence of the Negative Element.—Negative Predicates (?).

§ The present section is devoted to what may be called the *incidence of the negative element.* It will show that certain writers have divided the proposition into its three parts differently, the generality having referred the negative element to the copula, whilst some have connected it with the predicate.

a. By changing *is* into *is not*, we convert an affirmative into a negative proposition. This is how the statement stands in words.

b. By changing = into ≠ we convert A = B into A ≠ B. This is how the statement stands in symbols.

From this it follows, that it is the character of

the copula, that determines the character of the proposition; the rules being that—

a. Affirmative copulas make affirmative propositions, and (*vice versâ*) that—

b. Negative copulas make negative propositions.

Such is the current doctrine. But it is clear, that a very little ingenuity may modify it. An affirmative copula with a negative predicate, will give us the same result as an affirmative predicate with a negative copula. Thus:—

Cæsar is not dead,

may be read either

Cæsar (is-not) dead, or—
Cæsar is (not-dead).

If this be true, the symbolic formula lately suggested, requires alteration. If so—

Let A stand for the Subject.
„ B „ „ Affirmative } Predicate.
„ B′ „ „ Negative }
„ .= „ „ Copula.

Here we get rid of $\neq$, but take B′ in its place.

This difference of the distribution of the negative element of propositions has not obtained the assent of either the major or the most distinguished part of our recent writers.

EXTRACT.

"Some logicians state this distinction differently; they recognise only one form of copula, *is*, and attach the negative sign to the predicate. 'Cæsar is dead,' and 'Cæsar is not dead,' according to these writers, are propositions agreeing not in the subject and predicate, but in the sub-

ject only. They do not consider 'dead,' but 'not dead,' to be the predicate of the second proposition, and they accordingly define a negative proposition to be one in which the predicate is a negative name. The point, though not of much practical moment, deserves notice as an example (not unfrequent in logic) where, by means of an apparent simplification, but which is merely verbal, matters are made more complex than before. The idea of these writers was, that they could get rid of the distinction between affirming and denying, by treating every case of denying as the affirming of a negative name. But what is meant by a negative name? A name expressive of the *absence* of an attribute. So that when we affirm a negative name, what we are really predicating is absence, and not presence; we are asserting not that anything *is*, but that something is *not;* to express which operation no word seems so proper as the word denying. The fundamental distinction is between a fact and the non-existence of that fact; between seeing something and not seeing it, between Cæsar's being dead and his not being dead; and if this were a merely verbal distinction, the generalisation which brings both within the same form of assertion would be a real simplification: the distinction, however, being real, and in the facts, it is the generalisation confounding the distinction that is merely verbal; and tends to obscure the subject, by treating the difference between two kinds of truths as if it were only a difference between two kinds of words. To put things together, and to put them or keep them asunder, will remain different operations, whatever tricks we may play with language."—MILLS, *Logic*, i. 4, § 2.

Now it is clear that this refinement on the ordinary view is made for the sake of simplicity. But is not the ordinary view made so too? And, if this be the case, is it not possible, that an undue sacrifice may have been made? It is transparently

clear that those who take the view of Hobbes (for it is to the view of that writer that Mill takes his exceptions), and those who take the other, admit but *one* formula, the doctrine on both sides being that *either* the copula or the predicate is negative, and that as a general rule. But is this assumption the true one? May we not err in looking towards simplicity too exclusively? What if Hobbes' view be the true one in some, the ordinary in other, cases? Propositions would then be less uniform in their construction, less simple in their form, and less manageable in their handling. Logic, in short, would be somewhat more complex. But this is no reason for ignoring a distinction, provided that the distinction be real. Generality and simplicity are good things, but they must not be bought at the price of facts.

The present writer suggests that, in philology at least, it may be inaccurate to hold that, because the negative belongs to the copula in *some* cases, it does so in *all*.

And it may be just as inaccurate to maintain that, because it *sometimes* attaches itself to the predicate, it is *essentially and necessarily* predicative.

He believes that negatives are sometimes what he would call *terminal*, and sometimes *inter-terminal*; terminal negatives belonging to the predicate rather than the copula, inter-terminals to the copula rather than the predicate.

As a philologue he goes farther still. He doubts whether it be in accordance with the phenomena of language to make the negative element of propositions a part of either predicate or copula. It certainly simplifies matters to say that the parts of

a proposition, whether negative or affirmative, are three, and no more than three; and that the one sort differs from the other simply in the different character of one of these three constituents. But what if the truer view be that the negative sign is no modification of any pre-existing element, but a fresh element altogether?

Certain languages dispense with the copula when it is affirmative; but not when it is negative. If we say *fire hot*, the word *is* may be supplied by the person spoken to, when we simply mean that the property of *heat* is connected with substance *fire*. But what if we deny this? We cannot leave the person spoken to to supply such a word as *not*.

(16.)

Differences between the logical and philological view of Propositions.

§ It may now be said that, if the logical form of a proposition be thus unsuited to the purposes of the grammarian, the grammarians and the logicians should part company, and that the former should find their own formula for their own propositions, making it no part of their business to attend to the view taken by the latter. In this there is much, but not, perhaps, enough to constitute the whole, truth. There is, doubtless, a certain amount of difference between the operations of the philologue and the logician; but there is also a very close connection, as we have seen already.

Nine-tenths of what has been written in the present treatise is as much a matter of logic as it is of language. Neither can anything easily be found con-

nected with the latter of these two subjects, which has not some bearing upon the former. It may, possibly, be wrong to say that our modes of speaking act upon our modes of thinking; in other words, that Thought *without* Language would be something different from Thought *with* Language. It would not be expressed so as to be intelligible to a second person; nevertheless, it would be Thought.

Again, it may possibly be right to say, that language is limited to the *expression* of our thoughts (just as pictures express the objects they represent, and the letters of the alphabet stand as signs of certain sounds), and that language so limited has nothing to do but to take thought as it finds it, and put it in a form that shall communicate it to some one external to the sentient or thinker; the sentient or thinker being able to commune with *himself* without language, *i.e.* to think to himself without talking to himself.

All this may be true. Nevertheless, excellent logicians (and I believe a vast majority of them) hold that language is not only the expression of thought, but, to a certain extent, the instrument by which thought is formed.

Extracts.

1.

"Logic is derived from a Greek word (λόγος) which signifies communication of thought, usually by speech. It is the name which is generally given to the branch of inquiry (be it called science or art) in which the act of the mind in reasoning is considered, particularly with reference to the connection of thought and language."—De Morgan, *Formal Logic*, chap. ii.

2.

"Logic is a portion of the art of thinking. Language is evidently, and by the admission of all philosophers, one of the principal instruments or helps of thought; and any imperfection in the instruments, or in the mode of employing it, is confessedly liable, still more than in almost any other art, to confuse and impede the process and destroy all ground of confidence in the result. For a mind not previously versed in the meaning and right use of the various kinds of words, to attempt the study of methods of philosophising, would be as if some one should attempt to make himself an astronomical observer, having never learned to adjust the focal distance of his optical instruments so as to see distinctly."—MILLS, *Logic*, i. 1, § 1.

3.

"Here, therefore, we find a new reason why the signification of names, and the relation, generally, between names and the things signified by them, must occupy the preliminary stage of the inquiry we are engaged in.

"It may be objected, that the meaning of names can guide us at most only to the opinions, possibly the foolish and groundless opinions, which mankind have formed concerning things, and that as the object of philosophy is truth, not opinion, the philosopher should dismiss words and look into things themselves, to ascertain what questions can be asked and answered in regard to them. This advice (which fortunately no one has it in his power to follow) is in reality an exhortation to discard the whole fruits of the labours of his predecessors, and demean himself as if he were the first person who had ever turned an inquiring eye upon nature.

"What does any one's personal knowledge of things amount to, after subtracting all which he has acquired by means of the words of other people? Even after he has learned as much as men usually do learn from others, will

the notions of things contained in his individual mind afford as sufficient a basis for a *catalogue raisonnée* as the notions which are in the minds of all mankind?"—MILLS, *Logic*, i. 1, § 3.

4.

"That language is an instrument of human reason, and not merely a medium for the expression of thought, is a truth generally admitted. It is proposed in this chapter to inquire what it is that renders language thus subservient to the most important of our intellectual faculties. In the various steps of this inquiry, we shall be led to consider the constitution of language, considered as a system adapted to an end or purpose; to investigate its elements; to seek to determine their mutual relation and dependence; and to inquire in what manner they contribute to the attainment of the end to which, as co-ordinate parts of a system, they have respect.

"In proceeding to these inquiries, it will not be necessary to enter into the discussion of that famous question of the schools, whether language is to be regarded as an *essential* instrument of reasoning, or whether, on the other hand, it is possible for us to reason without its aid. I suppose this question to be beside the design of the present treatise, for the following reason; viz. that it is the business of science to investigate laws; and that, whether we regard signs as the representatives of things and of their relations, or as the representatives of the conceptions and operations of the human intellect, in studying the laws of signs we are in effect studying the manifested laws of reasoning. If there exists a difference between the two inquiries, it is one which does not effect the scientific expressions of formal law, which are the objects of investigation in the present stage of this work, but relates only to the mode in which those results are presented to the mental regard. For though in investigating the law of signs, *à posteriori*, the immediate subject of examina-

tion is language, with the rules which govern its use; while making the internal processes of thought the direct object of inquiry, we appeal in a more immediate way to our personal consciousness,—it will be found, that in both cases the results obtained are formally equivalent. Nor could we easily conceive that the unnumbered tongues and dialects of the earth should have preserved through a long succession of ages so much that is common and universal, were we not assured of the existence of some deep foundation of their agreement in the laws of the mind itself."—BOOLE, *Laws of Thought.*

17.

Questions.

§ All statements, assertions, or declarations, are propositions.

Is the converse of this true?

Are all propositions statements, assertions, or declarations?

Up to the present stage of our inquiries, the three parts, members, or constituent elements of a proposition—the two *somethings*, and the link that joins them—the subject, predicate, and copula—have been considered from one point of view only.

Let us now, however, instead of saying

Bread is dear,

say,

Is bread dear?

Does this latter combination of words constitute a proposition?

It certainly has some of the elements of one, and those very important ones.

It contains the two words significant of the two *somethings*—*bread*, *dear*. It contains the word which connects them—*is*.

It contains all this, and it contains nothing besides. A chemist would say that a sentence like the one in question, gave us the same elements as the other, with a different arrangement.

Nevertheless, there is no assertion, no statement, no declaration; none, at least, of a direct and straightforward kind.

Instead of this, there is a *question*.

Now, at the first view, few things can be more unlike each other than a question and an assertion. The latter implies knowledge, the former the want of it. The latter contains a certain amount of information, real or supposed; the former seeks for such information; and for this reason, the chief works on logic have formally, and by name, excluded *Questions* from the class of propositions. All, however, that the grammarian says is, that a question is not an assertion, a declaration, or a statement. All that the grammarian says is, that whenever there is an assertion, a declaration, or a statement, there is also a proposition. He never says that wherever there is a proposition, there is also a statement.

The fact is, that in grammar, a Question is neither more nor less than a variety of the ordinary proposition, implying that the subject is something concerning which the speaker requires information; something unexplained, but not incapable of explanation; explanation that may possibly be supplied by the person spoken to.

The sentence—

What is this? = this is what?

What = something upon which information is requested.

It may be objected, however, that it is not the

habit of language to use such expressions as *this is what?* but, on the contrary, to prefer the form, *what is this?* All that need be said upon this point is, that it is not the *general* custom of the *English, and certain other languages*, to do so. The English, and certain other languages, transpose the predicate and subject when the proposition is a question; but there is no necessity for their doing so. It is merely a particular practice, and no general law of language.

A question, then, or interrogation, is only an ordinary assertional or declaratory proposition with its parts transposed.

18.

Questions of appeal.

§ There is a certain sort of question which is neither more nor less than a negative. When a person in extreme perplexity says, *What am I to do?* he often means that there is nothing that can be done. In like manner—

What do you say to that? means *You have nothing to say* to it.

Who would rely on the word of a convicted perjurer, or on the honour of a notorious cheat? Here, *who* means *no one.*

In questions of this kind, we not only appeal to the person spoken, as to whether such or such a fact is true, but we imply our own belief to the contrary; in which case our last example means, *I know of no one who relies on the word and honour of perjurers and cheats, and have a strong conviction that no one does do so.*

* * * * *

"The miserable Sporus is too vain and frivolous a thing to be the object of either advice or anger. No one uses a wheel to break a butterfly."

Such the plain prose; but not so the verses of Pope:—

"Satire or sense can wretched Sporus feel?
Who breaks a butterfly upon a wheel?"

Again:—

"Or* hear'st thou rather pure ætherial stream,
Whose fountain *who* can tell?
Paradise Lost.

Who = no one.

Questions of this kind are called *Questions of Appeal.*

19.

Commands.

§ At the first view, few things can be more unlike each other than an assertion and a command; indeed, it may be admitted, that the propositional character of commands is less clear than that of questions. Words like *walk*, *stand*, &c., convey neither an affirmation nor a denial, as a matter of direct assertion. Nevertheless, they are essentially affirmative, and, by attaching to them the word *not*, can be made negative: *walk not, stand not, fear not, eat not, drink not, do not.*

Again—

Walk = thou be walking.
Stand = thou be standing.
Eat = thou be eating, &c.

And what is *thou* but a subject, *be* but a copula, and *walking* but a predicate?

* This means, *Do you hear as your name? art thou called?*

20.

Grammatical Propositions of three kinds—declaratory, interrogative, and imperative.

§ A proposition that conveys an assertion, statement, or declaration, is called a *declaratory* proposition. It may also be called an *assertional* one.

A proposition by which we ask a question is called an *interrogative* proposition.

A proposition that conveys a command is called an *imperative* proposition.

The grammarian recognizes all these three varieties as propositions. The logician recognizes the first only. Questions and commands he excludes. In his eyes there is no proposition where there is no declaration or assertion.

21.

Practice in columns.—Words capable of forming, by themselves, terms.

§ Peruse the following columns, noting that they are marked 1 and 2.

Draw a line sufficiently long to have three words written on it.

Take any word from list 1, and write it on the *left* end of the line.

Take any word from list 2, and write it on the *right* end of the line.

Insert between the words thus written the word *is*.

Before the *left-hand* words, put *a*, *an*, or *the*, if necessary to make sense.

List 1.

man	bow	wealth
woman	arrow	happiness
child	dart	goodness
father	spear	strength
mother	fishing-rod	length
son	fisherman	air
daughter	hunter	fire
horse	shooter	water
mule	lioness	body
dog	book	soul
ox	pen	atmosphere
ass	ink	firmament
fowl	paper	sun
bird	virtue	sky
egg	vice	essence.

(2.)

good	deep	shooting
bad	broad	shining
indifferent	long	weeping
big	short	groaning
little	fierce	blazing
great	happy	laughing
small	virtuous	thinking
black	vicious	standing
white	manly	conquering
red	womanly	conquered
green	childish	hunted
hot	fatherlike	moved
cold	bodily	beaten
weak	atmospheric	drifted
strong	essential	sifted
high	personal	driven.

The lines will then run thus :—

Man is good, &c.,
A child is little,
The bow is small,
The woman is thinking,
The water is beaten, &c., &c.,

in any sort of combination or to any number.

Or we may throw the two lists into two columns, the former on the left, the latter on the right side of the paper, and connect the two by *is*, writing—

$$\left.\begin{array}{l}\text{The man}\\ \text{The woman}\\ \text{The child}\end{array}\right\} \text{ is } \left\{\begin{array}{l}\text{good,}\\ \text{bad,}\\ \text{indifferent, \&c.}\end{array}\right.$$

In each and all of these instances, we have a proposition—a proposition with its subject at the beginning (or on the left-hand side as we write), its predicate at the end (or right-hand side), and its copula between them (or in the middle).

Some of these propositions are false, improbable, and even impossible. Nevertheless, they are all propositions, grammatically constructed, and accurate in form. And this is all that need be.

22.

Practice in columns.—Words capable of forming Predicates, but not capable of forming Subjects.

§ The previous lists have shown us that there is a certain class of words which can constitute the subjects of propositions.

They have also shown that there is another class which can constitute the predicates.

Can the same words constitute *both* subjects and predicates?

Let us answer this by again operating on our lists.

Reverse the order of the columns by writing the words of No. 2 on the left-hand side of the paper, and those of No. 1 on the right.

Good is man,
Little is child,
Small is bow,
Thinking is woman,
Beaten is water, &c., &c.

Are these sentences grammatical? Do they constitute propositions? No. It may be said that they are intelligible, and that, if interpreted so as to be made so, they would be no more untrue, improbable, or impossible than some of the acknowledged propositions of the previous section. It may be said, for instance, that *good*, *little*, *small*, &c., mean a *good thing*, a *little thing*, *goodness*, or *littleness*, &c., and that

Goodness is (*a*) man,
Littleness is (*a*) child, &c.,

are propositions. The qualities in question may, it may be said, have been personified, so that Goodness may be a man, just as Britannia is a woman, or Cupid a boy. All this may be the case; but if it be so, the words must have changed their mean-

ing. In the plain unvarnished language of common sense no one will say that

Good is man

is a proposition in the same way as

Man is good

is one.

Again, it may be said, that combinations like *good is man*, are combinations like one already quoted, viz. *great is Diana of the Ephesians*, which is the same as *Diana of the Ephesians is great.* This, however, is by no means an instance of the word *great* being used as a subject. It is only an instance of the usual order of the subject and predicate being reversed.

We may, then, safely say there is a certain class of words—words like those in No. 2—which can form the predicates of propositions, but not the subjects. And this gives us a partial answer to the question with which we commenced, viz. Can the same word constitute *both* subjects and predicates?

Answer. Whatever may be the case with the words of No. 1, the words of No. 2 have no such double power. They constitute predicates only.

23.

Practice in columns.—Words capable of forming both Subjects and Predicates.

§ This answer, however, is only partial, inasmuch as it applies only to the words of List 2. What can those of List 1 do? They can certainly form *subjects.* This we have seen. Can they also

form *predicates?* They can. They can do two things at once. Operate on the columns, and you will see that this is the case.

A man is a man;

this is a truism. Nevertheless, it is a proposition.

A man is a woman;

this is an untruth. Nevertheless, it is a proposition.

Insert the word *not*, so converting the affirmative into the negative.

A man is not a man;

this is no longer a truism, but an untruth.

A man is not a woman;

this is no longer an untruth, but a truism.

An egg is food,
Vice is not virtue;

these are truths. All, however, are propositions.

And now our question is answered altogether.

Question. Can the same words constitute both subjects and predicate?

Answer. The words of No. 2 can constitute predicates only; but the words of No. 1 can constitute subjects and predicates both.

24.

Practice in columns.—Words capable of forming both Predicates and Copulas.

§ From List 2, select all the words ending in *-ing*, as think-*ing*, remembering that they had

the property of being able to form predicates—not subjects, still less subjects and predicates as well—but only predicates.

Form a certain number of propositions with them,

The woman is thinking, &c.

Separate the syllable *-ing* from the syllable that precedes it by a hyphen—

The woman is think-*ing*.

Write *-s* instead of it, and omit the word *is*.

The result is a series of propositions of the following form :

The woman thinks, &c.

In these propositions which is the subject? The words *woman*, &c.

And which the predicate and copula? The words *thinks*, &c. They are predicates and copulas at once.

Mutatis mutandis, the same applies to the words in *ed* and *en*, *conquered*, *beaten*, &c.

The hunter is conquered,
The fisherman is beaten,

or

The hunter is conquer-*ed*,
The fishermen is beat-*en*,

or

The hunter conquer-*s*,
The fisherman beat-*s*,

or

The hunter conquers,
The fishermen beats, &c.

The following words, amongst others, are capable of forming by themselves both a predicate and a copula at once.

eat	teach	shoot
drink	learn	shine
speak	read	weep
breathe	write	groan
live	worship	blaze
die	petrify	laugh
fear	boil	think
hope	ride	stand
love	walk	conquer
see	sigh	simmer
hear	hunt	astonish
feel	fish	pine
hunger	impeach	beat
mock	drive	drift
stain	move	sift.

25.

Practice in columns.—Words capable of forming only parts of Terms.

§ The examples of propositions hitherto given have been of either the simplest form possible, or very simple. They have rarely consisted of more than three words, and even when they have done so, the additional word has generally been either *an* (*a*) or *the*; as—

An eagle is a bird; or—
The man is good, &c.

Sometimes, however, it has been *some*, and *all*; whilst in § 9, for the sake of showing that it was

by no means necessary for a proposition to be absolutely simple, we find such ones as—

> Human life is comparatively short,
> Iron is always useful to man,
> An axe of good iron is very useful in the backwoods of America.

Examples of this kind may be multiplied indefinitely. They are examples of comparatively, though not of absolutely simple propositions.

Analyse them, and classify the words of which they consist.

In doing this, first find the terms.

This we do by finding the copula—*is*.

The words to the left of it (for we still proceed mechanically) form the subject: the words to the right of it the predicate.

SUBJECTS.			PREDICATES.
Human life	}	is	{ comparatively short,
Good iron			always useful,
An axe of good iron			very useful in the backwoods of America.

Now, pick out from the terms of these three propositions all the words that find a place in either of the lists of the previous section. These will be *life*, *axe*, *iron*, *backwood*, and *America*, for the class capable of forming *either* subjects or predicates, and *human*, *good*, *short*, and *useful* for the class capable of forming predicates only. Verify this, if necessary, by constructing propositions accordingly.

The remaining words will be *an*, *the*, *comparatively*, *always*, *very*, *in*, *of*.

To see whether any of these words, *by themselves*, will form either subject or predicate; *i.e.* write *is* in the middle of a line, and the words in question on either side of it.

The *is* comparatively,
Comparatively *is* the,
In *is* very,
Very *is* in, &c., &c.

Ring what changes we may upon them, the result is the same; or rather the no-result is the same. No proposition is created; and this is because the words in question, though capable of forming *parts* of either a subject or a predicate, cannot form a *whole one.*

The previous examples have shown something more. They have shown that it by no means follows, that because a word can, by itself, constitute the whole of a term, it cannot, therefore, constitute a part of one. *A*, *the*, *in*, *very*, &c., can constitute parts of terms only; *iron*, *good*, &c., can constitute whole terms, but they can constitute parts of terms as well.

The words of our two lists—the words like *man*, *iron*, *good*, *useful*, &c.—were only a few out of many. There were many others like them. The same is the case with *a*, *the*, *very*, *comparatively*, *in*, and *of*. They are simply specimens or samples of a class.

The character of the class last under notice was, that the words which it contained (*man*, *good*, &c.) were capable of forming by themselves, and without the aid of other words, terms; the terms thus formed being, of course, simple.

The character of the class now claiming consideration is, that the words which it contains (*a*, *very*, *in*, &c.) are not capable of forming, by themselves, but only with the aid of other words, terms; the terms thus formed are, of course, other than absolutely simple.

The class last under notice fell into certain divisions, one containing the words capable of forming *both* subjects and predicates; another, the words capable of forming predicates only; another, the words that formed predicates and copulas as well. Hence, whilst *man* and *good* agreed in the general character of being able, by themselves, to form terms, the terms that they severally formed were different.

The same applies to the class containing *a*, *the*, *very*, *in*, &c. They agree *generally*, i.e. they agree in the fact of their powers or functions being limited to the formation of parts of terms only. They differ in the particular parts of a term that they severally have the power, or function, to form.

They agree, however, generally.

a. Of this general class to which they all belong *a* and *the* form one division—a small one, for there are not many other words in the same predicament as these.

b. *Comparatively* and *very* form a second—the largest.

c. *In* and *of* form a third, intermediate in magnitude.

A further illustration of the characteristics of these three classes will be found in Part II.

26.

Propositions Universal or Particular.

§ It may, perhaps, have already struck the reader that the division of propositions into Negative and Affirmative, the only division hitherto made, has been insufficient. If so, he will anticipate the introduction of new terms, some of which may be, more or less, technical. And this is exactly what he will find. Propositions may be of any amount of simplicity or complexity. They may be three-worded, *i.e.* with no more words than elements, or they may extend over whole lines, and fill up moderate-sized pages.

In the following pair of propositions, one of which is negative and the other affirmative, it is more important to notice the likeness between them than the difference.

Swans are white,
Swans are not white.

All the parts here are clear. The words *swan* and *white* tell us what is meant by the subject and the predicate; the words *are* and *are not* give us the copulas. All, then, is clear—but only to a certain extent; for a little reflection will show us that there is still a piece of information wanting.

How many swans are white? *How many* swans are not white? This is what we have yet to be told. It *may* be that the whole class, genus, or group of swans—every individual bird belonging to it—is of the same colour, or it may be that only one *per cent.* thereof is so. What, in short, does the word *swans* mean? Does it mean *all* or *some*,

the whole of a class or the part of one? Does it mean *swans* universally, or *swans* partially? All that the wording of the proposition supplies us with is the statement that there is more than *one* swan which is white; more than one swan other than white. This we collect from the copula being *are* instead of *is;* and it is all that we do collect.

So that our notion of a proposition is still incomplete, and we still want a fresh class of words. Nor is it difficult to see what sort of words these must be. They must stand in the very closest juxtaposition with the subject. They must almost be part and parcel of the subject. They must combine or coalesce with the subject much in the same way that the negative combines with the copula. Whether they will be separate words, or words inseparably united, will depend upon circumstances.

The two chief words of this kind are *all* and *some;* as we may see by prefixing them to the two propositions under notice, and writing

All-swans are white,
Some-swans are not white.

By writing *all* or *some*, we know what we may call the *extent*, or *quantity*, of our proposition; *i.e.* we know how far the words *white* and *not white* extend to the class of birds called *swans*. We know that in the first proposition, they extend over the whole class; whereas, in the second, they extend over only a part of it.

To say that *some swans are white*, is to say that a portion, or *part*, of the class of birds called *swan* is endued with the property or attribute of *whiteness*—a portion, or *part;* not the whole. Some of

them may be brown; some even black. What are we to call such an affirmative as this, an affirmative that applies only to a part of a class? We are to call it a *Particular affirmative*; just as we called the other a *Universal* one. If we choose, we may contrast these two sorts of propositions. We must remember, however, that they are both Affirmative.

The same difference presents itself, when we come to the *Negative*.

No swan is white,
Some swans are *not* white.

The first of which is an *universal*, the second a *particular, negative*.

There are, then, four sorts or species of propositions; and these it is the business of the logician to arrange or classify. In doing this, he has his choice between two principles.

a. He may do as has just been done. He may make the primary divisions, *affirmative* and *negative*, each falling into the *universal* and *particular*, or sub-divisions, in which cases his table stands thus :—

Affirmatives.	Universal—*All* swans are white, Particular—*Some* swans are white;
Negatives.	Universal—*No* swans *are* white, Particular—*Some* swans *are not* white;

or,

b. He may make the division into *universal* and *particular* primary, and that of *affirmative* and

negative secondary. If he do this, his table stands as follows :—

Universal.	Affirmative—	*All* swans *are* white,
	Negative —	*No* swans *are* white ;
Particular.	Affirmative—	*Some* swans *are* white,
	Negative —	*Some* swans *are not* white.

Now, it is this latter arrangement which is the arrangement of the logician, in whose writings the sequence (which it is very important to remember) is—

1. Universal Affirmative,
2. „ Negative ;
3. Particular Affirmative,
4. „ Negative.

We now proceed to the consideration of—

27.

Many-worded Terms.

I should be glad to think that either the present work, or some work like it, was to be studied earlier than even the first rules of the ordinary grammars. But this is a thing to be desired rather than expected—*optandum magis quam sperandum*. Such being the case, I assume that the ordinary grammatical meaning of such words as *masculine*, *feminine*, *neuter*, and *gender*, is understood by the reader.

Now the old grammarians are in the habit of speaking of the relative value, dignity, or worth of these three genders. The "masculine," they say, "is more worthy than the feminine, and the feminine more worthy than the neuter." They generally proceed to show what this means by examples. I stop, however, here; using the words only as an illustration. For——

Just as one gender in grammar is more worthy than another, one class of words in logic has greater worth than its fellows. And it is evident where this greater worth or value lies. It is to be found with those words which can not only form, by themselves, and single-handed, *terms*, but terms of either kind. A word that can be both predicate and subject, may fairly be called worthier than one which can form a predicate only. A word like *sun*, for instance, is a worthier word (so to say) than a word like *bright*.

I shall often have to speak of these words, but, at present, we have no names for the classes to which they belong. To speak of words-which-can-form-both-subjects-and-predicates, and words-which-can-form-predicates-only, is somewhat inconvenient. We want a shorter term. But this we shall not get, until we reach the third part of our treatise, and it is not expedient to anticipate. What are we to call them? I shall take a word from each class, as a sample of the whole group; say *sun* and *bright*. Then for those that can form both *copulas and predicates*, I shall make *shine* stand as a specimen. Hence, the phraseology for the present section will be——

1. *Words like sun*—words that can be *either subjects or predicates.*

2. *Words like bright*—words that can be *predicates only :* and

3. *Words like shine*—words that can be *copulas and predicates.*

With this preliminary, we may investigate the nature of *many-worded terms.*

Before we have finished doing this, other classes of words will have to be treated in a similar manner. First—

The words by which we expressed the *extent* of propositions require notice;—*all, some, no.* These, for the present, may be looked upon as parts of the word which they precede, rather than as separate words ;—*all-swans, some-swans, no-swans.* The fuller explanation of this will appear in the sequel.

The same applies to the little words *an, a,* and *the ;* and it applies to them even more strongly and decidedly than it did to *all, some,* and *none ;* inasmuch as they have no separate independent existence at all. We cannot use them by themselves. On the contrary, wherever they appear, they appear as the part of some other term, and that inseparably;—*a-man, an-egg, the-man,* &c.

Examples.

A heavy body, or *a-heavy-body,* is a many-worded term.

So is *a court of justice,* or *a-court-of-justice.*

So is *John-Nokes-the-mayor-of-the-town.* (*Examples from Mill.*)

So is *a-man-in-a-black-coat-riding-along-the-road-on-a-bay-horse.*

We "might," writes De Morgan, "coin a single word to express" this.

Let us keep, however, as much as possible to the words which we have chosen as samples of these several classes, viz.: *sun*, *bright*, and *shine*.

1. The-bright-sun is shining—
2. The-sun-of-summer is shining—
3. The-bright-sun-of-summer is shining—
4. The-bright-sun-of-summer is shining-cheerfully—
5. The-sun-of-summer shines-cheerfully—
6. The-sun-of-summer shines-cheerfully-with-its-beams-through-the-air-of-the-morning-in-this-lovely-month-of-June.

All these are instances of many-worded-terms.

They give us two new words—samples of classes, viz.: *a—of—* and *cheerfully*. Let us add these to our previous list, which now runs thus; *sun—bright—shine—cheerfully—of—a*.

Summer, *beams*, *air*, and *morning*, belong to the same class as *sun*.

With and *through* belong to the same class as *of*.

What is the principle upon which these several words (and the words like them) combine, so as to form many-worded-terms?

First rule.—This is the rule for words like *bright*. They combine with words like *sun*; and that without the interposition of any intermediate link;—*the bright sun*. They can, however, form terms by themselves; *i. e.* they can form predicates. Hence they suggest no new class, having been already considered. This is not the case with the words that come next. *They* give us new classes of words.

Second rule.—This is for words like *cheerfully*, which can only form *parts of terms*. They combine only with words like *bright*. We cannot say *the cheerfully sun shines*. We *can* say the *cheerfully bright sun shines*.

We can also say, the *bright sun shines cheerfully*, or the *cheerful sun shines brightly*; for *cheerfully* is in the same class with *brightly*, and *cheerful* is in the same class with *bright*.

But is not this an exception to the rule? Is not *shines* in a different class from *bright*? It is, and it is not. *Shines* = *is shining*, and *shining* and *bright* are in the same class. *Bright* is a word that forms a predicate. So is *shining*. But *shines* is a predicate and copula as well. Hence, when we say the *sun shines brightly*, we attach the word brightly to the predicative, and not to the copular part of *shine*.

1. The sun shines = the sun is shining,
2. The sun shines brightly = the sun is shining brightly;

or,

3. The sun is brightly-shining,

not

4. The sun is-brightly shining.

We can*not* say—

The sun is brightly;

we *can* say—

The sun is shining.

Third rule.—This applies to words like *of*, *with*, *through*, &c., words which, like the last, can only form *parts of terms*. They combine with words

like *sun*, *summer*, *beam*, and *air*, and with no others. We cannot say—

This is the sun of bright.

We *can* say—

This is the sun of summer.

More than this; they cannot enter into the structure of a term, unless there be not only *one* word like *sun*, with which alone they can be combined, but *two* such. Strike out from the example last given either of the two words *sun* or *summer*, and you must strike out *of* also.

Now it is clear that, in the different places in the structure of many-worded terms which these several words fill, we have the basis of a division of them into classes.

One of these contains words like *a*, *an*, and *the*, which blend themselves, almost inseparably, with words like *sun*, *summer*, *beam*, &c.

An anatomist may compare these combinations to the bones and ligaments of the human body, with which his professional studies have made him familiar. If so, he sees in such combinations as *a-man*, and *the-sun*, two parts joined, or jointed together—*articulate*, as he calls them in the language of his science; *articulate*, from the Latin word *articulus* = *joint*, *knuckle*. What if we see, in some future page of this work, this word *articulus* again, and that with a meaning very unlike its anatomical one? It will not be the only instance of the kind. *Dactylus* is the Greek for a *finger*. It is also the Greek for a combination of syllables of different quantities or lengths. A

finger has one longer and two shorter joints; a *dactyle* has one longer and two shorter syllables.

A second of these suggested classes contains *cheerfully*, and a vast number of words like it; words which may be said to qualify the meaning of terms like *bright* or *shining*. And this is what they do. They do it, however, in various ways.

Sometimes they give us the *manner* in which the predicate applies to the subject.

Now this is only another way of saying that they give us the manner in which a certain thing is done, or a certain state occurs. To say the *sun is shining cheerfully*, is to connect the predicate *shining*, qualified by the word *cheerfully*, with the subject *sun*; but it is also to make the statement that the object called *sun* does a certain act (*i.e.* the act of *shining*), in a certain manner, *i. e. cheerfully*. He might have done it differently, *i. e.* the *sun* might have shone *dully*, or *faintly*. In like manner to say *I am rather tired*, is to say that *I* (the person who speaks) *am* (or *is*) in a certain state, *i. e.* the state expressed by the word *tired*. But I might be *very tired*; in which case the predicate (*tired*) would have been qualified by a different word from *rather*, but still by a word of the same class.

Now the words of this class are numerous, and they fall into divisions and sub-divisions. And this is no more than what we expect from the word *manner*, which is a word of wide signification. There are many *manners* in which a thing may be done. It may be done *slowly*, *quickly*, *well*, *ill*, &c., &c.

Again, in respect to states of being, there are

many *degrees* in which they may occur; for instance, men may be *just-a-little*, or *slight-ly*, or *rather*, or *very*, or *exceeding-ly tired*.

Then there are the words denoting *time* and *place;* for it is clear that an action done in one place, or at one time, differs from an action done elsewhere, and at another. We may, perhaps, say that it differs in the *manner* of its doing; for though the two actions, when taken by themselves, may be alike, the circumstances under which they occur constitute a difference of no small importance. This gives us words like *here* and *there*, and also words like *now* and *then*.

Other examples may be given, but they will probably suggest themselves spontaneously. They are by no means either few or rare. They have what may be called their *function*, which is to qualify or *modify* the meaning of words like *bright*, *tired*, *shining*, &c. And now—

Observe the word *modify*. It is derived from *modus*, a *mode* or *manner*. From *modus* the Latin language derived the word *modal-is*, from which grammarians and logicians get the term *modal* = *in mode or manner* of a thing.

All the words belonging to the present class are more or less *modal* in their function.

1. Words like *of*, *with*, *through*, &c., still stand over for notice. The class that they form, though important, is small. It consists chiefly of the following words—*by*, *from*, *in*, *out*, *near*, *through*, *with*, *up*, *down*, along with a few others.

This is all that will be said about it at present.

28.

Many-worded copulas.—Negative element compound.

§ So much in respect to the complexity of *terms*. We may add that, even the sign of the *negative copula* is rarely, if ever, simple. The word *not* = *n* + *whit*, *n* + *aught*, *n* + *ot*, its sense being *not-a-whit*, *not-a-bit*, *not-at-all*. The French language illustrates this still more clearly—where the second element (*pas* or *point*) is separated from the negative proper by the verb. *Je ne l'ai vu pas* = *I have not him seen at all*, being, as in English, only more evidently, a negative, and something else.

This second element of the negative is *modal*. It gives not only the negative itself but its *manner* or *degree* as well.

29.

Propositions isolate or connected—THEREFORE.

§ In sentences like *bread is dear*, &c., we have the connection between two *terms*.

Can two *propositions* be connected? The proper logicians are those who have most to do with this branch of inquiry; and it is in the language of the proper logicians that the illustration of it may best begin. The proper logicians have so much to do with the connection of propositions that their whole science turns upon it: indeed, if a proposition stand alone, they have nothing to do

with it. One of the most important words in all logic is a word which makes no part of a term, no part of a copula, no part of a proposition at all. It is extra-terminal, so to say—extra-copular—extra-propositional. It comes between two propositions, but belongs to neither. It is part of the masonry of logic, but it is neither brick nor scaffolding. It is the cement or mortar. The word in question is *therefore*. There are other words like it; but if we understand the import of the word *therefore*, we shall understand the basis and foundation of the science of formal logic.

1. Frame a universal proposition, and let it be affirmative.—*All swans are white.*

2. Fix your attention on its subject—*swans.*

3. Frame a second proposition, which shall also be affirmative, but not universal. Let it be particular.

4. Let the predicate of this second proposition be the same as the subject of the first.—

Some-of-the-birds-in-St.-James's-Park are swans.

5. Out of these two propositions make a third. There is no difficulty in doing it. It will be as follows—

Some-of-the-birds-in-St.-James's-Park are white.

6. Consider the nature of the connection between this third proposition and the two which preceded, and select the proper word for expressing it. This will be *therefore.*

1. All swans are white.

2. Some-of-the-birds-in-St.-James's-Park are swans.

Therefore

4. Some-of-the-birds-in-St.-James's-Park are white.

Instead of the second of the three propositions being universal, let it be particular. The result will be the same. There will be a place for a word between the second and third, and the word that fills that place will be *therefore*.

1. All swans are black.

2. Some-of-the-birds-in-the-pond-in-St.-James's-Park are swans.

Therefore

3. Some-of-the-birds-in-the-pond-in-St.-James's-Park are black.

We may substitute for *swans*, *birds*, &c., and *white* (or *black*), any words whatever which can take their place as terms of a proposition, and the result will be the same. The statement conveyed in the third proposition will necessarily follow, and be deduced from the statements of the first and second, and this necessary relation will be expressed by the word *therefore*, the first example of a peculiar class of words, viz. words that enter into language without entering into propositions.

They enter into language without entering into propositions. Nevertheless, they are anything but independent of them. On the contrary, they have, in one sense, more to do with them than even words like *man*, *bright*, and *shine*. Words like *man*, *bright*, and *shine*, can exist where there is only a single proposition into which they may enter.

Words like *therefore* enter into no proposition at all; yet they require *two* before they can exist. This is because they must have something that they can come *between*. The copula is somewhat in the same way. It requires two terms before it can exist; two terms between which it can find its place. The words, too, like *of* and *with*, originated under like conditions. They come *between* two other words.

30.

Propositions isolate or connected—BECAUSE.

§ Transpose the order of the three propositions last given, beginning with the last and ending with the first; and instead of writing *therefore* after the second, write *because* after the first.

Some-of-the-birds-in-the-pond-in-St.-James's-Park are white,

because

Some-of-the-birds-in-the-pond-in-St.-James's-Park are swans, (and)
All swans are white.

This is a second instance of a word coming between two propositions, but belonging to neither.

31.

Propositions isolate or connected—IF—AND.

§ Instead of stating directly and unconditionally that *all swans are white*, or that certain *birds-in-*

the-pond, &c., are *swans*, qualify one or both of the propositions by the word *if*. Thus—

If
All swans are white, (and)
Some-of-the-birds, &c., are swans,
Some-of-the-birds, &c., are white.

Or,—

All swans are white, (*and*)
if
Some-of-the-birds, &c., are swans,
Some-of-the-birds, &c., are white.

These are additional instances of a word standing between two propositions, but belonging to neither of them.

32.

Propositions isolate or connected—AS (*or* SINCE), FOR, THEN.

§ *As* (or *since*), *for*, and *then*, are in the same class with *therefore*, *because*, and *if*. Thus—

Some-of-the-birds, &c., are white,
because,
They are swans;
for, *as* (*since*)
All swans are white,
Some-of-the-birds, &c., must be white.

Or,—

If
All swans are white,

then

Some-of-the-birds, &c., are white,

for (*as* or *since*)

They are swans.

33.

Propositions isolate or connected—BUT.

§ The word *but* shall supply us with our last illustration, and it shall do so in a sentence arising out of the subject itself, and already made familiar to us—

"*Therefore, because, if, and, as, since, for, then,* and *but*, stand between two propositions,

but

They belong to neither."

(34.)

Sketch of the structure of the ordinary syllogism—its mechanism.

A combination of three propositions, the third of which is connected with the other two by means of the word *therefore*, is called a *syllogism*; and with the structure of the syllogism the province of the logician begins—the province of the logician as distinguished from that of the grammarian. The latter deals with single propositions, and with propositions in pairs; the former with propositions in *threes*, or *triads*, if we may borrow an expression from the Welsh antiquarians.

If he strictly limit himself to his own subject, the grammarian will have nothing to say to syllogisms. However, in the present work we have

said so much about terms that we will utilize our familiarity with them, carry our observations a little further, and (although wide of our mark) direct our attention to a point of proper logic.

Our first analysis of the syllogism will be that of a watchmaker, who, in explaining the mechanism of a watch, is satisfied, in the first instance, at least, with taking one to pieces, numbering the several parts of which it consists, and naming them. The *principles* of his art he reserves for a second division of his subject.

A syllogism, then, consists of three propositions, the third of which is connected with the other two by means of the word *therefore*. And this alone is sufficient to suggest the nature of the proposition thus connected, and, through it, of the syllogism altogether. It suggests that it is a form of *reasoning*. Something has gone before, and *therefore* something else will come after it.

Of the three propositions that constitute a syllogism, the third is called the *conclusion*, the other two the *premises*.

So much for the number and names of the three propositions that constitute a syllogism.

Next follows the question as to the number of its *terms*. How many of these are there? In one sense, there are *six*; in another, only *three*. There are six, because each proposition contains two, a subject and a predicate. There are six, because $3 \times 2 = 6$. There could not be fewer

But it by no means follows that because there are six terms altogether in a proposition there should be six *different* ones. One, or more, of them may be repeated. The subject of one propo-

sition may be the predicate of another, as is the case with the following pair of sentences :—

Man is mortal,
Socrates is a *man* ;

and with innumerable others.

Now the real number of the *different* terms of a proposition is three ; so that our formula is *three and three—three propositions* and *three terms*, each term appearing twice—three propositions—three pairs of terms.

So now we see why the number of terms in a syllogism is, in one sense, *six*, in another, *three*. There are *six*, if we look to the whole number of predicates and subjects ; *three*, if we look only to the different words that constitute them.

All men are mortal,
Socrates is a man, } *Premises.*
therefore
Socrates is a mortal.—*Conclusion.*

In this conclusion, *Socrates* is the subject, *mortal* the predicate.

It is absolutely necessary to the structure of the syllogism that the terms of the conclusion must previously have appeared in the premises. How could it be otherwise, when each term has to be taken twice ?

But this is not all ; the two premises have to be distinguished from one another. If so, they require to be named.

Now the names for the premises are obtained from the names of the terms of the conclusion, the

predicate of the conclusion being called the *major* term, the subject of the conclusion the *minor*.

Each of these not only (as has been already stated) appears in the premises generally, but in different and specific parts of them; *i.e.* one appears in their first, the other in their second proposition; and this is only another way of saying that, of the two premises in a syllogism, one must contain the subject, the other the predicate, of the conclusion. Unless this be the case, there is no syllogism at all.

The premiss that contains the predicate of the conclusion, is called the *major* premiss; the predicate of the conclusion having been called the *major* term.

The premiss that contains the subject of the conclusion is called the *minor* premiss; the subject of the conclusion having been called the *minor* term. Hence—

A premiss often takes its name from the name of the term it includes; and *major* terms make *major* premises, and *vice versâ*.

Major.—All men are mortal.
Minor.—John is a man.
Therefore,
Conclusion.—John is mortal.
(*Barbara*.)*

Here *mortal*, the predicate of the conclusion, is the *subject* of the *major* premiss as well.

John, the subject of the conclusion, is also the subject of the *minor*.

* The words in italics appended to the end of each syllogism need not be noticed at present; they are explained in § 45.

But what is the third term, *man*, which has no place in the conclusion at all?

This will be considered after the *order* of our three propositions has been examined.

In the examples just given, the *major* preceded the *minor*, and the *minor* the *conclusion*. Was this necessary? No. The *minor* might have come first.

John is a man.
All men are mortal.
Therefore,
John is mortal.—(*Barbara.*)

More than this: substitute *because* for *therefore*, and the conclusion might have come first, *i. e.* we might have begun with the end.

John is mortal,
Because
John is a man, (and)
All men are mortal.

or,

John is mortal,
Because
All men are mortal, (and)
John is a man.

It is a matter of custom, however, to use *therefore* instead of *because*, and, in accordance therewith, to write the *major* first, and the *conclusion* last, the *minor* coming between. It is only, however, a matter of custom.

And now we may ask the name of the third term, *man*; the term that has no place in the conclusion at all.

It is called the *middle* term; and a very important term it is. It is called *middle*, because it is neither the *greater*, like the *major*, nor the *smaller*, like the *minor*. It appears in the minor premiss; and as the minor premiss is between the major and the conclusion, its place in the syllogism looks like a reason for the name *middle*. It is, however, only an apparent, the other being the true, one. Besides this, the middle term is not limited to the middle proposition; but occurs in the first as well:—

1. All *men* (*middle term being the subject*) are mortal;

2. Socrates is a *man* (*middle term being the predicate*);

Therefore,

3. Socrates is mortal (*no middle term at all*).

A middle term in the conclusion, either as subject or predicate, is a logical impossibility, as the very terms *major* and *minor* exclude it. A *major* is a *major* because it is one term of the conclusion; and a *minor* is a *minor* because it is the other. Now there is no third term at all; and hence a middle term in the conclusion of a proposition is a contradiction in terms.

A *middle* term, then, takes its name from the fact of its being intermediate to its *greater* and *lesser* fellows, or *co*-terms; its *major* on one side, and its *minor* on the other. But what sort of an explanation is this? Is it not an instance of the *obscurum per obscurius?* What are *majors* that they should be made much of, and called *great?* What are *minors* that they should be made little of, and called *small?* Whence the idea of size,

magnitude, or quantity; these notions of little-ness, of much-ness, and of mean-ness? By *mean* I mean *middle*, as is meant in the expression *golden mean = aurea mediocritas.*

Any affirmative proposition whatever answers this question; *e. g. All swans are birds*, What is *swan?* The name of a class consisting of an indefinite number of objects, to all of which the characteristics of the bird called *swan* apply. *Swan*, then, is the name of a class. And what is *bird?* The name of a class also; the name of a class which contains all the *swans* in the universe, and in addition to these, all the *geese, eagles, pigeons, sparrows, &c.*, besides. Which of these two classes is the larger? The class of birds. Why? Because, though all swans are birds, all birds are not swans. Hence, the term bird is the term by which the greater class is denoted. The same applies to *All men are mortal*, though not quite so evidently, inasmuch as *mortal* is not so evidently the name of a class as *bird*. Yet what does it mean? All beings endowed with the attribute of *mortality*. Call them *mortals*, and you have a class of them. Now as this class comprises not only *man*, but all other living beings, it is the name of the greater class, *i. e.* it is a greater, or *major*, term.

For negative propositions, this explanation of the words *major* and *minor* is wanting.

No bird is a quadruped,
All swans are birds,
No swan is a quadruped;
(*Celarent.*)

Or,

No animal is immortal,
All men are animals,
No man is immortal.

It is probable, however, that the phraseology of the affirmatives has been extended to them.

Premiss is derived from the Latin word *præmissus* = *sent before*, wherein *præ* = *before*, and *missus* = *sent*. Its application to the *major* and *minor* premises of a syllogism is clear and appropriate. These are the fore-runners, heralds, or vaunt-couriers of the conclusion. But what are we to say to some of its secondary applications, as they appear in the language of common life, amongst surveyors, beershop-keepers, and legislators, who talk of the *premises of a house*, and of *beer* that may or may not be *drunk* upon such *premises*. Strange divergence of a meaning! A word that originally meant *sent before* now means something upon which a man either consumes malt liquor or founds the conclusion of a syllogism. Strange, but not stranger than many hundred others.

More important than such a question as this is the fact that the words conclusion and premiss are essentially relational terms, as much so as *husband* and *wife*, *parent* and *child*, *sovereign* and *subject*, &c. Where there is no conclusion, there is no premiss; and there is no premiss where a conclusion is wanting. The one leads to, the other follows from, the other. A premiss without a conclusion is a *road* leading to *nowhere*; and that is no road at all. A conclusion without a premiss is an effect without a cause, *i. e.* no effect whatever.

Such is the fact, though common language disguises it. Common language often leads us to say

that such and such conclusions are *false*. So they may be as matters of fact, or as propositions; but not as matters of logic, or as conclusions. They may be false as matters of fact, because the premises from which they are deduced are false; and this is the case with such a statement as, *No swan is black*, supposing it to be deduced from—

No bird with web-feet is black,
Swans have web-feet,
Swans are not black.
(*Celarent.*)

It is false because the premises are false. As a deduction from the premises, it is true; and would have been true as a matter of zoology if they had been so. But they were not. On the other hand—

Some web-footed birds are black,
Swans are web-footed,
Some swans are black,

gives us a true piece of ornithology, but a bad piece of logic. In other words, the proposition, *as a proposition*, is true, as a conclusion false.

A conclusion is a conclusion because it follows from its premises; and premises are premises because they lead to their conclusion: the terms being relative. A false conclusion is, in reality, a loose and inaccurate name for no-conclusion. Premises, on the other hand, may be false as single propositions, though true as parts of a syllogism; false as matters of fact, but true as leading to the inference which follows them.

(35.)

Structure of the Ordinary Syllogism.—Combination of Propositions.—Mood.

§ We shall now find it convenient to depart pretty widely from the language of the first sections of this treatise, and to adapt our phraseology to our new department, which has ceased for a while to be that of the grammarian rather than the logician, and begins to be that of the logician rather than the grammarian. We shall find it, I say, convenient to change our phraseology. But, nevertheless, the *things* we talk about will be the same as before. We have, still, under notice, subjects and predicates, terms, copulas which connect them, and statements, assertions, declarations or propositions. Terms and propositions—propositions and terms—it is still the old song; though to a somewhat altered tune. It is still the same series of pictures; though we examine them from another point of view.

It is now convenient to talk less of propositions *simply as such* than of propositions in their character of premiss or conclusion. It is convenient, in short, to talk of conclusions and premises, the premises being either majors or minors.

In like manner, it is also convenient to talk less of terms *simply as such* than of terms in their characters of major, minor, and middle. At any rate, we must fix our attention steadily on these five words—conclusion, premiss, middle term, major, and minor. We must remember, too, that major and minor are the names of certain propositions as well as the names of certain terms.

The first analysis of the syllogism is into its conclusion and premises, the premises being either major or minor; each of the three being a proposition of some kind or other, the conclusion being a proposition, the major premiss being a proposition, the minor premiss being a proposition—three propositions in all. But propositions are of four kinds:—

1. Universal Affirmative.
2. Universal Negative.
3. Particular Affirmative.
4. Particular Negative;

as has been shown in § 26; and any one of these four kinds may constitute any one of the parts of a syllogism. Thus—

a. The major premiss may be one of four things; viz. universal affirmative, universal negative, particular affirmative, or particular negative. It may be any one of these; and cannot be anything else.

b. The minor premiss may be one of four things; viz. universal affirmative, &c.

c. The conclusion may be one of four things, &c.

To proceed—the conclusion may be the same as one of the premises, *e.g.* Say that it is the same as the minor, and that they are both universal affirmatives. We, then, have one universal affirmative followed by another

Again—the minor may be the same as the major. Say, that both are universal affirmatives, and (the conclusion being the same as the minor), we have, then, three universal affirmatives running. This is neither more or less than saying that all the three propositions of a syllogism are of the same sort, *i.e.* universal and affirmative, affirmative and uni-

versal. In such a case, the order of the proposition would be :—

Major—Universal Affirmative,
Minor—Universal Affirmative,
Conclusion—Universal Affirmative.

There are plenty of syllogisms of this kind, *e. g.*:—

All men are mortal ;
All heroes are men ;
Therefore,
All heroes are mortal.—(*Barbara.*)

Contrast with this—

No men are immortal ;
All heroes are men ;
Therefore,
No heroes are immortal.—(*Celarent.*)

What is the order here? The following :—

Major—Universal Negative,
Minor—Universal Affirmative,
Conclusion—Universal Negative.

Again, as a third combination, consisting of a Universal Affirmative, followed by two Particular ones, take—

All men are mortal ;
Some heroes are men ;
Therefore,
Some heroes are mortal.—(*Darii.*)

Here the order (which we may as well express somewhat more compendiously than has hitherto been done) is U. A.—P. A.—P. A.; the words

major, minor, and conclusion being omitted, and the initials standing for the whole word, viz. :—

U. A. for Universal Affirmative,
P. A. for Particular Affirmative.

To these add—

U. N. for Universal Negative,
P. N. for Particular Negative.

Hence, a fourth combination,—

No bad-man is happy ;
Some heroes are bad-men ;
Therefore,
Some heroes are not happy,
(*Ferio.*)

may be read off thus—U. N.—P. A.—P. N. ; or—

Major—U. N. (or) Un. Ng.
Minor—P. A. (or) Pa. Aff.
Conclusion—P. N. (or) Pa. Ng.

There is some advantage, as will appear in the sequel, in writing the order in which the propositions of a syllogism follow each other vertically, or from top to bottom, rather than horizontally, or from side to side.

The order in which the propositions of a syllogism follow each other is called the *mood* of the syllogism.

Enough has now been said respecting the different combinations of the different sorts of propositions that constitute the conclusions and premises of syllogisms. The subject is, by no means, exhausted ; indeed it is only touched. All that is suggested by the present section is, that the

sequence, order, or combination of the constituent propositions of a syllogism is a matter upon which we must steadily fix our attention.

(36.)

Structure of the Ordinary Syllogism.—Combinations of Terms.—Figure.

The combinations effected through the difference between Affirmatives and Negatives, Universals and Particulars, *as propositions in the structure of premises and conclusions*, is one thing; and this we have just noticed.

The combinations effected through the difference between Majors, Minors, and Middles, as *terms in the structure of propositions*, is another; and this we are now about to notice.

They are both questions of order or sequence.

The following syllogisms are the syllogisms of the previous section. Over each of their subjects and predicates the word *major*, *minor*, or *middle*, according to the nature of the term to which it applies, is written:—

1.

Middle.		*Major.*
All men	are	mortal.
Minor.		*Middle.*
All heroes	are	men.
Minor.		*Major.*
All heroes	are	mortal.

(*Barbara.*)

2.

Middle.		*Major.*
No men	are	immortal.

Minor. *Middle.*
All heroes are men.
Minor. *Major.*
No heroes are immortal.
(*Celarent.*)

3.

Middle. *Major.*
All men are mortal.
Minor. *Middle.*
Some heroes are men.
Minor. *Major.*
Some heroes are mortal.
(*Darii.*)

4.

Middle. *Major.*
No bad-man is happy.
Minor. *Middle.*
Some heroes are bad-men.
Minor. *Major.*
Some heroes are not happy.
(*Ferio.*)

Here the sequence, or order, is—*middle, major ; minor, middle ; minor, major.* Or,—

1. *Middle, major.*
2. *Minor, middle.*
3. *Minor, major.*

And it is the same throughout—the same throughout, notwithstanding the difference of order, sequence, or combination in the propositions.

What do we infer from this? Do we infer that the order of the *terms* of a syllogism is constant and invariable, whilst the order of the *propositions* is variable and inconstant? That the affirmatives and

negatives, the particulars and universals, may be chopped and changed, whilst the majors, minors, and middles, have fixed positions? No such thing. So, at least, says the following example, the form of which is—

Major, middle,
Minor, middle,
Minor, major,

or—

Major.		*Middle.*
No bird	is	an-animal-that-brings-forth-its-young-alive.
Minor.		*Middle.*
Every bat	is	an-animal-that-brings-forth-its-young-alive.

Therefore,

Minor.		*Major.*
No bat	is	a bird.—(*Cesare.*)

There are more ways than one, then, in which the majors, minors, and middles of the terms of the premises and conclusions of syllogisms may be arranged, ordered, or combined; and as the object of the present notice is to indicate, rather than exhaust, this difference, this is as much as need be said at present, except that the order in which the terms of a syllogism follow each other is called the syllogism's *figure.*

(37.)

Structure of the Ordinary Syllogism.—Combinations of Propositions and of Terms considered together.—Mood and Figure.

§ The combinations effected through the difference between affirmatives and negatives, universals and

particulars, are one thing (*i. e.* matters of *mood*). The combinations effected through the difference between majors, minors, and middles, are another (*i. e.* matters of *figure*).

We have hitherto kept them separate.

Let us now treat the two together; briefly, and as an illustration rather than a full exposition of the subject.

In doing this, it will suffice to select two pairs out of the foregoing syllogism, and to contrast them with one another.

FIRST PAIR.

1.

A. All men are mortal,
A. All heroes are men,
A. All heroes are mortal.—(*Barbara.*)

2.

E. No man is immortal,
A. All heroes are men,
E. No hero is immortal.—(*Celarent.*)

These, considered as combinations of propositions and terms, run thus:—

1.

AS PROPOSITIONS.	AS TERMS.
A, *or*, Universal affirmative.	Middle, major.
A, *or*, Universal affirmative.	Minor, middle.
A, *or*, Universal affirmative.	Minor, major.

2.

AS PROPOSITIONS.	AS TERMS.
E, *or*, Universal negative.	Middle, major.
A, *or*, Universal affirmative.	Minor, middle.
E, *or*, Universal negative.	Minor, major.

Here the order of the terms is the same, the order of the propositions being different; a fact which the next pair of examples will reverse.

SECOND PAIR.

1.

E. No man is immortal,
A. All heroes are men,
E. No hero is immortal.—(*Celarent.*)

2.

E. No bird is an-animal-that-brings-forth-its-young-alive,
A. Every bat is an-animal-that-brings-forth-its-young-alive,
E. No bat is a bird. (*Cesare.*)

Or,—

1.

AS TERMS.	AS PROPOSITIONS.
Middle, major.	E, *or*, Universal negative.
Minor, middle.	A, *or*, Universal affirmative.
Minor, Major.	E, *or*, Universal negative.

2.

AS TERMS.	AS PROPOSITIONS.
Major, middle.	E, *or*, Universal negative.
Minor, middle.	A, *or*, Universal affirmative.
Minor, major.	E, *or*, Universal negative.

Here, the combination of the terms differs, the combination of the propositions being the same. Syllogisms, then, may be of the same *mood*, but of different *figures*, and of the same *figure*, but of different *moods*.

(38.)

Structure of the Ordinary Syllogism.—White.—Socrates.—Some.

This is a convenient place for noticing three points of logical language, which, if neglected, may strike the reader at some future time as having been insufficiently explained.

I. WHITE, *and words like* WHITE.—These are the words that can, by themselves, constitute predicates, but which cannot, by themselves, constitute subjects, as—

All swans are *white.*

The grammarian has good reasons for denying that words of this kind are *names.* He allows *whiteness* to be a name. *White-thing*, also, he allows to be a name; but not the simple word *white.* He allows, however, that it is a word which suggests and implies a name, and that by adding to it the word *thing, object, entity, being,* or some equivalent word capable of forming a subject, it may be converted into a name. Finally, he admits that this conversion is easy, and, in logic, always legitimate.

Now, this reduction of words capable of forming predicates only into words capable of forming predicates and subjects as well, which the grammarian allows to the logician, the logician finds absolutely necessary.

All swans are white,
But,
All white——are not swans.

We must fill up the blank here, by *bird*, *animal*, *thing*, *object*, *entity*, &c., as the case may be. Hence,—

1. *White-thing* is an actual name, a name *in esse*; whilst—

2. *White*, a word implying a name, is a name *in posse*.

Between these two, the grammarian draws a difference. The logician treats them both alike; both as actual names. *White*, in logic, is a name; and, in logic, a term must be a *name*.

In grammar, a term must be either a *name* or a *word that implies a name*.

This will be noticed more fully in the sequel.

II. SOCRATES, *and words like* SOCRATES.—These (John, Peter, Julius Cæsar, &c.) are names for single individuals. As such they wear the appearance of being particular rather than universal terms.

If, for instance,

Some men are mortal,

be a particular proposition, surely—

Socrates is mortal,

is particular as well; inasmuch as Socrates is only *one* man. He is only *one* out of *some*; a part of a part; a fraction of a fraction; an individual out of a collection; the collection itself being but part of another, and a larger, one.

Nevertheless, *Socrates*, and terms like *Socrates*, are not particular, but universal; the fact being that when we say that *Socrates* (*John*, *Peter*, *Julius Cæsar*, &c.) *is mortal* (*man*, *philosopher*, &c.), we mean not so much the particular individual as a class of individuals whom *Socrates* (*John*, &c.) re-

presents. But classes may be either great or small. They may consist of a million million million of individuals or of only one.

Now the class that is represented by names like *Socrates*, *John*, &c., is a class consisting of a single member. As a *class*, however, it is unbroken in such propositions as

Socrates is mortal,

which give it in full, and not in parts.

III. SOME.—In common conversation, the speaker who says that *some swans are white*, implies that there are *others* which are *not white*. And, in like manner, the statement that *some swans are* not *white*, implies that some *are*. In other words, the affirmation of a part implies the denial of the remainder, and, *vice versâ*, the denial of part implies the affirmation of the remainder. But in logic, this is not the case. In logic, every proposition means exactly what it states, and implies nothing beyond it. In logic, a man may say that *some* swans are white, and, by no means, suggest the notion that they are not *all* so. This may, or may not be the case. If *all* swans are white, it is self-evident that *some* of them are. If *some* swans are white, *all* swans *may* be so.

Some, then, in logic, may mean the same as *all* or *every*; a meaning which, in common speech, it has not.

Some, in logic, means *more than none—i. e. more than none, and possibly all.*

(39.)

Structure of the Ordinary Syllogism.—Quantity or Extent of the Predicate.

The care that is taken by the logicians, that the word *some* should not, by implying (as it does in common conversation) something more than it actually expresses, mean too much, has just been noticed. Through it, we attain (no doubt) a certain amount of caution and accuracy of thought. To say neither more nor less than we mean, and to mean neither less nor more than we say, is only what is right and proper. Be it so. The accuracy, however, in question is limited to one of the members of the proposition. It is only in the Subject that it shows itself; the Predicate being, by no means, well furnished with signs of its quantity or extent.

Mark the blank in the following syllogism :—

All men will die,
All men are rational beings,
Therefore,
—— rational beings will die.

Mark the blank; and ask what is required to fill it up. It must be one of three words—*no*, *all*, or *some*. That it cannot be *no* is evident. On the contrary, it must be either *all* or *some*. Which of these two words is the right one remains to be investigated, and this investigation must be limited to the syllogism itself. We are not allowed to argue, from the rationality of immortal spirits, that only *some* of the beings endowed with reason will

die, and as little are we free to limit the domain of rational beings to the earth upon which we dwell, and, on the strength of all the rational beings of the world of man being liable to death, to assume that *all* will die. We are precluded from all reasoning of this kind; precluded from it because our field of inquiry is limited to the syllogism itself.

In examining this, the first step is to remark that the term *rational beings* in the subject of the conclusion is neither more nor less than the *rational beings* which stood as predicate in the minor premiss. What is it then? Universal or particular? Is it *all men are* (ALL) *rational beings*, or *all men are* (SOME) *rational beings;* by which is meant, Do men constitute the *whole* of the class of rational beings, or do they constitute only a part of it? The answer to this must be got at as we best can. It is transparently evident that it is not given in the wording of the proposition. The subject (*men*) was preceded by *all*; but what precedes the predicate (*rational being*)? Nothing. As far as words go, the whole of the class may as easily be meant as a part of it, and *vice versâ*. Now—

A subject that has previously been a predicate retains its predicative *quantity*.

But this, as long as it was the quantity of a predicate, was a matter of inference only. No sign expressed it. Hence—

Wherever there is a subject in a later, which has stood as the predicate in a former, proposition, the *sign of its quantity* has to be *inferred*.

The rules for doing this are simple; and we arrive at them from the *quality* of the proposition

in which the terms occur—from its *quality*, not its *quantity*, from its character as affirmative or negative, rather than from its character as universal or particular.

The *quantity* helps us but little—

All swans are white.

Admit this to be true, and it will by no means follow that—

All white-things are swans,

however much *some* white-things may be so.

This gives us the rule, that—

1. Universal affirmatives have particular predicates. On the other hand—

2. With universal negatives, the predicates are universal. To say that—

No horse is a bird,

is to say that—

No bird is a horse.

3. The predicates of particulars are of the same extent as their subjects. Hence, as the general rule,—

4. Affirmative propositions have particular, negative, either universal or particular, predicates.

(40.)

Operations on the Ordinary Syllogism—Strengthening and Weakening.

§ *Strengthen* and *weaken* are words of a definite and technical meaning in Logic.

If ALL *men are mortal*, it stands to reason that SOME *men* MUST BE *so*. The two propositions, however, differ. SOME men may be mortal without *all* being so.

The two propositions differ, the one being *particular*, the other *universal*.

To change a proposition from universal to particular is to *weaken*, to change one from particular to universal is to *strengthen*, it.

Now, a universal conclusion from particular propositions is a conclusion too strong for its premises; or rather, it is a conclusion for which the premises are too weak; or rather, it is no conclusion at all.

(41.)

Operations on the Ordinary Syllogism—Conversion and Reduction.

§ To change the order of the terms of a proposition is to change the predicate into the subject, and *vice versâ*. This is called *conversion*.

Simple conversion occurs where we transpose both the term itself and the sign of its quantity, *i. e.* we change their places without making any further alteration; or, as the sign of its quantity is a part and parcel of the term itself, we have an instance of simple conversion where we transpose the terms altogether. This we do with such propositions as—

No horse is a bird,

which is the same as

No bird is a horse;

and with

Some quadrupeds are horses,

which is the same as

Some horses are quadrupeds.

With

All horses are quadrupeds,

the case is different. Here the conversion into

All quadrupeds are horses,

is incorrect.

Change, however, *all* into *some*, and the conversion is legitimate. For—

All horses are quadrupeds,

and

Some quadrupeds are horses.

This, however, is something more than simple conversion. It is conversion accompanied with weakening.

It is obvious that by conversion we may change the mood and *figure* of the proposition converted. This is called *reduction*.

(42.)

Structure of the Syllogism illustrated by treating its Terms as the Names of Classes.—Is (*or* =) *equivalent to* INCLUDED IN.

§ The notion that the terms of propositions partake of the nature of the names of classes has already been suggested. It may now be added that, upon this view, certain aids to the understanding have been framed; aids to the understanding, because they address themselves to the

senses. Form a small triangle, a larger circle, and a square larger still; a square large enough to contain the circle, a circle large enough to contain the triangle, and a triangle small enough to go into the square.

△ ○ □

It is clear that

If

All the △ be included in ○

and

All the ○ be included in □

therefore

All the △ must be included in □

And this may be stated more compendiously by writing =, or > for *included in*, and ∴ for *therefore*. Thus—

	△	=	○		△	>	○
	○	=	□	*or*	○	>	□
∴	△	=	□	∴	△	>	□

Again: instead of *all* △ being included in ○, and all ○ in □, parts only of the classes thus symbolised may be included—facts for which it is by no means difficult to find material or diagrammatic illustrations. Thus—

◎	means all		△	is included in	○
△ ○	„	no part of	△	„	○
◭	„	some part of	△	„	○
▣	„	all	○	„	□
○ □	„	no part of	○	„	□

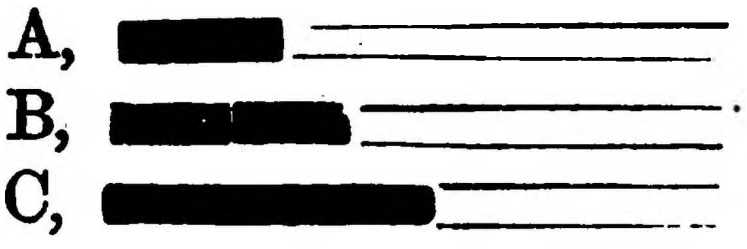
&c., &c.

EXTRACT.

"Let us take the simple assertion, 'Every living man respires,' or 'every living man is one of the things (however varied they may be) which respire.' If we were to enclose all living men in a large triangle, and all respiring objects in a large circle, the preceding assertion, if true, would require that the whole of the triangle should be contained in the circle. And in the same way we may reduce any assertion to the expression of a coincidence, total or partial, between two figures. Thus, a point in a circle may represent an individual of one species, and a point in a triangle an individual of another species; and we express the whole of one species as asserted to be contained or not contained in the other, by such forms as, 'All the △ is in the ⊙; none of the △ is in the ⊙.'"—De Morgan, *Formal Logic*, pp. 8, 9.

Other illustrations are given by means of black and white lines superimposed over each other.

Thus, if all the black portion of A be contained within the black of B, the black of B being similarly contained within the black of C, the black of A must also be contained within that of C.



Other illustrations of the same kind might be added. These, however, are sufficient for the present.

(43.)

Structure of the Syllogism.—Symbolic Representation of Terms by means of Letters.

§ The extent to which the syllogism is independent of the truth of the facts, or opinions,

exhibited in its propositions has already been stated; nor have the repetitions and expansions of the statements to this effect been made without an object. They have served to illustrate what may be called the *formal* character of the syllogism, by which is meant, the fact of the conclusion being deduced from its relation to its premises, rather than the accuracy as matters of fact of the premises themselves.

Such being the case, we are prepared to find in Logic what we find in Algebra, viz. the symbolic representation of the parts of propositions by means of letters—a representation that the generality of the processes of syllogistic reasoning favours and suggests.

EXTRACT.

"When we say that all men will die, and that all men are rational beings, and thence infer that some rational beings will die, the *logical* truth of this sentence is the same, whether it be true or false that men are mortal and rational. This logical truth depends upon the *structure of the sentence*, and not upon the particular matters spoken of. Thus,

Instead of,	*Write,*
All men will die.	Every Y is X.
All men are rational beings.	Every Y is Z.
Therefore some rational beings will die.	Therefore some Zs are Xs.

The second of these is the same proposition, logically considered, and rightly inferred from, the premises. Whether the premises be true or false, is not a question of logic, but of morals, philosophy, history, or any other sort of knowledge to which their subject-matter belongs; the question

of logic is, does the conclusion certainly follow if the premises be true?"—De Morgan, *Formal Logic*, pp. 1, 2.

Should this leap from a particular instance to a general formula be too sudden, we may take, instead of it, the same amount of change by instalments. Thus, for *men* write *Y*; which will give—

Every Y is mortal,
Every Y is a rational being,
Therefore,
Some rational beings are mortal.

Then for *mortal* write X:—

Every Y is X,
Every Y is rational,
Therefore,
Some rational beings are X.

Lastly, for *rational* write Z, which will give us the formula with which we began.

Extract.

Let us examine and analyse such an example as:—

"'Every animal that has horns on the head is ruminant; the elk has horns on the head; therefore the elk is ruminant.' It will easily be seen that the validity (or 'conclusiveness,' or 'soundness') of the argument does not at all depend on our conviction of the truth of either of the premises; or even on our understanding the meaning of them. For if we substitute for one of the things we are speaking about, some unmeaning symbol (such as a letter of the alphabet), which may stand for anything that may be agreed on, the reasoning remains the same. For instance, suppose we say (instead of 'animal that has horns on the head'), 'Every X is ruminant; the elk is X; therefore the elk is ruminant;' the argument is equally valid.

"And again, instead of the word 'ruminant,' let us put the letter 'Y:' then the argument, 'Every X is Y; the elk is X; therefore, the elk is Y;' would be a valid argument as before.

"And the same would be the case if you were to put 'Z' for 'the elk;' for the syllogism 'Every X is Y; Z is X; therefore Z is Y,' is completely valid, whatever you suppose the symbols X, Y, and Z to stand for.

"Any one may try the experiment by substituting for X, Y, and Z, respectively, any words he pleases, and he will find that, if he does but preserve the same *form* of expression, it will be impossible to admit the truth of the premises, without admitting also the truth of the conclusion."—WHATELY, *Logic*, i. § 4.

Observe how decidedly both authors insist on the unimportance of the accuracy or inaccuracy of the propositions as taken by themselves, and how thoroughly they admit nothing as essential to the conclusion but its *relation* to the premises, and their *relation* to each other. Observe, how thoroughly they make the *form*, rather than the substance, of the proposition, the all-important and fundamental element of the syllogism. Yet it is not because they, or any other writers, are indifferent to the actual truth of either the propositions of a syllogism or any other series of sentences. It is only because logic is essentially a science of relations, and (as such) a *formal* science.

Formal Logic is the title of Professor De Morgan's work. Open any treatise on logic, and you soon find the statement that "Logic has no province of its own." What, then, has it? It has the handling and testing of all the facts, opinions, and postulates of all departments of inquiry. It

has no field of its own. It measures the growths of all fields. That—

1. Some men are mortal,
2. Socrates is a man,
3. Socrates is a mortal,

is a triad, or leash, of propositions, all of which are true in respect to the facts they declare or affirm. But are they true as premises and conclusion? Are they premises and conclusions at all? No. It is only *some* men whom the first (we cannot call it the *major*) proposition affirms to be mortal. What if there be *some* who are not? What if Socrates be among them? There may be only one in that predicament. But what if Socrates were he? We *know* that he was *not* this. We know, too, that there are no exceptions to the first statement. We know that we might safely have said *all* instead of *some*. Nevertheless, because we failed to do so, we missed a syllogism, though we stated truths enough to form one from.

On the other hand, that—

1. All horses are six-legged,
2. Socrates is a horse,
3. Socrates is six-legged,

is true as a syllogism, though false as a series of propositions, and that in respect to each and all of the three. However—

To save our sense of propositional or substantial truth from being shocked by this indifference on the part of the syllogism, let us insert—

Before the major proposition—*if*,
Before the minor proposition—*and*,
Before the conclusion—*then*,
In the conclusion—*must be*.

In which case our former series of false assertions runs—

if,

All horses are six-legged,

and

Socrates be a horse,

then,

Socrates *must be* six-legged.

The fact is, that this indifference to truth on the part of the syllogism is, practically, in many cases, an instrument in the investigation of truth. There is many a premiss, the accuracy or inaccuracy of which is doubtful, as long as it is looked at alone. See, however, what it leads to, and you see its truth or falsehood.

Finally, it is this indifference to the matter of propositions that makes the symbolical expression of them possible.

The symbols themselves, as we have seen, are certain letters of the alphabet, and, until some reason is given for preferring one to another, they are all equally convenient. In the previous example we wrote Y is X = MAN is MORTAL. But we might have written H is Y, or A is B, or B is A, &c.

There are reasons, however, in favour of a certain selection. In X, Y, Z, the order of the alphabet coincides with the order of the terms *major* (X), *middle* (Y), and *minor* (Z), which is an advantage.

They are better than A, B, C, for another reason. A is already used for another purpose. A is one of four letters which are used to denote *whole propositions*, rather than the *terms* that constitute

them; the other three being E, I, O, three out of the four remaining vowels.

How are they used? We are prepared to answer this by our knowledge of the division of propositions into universal or particular, and affirmative or negative.

1. The two universals come first, A stands for the universal affirmative, and E for the universal negative—

Every man is mortal = Every Y = X *or* A,
No man is mortal = No Y = X *or* E.

2. The two particulars follow:—

Some men are mortal = Some Y = X *or* I,
Some men are not mortal = Some Y ≠ X *or* O.

We, doubtless, felt the want of a notation of this kind in § 35, when we wrote such formulæ as *universal affirmative, universal negative*, &c., in full—*totidem verbis et totidem literis*. Indeed, it forced us upon the abbreviations, U. A., U. N., P. A., or P. N., &c. Had we, however, used them to any great extent, they would have failed both in compendiousness and generality. Neither would they have had any value in any language where the equivalents to *universal, particular, negative*, and *affirmative* began with letters other than A., N., P., or U.; as they do (for German) where *Bejahende* = *affirmative*.

With X, Y, Z, as symbols of *terms*, the use is by no means constant. Several logicians use any letter that strikes them instead.

With A, E, I, O, however, the writer has no discretion. He must apply as they have been applied, *semper, ubique, ab omnibus*.

And now we may state that the same sort of illustration which was supplied by means of our △s, ⊙s, □s, ▬s, &c., may be supplied by the letters of the alphabet.

Let the largest of the three classes, or the longest of the three black lines, be represented by a long line of Zs; each letter denoting the individual objects by the aggregation of which the class is constituted.

Under each Z write Y, for every object that is, at once and the same time, a member of both classes.

Repeat this with X and Y. The result will be lines like—

Z Z Z Z Z Z Z Z Z Z.
Y Y Y Y Y Y Y y y y.
X X X X X x x x x x.

Every X that comes under Y, comes under Z also.

The meaning of the smaller letters is clear. They denote the contraries to X and Y, *i. e.* the objects which are *not*-X, and *not*-Y. The study of these relations, though important, is only suggested in the present section.

(44.)

Propositions Categoric or Hypothetic.

The last example of the previous section suggests a third division of propositions.

That they are either *universal* or *particular* has been seen.

It has also been seen that they are either *affirmative* or *negative*.

We now see that they are either conditional

or unconditional, or, as the logicians say, *hypothetical* (conditional) or *categorical* (unconditional).

In the example just given, the truth of the conclusion as a proposition depended on the truth of the major; this dependence being expressed by *if*.

To speak of propositions as universal and particular is to speak of them in respect to their *quantity*.

To speak of propositions as negative or affirmative, is to speak of them in respect to their *quality*.

To speak of propositions as categorical or hypothetical, is to speak of them in respect to their *substance*.

(45.)

Mnemonics.

§ Symbols and diagrams, abstractions and sensible representations, letters and circles, letters and squares, letters and triangles, black lines and letters, squares and white lines,—all these are matters that we have to take cognisance of in logic. Their relation to the syllogism itself is that of a picture to the object it represents.

They are matters connected with the illustration of its structure. But they are not points in the structure itself.

Is there anything more in this way? We ask this, because, as yet, we have had nothing but detail, nothing but the dead members of the syllogism, taken separately, and destitute of the principle that holds them together as the constituent parts of an organic whole.

We have nearly done with these—nearly, but

not quite. There are certain mnemonic words that still stand over for notice.

Suppose that I wish to remember the order of the propositions of any particular syllogism in respect to their *quantity* and *quality*, *e. g.*,

A. All men are mortal,
A. All heroes are men,
A. All heroes are mortal,

I fix in my mind the sequence A A A.

I proceed, and, as I proceed, find it necessary to remember another series.

E. No man is immortal,
A. All heroes are men,
E. No hero is immortal.

This is E A E; and it is clear that my memory is beginning to be taxed. I must first carry A A A in my head, and then E A E; and then (perhaps) a dozen more such formulas.

Now A A A are three separate words, for they are three separate instances of the name of a letter.

And E A E are the same; except that E and A are the names of different letters, a fact which encumbers the memory more than it helps it. So that, for two syllogisms, I have six words to remember.

Now, by certain additions, I can reduce these six words to two; but then, in order to do so, I must manipulate and manœuvre a little.

Suppose that, between each of the A's in A A A, I write one or more letters.

Let these letters be consonants. Let them be *b*, *rb*, and *r*. The result is the word *barbara*.

This is the neuter plural of the Latin adjective *barbarus*; but it is not on this account that the

word is useful. *Rarbaba*, or any other combination of three A's, with a sufficient number of consonants to reduce them to a single word, would have done as well. The identity of the word under notice with another word goes for nothing. It is a mere accident. *Barbara* is, as far as its sense goes (or rather its want of sense) unmeaning. Yet it has a function.

Now treat E A E as we treated A A A, varying in some degree the consonants. In short, write *celarent*. This happens to be a Latin word also, but, *mutatis mutandis*, all that has been said about *barbara* applies to *celarent* also.

Celarent like *barbara* has its function; and the function of the two words is the same. The consonants merely serve as framework; the vowels alone must be attended to. Read off these, and you have six words in two, or three in one. Bar*bara* gives the sequence A A A, and *celarent* the sequence E A E. It is obvious that every possible combination of A E I O, *i.e.* every *mood*, can be thus treated, and it is a fact, that they *have* been thus treated. Hence, we have a certain number *of* mnemonic words ready made. Do I want to remember the sequence—

A. All tyrants are blameworthy,
I. Some heroes are tyrants,
I. Some heroes are blameworthy—

I fix in my mind the word d*arii*. For

E. No tyrant is praiseworthy,
I. Some heroes are tyrants,
O. Some heroes are not praiseworthy,

F*erio* is my mnemonic word.

No one need forget the *mood* of a syllogism for want of a mnemonic. There are plenty of them, as will be seen in the sequel.

But what if we want the figure as well? This will be answered in the sequel also. The object of the present section is to state the fact, that some of the difficulties in the way of detail arising out of the combinations of A E I O are met by means of certain mnemonic words, or words coined for the assistance of the memory. The fuller details of their application will constitute another notice.

At present it is sufficient to state, that in (1.) *Barbara*, (2.) *Celarent*, (3.) *Darii*, and (4) *Ferio*, the figure is the same, viz. :—

Middle major, *or* Y Z,
Minor middle, *or* X Y,
Minor major, *or* X Z.

Hence, in symbols, the previous examples run thus :—

Barbara.	*Celarent.*
A. Every Y = Z.	E. No Y = Z.
A. Every X = Y.	A. Every X = Y.
A. Every X = Z.	E. No X = Z.

Darii.	*Ferio.*
A. Every Y = Z.	E. No Y = Z.
I. Some X = Y.	I. Some X = Y.
I. Some X = Z.	O. Some X = Z.

Substitute *man* for Y, *immortal* for X, &c., &c., and you have the syllogisms as they appeared before.

Substitute *any word* whatever for X Y Z, and you have a legitimate conclusion. As a separate proposition, or as a statement of fact, it may be

untrue. But that will be because the premises were incorrect. As a *deduction* from those premises it will be strictly logical.

EXTRACT.

"Logic is a formal science. It takes no consideration of real existence, or of its relations, but is occupied solely about that existence and those relations which arise through and are regulated by the conditions of thought itself. Of the truth or falsehood of propositions, in themselves, it knows nothing and takes no account: all in logic may be held true that is not conceived as contradictory. In reasoning, logic guarantees neither the premises nor the conclusion, but merely the *consequence* of the latter from the former; for a syllogism is nothing more than the explicit assertion of the truth of one proposition *on the hypothesis* of other propositions being true, in which it is implicitly contained. A conclusion may thus be true in reality (as an assertion), and yet logically false (as an inference.)"—SIR W. HAMILTON, *Discussions on Philosophy*, p. 144.

(46.)

Analysis and Synthesis.

It is always useful (and in matters of teaching and learning most especially so) to have a clear notion, not only of the subject under notice, but also of the method according to which we investigate it. It is good to know in what light we see the picture; at what end we take up the staff. For this reason, I pause to remark, that our view of the syllogism has been what is called *analytic* as opposed to *synthetic*. Analysis takes to pieces; Synthesis builds up. Much may be learned from both processes.

Our view, I say, has been wholly analytic. We

started with the largest mass of terms we had—viz. the syllogism. And, of this we considered the propositions first; for the syllogism contained the propositions, the proposition the terms. The syllogism contained the premises and conclusion; the premises and conclusion the majors, middles and minors. With these, the ultimate elements, we concluded. This was to take the watch to pieces.

But we might have reversed the order of our operations, and have begun with the term, forming, out of the terms, the propositions, and, out of the propositions, the syllogism. Had we done this, the watch would have been put together; our method having been synthetic.

Neither Synthesis nor Analysis are words foreign to systematic works on logic, and for this reason they have been noticed.

The following quotation is from the opening of the Second Book of Whately; the Second Book being especially entitled the *Synthetical Compendium* as opposed to the First, which gave the *Analytical Outline.*

Observe, too, the two departments of inquiry to which it refers—Language and Mental Philosophy. They are separate from Logic proper, but closely connected with it. Analysis leads to, Synthesis starts from, them.

EXTRACT.

"There are three operations of the mind which are immediately concerned in argument:—

"1st. Simple apprehension.

"2nd. Judgment.

"3rd. Discourse, or reasoning.

"1. Simple apprehension is the notion (or conception) of any object of the mind, analogous to the perception of the

senses. It is either incomplex, or complex. Incomplex apprehension is of one object or of several, without any *relation* being perceived between them, as of *a man*, *a horse*, *cards;* complex is of several *with* such a relation, as of a *man on horseback*, a *pack of cards*.

"2. Judgment is the comparing together in the mind two of the notions (or ideas) which are the objects of apprehension, whether complex or incomplex, and pronouncing that they agree or disagree with each other (or that one of them *belongs* or does not belong to the other). Judgment, therefore, is either *affirmative* or *negative*.

"3. Reasoning (or discourse) is the act of proceeding from one judgment to another founded upon that one, or the result of it.

"Language affords the signs by which these operations of the mind are expressed and communicated.

"An act of *apprehension* expressed in language is called a *term;* an act of judgment a *proposition;* an act of *reasoning* an *argument*."—WHATELY, ii. 1. § 1, 2.

The *syllogism* itself is either analytic or synthetic; or rather the synthetic syllogism (for the ordinary one with which we have hitherto dealt belongs to this division) is capable of being put in an analytic form. And this is what we have been led to anticipate. For has it not been said, that instead of beginning with our premises and ending with our conclusion, and writing *therefore* between the last two propositions, we might have begun with the conclusion, and ended with the premises, writing *because* between the first proposition and the second? Has it not been said that it is only in accordance with *custom* that we write—

All men are mortal,
Socrates is a man,

Therefore,
Socrates is mortal,

instead of—

Socrates is mortal,
Because,
Socrates is a man,
And,
All men are mortal,

or—

Socrates is mortal,
Because,
All men are mortal,
And,
Socrates is a man.

Now, the latter of these syllogisms is analytic. How? Because it begins by taking the whole and then giving the parts it is made of. Synthesis, on the other hand, takes the parts first, the whole last.

(47.)

Rationale of the Ordinary Syllogism.—Its Terms viewed as the Names of Classes.—The DICTUM DE OMNI ET NULLO.

We may now look back on what we have read about the syllogism with a double view; with the view of ascertaining what portions of it we have considered, and with the view of learning what portions of it we have either overlooked or reserved for future or present notice.

Doing this, we shall find that of the details of its structure we have seen a somewhat large amount, also a fair amount of the terminology used to ex-

press them; along with which we have a notice of some of the operations in the way of *strengthening*, *conversion*, &c. The symbolic notation, along with the quality and quantity of propositions has not been neglected; nor yet the value of the several terms. The mnemonic manœuvres for recollecting the differences of figure and mood have been alluded to. Lastly, there has been an exhibition of certain material illustrations in the way of circles, triangles, and squares, on one side, and black and white lines on the other.

Now, these last will help us in what is now coming under notice; viz. the principle, or *rationale*, of the syllogism, a question that has yet to be considered.

What is the leading or fundamental principle of the ordinary syllogism? More especially, how is it illustrated by our squares and lines?

The triangles, circles, and squares shall be noticed first. Let us consider them as filled with points—these points standing for individual objects; the figures themselves standing for classes. As long as the triangle lies within the circle, and the circle within the square, the points contained in the triangle are contained in the square also. Common sense says this. It is the kernel in the shell, with the embryo of the future plant in the kernel. It is the foot in the stocking, with the stocking in the boot. It is the blood in the artery, with the artery in the body. It is anything, in short, contained by anything else, which something else contains.

It cannot but be in two things at once; for what is in the nut is in the nutshell that contains the nut. The part of a part is part of any whole

that contains that part. *Socrates* is part of the class of *men*, and *men* part of the class of *mortals*. What, then, must Socrates be? What can he be but mortal?

Mutatis mutandis, the same reasoning applies to negative propositions. If the kernel lie outside the shell, the embryo within the kernel must do the same. Hence—

"Whatever is predicated (*i.e.* affirmed or denied) universally of any class of things, may be predicated in like manner (*viz.* affirmed or denied) of anything comprehended in that class."

This is called the *dictum de omni et nullo*, *i.e.* the *rule concerning all and none.*

The writer who gives the greatest prominence to the *dictum de omni et nullo* is, perhaps, Archbishop Whately. The writer who gives (if not the least) but little to it is J. S. Mill. I subjoin an extract from each.

Extract.

I.

"In order to trace more distinctly the different steps of the abstracting process by which any particular argument may be brought into the most general form, we may first take a syllogism (*i.e.* an argument stated accurately and at full length), such as the example formerly given, 'whatever exhibits marks of design, &c.,' and then somewhat generalise the expression by substituting (as in Algebra) arbitrary unmeaning symbols for the significant terms that were originally used; the syllogism will then stand thus: 'every B is A; C is B; therefore C is A.' The reasoning, when thus stated, is no less evidently valid, whatever terms A B and C, respectively, may be supposed to stand for. Such terms may, indeed, be inserted as to make all or some of the assertions *false;* but it will be no less impossible for

any one who *admits* the truth of the *premises*, in an argument thus constructed, to deny the conclusion; and this it is that constitutes the conclusiveness of an argument.

"Viewing, then, the syllogism thus expressed, it appears clearly, that 'A stands for *anything whatever* that is affirmed of a certain entire class' (*viz.* of *every* B), 'which class comprehends or contains in it *something else*,' *viz.* C (of which B is in the second premiss, affirmed); and that, consequently, the first term (A) is, in conclusion, predicated of the third C.

"Now to assert the validity of this process, now before us, is to *state the very dictum* we are treating of, with hardly even a verbal alteration, *viz.*:—

"1. Anything whatever, predicated of a whole class,

"2. Under which class something else is contained,

"3. May be predicated of that which is so contained.

"The three members into which the maxim is here distributed correspond: to the three propositions of the syllogism to which they are intended respectively to apply."—WHATELY, *Logic*, *i.* § 4.

II.

"All ratiocination, therefore, starts from a general proposition, principle, or assumption; a proposition in which a predicate is affirmed or denied of an entire class. The other premiss asserts that something belongs to or is included in the class respecting which something was affirmed or denied in the major premiss.

"It follows that the attribute affirmed or denied of the entire class may (if there was truth in that affirmation or denial) be affirmed or denied of the object or objects alleged to be included in the class: and this is precisely the assertion made in the conclusion.

"Whether or not the foregoing is an adequate account of the constituent parts of the syllogism will be presently considered; but, as far as it goes, it is a true account. It has accordingly been generalised and erected

into a logical maxim. The maxim is, that whatever can be affirmed (or denied) of a class may be affirmed (or denied) of everything included in the class. This axiom, supposed to be the basis of the syllogistic theory, is termed by logicians the *dictum de omni et nullo*."—MILL, i. p. 234.

(48.)

Rationale of the Ordinary Syllogism.—Its Middle Term viewed as a Measure.

The △s ○s and ▭ suggest the notion of *classes*. The black and white lines  raise the idea of a *rule* or *measure*.

Of the two illustrations this latter is, perhaps, the less common; the *dictum de omni et nullo* being considered of such importance as scarcely ever to be omitted in logical treatises. The other, however, is the illustration which we find in Watts's *Logic* as an old, and Gilbart's as a new, work.

EXTRACT.

"If the mere perception and comparison of two ideas would always show us whether they agree or dis-agree; then all rational propositions would be matters of intelligence or first principles, and there would be no use of reasoning, or drawing any consequences. It is the narrowness of the human mind which introduces the necessity of reasoning. When we are unable to judge of the truth or falsehood of a proposition in an immediate manner, by the mere contemplation of its subject and predicate, we are then constrained to use a medium, and compare each of them with some third idea, that by seeing how far they agree or disagree with it, we may be able to judge how far they agree or disagree among themselves. Thus, if there are two lines A and B, and I know not whether they are equal or no, I take a third line C, or an inch, and apply it to each

of them: if it agree with them both, then I infer, that A and B are equal; but if it agree with one, and not with the other, then I conclude A and B are unequal; if it agree with neither of them, there can be no comparison.

"So if the question be, whether God must be worshipped, we seek a third idea, suppose the idea of a Creator, and say:—

"Our Creator must be worshipped,
God is our Creator,
Therefore, God must be worshipped.

"The comparison of this third idea with the two distinct parts of the questions usually requires two propositions, which are called the premises; the third proposition which is drawn from them is the conclusion."—WATTS (*from* GILBART'S *Logic for the Million*, iv. 4).

(49.)

Rationale of the Ordinary Syllogism.—Its Terms viewed as expressive of the co-existence of certain Attributes.

Take from Euclid the axiom that—

"Things which are equal to the same thing are equal to one another."

Instead of *equal* to, write *co-exists* with, so that the axiom run—

"Things which *co-exist* with the same thing, *co-exist* with one another."

This is the form in Mill's Logic; a form which is illustrated by the *rule*, rather than *class*-view; by [redacted] rather than △ ○ and □. Nor are there wanting reasons, notwithstanding the historical importance of the *dictum de omni et nullo*, for preferring the former to the latter.

Things, then, *which co-exist with the same thing, co-exist with one another.* Such is the principle of the affirmative syllogism; that of the negative being that—

A thing, which co-exists with another thing, with which other a third thing does not co-exist, is not co-existent with that third thing.

By *co-existence* is meant existence in the same object or class of objects; by *things*, the *attributes* or *qualities* of such object.

In the first proposition of the syllogism—

All men are mortal,
All heroes are men,
All heroes are mortal,

the import is, that *wherever there is the attribute of manhood there is the attribute of mortality also*, the co-existence, as shown in the wording of the proposition, being as follows:—

In *all* cases of *manhood* there is a co-existent *mortality.*

In *some* cases of *mortality* there is a co-existent *manhood.* It may be that there is in *all.* The proposition, however, only states that it is so in SOME. *All men are mortal* OBJECTS; conversely, *some mortal objects are men.*

Wherever there is either *manhood* or *mortality*, there may be other attributes as well. Of these, the first of our three propositions takes no notice. Thus, with *manhood*, there may be *heroism*, *cowardice*, *virtue*, *vice*, all of which, if they co-exist with *some* manhood, and if *all* manhood co-exist with some *mortality*, must, so far as they co-exist with that manhood, also co-exist with its co-existing mortality.

But, as has already been stated, our first proposition, the only one under immediate notice, tells us nothing about them. It is only the second that does anything for us in this respect.

It is the second (or the *minor*) that tells us that—

All *heroes* are *men*,

by which is meant, that all the attributes that constitute our idea of a *hero* co-exist with some *manhood*; all *heroes* being men, though all *men* are not *heroes*.

But *all* manhood whatsoever, consists with *mortality*, in other words, there is none of the former, without some of the latter.

Hence—all the *hero-hood* that co-exists with the *manhood*, co-exists with the *mortality*, with which the *manhood* co-exists.

And this is what the conclusion tells us *ex*plicitly; the premises having *implied* it, *i.e.* contained *im*-plicitly, *i.e.* as a thing folded up in them.

In = *in*, and *plicat-us* = *folded*; Latin words both. *Ex* = *out*. *Implicit* = *wrapped up* IN; *explicit* = *with the folds done* OUT.

(50.)

Rationale of the Ordinary Syllogism.—The Middle Term always in the Premises, and never in the Conclusion.

§ Still holding to our old syllogism—

All men are mortal,
All heroes are men,
All heroes are mortal,
(*Barbara*,)

let us keep our attention on its *middle term*, *i.e.* on the word *man*.

It is, essentially, *a means to an end*—nothing more. As the name of a class, it contains such contents as it has solely for the purpose of enabling them to be placed in some other class. As a rule, or measure, it is thrown aside when it has effected its measurement. Under such conditions how can it show itself in the conclusion? The conclusion contains nothing but results—the equalities, or co-existences, that the rule, or survey, determined—the individuals that the smaller class gave to the larger one. The middle term, then, cannot but be absent from the conclusion.

But this is only another way of saying (its necessity being supposed to be proved) that it must appear in the premises. And this is what it invariably does.

It must appear in the premises not only once, but twice.

It must appear in the premises *not* only twice, but each appearance must be made in a different proposition—*i.e.* one in the major, and one in the minor.

If it were not so we could have none of the necessary comparisons. To predicate of *mortal*, that it is anything except *mortal*, requires two *different* terms to the proposition; *mortal* is *mortal*, being a useless truism. But of these two different terms one must be a new one; *i.e.* different from those of the conclusion. If not, we only get the conclusion repeated with, or without, variations, *e.g.*:—

Heroes (*all*) are mortals,
Mortals (*some*) are heroes.

There is nothing of much use in this.

So much for the place of the middle term in one of the premises. How does it show itself in the other? The *minor* term (*heroes*) we have ready to our hand. But this we cannot repeat. That were to construct a truism; *e. g.*

Heroes are heroes.

Nor yet can we attach the major (*mortal*) to it. That were to repeat the conclusion.

Nor yet can we bring in a wholly fresh word. That were to abolish the comparison altogether.

Man = *mortal*,
Hero = *angel*,

what can follow from this? Nothing.

The only second term that we can introduce is the middle term; which we may now say has been shown to be—

1. Repeated;

2. Appearing, each time, in a different proposition;

3. Neither of those propositions being the conclusion; but (on the contrary) the premises, and nothing but the premises.

If this exposition appear somewhat mechanical (as it really is), let it be suggested that the positions for the middle term which it illustrates are of great importance, and that it is to give these positions (simply as details of structure) full prominence, rather than to exhibit the disposition of the terms of a syllogism in a general and scientific manner, that the previous notices have been made.

(51.)

The Place of the Middle Term in the several Figures. —The Figures four in Number.

§ Let us still keep the middle term in our minds; even though at the commencement of our forthcoming notices, it occupies no very prominent position. It will appear towards the end of them.

The order of the *terms* of a syllogism has been already considered (§ 36).

It has also been stated that a difference in the arrangement constitutes a difference of *figure*.

How many of these arrangements, *i.e.* how many syllogistic figures, are there? That depends upon what we mean by *figure*. The number of combinations and permutations capable of being effected by ringing changes on the one *major*, one *minor*, and two *middles*, the terms of the premises of a syllogism, is a matter of arithmetic. They are limited, and definite, and can be ascertained *à priori*. The number of combinations and permutations that are available for the purposes of syllogistic reasoning is a special matter of logic. One is one thing, the other another. They may or may not agree. *All* the combinations of *major* and *middle*, *middle* and *minor*, may be logical; or only *some* of them may be so. Hence, *figure* may mean all the combinations of *major*, *middle*, &c., that can be effected, or it may mean only those that contribute to the formation of conclusions. The former gives us the *possible*, or arithmetical, the latter the *actual*, or logical, forms.

Such is the preliminary distinction. How does it

apply? At the present moment it is no distinction at all. At the present moment, and ever since the time of Galen, *all* the arithmetical combinations, are also, one and all, logical. Between, however, the time of Galen and Aristotle, there was one of them which seemed to lead to no conclusion at all, *i.e.* to be extra-logical. That this was only apparent, and that it was a real logical *figure*, is said to have been discovered by the philosophers just named.

The distinction, then, in question between the logical and arithmetical combination of the terms of a syllogism is historical rather than scientific. As such we have noticed it. We have noticed it also for a reason which will appear in the sequel.

To proceed, however, to our present details—the number of figures is four, the full arithmetical number. We can ascertain them *à priori*. There are two possible changes for the *major* proposition, and two for the *minor*—two for each, and no more than two.

1.

Major term, middle term,
Middle term, major term.

2.

Minor term, middle term,
Middle term, minor term.

These give—

FIRST FIGURE.

All men are mortal,
All heroes are men,
All heroes are mortal;

or,

Middle, major,
Minor, middle,
Minor, major ; } or { X Z,
X Y,
Y Z.

(*Barbara.*)

SECOND FIGURE.

All true patriots are friends to religion,
Some great statesmen are not friends to religion,
Some great statesmen are not true patriots ;

or,

Major, middle,
Minor, middle,
Minor, major ; } *or* { Z Y,
X Y,
X Z.

(*Baroko.*)

THIRD FIGURE.

All men are mortal,
All men are rational,
Some rational beings will die ;

or,

Middle, major,
Middle, minor,
Minor, major ; } *or* { Y Z,
Y X,
X Z.

(*Darapti.*)

FOURTH FIGURE.

Whatever is expedient is conformable to nature,
Nothing conformable to nature is hurtful to society,
Whatever is hurtful to society is not expedient ;

or,

Major, middle,
Middle, minor,
Minor, major ; } *or* { Z Y,
Y Z,
X Y.

(*Camenes.*)

All the *figures* are equally true ; a fact which

follows from the formal character of the science of logic. Its truths arise from relations. As such they are necessary; and in necessary truths there are no degrees.

But are they all equally clear?

The answer to this has been already suggested. The first three are said to have been discovered some three hundred years before the fourth; which, certainly, looks as if they were not.

Are they all equally *direct*, *i.e.* do they all come under the immediate application of the *dictum de omni et nullo*, or its equivalents? The extent to which they do this has, doubtless, something to do with their clearness; but it is a question which may stand over for a while.

What now claims our attention is the fact that—

The four *figures* are only so many names for so many places for the middle term.

1. In the *first*.—The middle term is subject in the major, and predicate in the minor premiss.

2. In the *second*.—Predicate in both.

3. In the *third*.—Subject in both.

4. In the *fourth*.—Predicate in the major, subject in the minor.

Should it be easier for us to remember numbers than names, we may say that—

In the first figure, the middle term is in 1 and 4, *i.e.* that it is in the first and third places of the syllogism. Or, we say that it is 1 by 4.

In the second it is 2 and 4, or 2 by 4.

In the third, 1 and 3, or 1 by 3.

In the fourth, 2 and 3, or 2 by 3.

In the other places we have, of course, one of the other two terms—the major in the major, the minor

in the minor premiss. Hence, in knowing the place of the middle term, we also know that of the other two. Thus—

1. If the middle term be in 1 and 4, the major must be in 2, and the minor in 3.

2. If the middle be in 2 and 4, the major is in 1, and the minor in 3.

3. If the middle be in 1 and 3, the major must be in 2, and the minor in 4.

4. If the middle be in 2 and 3, the major must be in 1, and the minor in 4.

(52.)

The Moods.—Mood and Figure.—A Real and Rational Relation of the Middle Term essential to the Perfection of the Syllogism.

Let us still keep the middle term in our minds, &c.

The order of the *propositions* of a syllogism has been already considered (§ 35).

It has also been stated that a difference in the arrangement constitutes a difference of *mood*.

How many of these arrangements, *i.e.* how many syllogistic moods, are there?

That depends on what we mean by *mood*.

All this (and more might be added) is what we read at the opening of the preceding section. It is repeated, however, because, *mutatis mutandis*, the main part of what applies to figures applies to moods also.

There is, however, this difference. *All* the combinations of *middle*, *minor*, and *major* (of Y X Z)

in arithmetic were logical combinations also, *i.e.* they were all used in syllogism. Of the moods, *i.e.* the combinations of universal or particular, affirmative or negative (A E I O), only *eleven* are logical.

Can each of these eleven moods appear in each of the four figures? If they can, the number of syllogisms is $11 \times 4 = 44$. But they cannot. Their distribution amongst the figures is as follows:—

1. In the first figure the moods are, A A A—E A E—A I I—E I O.

2. In the second, E A E—A E E—E I O—A O O.

3. In the third, A A I—I A I—A I I—E A O—O A O—E I O.

4. In the fourth, A A I—A E E—I A I—E A O—E I O.

Written out, symbolically, and in full the moods and figures run as follows:—

FIRST FIGURE.

Barbara.	*Darii.*
A. Every Y is Z.	A. Every Y is Z.
A. Every X is Y.	I. Some X's are Y's.
A. Every X is Z.	I. Some X's are Y's.
Celarent.	*Ferio.*
E. No Y is Z.	E. No Y is Z.
A. Every X is Y.	I. Some X's are Y's.
E. No X is Y.	O. Some X's are not Y's.

SECOND FIGURE.

Cesare.	*Festino.*
E. No Z is Y.	E. No Z is Y.
A. Every X is Y.	I. some X's are Y's.
E. No X is Z.	O. Some X's are not Z's.

Camestres.

A. Every Z is Y.
E. No X is Y.
E. No X is Z.

Baroko.

A. Every Z is Y.
O. Some X's are not Y's.
O. Some X's are not Z's.

THIRD FIGURE.

Darapti.

A. Every Y is Z.
A. Every Y is X.
I. Some X's are Z.

Felapton.

E. No Y is Z.
A. Every Y is X.
O. Some X's are not Z's.

Disamis.

I. Some Y's are Z's.
A. Every Y is X.
I. Some X's are Z's.

Bokardo.

O. Some Y's are not Z's.
A. Every Y is X.
O. Some X's are not Z's.

A. Every Y is X.
O. Some X's are not Z's.

Fresison.

E. No Z is Y.
I. Some Y's are X's.
O. Some X's are not Y's.

Each and all of these can be treated like A A A, E A E, &c., above. Indeed, they *have* so been treated, their mnemomics running—

First figure—bArbArA, cElArEnt, dArII, fErIO.

Second figure—cEsArE, cAmEstrEs, fEstInO, bArOkO.

Third figure—dArAptI, dIsAmIs, dAtIsI, fElAptOn, bOkArdO, fErIsOn.

Fourth figure—brAmAntIp, cAmEnEs, dImArIs, fEsApO, frEsIsOn.

Such are the mnemonics for the syllogisms in mood and figure. The form, however, in which they are best remembered is that of the four Latin hexameters which will be given in the next section. At present, observe that—

In the fourth figure (the last discovered, and, as such, apparently the least clear) all the conclusions but one are particular, and that one negative; that—

In the third, all are particular; three negative, three affirmative; that—

In the second, all are negative; two universal, two particular.

It is in the first only that we have all four kinds —negative, particular, universal, and affirmative. It is in the first only that we have any *universal* affirmative conclusion at all. It is in the first only that we have (as aforesaid) the direct application of the *dictum de omni et nullo*. The first figure, in short, is, at once, the clearest and the most comprehensive. In the first, we have the perfection of the syllogism; the syllogisms belonging to it being actually called *perfect* as opposed to the *imperfect* ones of the other three. No one reduces a syllogism of the first figure to any of the others. Many reductions are made from figures II., III., and IV., to figure I.

So much then, in the way of honour and glory

to figure I., with its *barbara, celarent, darii,* and *ferio.*

If we examine the reasons of this perfection, we shall find that they lie, to a great extent, in the place taken by the middle term.

(53.)

The Mnemonics.—What is meant by their Consonants.—Reduction.

§ The metrical form of the mnemonic lines of the last section is now due; along with which a further explanation of their contents will be given. The lines themselves are as follows:—

Barbara, celarent, darii, ferioque, prioris.
Cesare, camestres, festino, baroko secundæ.
Tertia darapti, disamis, datisi, felapton.
Bokardo, ferison, habet; quarta insuper addit.
Bramantip, camenes, dimaris, fesapo, fresison.

These, are Latin hexameters—at least, they pass for such. And this we should remember: otherwise there will be more than one of our coinages of doubtful quantity. It is only by the metre, that we are taught to pronounce barōko instead of barŏko, disămis instead of disāmis, datīsi instead of datĭsi, ferīson instead of ferĭson, camĕnes instead of camēnes, dimăris instead of dimāris, fesāpo and fresīson instead of fesăpo and fresĭson.

That the *vowels* denote the moods has already been stated, and there is not a vowel in the whole list that is superfluous.

The vowels denote the mood, and nothing else. What tells us the figure? This we learn from the

context, and it is all that the context, consisting of but few truly Latin words, does tell us. With *prioris* (the *first*), *secundæ* (the *second*), *tertia* (the *third*), and *quarta* (the *fourth*), we must understand or supply *figura* (or *figuræ*) = *figure*.

But the consonants—what is their function? Have they any? May they not be merely arbitrary?

Let us first ask what there is that they *can* teach us, *i.e.* what there is beyond the two facts of mood and figure which we have already been taught. De Morgan calls the mnemonics under notice, "magic words—words which I take to be more full of meaning than any that were ever made."—(*Formal Logic*, p. 130.) Now words of this kind should speak through their every letter—consonants as well as vowels. And so they do. They speak to the phenomena of conversion and reduction, telling us what sort of conversions are effected, *i.e.* whether they are simple or accompanied by weakening or strengthening. They tell us, too, to what forms others are reduced. It is not for nothing that *cesare* begins with the same letter as *celarent*, and *darii* and *darapti* with D. Observe, too, how *baroko*, &c., begins like *barbara*, and *felapton* like *ferio*.

Whatever may be the case with the remainder, none of the consonants at the *beginning* of the words are arbitrary. On the contrary, they connect the words to which they stand as initials with each other, *e.g. cesare* with *celarent*; and that for the purposes of reduction. *Cesare*, when reduced, is reduced to *celarent*.

With the exception of the initials, however, all the other consonants of the first line *are* arbitrary;

these being *b* (when in the middle of a word as the second *b* in bar*b*ara), *r*, as in ba*r*ba*r*a, cela*r*ent, da*r*ii, and fe*r*io, and *l*, *n*, and *t* as in cela*r*ent. Add to these from the fourth line the *d* in boka*rd*o ; which (unlike the *d* in *darii*, *dimaris*, *datisi*, &c., full of meaning) has no special signification. The only use, then, of *b* and *d*, when not initial, as well as of *l*, *n*, and *t*, is to improve the shape and sound of the words in which they occur. They generally improve the sound, and sometimes help the metre.

The remaining four—*m*, *s*, *p*, and *k* are *never* used indifferently. Hence, in *disamis* and *fesapo* every letter has not only its use but its meaning also. In *disamis* we learn from

D, that the syllogism is reducible to *darii* ; from

I A I, that its premises are particular affirmative and universal affirmative followed by a particular affirmative conclusion ; from

S, that the major premiss, denoted by I, requires, in order to effect its reduction, that its terms should be transposed ; from

M, that the minor premiss expressed by A, and the conclusion expressed by I must be transposed ; and, finally, from the second

S, that the terms of the *conclusion* must be transposed.

In like manner, *f*esapo says that the conversion must be to *f*erio ; and that the major premiss must have its terms transposed. But what is the meaning of *p* ? It is a new letter, and requires explanation. It means as much as *s*, and something more. It means not only, that the terms of the proposition expressed by *a* are to be transposed, but

that their signs are to be changed as well. It means, for instance, that such a proposition as *all men are mortal*, is to be be converted, not into

All mortals are men,

which is illegitimate, but into

Some mortals are men.

K still remains to be explained. It means that BaroKo and BoKardo must be reduced by a peculiar process; a process which, in a sketch like the present, finds no place.

All the significant non-initial consonants, then, express conversion and reduction.

S expresses conversion in its simplest form, and, doubtless, stands for *simplex*, *simplex conversio*, or *conversio simplex*.

P, which denotes conversion accompanied by either strengthening or weakening is the first letter of *per accidens*, the technical name for conversions of this kind.

M, as I imagine, = *mutatio* = *change*, and denotes the conversion, or transposition, of *propositions*—not merely of *terms*, but of whole combinations of terms, premises, and, even, conclusions.

K, *perhaps* (I have not the knowledge that enables me to speak with confidence), is used for the exceptional cases of BaroKo and BoKardo, from the fact of its being but half a Latin letter—an exceptional element in the Latin alphabet.

The greatest amount of conversion occurs in the several reductions of the syllogisms of the fourth figure. For this reason the two forthcoming examples are taken therefrom. The first gives us a

process which, in practical logic, never occurs, viz. the reduction (if so it may be called) of a syllogism in figure I. to a syllogism in figure IV.; the change being, always, in the other direction, *i.e.* from IV. to I. The present section, however, is meant to anticipate one in the sequel; and for this reason, a secondary object is aimed at. The relation between the first and last of the four figures is so important, that I shall exhibit them by effecting a to-and-fro conversion; *i.e.* a conversion from the perfect into the imperfect, as well as one from the imperfect to the perfect.

1.

OPERATIONS ON BARBARA.

Write—

A. All men are mortal,
A. All heroes are men,
A. All heroes are mortal,

remembering that the mnemonic of it is BARBARA.

Eviscerate *Barbara*; *i.e.* take out its middle consonants, leaving spaces between the vowels, to be filled up as occasion requires—BA.A.A.

Operate on the syllogism, beginning with the *conclusion*, by transposing its terms. But this cannot be done without weakening the subject, the converse of ALL *men are mortal* being SOME *mortals are men*. However, as this weakening can be effected, our syllogism now runs—

A. All men are mortal,
A. All heroes are men,
I. Some mortals are heroes;

a change having been made which we must now

express by acting on the BA.A.A,—the skeleton of the eviscerated *Barbara*,—and changing the third A into I, adding P. This will give BA.A.IP; a form which shows that a *universally* affirmative conclusion has been weakened by conversion into a *particular* one, the conversion, with its concomitant change of *all* into *some* being denoted by P.

Proceed, moving from the conclusion to the minor premiss, moving *upwards*, so to say. Proceed, and change. Transpose the premises. This will give—

A. All heroes are men,
A. All men are mortal,
I. Some mortals are heroes.

Express this change in the order of the propositions by its proper letter, M, which must be written between the first two A's in the now metamorphosed *Barbara*,—BAMAIP,—every letter of which word is significant.

Finish, however, with improving its form by means of the letters *r*, *n*, *t*, *n*, *d*, or *b* — say by means of the first three. In short, write BRAMANTIP, or (with the non-significant letters in italics) B*R*AMA*NT*IP.

2.

OPERATIONS ON CAMENES.

The mnemonic for the second syllogism of the fourth figure is CAMENES, every letter of which tells a tale.

To begin with C. This informs us that *Celarent* is the form to which it is reducible.

A. E. E. These denote that the major premiss is universally affirmative, but that the minor and the

conclusion are universally negative. But this order (A E E) is not that of *Celarent* (which is E A E). And now—

M brings its quota of information. It says that the two premises between which it stands must change places—a transposition which actually gives us E A E.

N, as aforesaid, says nothing, but—

S bids us effect a *simple* conversion (*i.e.* a conversion without either weakening or strengthening) of the *terms* of the conclusion—a *simple* conversion. Had it been accompanied by any further change, we must have written *p*; *i.e.* CAME*n*EP, instead of (which we have now) CAME*n*ES.

Follow the directions thus given, and out of the following in *Camenes*—

A. Whatever-is-expedient *is* conformable to Nature,

E. Whatever-is-conformable-to-Nature, *is-not* hurtful to society,

E. Nothing-hurtful-to-society *is* ever expedient,

you get

E. Whatever-is-conformable-to-Nature *is-not* hurtful to society,

A. Whatever-is-expedient *is* conformable-to-Nature,

therefore

E. Whatever-is-expedient *is-not* hurtful-to-society,

in *Celarent*: *i.e.* in figure I.

These are fair samples of the amount of operations required in order to reduce either I. to IV., or IV. to I.

(54.)

The Middle Term, as Contained and Containing. —Perfection of the First Figure.

§. The figure most in use is the First.

Wherever conversion is effected, it is always from one of the last three figures to the first—never *vice versâ*.

No wonder. The first figure is the clearest and the most comprehensive. It contains Barbara, the only syllogism that gives a universally affirmative conclusion. Now,

In the first figure the middle term is eminently what its name denotes—*middle*.

In the two propositions

All men are mortal,
All heroes are men,

what is the value or magnitude of the middle term, *man*? What does it mean? It means more than *hero*, less than *mortal*.

All heroes are men, but, as *all men are not heroes*, the class of *men* is the larger of the two. There are some *men* who are not *heroes*.

All heroes are men,
but only
Some men are heroes.

Mutatis mutandis: when we say all *men are mortals* we state that the collection of *men* is smaller than, and contained in, the collection of *mortals*.

All men are mortal,
but only
Some mortals are men.

Here—
Mortals = the *major*, which *contains*
Men, or the *middle*, which, though contained by Mortals, *contains*
Heroes, or the *minor*, contained by both.

Viewed in respect to the collection of *mortals*, the collection of *men* is *contained*.

Viewed in respect to the collection of *heroes*, the collection of *men* is *containing*.

Such are the relations of the middle term, as the name of a class; *contained* and *containing* being the words that express them.

When the middle term is *containing* and *contained* it is both *really* middle, and *rationally* middle; *i.e.* it is what its name denotes, and that without disturbing the names of either of its two associated terms—*major* and *minor*.

How far this is the case with the other three figures remains to be seen. How far the *dictum de omni et nullo* applies *directly* to the other figures remains to be seen also. That it applies directly enough to figure I. is obvious.

But, before we see the indirect character of its other applications, the section upon the *Quantity of the Predicate* (§ 39) must be brought back to our memories.

(55.)

Contained and Containing capacities of the Middle Term.—Predicates Containing, Subjects Contained, Terms.

§. In a universally affirmative proposition the predicate is particular. *All men are mortal*, but

only *some mortals are men.* This has been stated more than once before, and that explicitly. But certain deductions from it have not been so explicitly stated. *Some* and *all* have different magnitudes according to the term to which they are attached. With a predicate they mean one thing, with a subject another.

To say *all men are mortal* is to say *some men are mortal*—this and something more. It is to say that, if *all men are mortal, some* men are so *à fortiori.* The greater includes the smaller, the whole the parts. But these powers of *all* and *some* are only found when they apply to the same word. When we come to such expressions as *man is mortal,* their import changes.

When one thing is affirmed of another, the predicate gives the larger, the subject the smaller class of objects. A collection, consisting of *all* the men in the world, makes but a *part* of the collection of all its mortals, or mortal beings.

Hence, particular predicates contain universal subjects; this being but another way of saying that the *whole* of a smaller class is no more than the *part* of a larger one; in other words, subjects, *as such,* are contained in predicates *as such.* Hence, when a middle term is a predicate, it *contains;* when a subject, it is *contained.*

Such is the case when the proposition is, at one and the same time, universal and affirmative. When the proposition is, at one and the same time, universal and affirmative, the predicate is necessarily larger than the subject. From this it follows that wherever the middle term is a predicate, it is, *ipso facto,* larger than the subject and contains the sub-

ject. On the other hand, wherever it is a subject, it is smaller than the predicate and contained by it.

Now, in *Barbara*, the middle term is not only a subject, but the subject of the major proposition. What would it be if it were the subject of the minor one? It would be something awkward, or, at any rate, something that would bring in limitations or complications of some kind, inasmuch as it would be in its wrong place. It would be *subject*, and small, where it ought to be *predicate*, and large. As a middle term, it ought to contain the minor; as a subject, it would be contained by it.

(56.)

Imperfection of the Second Figure.—The Middle Term not really Middle.

If the predicates and subjects in universally affirmative propositions be essentially, and, *as predicates and subjects*, of different capacities, it is obvious that a middle term, which is only a predicate, is below its functions; *i.e.* that it is incompetent to perform the double duty of containing and being contained.

Nevertheless, all the middle terms of the Second figure are predicates, and predicates only. They all, in universally affirmative propositions, *contain*; they none of them are *contained*. If this be the case, where are our majors? Nowhere. They are minors.

It is obvious that complications or limitations of some sort must come out of this imperfection in the

function of the middle term of the second figure. And come they do. There is no such a thing (as has already been stated) throughout the figure as a universally affirmative conclusion. There is no affirmative conclusion at all. The conclusions are, one and all, negative.

(57.)

Imperfection of the Third Figure.—The Middle Term not really Middle.

§ If predicates and subjects in universally affirmative propositions be, essentially, and *as predicates and subjects*, of different capacities, a middle term, that is only a subject, must be below its functions, *i. e.* incompetent to do the double duty of containing and being contained.

Nevertheless, all the middle terms of the Third figure are subjects, and subjects only. They all, in universally affirmative propositions, are *contained*. None *contain*. If this be the case, where are our minors? They are all majors.

We foresee what is to come of this. In the third figure, where the middle term is only the subject, we expect only negative or particular conclusions. And this is all that we shall find.

(58.)

Imperfection of the Fourth Figure.—The Middle Term not rationally Middle.

The reasons for the Second and Third figures being imperfect fail when applied to the Fourth.

Yet the Fourth is, if anything, the most imperfect figure of all. That it was the longest in being discovered has already been stated. It has also been suggested that it was no very valuable discovery, when made. The fourth figure is the one which is most generally, either avoided or reduced. Yet it has one of the characteristics of the first—the model first, the perfect first. Its middle term is truly middle. It stands between its major and its minor. What is this but mediety or middlehood? It stands between two other classes, and it contains intermediate quantities—more than one, less than the other. Is not this enough? It is enough, perhaps, to make a middle, if we look for mediety, or middlehood, alone. But we look for more than this. We must get not only an intermediate *middle*, but a greater *major*, and a smaller *minor*. But this the fourth figure denies us.

In the fourth figure the middle term is the predicate of the major proposition, the major term being, of course, the subject. Now, term for term, the predicate, as opposed to the subject, gives the larger, or containing, class. Here, however, this larger, or containing, class is represented by the middle, or smaller, term; whilst, *vice versâ*, the major, or nominally larger term, is the subject, or contained, term.

Mutatis mutandis, this contradiction repeats itself in the minor proposition. There, the middle term, being the subject, is smaller than, and *contained* in, the minor; which it ought, nominally, to *contain*.

It is not, then, too much to say, that *middles* of this kind are irrational *middles*. As *middles* alone

they stand fairly enough; but they terribly dislocate their neighbouring majors and minors. .In fact, they convert the one into the other.

In figure IV. all the conclusions are either particular or negative. This is what we expect; and that a great deal of manœuvring in the way of conversion and reduction is necessary, in order to transfer its syllogisms into figure I., has been seen. In fact, figure IV. is figure I. inverted.

If we now inquire as to the amount of disturbance manifested in the imperfect figures, we shall find that it is as follows:—

For Figure II—a contained instead of a containing *major*, and a containing instead of a contained *middle*.

For Figure III—a containing instead of a contained *minor*, and a contained instead of a containing *middle*.

For Figure IV—a containing *minor* and a contained *major*.

It is obvious that, wherever there is an abnormal middle term, there are limitations and complications to match.

(59.)

Recapitulation.

We may now recapitulate our statements upon the place and function of the middle term.

Its place is in the premises, as opposed to the conclusion; in which last its presence was impossible. The conclusion gave the results of a measurement or classification, the premises the act of measuring or

classifying. The result being obtained, the means by which it is brought about are kept back.

In the premises it had to appear twice; there being two things to which it served as a means of measurement or classification. It had to determine that (for instance) *man* was *mortal*, and, also, that *heroes* were *men*.

It had not only to appear twice, but each appearance had to be made in a different premiss. Were it not so, it must have appeared twice in the same, and that would have given us nothing but a truism —*men* are *men*.

Thus far its place was a matter of absolute necessity; inasmuch as, unless the previous conditions were complied with, there would have been no syllogism at all. The following were necessary for a *perfect* one.

The middle term should be really *middle*, *i.e.* it should contain one of the remaining terms and be, itself, contained by the other.

But, to make it this, a simple place in two different propositions was not enough. For the middle term to be really middle it was necessary for it to be a subject in one of its places and a predicate in the other.

Nor was it enough for it to be *really* middle. It must be really and *rationally* so. For though a place between a *major* and a *minor* may make a *middle*, the *majors* and *minors* themselves may be unreal—the *major* being smaller, instead of larger, than the *middle*; the minor, larger instead of smaller.

Hence, for middles to be really and rationally *middle*, their *majors* and *minors* must be real and

rational also; and this can only occur where the major *contains*, and the *minor* is *contained*.

But the former of these conditions (or the major containing the middle) can only be found where the major is predicate and the middle subject; the predicate being, essentially, the larger or containing term, the subject the smaller or contained.

And the latter (or the middle containing the minor) can only be found where the minor is subject, *i.e.* the smaller term.

But, *ex vi termini*, it is only in *major* propositions that we find *major* terms; and *vice versâ*. Hence it is only where the middle term is subject in the major and predicate in the minor, that it is really and rationally, at one and the same time, a contained and containing term.

(60.)

Rules.

§ 1. The middle term must enter universally in, at least, one of the premises.

This means, that if neither premiss contain a middle term universally, it is no premiss at all.

2. From two negative premises no conclusion can be drawn.

This means, that if both premises are negative, they are no premises at all.

3. From two particular premises no conclusion can be drawn.

This means, that if both premises are particular, they are no premises at all.

4. No term in the conclusion can be more general than it was in the premises.

This means, that conclusions which give out more than the premises supplied are no conclusions at all.

5. If one premiss be particular the conclusion must be particular.

6. If one premiss be negative the conclusion must be negative.

(61.)

The Ordinary Syllogism called Aristotelian.

The syllogism, when it is framed in obedience to the rules just laid down, and when it takes the form just exhibited, is conveniently called the *Aristotelian* syllogism. And it is called so by numerous important writers. The term is, by no means, unexceptionable; neither is it open to any very grave objections. It is intelligible and convenient, and not more incorrect than the generality of terms of the same kind.

The reason for the name is scarcely to be found in the fact of Aristotle being answerable for its present form; inasmuch as the ordinary syllogism is framed according to a series of hints and inferences miscellaneously distributed over his writings, but put into form and developed by his commentators rather than according to anything sytematically exhibited by the master himself.

Again, the fourth figure is attributed to Galen. This, alone, subtracts a certain number of formulæ from the Aristotelian list of moods and figures—

supposing, even, that all the others are due to Aristotle. The accuracy or inaccuracy of the current doctrine respecting Galen's share in the development of the syllogism as it stands at present is not very important. The common view, even if incorrect, is, to a certain extent, against the statement that the syllogism called *Aristotelian* took its name from the fact of Aristotle's having given it its shape, and sent it forth into the world under the sanction of his great and influential name.

The truer reason for the use of the word lies in the extent to which, during the prevalence of the Aristotelian philosophy, the syllogism in, as near as can be, its present form was the great instrument of reasoning with the schoolmen and philosophers akin to them. It was according to the rules of the syllogism that the vast majority of theological, moral, and other questions were investigated. Meanwhile, the authority of Aristotle was all-powerful; and it was in accordance with his formulæ, either expressed or implied, that men either actually reasoned, or imagined that they did.

The name *Aristotelian*, then, as applied to the ordinary syllogism, is convenient. It is also current. Whether, however, the rules upon which the syllogism is framed are, each and all, actually of Aristotelian origin, is another question.

Are they exceptionable or unexceptionable, sufficient or insufficient, capable or incapable of improvement? Is anything admitted that ought to be excluded? Is anything excluded that ought to be admitted? This is to be seen.

(62.)

Certain Aristotelian Syllogisms over-strong.

In propositions like—

I. Some men are heroes,
A. John is a man,
A. John is a hero,

the conclusion is too strong for the premises; or rather the premises are too weak for the conclusion. In other words, there is a violation of the fourth rule of the 60th section; the conclusion being more general than the premises; the conclusion being universal, the premises being partly universal, and partly particular. In consequence of this the three sentences under notice are neither more nor less than three separate and unconnected propositions. They are anything but a syllogism. They only take the guise of one.

Upon combinations of this kind enough, and, perhaps, more than enough, has been said. There is something, however, to be said concerning their contraries. What is the result when the premises are too *strong* for the conclusion, or rather the conclusion is too *weak* for the premises? In other words, what takes place when the limitations of our fourth rule are not only observed, but observed too strictly? What takes place when the last of three propositions is a conclusion, and something more?

This is, by no means, an irrelevant question.

Whether the reader have observed it or not, more than one instance of these over-strong conclusions has been laid before him. Have not the examples in Darapti been of this kind? When we wrote—

A. *All men are mortal,*
A. *All men are rational beings,*
I. *Some rational beings are mortal,*

there was an unnecessary expenditure of strength in the major proposition. If we had simply said—

I. *Some men are mortal,*

we should have said enough for our conclusion. Everything beyond this was a superfluity. It proved the case, but it proved it something more.

It may be said, however, that in this there is neither harm nor inconvenience, that a conclusion which is true concerning a whole is true concerning a part of that whole. It may be said, in short, that superfluities do no mischief—*superflua non nocent.* On the other hand, however, formulæ ought not to be multiplied unnecessarily, and what is Darapti but an unnecessary appendage to Disamis and Datisi? which is—

I. *Some men are mortal.*
A. *All men are rational beings.*
I. *Some rational beings are mortal.*

or—

A. *All men are mortal.*
I. *Some men are rational beings.*
I. *Some rational beings are mortal.*

The inference is the same, whatever be the order of the premises. Of these, *one*, provided it be

universal, will give a particular conclusion. *Two* will do no more.

It is clear, then, that there are such things in Logic as over-strong conclusions, conclusions which a smaller amount of premiss would have given equally well.

Extract.

"Several of the usual syllogisms are more strong than need be in the premises, in order to produce the conclusion. Thus,* Y) X and Y) Z being admitted as premises, the necessary conclusion is X Z. But if Y) X be weakened into Y X, the same conclusion follows. If we call a syllogism *fundamental*, when neither of its premises are stronger than is necessary to produce the conclusion, it is obvious that every fundamental syllogism which has a particular premise, gives at least as strong a conclusion when that particular is strengthened into a universal. But, except when strengthening the premise also enables us to strengthen the conclusion, in which case we have a new and different syllogism, it seems hardly systematic to mix up with fundamental arguments, syllogisms which have quantity or quality more than is necessary for the conclusion."—De Morgan, *Formal Logic*, p. 77.

Admit the truth of the last sentence in this extract, and you admit that an exception lies against one, at least, of the formulæ of the ordinary syllogism.

An exception lies against it on the score of its being over-strong.

* According to the notation of the work here quoted Y) X, &c. = *every* Y, whilst Y X = *some* Y is X.

(63.)

Certain Aristotelian Syllogisms over-strong.—*Conclusions* A FORTIORI.

With a clear notion of the difference between sufficiency and over-strength, we may now consider the import and suggestions of the following imaginary

DIALOGUE.

Examiner.—What is the predicate in the major proposition of this syllogism?

Elephants are stronger than horses;
Horses are stronger than men;
Elephants are stronger than men.

Hasty student (*at once*).—Horses.

Cautious student (*after a pause*).—Stronger than horses.

Examiner.—The latter answer is the right, the former the wrong, one. *Horses* is the subject of the minor, *stronger than horses* the predicate of the major, proposition. What follows from this?

Hasty student.—That the conclusion is true.

Cautious student.—That there is no middle term.

Examiner.—As a matter of fact each answer is correct. The latter, however, is correct as a point of logic. In syllogisms like the one in question THERE IS NO MIDDLE TERM.

Students.—Is it right, then, to call such combinations as the one in question syllogisms?

Examiner.—We can scarcely deny them the name.

Neither can we. The conclusion that they give is true, and over true; it is also deduced from the

premises. What more is wanted? Hear what Professor De Morgan says.

Extract.

"A is greater than B, B is greater than C, therefore A is greater than C. There is no middle term here: the predicate of the first proposition is 'a thing greater than B,' the subject of the second proposition is 'B.'

"Admitting fully that the quality of the premises—that which entitles the conclusion to be made is, as it is said, *à fortiori*—marks this argument out as, if anything, stronger, clearer (and could such a thing be), truer than a simple syllogism; yet it is plain, that the very additional circumstance on which this additional clearness depends, takes the argument out of a syllogism, as defined by all writers."—*Formal Logic*, p. 77.

(64.)

Syllogisms in which both the Premises are Particular.

It has been stated in § 60, that from two *particular* premises no conclusion can be drawn. Is this a rule for *all*, or is it a rule for only the *Aristotelian*, syllogisms?

It is *not* a rule for all syllogisms. It is only a rule for the Aristotelian.

This may be seen by the following operations on—

A. All men are mortal;
A. All men are rational beings;
I. Some rational beings are mortal.
(*Darapti.*)

Weaken either of the two premises into—

A. All men are mortal;
I. Some men are rational beings;
I. Some rational beings are mortal.

(*Datisi.*)

We have seen what comes of this. The fact of the premises in *Darapti* being over-strong has already been stated. The rule, however, in question has been adhered to.

To have written,—

Some men are mortal;
Some men are rational beings;
Some rational beings are mortal,

would have been to have written three unconnected propositions, looking as if they formed a syllogism, but not doing so in reality.

But what if, instead of the word *some*, we had written in the premises, the words *more than half?* In that case our sentences would have run thus:—

More than half the men in the universe are mortal;
More than half are rational beings;
therefore,
Some rational beings are mortal.

Is this a true conclusion? It is. Why, then, do we deny that the proposition in which it is embodied forms a syllogism? Because the Aristotelian rules exclude such expressions as *more than half*, limiting our quantities to the terms, *all*, *some*, and *none*.

More will be said in the sequel concerning the questions suggested by this and the two preceding questions. At present, it is considered that the

exposition of the rules and structure of the Aristotelian syllogism, followed by a sketchy suggestion of the chief points on which it is susceptible of modification, is enough.

65.

Two, or more, Propositions disguised as one.

§ No proposition has more than two terms, viz. one subject and one predicate. Where there is more than one of either, there is more than one proposition. Nevertheless, we may have two or more propositions conveyed by a single sentence. The commonest instances of this are the cases where, with two different subjects, we have the same predicate, or, with two different predicates, the same subject. Thus :—

1. The sun and the moon shine.
2. The sun shines and dazzles.

In each of these sentences we have, in reality, two propositions, viz. :—

1.

a. The sun shines.
b. The moon shines.

2.

a. The sun shines.
b. The sun dazzles.

This is because *sun* and *moon*, *shines* and *dazzles*, are separate and independent terms.

Had we, however, said—

1. The sun, along with the moon, shines;
2. The sun shines so as to dazzle,

the condition of the two latter words would have

been different. They would have been subordinated to *sun* and *shine*, so as to constitute only a single proposition. This single proposition, however, would have been many-worded in respect to one of its terms.

This difference between two separate terms and one compound is shown in the grammar of the following sentences :—

1. The sun and moon shine.
2. The sun shines.
3. The moon shines.
4. The sun shines and dazzles.
5. The sun shines so as to dazzle.

Such are the examples of two propositions disguised as one.

66.

Propositions as Parts of Terms.

§ A pair of simple propositions is one thing. A single proposition consisting of a multiplicity of subordinate terms is another.

I have now to remark that terms may be so very many-worded as to embrace not only other terms, like themselves, but even whole propositions.

1. The man (is) returning.
2. Who (was) sent to market.

Combine these (omitting the words *is* and *returning*, which serve as copula and predicate), and they form but a single subject. Thus: *the man who was sent to market* (*is*) *returning*. The words *man who was sent to market* form but a single

term; a many-worded one, doubtless, yet still but a single term.

In the opening of the *Paradise Lost*, the lines,

> "——— The fruit
> Of that forbidden tree, whose mortal taste
> Brought death into the world, and all our woe,
> With loss of Eden, till one greater Man
> Restore us, and regain the blissful seat,"

form in the estimation of the logician but one name; a many-worded one, no doubt; a *very* many-worded one, but not more so than many others.

67.

Extent to which Language consists of Propositions.—Extracts.

We are like the universally famous and immortal Monsieur Jourdain of Molière, who, beginning the study of grammar and rhetoric somewhat late, and beginning it with a definition of the difference between poetry and prose, was surprised to find that he had talked prose all his lifetime without knowing it. Instead ot *prose* write *proposition*, and Monsieur Jourdain's case is our own. We have uttered propositions ever since we knew how to speak, uttering them unconsciously. We have never stated either a truth or a truism without forming a proposition. We have never misstated, or heard misstated, a fact or a pretension to a fact without either delivering, or listening to, or writing, or reading a proposition. We have never asked a question that was not a proposition; never effected a command that was not one.

Consider all this carefully, and you will have found one way of measuring the great proportion which propositions bear to the rest of our conversation.

Or you may get at the same result by considering what words do *not* enter into the structure of propositions, and by observing how few they are. They are just the words like *ah ! oh ! pish !*

They will not combine with other words so as to form sense. They will neither make a proposition by themselves nor help to make one in conjunction with other words. The person who uses them, uses them as he would use a gesture, to express surprise, pain, or contempt ; but, although he uses them thus, he makes no *affirmation*. He no more affirms that *he is surprised*, or that *he is in pain*, or that *he is scornful*, than if he started back, or laid his hand upon a tender part of his body, or curled his lip contemptuously ; and in like manner the hearer understands his meaning. But he would have understood a gesture as well. Nothing is affirmed or denied by the words. Neither do they enter into propositions wherein anything is affirmed or denied. They are wholly independent of propositions ; as much so as the hiss of a snake, or the groan of a wounded animal—expressions of which we *infer* the meaning, but expressions as to the meaning whereof we are not informed in the way that we are informed by propositions.

Save and except such words as these, there are none in the whole universe of language that exist independently of propositions.

That they are words which exist *out of, or beyond, the limits of* propositions has been shown,

but an *existence beyond the limits of a proposition* is by no means the same as an *existence independent of a proposition.* Though words like *therefore, because, if,* &c., form no part of any one proposition at all, they connect several.

Hence, by observing that there are but two classes of words that do *not* enter into the structure of propositions, that neither class is numerous, and that the words of one of them, though belonging to no single proposition, imply the existence of *two*, we find additional proofs of the great extent to which propositions are the staple and foundation of language.

We may find them, too, by looking in another direction. Mathematicians, who rarely write upon language without supplying valuable suggestions to even the professed philologues, have, oftener than once, attempted an expression of its laws, by means of signs and symbols, algebraic in either detail or principle. The following extracts are from the *Laws of Thought* by Professor Boole. They show that by means of literal symbols we may express all terms, and by means of four signs all the relations between them. Now every one of these terms implies the existence of a proposition. With the exception, however, of the class of words like *oh ! ah !* &c., they represent all that is represented by language.

Extract.

Proposition I.

" All the operations of language, as an instrument of reasoning, may be conducted by a system of signs composed of the following elements.

"1st. *Literal symbols, as* x y, *&c., representing things as subjects of our conceptions.*

"2nd. *Signs of operation, as* +, —, ×, *standing for those operations of the mind by which the conceptions of things are combined, or resolved, so as to form new conceptions involving the same elements.*

"3rd. *The sign of identity* =.

* * * * * *

"CLASS I.

"*Appellative or Descriptive Signs, expressing either the Name of a Thing, or some quality or circumstance belonging to it.*

"Let us agree to represent the class of individuals to which a particular name, or description, is applicable by a single letter, as *x*.

"If the name is 'men,' for instance, let *x* represent 'all men,' or the class 'men.' By a class is usually meant a collection of individuals to each of which a particular name or description may be applied. Again, if an adjective, as 'good,' is employed as a term of description, let us represent by a letter, as *y*, all things to which the description of 'good,' is applicable, *i.e.* 'all good things,' or the class 'good things.' Let it further be agreed, that by the combination *x y*, shall be represented that class of things to which the names or descriptions represented by *x* and *y* are simultaneously applicable. Thus, if *x* alone stand for 'white things,' and *y* for 'sheep,' let *x y* stand for 'white sheep,' and, in like manner, if *z* stand for 'horned things,' and *x* and *y* retain their previous interpretations, let *z x y* represent 'horned white sheep,' *i.e.* that collection of things to which the name 'sheep,' and the descriptions 'white' and 'horned' are together applicable.

"CLASS II.

"*Signs of those Mental Operations whereby we collect Parts into a Whole, or separate a Whole into its Parts.*

"We are not only capable of entertaining the concep-

tions, as characterised by names, qualities, or circumstances, applicable to each individual of the group under consideration, but also of forming the aggregate conception of a group of objects, consisting of partial groups, each of which is separately named and described. For this purpose we use conjunctions, 'and,' 'or,' &c. In this and in all other respects, the words 'and,' 'or,' are analogous with the sign + in algebra. Let x represent 'men,' y 'women;' and let + stand for 'and' and 'or,' then we have—

$$x + y = y + x.$$

Let the symbol z stand for the adjective 'European;' then, since it is, in effect, the same thing to say 'European men and European women,' we may have—

$$z\,(x + y) = z\,x + z\,y.$$

The above are the laws which govern the use of the sign +, here used to denote the positive operation of aggregating parts into a whole. But the very idea of an operation effecting some positive change seems to suggest to us the idea of an opposite or negative operation, having the effect of undoing what the former one has done. Thus we cannot conceive it possible to collect parts into a whole. This operation we express in common language by the sign *except*, as, 'All men *except* Asiatics.' 'All States *except* those which are monarchial.' Here it is implied that the things excepted form a part of the things from which they are excepted. As we have expressed the operation of aggregation by the sign +, so we may express the negative operation above described by — (*minus*). Thus if x be taken to represent men, and y Asiatics, *i.e.* Asiatic men, then the conception of 'All men except Asiatics' will be expressed by $x - y$. And if we represent by x States, and by y the descriptive property 'having a monarchial form,' then the conception of 'all States except those which are monarchial,' will be expressed by $x - x\,y$.

"CLASS III.

"*Signs by which Relation is expressed, and by which we form Propositions.*

"Though all verbs may with propriety be referred to this class, it is sufficient for the purposes of Logic to consider it as including only the substantive verb *is* and *are*, since every other verb may be resolved into this element, and one of the signs included in Class I. The above sign, *is* or *are*, may be expressed by the symbol = 'The stars are the suns and the planets.' Let us represent *stars* by x, *suns* by y, and *planets* by z: we have then—

$$x = y + z.$$

"Now, if it be true, that the stars are the suns and the planets, it will follow that the stars, except the planets, are suns. This would give the equation—

$$x - z = y.$$

Thus a term z has been removed from one side of an equation to another."—*Laws of Thought*, chap. 2.

68.

Criticism.

§ An objection has now to be anticipated. It turns upon the element *thing* in the compound word *something*, a word that has played its part somewhat conspicuously.

Let us take two birds, a crow, and a *hen* blackbird.

What are their respective characters? The crow is unequivocally black, the hen blackbird (for it is of the hen that we most especially speak) is brown, rather than black. Both are birds; the crow being a black bird so-called from its colour, the other being no black bird at all, but a brown black-

bird. Hence—we may say (as many have said) that all *black birds* are not *blackbirds* (crows are not), and all *blackbirds are not black birds* (a hen blackbird is not). This is a convenient and common illustration of the difference between *two* words and a compound word.

When the combination consists of two words, there is an accent on each of them, as in bláck bírd.

When the combination results in a compound, the accent is on only one, *i.e.* the first of them, *e.g.* bláckbird. Hence, we pronounce (and often write) as follows:—

All bláck bírds are not bláckbirds, and all bláckbirds are not bláck bírds.

Now the same kind of difference that exists between *bláck bírd* and *bláckbird* exists between *sóme thíng* and *sómething;* a difference which is of no small importance. What have we written about propositions? That they are sentences, consisting of certain members, elements, or constituents called Subject, Copula, and Predicate, and that they either assert or deny SOMETHING *concerning* SOMETHING. The *something* here spoken of is evidently a compound word, spelt as such, and accented as such—*sómething*, not *sóme thíng*.

The *sómething*, then, that is spoken of in the definition of a proposition is a word like *bláckbird* and not a word like *bláck bírd*.

We shall see the reason for this distinction if we ask what would have been the case if it had been otherwise; *i.e.* if the definition of a proposition had been that it was a sentence wherein and whereby *sóme thíng was affirmed or denied of*

sóme thíng. What, with such a definition as this, would be the case of such a statement as

John is a hero?

Would it be right to say, that human beings like John are *things;* that heroes are *things?* Assuredly, this is not the language either of common life, or the common law, in both of which we draw a clear distinction between *persons*, on one side, and *things* on the other. A person is not a *thing;* neither is a *thing* a person. Nevertheless, the statement that *John is a hero* is a proposition. Neither is the ordinary definition inaccurate. All that is wanted to reconcile the two apparent contradictions is, a clear remembrance of the fact that *sómething* has a wider meaning than *sóme thíng*. The former includes persons and things properly so called. The latter excludes persons.

Persons are not the only somethings that are opposed to things. *Im*material beings, essences, existences, entities, or whatever else they may be called, are in the same predicament. We can make such propositions as the following:—

Hope is a blessing.
Patience is a virtue.
Fear is unworthy of a soldier.
Conscience is a good guide.
All that remains is hope.
There is no remedy but patience.
Health is the greatest worldly good.
Here is an instance of perfect disinterestedness.
Whiteness is the essence of snow.

All these are good propositions; yet few will

call Hope, Patience, Fear, Conscience, Health, Disinterestedness, Whiteness, *things*.

Are words like *white*, &c., *somethings?* We have assuredly predicated them of certain subjects, *e.g. snow is white.* This speaks of snow, and says *something* about it. Is *white* then a *name of something?* There is only one way in which the word *white* is a true and universally-admitted name. It is a true and universally-admitted name, when we speak of the word as the word itself. It is a true and universally-admitted name, when we say—

White is an English word.
White is a word of five letters.
White is a word beginning with *w* and ending with *e*.
White is a word of common occurrence.
White is often used for *white thing*.
White is sometimes used for *whiteness*.

In this case it is something that strikes our senses—hearing or sight. It does the former, when it is uttered by some one with whom we speak; the latter when written, or printed, by some one whose writing, or printing, we peruse. In the former case, it is the name of a particular combination of sounds; in the latter, it is a collection of written characters, or (if we chose to express ourselves more generally) of certain points and lines endowed with the property of expressing certain sounds.

In any other sense but this, we cannot introduce such a word as *white* into the subject of a proposition, unless in combination with other words, or parts of words, with a change of power, *e.g.*:—

A *white* crow is a rare bird.
White-ness is the chief property of snow.
White is my colour.

White, then, in *strict* language, is a *thing* only so far as it is a word; and it is, in strict language, a name of something only so far as it is the name of a word.

Nevertheless we use it as a name. This is because, though no true name itself, it suggests what is, actually, a true name, viz. *whiteness*, the name of the attribute or quality suggested by *white*.

Of this more will be said, both in Part II. and Part III.

PART II.

NAMES.

69.

Names, Individual or Common.

EVERY name is the name of something, real or imaginary.

Is the converse of this true? Has every something, real or imaginary, a name?

There are more than a million persons in London, and each of these has one.

There are more than ten thousand towns and villages in England, and each of these has one also.

There are more than fifty race-horses at Newmarket, no one of which is without its name.

Of the *persons*, then, in London, of *towns* and *villages* in England, and of the *race-horses* at Newmarket, every individual has its own individual designation: *John*—*Hammersmith*—*Eclipse*, &c., &c. And as the number of other persons, other towns and villages, and other race-horses, is great, the number of names, in England *only*, becomes enormous. There is more than a million for the Londoners only. Yet London and Newmarket are only parts of England, and England only a part of the world in general. Persons, too, and towns,

villages, and race-horses are mere fractions of the whole collection of the innumerable somethings, real or imaginary, of the universe. Have all these names?

They have *not*, that is to say, they have not names in the way that the persons of London, the towns and villages of England, and the race-horses of Newmarket have. They have not names like *Thomas*, *Hammersmith*, or *Eclipse*. Nevertheless, they have all names.

The million of *Johns*, *Thomases*, *Janes*, and *Marys*, that occupy London are all *persons*, *men*, *women*, *boys*, *girls*, *children*, as the case may be.

The ten thousand (and more) *Hammersmiths*, *Londons*, *Newmarkets*, &c., are all places, towns, villages, hamlets, &c., as the case may be.

The fifty *Eclipses*, &c., at Newmarket are all horses, mares, &c., as the case may be.

This shows that the *Johns* and *Thomases*, the *Janes* and *Marys* of London, constitute a part of an indefinite collection of individuals, each of which is a *person*, *human being*, *man*, &c., the word *person*, &c., being the name of the class constituted by this indefinite collection.

The *Hammersmiths*, &c., constitute part of an indefinite collection of individual places, towns, or villages; the word *place*, *town*, *village*, being names for the class or collection thus constituted.

The *Eclipses*, &c., of Newmarket constitute part of an indefinite collection of individual horses, the word *horse* being a name for the class to which these Eclipses, &c., belong; all which leads us to a great two-fold division of all names whatsoever.

Names are either *Individual* or *Common*.

An *individual* name is one which denotes a single object and no more.

A *common* name is one which denotes a whole class of objects.

Thomas is a single and particular individual of the class called *man*: *Julius Cæsar*, a single or particular individual of the class called *conquerors*. Or it may be that we look upon him rather as a *hero*. In that case he is an individual of the class of *heroes*. Whether, however, he be a *conqueror*, a *hero*, or a *man*, he is still *Julius Cæsar*; for this is what he is as an individual, irrespective of the particular class under which it may please the speaker to place him, and independent of any class at all.

The word *letter* is the name of a class; of a class to which *a*, *bee*, *cee*, and some twenty or thirty others belong. *A*, *Bee*, and *Cee* are the names of certain individual letters.

The word *London* is the name of an individual town; the word *town* the name of a class containing (along with others) *London*.

70.

Individual Names, Singular.

§ Examples of this sort may be given *ad infinitum*. The main point, however, to be remarked, remembered, and reflected on is the following:—

Common names apply to things of which there may be more than one. Individual names apply to things of which there is one and no more. There are many *towns*, but there is only one *London*;

many *men*, but only one *Thomas*; many *conquerors*, but only one *Julius Cæsar*.

Individual names, therefore, are also *singular* names, and there are many good writers who habitually call them so, preferring the term *singular* to *individual*.

The opposite to singular is *plural*—"London *is* a large town—London and Boston *are* large towns—Mæcænas *was* a patron of literature—Virgilius Maro *was* a poet, &c.—Mæcænas and Virgil *were* Romans."

Singulus is the Latin for *each*, and from *singulus* we get the word *single*, meaning *one*.

Plur-es is the Latin for *more*, and from *plures* we get the word *plural*, meaning *more than one*.

Father, *horse*, *stone*, &c., are singular. We use them in speaking of one object, and no more than one.

Fathers, *horses*, *stones*, &c., are plural. We use them in speaking of two or more objects.

71.

Individual Names, Proper.

§ *Individual* names are also proper names, and there are many good writers who habitually call them so—preferring the term *proper* to either *singular* or *individual*.

The reason for this lies in the fact of individual names being *appropriated*, or made *proper* to certain single individual objects to which they are exclusively attached.

72.

Common Names also called General.

§ *Common* names are also called *general;* and there is no objection to the term. It is possible, indeed, that it may be the better one of the two.

73.

Collective Names.

Common (or general) names as well as plurals, plurals as well as common (or general) names must be distinguished from a class of words to which they are allied, but from which they notably differ.

John Davies of the 62*nd* is an individual or proper name.

Soldier is a common, or general one.

John Davies and Henry Smith, soldiers of the 62nd, give us a plural.

The 62nd is an individual name.

Regiment, however, is a common one.

And it is something more. As opposed to *regiments,* which is plural, it is singular; and—

As opposed to John Davies, it is common;—and—

As opposed to *soldier* (which is common, or general, also), it is collective.

The following words are collective—*battalion, army, navy, parliament, multitude, collection, mob.*

Collection, itself, as may be inferred from the name, is *collective;* and so are its equivalents, *assemblage, group, class,* &c.

Collective names are the names *classes, groups,*

assemblages, collections of individuals dealt with as individual objects.

74.

Individual Names essentially Singular.

Individual names are essentially *singular*, and it is a common, as well as true statement, that no *individual name can be plural.* A grammarian would say that *no proper name can be plural.*

How, then, can we use such expressions as *both the Bostons are important sea-ports*, or, *as long as Mœcœnases abound Maros will be plentiful?*

"Sint Mæcænat*es* non deerunt, Flacce, Maron*es*." Again—when it was stated that "there were many *men*, but only one Thomas," was the assertion literally true? It is hoped that even the readers of this very sentence, whose name is Thomas, may be numerous. If so, the *dictum* under notice is inaccurate. It is inaccurate, however, only in appearance.

More men than one may bear the same name. *Thomas* à Kempis is one person; St. *Thomas*, the Apostle of India, another; *Thomas* the Rhymer a third; *Thomas* Aquinas a fourth—and so on *ad infinitum.*

Again—the *Boston* in Lincolnshire is a different town from the *Boston* in Massachusetts, so that though the same combination of sounds or letters —the same word—applies to both, it cannot be said that the same *name* is so applied. The same name is one thing. The same word applied to different objects is another. A name is only so far individual as it applies to some individual object. The

two Bostons, however, are different individuals; and so were the four Thomases, and so would be any amount of Thomases or Bostons or the like.

The case of *Mœcœnas* and *Virgil* is different.

Here there are but two individuals—one Mæcœnas and one Virgil. Mæcœnas, however, is something more than the particular patron of Virgil. He is the sample, type, or representative of *patrons in general.* Virgil, in like manner, is something more than the particular poet patronised by Mæcœnas. He stands for *poets in general.* Hence, the meaning of the Latin line, and of the English sentence that preceded it, is this:—

As long as there are men like Mœcœnas, there will also be men like Virgil.

But a man like Mæcœnas is a patron, and a man like Virgil a poet. Hence—

As long as there are patrons there will be poets also.

75.

Individual and Common Names.—Names of Persons and Places.

§ A little consideration, suggested by the ordinary names of common life, by the names of ourselves and friends, by the names of our dwelling-places, by the names of our domestic animals, by the names, in short, of the kind just exhibited, will tell us that, as a general rule, individual names are the names of persons, the names of animals, the names of places, personal names, or geographical names.

The illustrations of this are infinite; *e.g.*—

(1.)

Names of persons.

Individual—Adam, Eve, Julius, Cæsar, Julius Cæsar, Thomas, John, George, George the Fourth, George Barnwell, &c.

contrasted with,

Common—Man, woman, husband, wife, son, daughter, boy, girl, child, &c.

(2.)

Names of places.

Individual—Rome, Damascus, London, Troy, &c.

contrasted with,

Common—Mountain, hill, town, village, rock, promontory, &c.

(3.)

Names of animals.

Individual—Bucephalus, Eclipse, &c.

contrasted with,

Common—Horse, cow, &c.

Nevertheless, there are many others. Names like *Fortuna* the goddess of *Fortune*, and *Victoria* the goddess of *Victory*, in the Pagan mythology, are individual names. Perhaps, they may be called the names of *persons*. At any rate, they are the names of *personified* ideas.

Closely akin to these are words like *Prudence, Wisdom, Faith, Hope, Charity*. We call these, abstract names—a term concerning which much will be said hereafter. But it is clear, that they are closely allied to personifications. Indeed, in a language like the Latin, and under a mythology like that of the Romans and Greeks, they actually

come out as the names of personal beings. How slight is the difference between *Victory*, the English abstract, and *Victoria*, the Latin personification, a goddess. Upon the extent, however, to which abstract names are individual, more will be said in the sequel.

Collective names are, more or less, individual; as are the names belonging to the class considered in § 93, *i.e.* the convertible (or variable), and the inconvertible (or invariable).

76.

Individual and Common Names.—Necessity and Usefulness of Common Ones.—Extract.

Where the number of individual objects is infinite, it is clearly impossible to give a name to each. This compels us to make one name serve for many. In this compulsion, we find the origin of common terms.

Such is the view that is suggested to the reader; and such, I believe, on the whole to be, not only the true one, but the one universally admitted; provided always, that we discriminate between what is commonly called the efficient and the final causes of general names. The final cause (the word being used in its current but exceptionable sense) of general names, is their function as terms in all propositions of any value whatever. Without them, it is reasonably argued that we should be unable to state the result of a single comparison between two different objects. We should have nothing but truisms, *e.g. John is John*, &c. We should be well nigh as badly off as if we had no names at

all. Be it so. Nevertheless, we have no reason to believe, because the possession of them is of the highest value and the greatest importance, that it is also the cause of their having been invented. On the contrary, they may have grown up for uses never contemplated by those who first used them. Such I believe to have been the case; and, so believing, unwillingly take exceptions to the following extract from Mills' *Logic*:—

EXTRACT.

"And here I cannot omit to notice an oversight committed by some eminent metaphysicians; who have said that the cause of our using general names is the infinite multitude of individual objects, which, making it impossible to have a name for each, compels us to make one name serve for many. This is a very limited use of the *function*" (the italics are the present writer's) "of general names. Even if there were a name for every individual object, we should require general names as much as we do now. Without them, we could not express the result of a single comparison, nor record one of the uniformities existing in nature; and should be hardly better off in respect to induction, than if we had no names at all. With none but names of individuals (or, in other words, proper names), we might, by pronouncing the name, suggest the idea of the object, but we could not assert a single proposition, except the unmeaning ones formed by predicating two proper names one of another. It is only by means of general names that we can convey any information or predicate any attribute, even of an individual, much more of a class."—*System of Logic*, book iv. chap. 3, § 4.

In this extract the word *function* has had attention drawn to it by being printed in italics. This is because it is the term to which the chief exception is taken. It is not a question of a *function* that is

before us; but a question of *origin*. How common names originated, is one matter. How, after their origin, they were applied, is another.

77.

Common, General (Generic), and Subaltern Terms.

§ It was stated in § 72 that common terms were also called *General*. The word General, however, is not entirely free from ambiguity.

The best illustration of this is to be found by a reference to the language of the naturalists, zoologists, and botanists.

Genus is a Latin word, signifying *kind* or *sort*. Its plural is *genera*.

Species is also a Latin word, signifying *kind* or *sort*. Its plural is the same as its singular, i.e. *species*.

Genus = a *kind* or *sort*; *genera* = *kinds* or *sorts*. Derivatives; *general, generality, generally—generic, generically—generalise.*

Species = a *kind* or *sort*; *species* = *kinds* or *sorts*. Derivatives; *special, specific, specify*, &c.

Both *genus* and *species* denote *classes*. We may call them, if we choose, *class* names.

Question.—Of the two classes which is the larger? Of the two class-names which is the more comprehensive? Does the genus comprehend the species, or the species the genus?

Answer. The *genus* is the larger and more comprehensive. A *genus* may contain a species, but no species contains a genus. If this rule be neglected

in the language of common life, it is never neglected by that class of investigators who have most to do with these two terms, viz. the naturalists, be they botanists or zoologists.

Let us look at some of the classes upon which the naturalist employs himself. The objects of his science, in its widest sense, comprise men, the lower (and even the lowest) animals, trees, plants, minerals, even the fluids of the ocean and its rivers, and the gases of the atmosphere. How vast a difference between the two extremes of this wide field of inquiry! The objects, however, are capable of arrangement; an arrangement which has, by no means, been overlooked. First comes the great division between the organic and inorganic worlds; the former containing all objects that grow, and are endowed with either animal or vegetable life, the latter such as have neither life nor growth.

Say that the mineral world is inorganic; and it is clear that organisms fall into two great *kingdoms* (as they are called), the names of which we already anticipate. There is the animal kingdom, with its birds, beasts, and fishes; the vegetable, with its trees and plants, its flowers and weeds, its forests and meadows.

Each of these falls into divisions and subdivi sions. How wide the difference in the vegetable world between the fern and the rose, the moss and the oak! Amongst animals, what can stand further apart from each other than our horses, oxen, and sheep, from the sponges and corals of the sea? Yet there are more sorts of sheep, horses, and oxen, than one; whilst of sponges, corals, and the like, there are vast and unnumbered classes.

Of animals that so far agree with ourselves as to have an internal skeleton, external organs of sense, and other conjoint attributes—of animals that the naturalist calls *vertebrata*, how clear and definite, to even the commonest observation, is the difference between a quadruped, a bird, a frog (or snake), and a fish! How truly does each of these animals not only differ from the rest, but agree with a whole group of others! Say that every bird agrees with all other birds more than with any fish, and we get a notion of the import of the word *bird* as a class-name. Different, however, as are birds and fishes, they are more alike than fishes and insects, birds and shell-fish.

Of birds, the birds of prey belong to one class; the poultry-kind to another, &c.; each falling into divisions and sub-divisions. There are eagles, and hawks, and vultures on one side; turkeys, and chickens, and peafowl, &c., on the other. The same process may be applied to the objects of the vegetable kingdom. The kingdom itself comprises the oak and the moss, the sea-weed and the mould on the damp wall, the violet and the lily. But the mosses and sea-weeds, though belonging to different classes, are still included in a group which excludes the lily and the oak; themselves belonging to different groups, and, themselves, constituting groups that fall in divisions and sub-divisions, sections and sub-sections.

Such is the sketch of the classes of the zoologist and botanist as they present themselves, if we pass from the larger to the smaller ones; from the organic world to the vegetable kingdom, from the vegetable kingdom to the class of flowering plants,

from the class of flowering plants to the family, or tribe, of violets.

But we may reverse the process; we may begin with the violet, and end with the organic world.

The dog-violet and the sweet violet belong to different divisions of the violet class; a class which excludes the rose, the oak, the lily, &c.

Yet the rose, the oak, and the lily belong to a division of the vegetable kingdom that excludes the moss, the fern, and the sea-weed—plants with no flower.

All, however, are vegetables as opposed to animals.

Mutatis mutandis, we say may the same of horses, eagles, snakes, shell-fish, flies, &c.

The horse and ass belong to one class; a class included in that of

Beasts as opposed to *birds* and *fishes*.

Yet *beasts*, *birds*, and *fishes* belong to the class of vertebrate animals, *i.e.* animals with an internal skeleton, to which shell-fish, flies, worms, microscopic animals, &c., *do not* belong.

Yet they are all animals; the animal and vegetable kingdoms making up the organic world.

The classes under notice are like those Chinese curiosities where a large hollow ball contains a smaller one, which contains a smaller one still, which contains one still smaller, which contains, &c., &c., till we get to the smallest of all, which contains nothing; but which is itself contained by the smallest but one. In this, there are two extremes, the largest and the smallest; all the other sizes being intermediate.

Of these extremes we may begin with either.

To begin with the largest and end with the smallest is to *descend.*

To begin with the smallest and end with the largest is to *ascend.*

The class that comprehends all the others is the *highest ;* and, as *summum* is the Latin for *highest,* a class of this kind is called *summum genus.* Our words *sum* and *summary* are derived from this *summ-um.*

The class that comprehends no other (but only so many individuals) is the *lowest;* and, as *infimum* is the Latin for lowest, a class of this kind is called *infimum genus.*

So much for the extremes. What, however, is the logical name for the intermediate classes, the classes smaller, or lower, than the *summum,* larger, or higher, than the *infimum, genus?* We call them by a name which a thought upon the constitution of the British army will explain. In the British army a certain class of officers are called *subalterns.* They are above the private soldier, below the commissioned officers. Think of the *subalterns* of an army, and you will remember that the intermediate genera of the logician are called *genera subalterna.*

The relations suggested by this word *subaltern* are found everywhere in the domain of thought and language. These are found wherever there is a change of import coinciding with a change o relation.

What is the word *men* in such a series of propositions as—

All men are mortal beings,
All heroes are men ;
Therefore
All heroes are mortal beings,

but the name of a class, larger than that of *heroes* and smaller than that of *mortals?* As such it is the name of a subaltern genus.

EXTRACT.

"A species, then, it is plain, when predicated of individuals, stands in the same relation to *them*, as the genus to the species; and when predicated of other (lower) species, it is, then, in respect of these, a genus, whilst it is a species in respect of a higher genus: as 'quadruped' which is a species of 'animal,' is a genus in respect of 'horse;' which latter, again, may be predicated of 'Bucephalus' and other individuals. Such a term is called a subaltern species or genus; being each, in respect of different other terms, respectively.

"A genus that is not considered a species of anything, is called *summum* (the *highest*) *genus;* a species that is not considered a genus of anything, *i.e.* is regarded as containing under it only individuals, is called *infima* (the *lowest*) *species.*"—WHATELY, *book* ii. *supplement to chapter* 1. § 4.

78.

Individual and Common Names.—Degrees of Generality.—Generic.

§ A *genus* is said to be *general*, in proportion as it contains, or has under it, other genera. Thus, *organized being* is a more general term than *animal*, *animal* than *quadruped*, and *quadruped* than *horse;* and *vice versâ*.

Londoner is a less general term than *Englishman*, *Englishman* than *man*, *man* than *animal*, *animal* than *organized being*, &c.

Hence, there are degrees in the generality of terms; some being nearer to the summum genus, and (as such) more *general*, and some being nearer

to the infima species, and (as such) more *specific* (or *special*) than others.

More than this—the names themselves of genus and species change their application according to the changes of relation between the classes to which they apply. There is no such thing as a name exclusively applicable to a genus; no such thing as a name exclusively applicable to a species. On the contrary, the name which, on one occasion, is a genus, is, on another, a species and *vice versâ*. Talk of *heroes*, and *man* is a genus. Talk of *animals*, and *man* is a species.

Genera are at different *distances* from each other. In *all heroes are men, all men are animals, all animals are organized beings*, the class of *men* immediately includes that of *heroes*, and (so doing) is called its *nearest* (*proximum*) genus; whilst that of *animals* constitutes a *remote* (*remotum*) genus. The longer the series of subalterns between the *summum* and the *infima*, the more numerous the degrees of nearness and remoteness.

Observe—It has been stated, that some writers, instead of the word *common* use *general*, so that the opposite to an *individual* is a *general* name. When this is the case, it is convenient to denote the approach of a subaltern to a summum genus by the word *generic*. This is, merely, saying "that *animal* is a more gene*ric* term than *man*, *man* than *Englishman*," &c.

79.

Individual and Common Names.—The Extremes. —Infima Species and Individuals.

§ The lowest species contains a certain number

of individual objects. Say that it contains a hundred. It can, of course, be divided into so many parts. When this, however, has been done, the process of division ceases.

The *individual* is (as the term denotes) incapable of further division. The class of *men* consists of so many Johns, Peters, &c.; John, however, and Peter, consist of nothing but their own attributes.

In passing from the species to the individual we descend, and when the individual is reached we are as low as we can get.

80.

Individual and Common Names.—The Extremes. —Summa Genera and the Universe.

§ From the species, we *des*cend. From the summum genus, we *as*cend. Before, however, we consider the nature of our ascent, it is necessary to notice certain limitations on the word *summum*.

What term was general—what class was large—enough to comprehend the two great classes of the animal and the vegetable kingdoms, kingdoms concerning which we have spoken somewhat freely and fully? Did we not say that they were divisions of the great organic world; and was not this great organic world their *summum genus?* It was so. It was so, inasmuch as we made it so. Yet it might have been something else. It might have been nothing at all, or it might have been a mere subaltern.

Had the question been one of birds, beasts, fishes, reptiles, insects, shell-fish, &c.—had it been a

question of *animals* only—there would have been no mention of the vegetable kingdom at all; and, *vice versâ*, had it been a mere question of roses, lilies, oaks, mosses, or lichens—a question of vegetables and nought else—the animal kingdom would have lain so entirely out of the pale of our discourse as to have no existence at all; none, at least, for the purposes under notice. In other words, we might have applied to them the axiom that "things non-apparent were no better than things non-existent" (*de non apparentibus et non existentibus eadem habenda est ratio*), and have ignored them altogether. In such a case, the *summum genus* would have been the *animal* or *vegetable* kingdom, alone—as the case might have been; the *organic* world being no-where and nothing.

But what if, instead of the special details of either the zoologist or the botanist, we had had a comparison between the phenomena exhibited by plants and animals on the one side, and rocks, soils, waters, winds, &c., on the other? What if the inorganic world were compared with the organic? In such a case, a summum genus would, perhaps, be wanted in order to comprise the two. Could such a one be found? Certainly. There is always one summum genus wide enough for everything. This is the UNIVERSE. The Universe is the name of a class from which no two genera are so remote as to be excluded. Whether it may not be too wide to be of any practical use, is another question.

The UNIVERSE = EVERYTHING; and Everything is the name of a class from which nothing is excluded—nothing, whether real or imaginary;

for the Universe means, not merely the world of real objects, but the world of Thought, or conceivable existence.

81.

The Universe—Positive and Negative Names—Non-effective Negative Names.

The Universe means Everything. Everything means All things. All things mean an incalculable and inconceivable number of real or imaginary Somethings.

Of these real or imaginary Somethings, let us take the largest number that the largest-minded arithmetician can conceive. Let us double, treble, or quadruple it. Let us multiply this till the figures become too numerous to deal with. Let us do all this, and more, so as to swell and magnify it, indefinitely, infinitely. And having done all this, let us reverse the process by subtracting from it the smallest fraction of a single, humble, and scarcely appreciable unit. What shall we have got by our trouble? We shall have got two things instead of one. We shall have got, instead of a single sum, a difference and a remainder, each of which has its name, no matter how small, or how large, it may be.

Let the single solitary unit thus subtracted from the unnumbered and innumerable, tangible and intangible, visible and invisible, sensible and supra-sensual, real and imaginary Somethings of our Universe, be a single grain of sand. The result is, on one side, the rest of the world *minus* the grain of

sand; on the other, the grain of sand *minus* the rest of the world.

The difference = The grain of sand.
The remainder = Everything else.
The sum = The Universe.

But what is a grain of sand amongst so many other objects? It is something. Small as it is, we have succeeded in separating it from the mass at large, and giving it a separate existence. Small as it is, we succeed in giving it a certain amount of attention. We have done more; we have given it a very great deal of attention. We have put the Universe in one scale, and it in another; and we have looked at each. Indeed, it is very possible that we may have thought quite as much upon the grain of sand *minus* everything else, as upon the Universe *minus* the grain of sand.

The name of *the* grain of sand, has been the name of an individual, *i. e.* of some single, particular grain.

Let us, however, leave out the word *the*, and say *grains of sand*, in general, or (more simply) *sand*, and we get a species.

We do not, however, get any notable addition to our difference. We get, however, the statement—the universe consists of *sand*, and objects *other than sand*, or *not-sand*.

And now, instead of *sand*, write *horse*, *man*, *glass*, *sword*, &c., &c., &c.—no matter what. *Mutatis mutandis*, the statement will remain the same. The Universe will = *horse* and *not-horse*, *man* and *not-man*; and so on.

Can we express this in language? Have we not already done it? Take any word you like, and

prefix *not*-, and you have the name for one of the two classes which constitute the Universe.

You have also the division of names into NEGATIVE and POSITIVE.

A little consideration will show that, for the most part, negative names of the kind in question are of no great use; also, that when words are of no great use, they rarely find their way into language. It is, of course, possible to have, for every positive name, a negative to match. Yet no language has it. No language has anything like it. No wonder. A negative name is the name of a class; but who learns anything from a class that contains such heterogeneous elements as spirits, ghosts, elephants, pens, mountains, leaves, &c., &c., simply on the score of their being other than *sand*, other than *man*, other than *horse*, *i. e. not*-sand, *not*-man, *not*-horse, &c.?

The opposite to *Negative* is *Positive*. All names are either one or the other. The extent to which the latter preponderate over the former has been seen. Nor is this wonderful. In all the cases before us, and in innumerable others like them, the positive class is so very limited, and the negative so inordinately wide, that the latter contains objects upon objects that have nothing in common with one another, except the mere fact of their being different from something else—a difference (in most cases) insufficient to give the grounds of a useful classification.

Let us, then, lay aside these negatives as ineffective, and (as such) unimportant, in language, remembering only the two terms, and preparing ourselves for learning that *some* negatives (though not the

ones which we have just noticed) are actually, not only part and parcel of Language, but useful elements of it.

82.

The Universe—Its Limitations.

§ It has been suggested by the remarks of § 77 upon the extent to which such a name as Animal Kingdom might, under certain, conditions, be a summum genus, that there were *two* universes.

The remarks upon the extent to which objects which have no existence in nature may still enter into the universe of the fancy or imagination, indicate a *third*.

1. There is the Universe as it exists in nature, containing men and horses, &c.; but not containing hippogriffs and centaurs.

2. There is a Universe of the imagination, containing all that Nature contains, and much more besides, *e. g.* hippogriffs and centaurs, as aforesaid, goblins, heathen deities, and the like.

3. There is a Universe that contains all the objects that the speaker, writer, or thinker is considering; and nothing beyond. What more do two men in argument, what more does the solitary thinker, want than this? What more than the ideas, objects, entities, names, or terms which belong to the subject under treatment or consideration? These are *his* Universe; no matter how much there may be besides for other people and for other purposes. Out of sight, out of mind. Out of mind, out of existence. *Quæ supra nos nihil ad nos*—not, at least, for the time being. *De non apparentibus et non existent-*

ibus eadem habenda est ratio. This has been said already. I repeat it in order to give prominence to the exclusion of all things beyond the pale of the immediate argument. The universe of the thinker is bounded by the horizon of his thoughts. He may extend this horizon by changing his ground. As long, however, as he is upon the same point of the same question, the horizon is his limit.

83.

The Universe—Negative Names effective when it is limited—Contraries.

The universe of the thinker is a temporary universe. He changes it for another when he changes the range of his ideas.

It is temporary and limited—a universe (as it may be called) of a Discourse, or train of reasoning. And this is what it has been called.

In a universe limited to the ideas of a given train of reasoning, negative names take a different character. They become effective.

All the men in existence are either *British citizens*, or they are not. Those who are not we call *aliens*. The first of these classes excludes the second; the second excludes the first. The two together make the class *man*. Yet *alien* is nothing more than *not-Briton;* and there are certain cases where *Briton* may be merely *non-alien*.

Extract.

"*Alien* is strictly *non-Briton;* but suppose a man taken in arms against the Crown on some spot within its dominions, and claiming to be a prisoner of war. The answer that he *is* a British subject is a negation; to establish his

positive claim, he must first prove himself an alien, and moreover, that he is in another positive predicament, namely, that he is the subject of a Power at war with Great Britain. Accordingly, of two contraries, neither must be considered as *only* the negation of the other. In the matter of property, personal and real are contraries, and a definition of either is a definition of the other. But though each be a negative term as compared with the other, no one will say that the idea conveyed by either is that of a mere negation. Money is *not* land; but it is something."—De Morgan, *Formal Logic*, chap. 2.

The importance of the class of contraries, in Logic, will be indicated in Part III.

84.

Negative Names—Opposites—Privatives.

§ Words like *alien* and *Briton* are simply contraries. They make up by themselves the whole of the class *man*. All that is not *alien* is *Briton*; and all that is not *Briton* is *alien*. No third term comes between them. This is not the case with words like *cheap* and *dear*, *hot* and *cold*, *scarce* and *abundant*, &c., which are *opposites*.

The affirmation of one involves the denial of another.

Bread is dear = bread is not cheap.

It does this as the ordinary contraries did; but it does something more. It declares that one attribute of bread (*dearness*) is the very opposite of the other (*cheapness*).

The weather is hot = the weather is not cold.

It does this, and it does something more. It declares that the one attribute of the weather (*heat*)

is the very opposite of the other (*coldness* or *cold*).

The real words to which *cold* and *hot*, *cheap* and *dear*, are simply negative, are *temperate* and *moderate* (or *average*), as we may easily imagine by thinking of a scale of prices, or a thermometer.

Different, again, are words like *blind*, &c. *Blind* means *unable to see*. But it also means something more. *Chairs* and *tables* are unable to see. So are all objects destitute of an optic nerve —by far the larger portion of creation. Yet these are not the objects we call *blind*. The objects we call blind are those members of a class *naturally endowed with sight* which are unable to see. Such are *sightless* men and women amongst human beings, and moles amongst quadrupeds. Hence, *blind* means *unable to see when sight is expected*. A *blind* object is not merely an object without *sight*, but an object *deprived* of it; or at any rate, an object which is exceptional to the class to which it belongs.

Now the *extreme* character of words like *hot* and *cold*, &c., and the *exceptional* character of words like *blind*, &c., have the effect of giving a positive character to a negative name. And this is the case with many other words, for different reasons. *Un-pleasant* means something more than the mere negation of pleasantness; *inconvenience* is a stronger term than *not convenient*.

Words like *blind*, &c., are called *privative*—*priv-atus* = *de-priv-ed*. They suggest the idea of something naturally possessed, but, in a particular case, lost. Now *loss* is a great deal more than mere non-possession.

(85.)

I and Not-I—Ego and Non-Ego.

§ Of the three views that can be taken of the universe, or, to speak more concisely, of the three universes, it is the third with which the logician has the most to do; and it is with the first that he has the least. The proper student of the universe, as it exists in Nature, is the natural philosopher, whose logic is not syllogistic but inductive. The universe of the Imagination is the universe of Language. Language has names for many objects that have no real existence whatever.

The universe of discourse is generally narrower than either of the other two. But it is not so necessarily. Nothing prevents a thinker or speaker from making either nature in general, or the world of the imagination, the subject of his discourse. Nothing prevents him from taking from it, on one side, a fraction of infinitesimal smallness, and comparing that with the remainder; in which case the relation of the difference would be that of the grain of sand of a previous section, or even less. Occasions for doing this are rare, very rare. Still they are possible. When they occur, the universe of the discourse coincides with those of either nature or the imagination. It is, still, however, the universe of our discourse, its increase of magnitude being an accident.

I say that it is not often that these coincidences occur; neither does it always happen that, when they *do* occur, they act upon language. There is nothing, perhaps, that more disposes the mind to

effect a separation of this kind than the contemplation of the stars, attended by a knowledge of their magnitude and distance, and the feeling, thereby engendered, of the insignificance of him who views them. The sense of self—of self in its smallness—comes upon him. How vast the universe! How small man! How insignificant, amongst men, I!

In thoughts of this kind the separation of the universe into two parts, of utterly disproportionate magnitudes, is made. On one side is a single individual of a single species; on the other, countless collections. Yet no inclination arises on the part of the maker of this division to create a name for the two classes, though he might do so by merely joining the words *not* and *I*; by *I* denoting himself, by *not-I*, everything else.

He might do this, though he does not. He might do it as far as language is concerned, inasmuch as *not-I* is as good a word as *not-horse*, or *not-man*, &c. Yet he does not do it; and the reason why he does not is, because the feeling of separation that throws his thoughts upon himself is accompanied by a feeling of weakness, littleness, insignificance, nullity. What is he, that he should weigh himself against everything else, and be one in a dualism? Egotist as his contemplations have made him, they have made him a humble one.

Yet the words I and not-I (or at least their Latin equivalents, Ego * and Non-ego,) have an existence in language, and this existence is due to a division of the kind under notice—a single thinker on one side, the external world on the other. I have

* Also the German Ich and Nicht-Ich.

before me, at the present moment, a work in which Ego and Non-ego occur upwards of twenty times in a single page,* and they do not do this for nothing.

It is well known that more than one profound metaphysician has taken exceptions to the general belief in the existence of an external material world, arguing that the only things concerning which the mind of a sentient being can be sure, are its own states of consciousness. Whether there are corresponding objects beyond the mind of the thinker is doubtful.

The only certain fact in the eyes of an idealist philosopher of this kind is his own mental existence. Of this he is sure; of everything else doubtful. In such a frame of mind the difference between himself and everything else is not only real, but in favour of the thinker. The *I* (or if he find the Latin expression more convenient), the *ego*, is the one fundamental truth; the *not-I* (or *non-ego*) has a far inferior degree of certainty.

Of the following extracts, the former refers to the idealism of Berkely, the latter to that of Fichte.

EXTRACTS.

I.

"A profound and judicious thinker, animated by a spirit of genuine benevolence, and venerable for his personal character, was shocked by the evil consequences which the prevailing theory of experimentalism had produced. He was led to imagine that the fruitful source of all such aberrations was the unfounded belief in the reality and existence of the world, and adopted a system of

* TENNEMAN'S *Manual of the History of Philosophy* (English Translation), p. 249.

absolute *idealism* as the only means of correcting such hallucinations. Berkely has evinced no little sagacity in the arguments he adduces to show the difficulties attendant on the ordinary belief, and the obscurity of our ideas of substance, accident, and extension; maintaining that our senses convey to us none but sensible impressions, and do not afford us any proof of the existence or substantiality of their objects, and that consequently the existence of an external world, independent of our sensations, may be nothing more than a chimæra."—TENNEMAN'S *Manual of the History of Philosophy* (English Translation), p. 344.

II.

"First principle, A = A X, represents the systematic dependency of the whole. A and X being supposed to exist in *ego*, may be signified by this formulary, *ego sum ego*. This is the self-evident principle of moral philosophy and knowledge in general, expressing the necessary form and substance of consciousness. In virtue of this principle we form judgments; to judge being an act and operation of *ego*. *Ego* then establishes, absolutely and independently, its own existence, being at once the agent and the result of the action, in which combination consists the essence of consciousness. The first operation of *ego* is that of reflection on itself, which is occasioned by an impediment to its hitherto unrestrained energies. *Ego* places itself in the position of the subject, inasmuch as it opposes itself as subject to the obstacle contemplated. The *second* principle (involved in the former) is this—that *ego* is not *non-ego*. There remains yet a *third* principle, conditional as far as relates to its form, but not as respects its value. To exemplify this, an action of *ego* is required, which may illustrate the opposition of *ego* and *non-ego* in *ego* without destroying *ego*."—*Ibid.* pp. 427, 428.

86.

Substance and Attribute.—Abstract and Concrete.

We now come to four new terms, that mutually illustrate each other. They run in pairs, (1 and 2) *Substance* and *Attribute*, (3 and 4) *Abstract* and *Concrete*. They do not take us away from the consideration of the important divisions that we have just been considering altogether, though they do so for a while.

Substance is from *sub* (=*under*) and *stans*, *stant-is* (=*standing*). It is the same word, in respect to its etymology, as *hypostasis*, which is from *hypo* = (*under*), and *stasis* (=*standing*). The difference between the two words consists in the former being of Latin, the latter of Greek, origin.

Attribute is from *ad* (=*to*) and *tributum* (=*a thing paid*); an *attribute* being that which we ascribe, give to, lay to the account of, or connect with anything. To pay a man the compliment of being honest is to attribute honesty to him.

Concrete — *Con*, is the Latin word *cum* (=*with*); *cretum* is the participle of *cerno*. *Cerno*, in the Latin, is, usually, translated *see*, or *perceive*. It is, however, the same as the Greek word *crino* (κρίνω) = *I judge*; so that the truer and fuller import of the word is to denote *observation with judgment*. Where we not only *see* an object, but *see* it in such a manner as to take cognizance of either the differences between its constituent parts, or the difference between the object itself and others, we get the compounds *dis-cern*, and *dis*-crete (*dis* = *difference* = *separation*). Where we not only *see*, but take

cognizance of points of *likeness* rather than difference, we use *con* (=*with*=*union*=*unity*), and get words like *con-cern* and *con-crete*. Wherever we have anything *concrete*, we have an union or conjunction of qualities or properties.

Abstract is the opposite to concrete both in meaning and in derivation. *Abs* = *from*, whilst *tractum* = *drawn*. Hence, *abstract* = *that which is drawn off*, and this is as different from concrete as *subtraction* is from addition.

87.

Substance and Attribute.

§ Take (for instance) an orange. It strikes our senses.

We see, with our *eyes* that it is more or less *round*, *i.e.* that it is endowed with the *property or quality of roundness*.

We see, too, that it is more or less *yellow*, *i.e.* that it is endowed with the *property or quality of yellowness*.

We see that it is more or less *smooth*, *i.e.* endowed with the *property or quality of smoothness*.

Our eyes tell us all this, the eyes being the sense by which our belief as to the properties in question is conveyed to us. They tell a great deal more, but this it is unnecessary to enlarge on.

Then comes the evidence of our other senses.

By our *ears*, we detect a sound if we rub the skin with our fingers. We also do so if we squeeze it so as to let the juice flow from one compartment to another.

We *smell* it and find a peculiar and not unpleasant aroma.

We *taste* and are gratified by a not unpleasant flavour.

We *feel* that it is elastic, or endowed with the property of elasticity. We feel, too (even as we saw), that it has a certain figure and size. We feel, too, that it has a certain weight.

On the strength of all this we say (and we might say much more) that

An orange is *round, yellow, smooth, capable* (*under certain conditions*) *of exciting sounds, fragrant, sapid, elastic,* &c.

When we say that an orange is this, we *attribute* to it certain properties, or qualities.

What are they? The qualities, or properties, of *roundness, yellowness, smoothness, sonorousness, fragrancy, sapidity.*

And how do we speak when we say that we do so? It is convenient to begin with saying how we do *not* speak.

We do *not* say that an *orange has the property of round, yellow, smooth,* &c. On the contrary, we say that it has the property of *round-ness, yellow-ness, smooth-ness,* &c. To say

An orange is round,
An orange has the property of roundness,
An orange has roundness,

is accurate. To say

An orange has round,
An orange is the property of roundness,
An orange is roundness,

is exceptionable.

So much for the attributes of an *orange;* at

least for some of them. The attributes of a *guinea*, a *loaf*, a *man*, a *fish*, or anything else may be considered in the same way. They are, of course, when taken altogether, different from those of an orange. The principle, however, of considering them is the same.

Let us now suppose that all these attributes are, one by one, taken away, *and replaced by others;* that instead of an orange striking our eyes and sense of touch as round, it strikes them as square, or rhomboid; that it loses its fragrance and becomes fetid; that it sounds like a bell, and tastes like a loaf of bread. Would the object still be an orange? Would it not be something else? This leads to the question of the *essential* attributes, or *essences* of things. Never mind them for the present; but put your thoughts in a somewhat different direction.

Divest the orange of all its attributes *without supplying it with new ones.* What will it be then? Take away its original colour without replacing it by any fresh one. Let it lose its softness without becoming hard, its roundness without becoming of any other form. Annihilate its weight, taste, and smell. Let it have no means of appealing to eye, ear, taste, smell, or touch, so that it become, at one and the same time, impalpable, invisible, imperceptible. What will it be then? Will it be anything at all?

What becomes of the attributes? We have seen that they were taken away. What was done with them? They were taken away *separately*, and it is separately that they are put aside. *Roundness* and *yellowness* no longer go together. Each is in

its own place; and that is a place by itself. No link now unites them; the orange in which they met being no more.

But we may unite them afresh—say in the idea of a golden ball, a guinea, a full moon, &c.

And we may, also, separate them, again and again.

United, they give the idea of an object clear, palpable, sensible. Separated, or abstracted from those objects, they do nothing of the kind.

Yet the mind takes cognizance of them. The idea of the particular attribute of yellowness, abstracted from an orange, is not much more difficult than the idea of the orange *minus* the attribute of yellowness. It is merely a case of difference and remainder; the additions and subtractions being made unconsciously and instinctively.

What becomes of the orange? Is it annihilated by the abstraction of its attributes, one and all? Few are prepared to say *yes* to this question. Few divest themselves of the notion that sensible, and material, objects are nothing more than the combination of certain properties, qualities, and attributes, each and all of which may be removed in such a way as to leave an absolute nothing. We rather imagine that, where there are certain attributes in union, there is a certain link which connects them; a basis, or foundation, which supports them; a basis or foundation different from the attributes themselves,—something, which they are not, but upon which they rest.

This *something sup*ports them. This something stands *under* them. This something is the *sub-stance*, or *under-standing*, of objects, as opposed to, and contrasted with, their *attributes*.

88.

Concrete Names the Names of Substances.—Abstract, the Names of Attributes.

Concrete terms are the names of Substances.

Abstract terms are the names of Attributes; *e.g.*—

Abstract.		Concrete.
Brightness, Heat, Light, &c.	Attributes of the Substances	*Sun. Fire. Spark.*
Mortality, Vitality, Animality,	Attributes of the Substances	*Animal. Man. Horse.*
Solidity, Resistance, &c.	Attributes of the Substances	*Wood. Stone.*
Fluidity, &c.	Attributes of the Substance	*Water.*

Vice versâ.

Concrete.		Abstract.
The Sun, Moon, Stars, &c.	Substances with the Attributes	*Brightness. Heat. Warmth.*
Man, Horse, &c.	Substances with the Attributes	*Mortality. Vitality. Animality.*

It is, perhaps, unnecessary to say that *substance* as used by logicians, has by no means the sense which so often attaches to it in common conversation, viz. that of *matter* or *body*. On the contrary, it means anything that can be looked upon as the basis of an attribute. A *ghost* is a sub-

stance of which the most important attribute is its *immateriality* or *incorporeity*.

On the other hand, it is an undoubted fact, and one of which the explanation readily suggests itself, that the abstraction of attributes is easy in proportion as the concrete substance is a sensible object, *i.e.* an object capable of being seen, heard, tasted, smelt, or felt. Terms like *roundness*, *roughness*, *smoothness*, *yellowness*, *sweetness*, &c., are much more readily suggested by *balls*, *guineas*, *sugar*, &c., than terms like *virtue*, *vice*, *goodness*, *badness*, &c., by *deeds* and *characters* which have to be got at by means of the observation and comparison of numerous different actions, performed at different times, by different agents. Of these, the substance itself is more or less of an abstraction.

89.

Abstract Names of different Degrees of Generality.

§ Some abstract names are more general than others; *e.g.*—

Whiteness,
Redness,
Yellowness, &c. } are species of the genus . *Colour*.

Bigness,
Littleness, &c. } species of the genus . . . *Size*

Lightness, &c., species of the genus . . . *Weight*.

Each of the cardinal virtues, prudence, charity, &c., is a species of the genus virtue.

90.

Abstract Names, how far Individual.

§ Each of the cardinal virtues is a species of the genus virtue.

If so, their names are common, rather than individual terms. At any rate virtue is a common name; and, not only that, but a common term of some generality, since it comprises prudence and charity, just as colour comprises redness and whiteness.

But what if these special virtues be personified, as they were in the creeds of antiquity, and as they are in the imagination of artists? They, then, become individuals. So does Virtue itself—general (or generic) though it (or she) be. Or, what if we look upon the group with the eyes with which we view the soldiers of a regiment—the soldiers being so many individuals, the regiment being the *collection* which they constitute?

Whichever view we take, we ought to be led to a question of some interest, viz. the extent to which abstract names are common or individual.

Extract.

"Do abstract names belong to the class of general or to that of singular names? Some of them are certainly general. I mean those which are names not of one single and definite attribute, but of a class of attributes. Such is the word *colour*, which is a name common to whiteness, redness, &c. Such is even the word whiteness itself, in respect of the different shades of whiteness to which it is applied in common; the word magnitude, in respect of the various degrees of magnitude and the various dimensions of space; the word weight, in respect of the various degrees

of weight. Such also is the word *attribute* itself, the common name of all particular attributes. But when only one attribute, neither variable in degree nor in kind, is designated by the name; as visibleness; tangibleness; equality; squareness; milkwhiteness; then the name can hardly be considered general; for though it denotes an attribute of many different objects, the attribute itself is always conceived as one, not many.—MILL's *Logic*, b. i. c. 2, § 4.

In this extract singular means individual, and general means, common. The view embodied in it is by no means unexceptionable. *Colour* is, doubtless, a more general name than *redness*, if by general we mean belonging to a higher genus (generic). See § 89.

The fact is, that colour is more general than redness, just as army is more general than regiment, both words being collective, and both, as such, more or less, individual.

Without being individual to the extent that such names as *John*, *Julius Cæsar*, and the so-called proper names, are individual, abstract names, whether general or specific, are, at least, on the confines of Individuality.

91.

Attribute—why a better Term than Quality—Attribute of a Quantity.

§ This is the place for a question concerning the word *Attribute* and its relation to the word *Quality*.

The former is a somewhat rare word; a word that may almost be called technical. The latter is current, common, and intelligible. It is the word, too, which when we spoke of the *whiteness of snow*, &c., we used pretty freely. At any rate, we called *whiteness* a *quality* of snow quite as often as we

called it an *attribute*. Why, then, not have done so always? Why use two terms when one would have sufficed? Why take up such a word as *attribute* at all, when *quality* would have served instead?

Again, why not say *property* instead of even *quality*? It is, perhaps, the commoner word. At any rate, it is equally intelligible. It is a word, too, of which the cognate derivative *proper* has already been in use. We spoke of *proper* names; why not of the *properties* of individuals or classes? *Whiteness* is a property of snow. It *belongs* to snow. It is something that snow, if it could speak, might call its *own*.

Quality is derived from *qualis*; which is a word somewhat difficult to translate. It answers, nearly, to our word *such*; and more still to our word *such-like*. A Roman, however, would not translate either *such* or *such-like* by *qualis*. The Latin for *such* or *such-like* is *talis*; a word evidently in a certain relation to *qualis*, as we infer from the similarity of form.

The nearest English translation of the word *qualis* is the somewhat awkward compound, *what-like*.

"*Question*. *What*, and *what-like*, were his reasons for acting as he did?

"*Answer*. Oh! they were *such* and *such-like*. He gave a long list of them."

A *quality*, then, is the *what-like-ness* of an object.

White-ness is a quality of snow, because, by possessing that property, snow is like some other white object—*which* it is *like* or *which-like* it is.

Wherever there is a *quality* there is *likeness*.

Of the same origin with *qu-al-ity* are the words *qu-idd-ity*, and *qu-ant-ity*. They are each derivatives from the root *qu-*, so that as far as the first two letters go, the three words agree—*qu*-ality, *qu*-iddity, *qu*-antity. The three last letters agree as well. All three end in *-ity ;* all three being derived from the Latin words in *-tas* (*tat-is*), viz. *qu*-ali-*tas*, *qu*-idd-*itas*, and *qu*-ant-*itas*— *-tas* (or *-tat*) being, in Latin, the sign of abstraction.

Concerning *quiddity* there is little, or nothing, to be said. It is obsolete. Nor need much, at present, be said about *quantity*. The only object of the present section is to give a reason for the use of the word Attribute, when, apparently, Quality would do as well. This lies in the fact of *all qualities being attributes though all attributes are not qualities.*

In other words, quality is a species of the genus attribute; attribute being, of course, the wider and more general term.

Another species of the same genus, another term subordinate to attribute, is *quantity ;* the *quantity* of any substance being as much one of its attributes as its colour, taste, or any ordinary *quality.*

This distinction is neither more nor less than a distinction of the common language of conversation. The fact of a couple of men being *two* (their *two-ness*, so to say), though allied to the fact of their being *mortal* (or their *mortality*), belongs to a different class of phenomena. The one is a matter of *quantity*, the other of *quality*. Both, however, are *attributes*.

It is, then, the greater generality of the word

Attribute which brings it into use. It includes quantities as well as qualities.

The *logical* difference between Quality and Property, a difference not made in common language, need not, here, be explained.

92.

Attribute of Relation.

There are, then, two kinds of Attributes, viz. Qualities and Quantities.

Are there any others? There is, certainly, one more; and that, in the history of language, a most important one, one to which Quantity itself is subordinate, the attribute of Relation.

The ordinary qualities of objects are more or less permanent and inherent to their several substances. If an object be *white*, it cannot become *black* or *red* without an absolute change in its nature or characteristics. It may not, indeed, always (or even generally) be converted into something else, inasmuch as the change may not go far enough to affect what are called its essential qualities. Nevertheless, the change may be considerable, and it may be of a permanent kind. It is, certainly, *internal*; i. e. it applies to something contained within the range of attributes that belong to the substance in which they occur.

But what are we to say to changes that, leaving all the ordinary qualities of an object exactly as they were, still are changes?

What are we to say to changes that, in some sense, are no changes at all? Do we not, in the first place, ask whether they actually exist? Can

one man be converted into another at all? Can he be so converted without any alteration whatever of any one of his qualities? He can. A man may, for the purposes of language, take the name of another man, of a horse, of an inanimate object, or of anything else *in rerum naturâ*; and that truly, and without losing any one of his original qualities, or gaining any fresh ones.

He may do this by a change of relation. We saw our way to something in this way in the section upon genera. The subaltern classes were greater or smaller according to the point from which they were viewed. They were this without any change whatever in the way of actual magnitude.

Words like *father* and *son*, *master* and *servant*, *ruler* and *subject*, are of the same kind. The *father* of John may be the *son* of Thomas. Yet *father* and *son* are, essentially, different (not to say opposite) names.

It is the point of view from which we contemplate the relation between such objects, or ideas, as these that determines the application of the names. Different as they are, they may yet apply to the same object. More than this, they may be changed and shifted from one object to another. The *father* of one moment may be the *son* of another, and *vice versâ*.

A *stone* in a certain relation to the speaker (*i. e.* in his hand) is named *this*. The same stone, when thrown to a distance, is named *that*.

Again—the word *this*, immediately after doing duty as the name of a *stone*, may stand for a *father*, a *son*, a *pen*, &c., &c.

Nevertheless, the *stones*, *fathers*, *sons*, *pens*, &c., that are named *this* (or *these*) are, in all matters of ordinary quality, the same as the *fathers*, *sons*, *pens*, &c., named *that* (or *those*); the change of attribute that justifies the change of name being simply that of relation to either the speaker or some other object.

It may be said that words like *this* and *that* are not *names*. That they are not permanent, unchangeable, and irremovable names is true. But why should permanence, &c., be considered essential to the idea of a name? The words in question are *terms*, and they denote *objects*. It would be difficult to show that more than this is necessary to constitute a name.

The fact is that words of the sort in question are not only names, but names of a very important kind.

93.

Convertible Names.

The difference between individual and common terms has long commanded the attention of both logicians and grammarians.

Not so, however, the difference between the two classes of names which form the subject of the present section—the difference between the Inconvertible and Convertible. In the Natural History of Language, no distinction is more important than this. Neither is it useless, but (on the contrary) very useful in ordinary grammar.

In order to understand it, a clear notion of the

attribute of relation, as opposed to that of quality, is all-important.

Compare the word *I* with the word *writer*. The latter is a name which can be applied to a certain class of objects only. A *writer*, for instance, must be a *person*. Probably, he will be a person of a certain age, or one who has arrived at years of discretion; he will also be more or less civilised. Finally, he will *write*. A child is no *writer*, a *savage* no writer; consequently, to neither children nor savages does the word *writer* apply. To apply it to a person who neither will nor can write, who neither has written nor is about to write, is to *mis*apply it. It is a word that can only refer to a certain class of objects; and, as such, is *in*variable.

But what is the case with *I*? A child may say *I am not a man*, and a *man* may say, *I am not a child*; and yet the word *I* retain its proper power. When *William* says *I*, it means *William*; when *Thomas* says *I*, it means *Thomas*. If a *mother* says *I*, it means a *mother* and a *female*; if a *father* says *I*, it means a *father* and a *male*. Even if an inanimate object be personified and be supposed to speak about itself and to say *I*, it means that inanimate object. It denotes the speaker, whoever it may be.

The same applies to *you*; which denotes the person spoken to, whoever he may be. If *I* speak to *you* and *you* are named *William*, *you* means *William*; but if *your* name be *Thomas*, then *Thomas* is what is meant by *you*. Any object that is capable of being spoken to is capable of being called *you*; even as any object capable of speaking

may be *I*. The generality of objects that are named *I* and *you* are, of course, persons, men, women, or children. But they need not necessarily be so. Animals, as we find in fables, may be supposed to speak. So may inanimate objects. They do not do so in nature. They do so, however, and that not unfrequently, in the imagination of the men and women who use and make language; and that is enough.

The word *he* may denote any male person concerning whom any one else chooses to speak. It may even denote a female. Suppose that I am speaking of a person seen at a great distance, a person that is actually a woman, but whom I imagine to be a man, I may say, *he is now in sight;* or I may say the same of a person in woman's clothes. Julius Cæsar, William the Conqueror, Julius Cæsar's dog, William the Conqueror's horse, are all equally *he;* but they, by no means, are all equally *men*, *dogs*, or *horses*. Julius Cæsar and William the Conqueror only are men. Their domestic animals were horses or dogs, as the case might be.

She may denote any female, real or supposed, just as *he* might denote any male—Queen Elizabeth, Cleopatra, Queen Elizabeth's mare, &c., &c.

It denotes inanimate, just as *he* and *she* denote animate, objects. There is nothing in the universe that may not be called *it*.

This and *that* have been noticed already.

It is obvious, then, that words like *I*, *you*, *he*, *this*, *that*, &c., are what may be called convertible, whilst words like *writer*, *man*, *woman*, *child*, *stone*, &c., are inconvertible. The former can be applied to any (or, at any rate, to several) objects, no matter

how dissimilar. The latter applies to one class of objects, and no more.

Instead of saying convertible and inconvertible, we may say variable and invariable.

All convertible names are individual. This is transparently visible with words like *I*, *thou*, *this*, &c.; nor is it difficult to see that the same must be the case with *we*, *ye*, *these*, &c. Plural as these words are in form, they are, really, collectives.

94.

Notation (or De-notation) and Con-notation—Individual Names not Connotative.

Convertible names simply *note* or *denote* the objects to which they apply.

To simply *note*, or *denote*, an object is to point it out, to mark it out, to set a mark on it, by which it shall be distinguished from all other objects; this distinguishing mark being its name. For names are nothing more than certain marks. The Latin for a *mark* is *nota*; the Latin for *I mark* being *noto*; the Latin for *marking* being *notatio*.

A mark in its narrowest application has very little meaning—properly speaking, writes Mill, it has not any. It has only a purpose. He proceeds to explain this distinction. The robber in the story of the Forty Thieves marks the house in which Haji Baba lives. Why? In order that he may distinguish it from the others in the same street. He marks it with chalk, and what does the chalk-mark do? It says, "this is the particular house that I

wish to know again." It says this, and nothing more. The house itself, however, was a great deal more than this. It was the house of a wealthy owner. It was the house in which much gold lay. It was a cottage, a mansion, a messuage, a first-class residence, a tenement, &c., as the case might be. But the chalk-mark told us nothing of this. It merely told us what it was *not*. Hence, when Morgiana marked all the other houses in the same manner, she defeated the scheme; not (be it observed) by rubbing off the chalk on Haji Baba's door, but by annihilating its value as a distinctive mark, by placing the rest of the street in the same predicament.

If Haji Baba had lived in London, instead of Bagdad, no chalk would have been needed. There would have been the number on the door—say No. 2. And this would have been the mark of the house; the mark by which it was distinguished from Nos. 3, 4, 5, &c.; all, perhaps, alike in external appearance. That this would have been sufficient for the purposes of the robber is clear; provided only he could read the number and remember it as No. 2.

The chalk-mark and *No.* 2 then are the names of the houses in question.

Let them be used as such in a conversation with some second person. What purpose will they serve? It is certain that, whatever else they may supply, they will not supply a *description* of any kind. They will not tell anything positive at all. They may be used in conversation, but if the person addressed have no key to their meaning they will be all but meaningless. They will merely

signify something different from No. 1, No. 3, &c., and something different from all things whereon no chalk-mark is to be seen.

But substitute *house* for *No.* 2, &c., and you will find that you are using a word of a different kind altogether, a word that not only *de*-notes something, but which *con*-notes something as well. A house, *as such*, has certain attributes. It serves certain purposes. It contains certain apartments. It is bounded by walls, covered by a roof. All this is the case with *No.* 1, or the *object marked with chalk*—when we know it to be a house, but not before. Until we have learned that it means a house, we only know that it is *not* something destitute of a chalkmark, or that it is something either not numbered at all, or numbered differently. In other words, whilst *house* implies the existence of certain attributes, *No.* 2, or *the object marked with chalk*, implies nothing of the kind, except so far as the number or mark itself is one.

To pass to another illustration.

At first sight it seems much more definite, in speaking of pictures, to say a *Flora by Rubens*, than a *painting by an artist;* inasmuch as the former expression tells us, not only that it is a painting of which we speak, but that the subject of it is a heathen goddess, and the artist the great Flemish master. And so it is—under one proviso, but not otherwise. This proviso is, that we must know, from other sources, that it is Art and artists that we are speaking about. It is only with this knowledge that words like *Flora* and *Rubens* have any practical meaning at all. So little do they, of themselves, tell us anything,

that, unless there be a context to explain them, Flora may mean a blood mare and Rubens her sire; as has actually been the case. It is a current story in one of the sporting counties, that an artist having called to see a famous Flora by Rubens, was shown into the stable; the owner of which might, perhaps, have been equally surprised if an artist, who had heard of his fondness for such things, had shown him into a picture-gallery.

This illustrates the extent to which individual names, *unless explained by a context*, are useless for the purpose of supplying information concerning the nature of the objects to which they apply. They only give us what we may awkwardly denominate their *so-called-ness—i.e.* the fact of their bearing a given name. Flora differs from Rubens and Rubens from Flora in having different names —the name in each, as long as it is the only fact known concerning them, being their one solitary property, or characteristic. This, single and solitary as it is, is still sufficient for one important purpose, that of denoting them, or marking them as separate from everything else. The name Flora, for instance, separates even the unknown object that bears it not only from Rubens, but from all other objects not named Flora.

Individual names, of the kind in question, then, require a context to explain them; *i.e.* to tell us the class of objects to which they apply. Unless they are thus accompanied, they are in the condition of the words of a foreign language. This is pre-eminently the case with the so-called proper names.

It is also the case with words like *I*, *this*, *that*, &c., or the whole class of convertibles. No one knows what *this* or *that* means from the bare use of

the words themselves. Every one knows what they mean when the object to which they apply is either pointed out, or indicated by the rest of the conversation.

This, too, is the case with the class of abstracts; although their application as individual terms is peculiar. Abstract names are essentially the names of intellectual, and internal, rather than of material and external, objects. They are, pre-eminently, the names of ideas. Now *yellowness* is as much an individual idea as the painter Rubens is an individual human being. It is, also, equally a substance, *i.e.* equally the basis of an attribute. It is a name that we can apply to many objects; but so we can the words, *I*, *thou*, *Flora*, &c., which are, nevertheless, the names of individuals rather than of classes. Like *I*, *Rubens*, No. 2, or the chalk-mark of our first illustration, it serves only for the purposes of separation; dividing *yellow* from *not-yellow*. This it does, and it does no more. It *connotes* nothing. It simply notes or denotes.

The reason why individual names are thus non-connotative lies in the fact, already suggested, of their conveying nothing beyond the mere *so-called-ness*, or *named-ness* of their objects. Whether this be an attribute will be considered in the sequel.

In *I*, *this*, &c., the attribute is that of the particular relation, for the time being, of the object to which the words apply to some other object, to the speaker, or to both.

In abstracts, the individual character of the name *yellowness* lies in the singleness of the idea which it expresses; the idea being based upon the peculiar character of certain sensations created by yellow objects in general.

There is nothing, however, that is so necessarily connected with *yellowness* as to make the word suggest anything like a class. The objects connected by the fact of their all being *yellow* are of the same heterogeneous character as the objects connected by certain negative names, *e. g. non-horse*, &c. (see §§ 81—85). Indeed, abstract and negative names have much in common. The former give but one attribute; the latter something even less than this; *viz.*, the bare fact of the objects to which they apply not being something else.

All individual names are notative, *de*-notative, or *non*-connotative.

95.

Notation, &c.—Common Names connotative.—Characteristics, or essential Attributes.

§ All Common names are Connotative.

They all apply to classes of objects.

Classes of objects consist of certain individuals endowed with certain attributes; and these attributes, in order for the objects to which they belong to form a class, must be *numerous*. They must, at any rate, be *more than one*.

It is by having a certain number of attributes alike, that objects belong to the same class. It is by having a certain number unlike that they belong to different divisions of it.

It is evident that all the attributes of an object are not of equal importance. Whilst some cannot be changed without changing its character, some can be withdrawn and replaced by others, the character of the substance to which they appertain

remaining unaltered. In other words, some attributes are characteristic, others not; some *essential*, or necessary to make the object what it is (*esse* = *to be*), others unessential or indifferent.

The *ink* with which these lines were written, was black and fluid. The *ink* with which they were printed was black, but scarcely fluid. The *ink* with which they were written, however, might have been red or blue. Nay, there is such a thing as purple *ink*. The Imperial signatures of the Byzantine Cæsars were made in it. Indian *ink* is a solid, capable, however, of being made fluid. Then there are several sorts of invisible *ink*; capable, however, of being made visible.

There is no ink, however, which cannot be used for *writing*, *limning*, *shading*, *marking*, or some similar application to which its fluidity and colour are subservient; and it is probably safe to say, that the essential character is its use for the above-named purposes. Fluidity and colour of some kind are also of great importance. The particular degree, however, of fluidity and the particular tint are matters of indifference. They may be changed without making the *ink* into *not-ink*.

The same applies to every object in either Nature or Art, to which a common, or class, name can be attached, except in the cases of absolute identity.

In order for objects of the same class to differ from each other, they must exhibit their difference in some unessential attributes. To differ in an essential one is to belong to a different class. This implies that there must not only be, at least, two attributes to the object, but that there must be two sorts of them—essential and unessential.

96.

Difference of view respecting the characteristics of Classes.

§ It is not every one that takes the same view of the essentiality of an attribute. In the eyes of a grazier, clover is a *grass;* so, at least, he would call it if he were speaking of the difference between the natural and artificial grasses. Wheat, on the other hand, and oats, and barley, are no grasses in his eyes, but so many kinds of corn. Still less is the sugar-cane a grass. Yet this is what they are in the eyes of the botanist; who withholds the term from clover.

Whence the difference?

The grazier considers one set of attributes essential, the botanist another.

In the eyes of the same farmer the bulb of an onion is a *root,* inasmuch as it has, in his eyes, the essential attributes of one. It lies, more or less, below the surface of the soil. It appears to feed the leaves, flowers, and seeds. It comports itself, in short, except in certain apparently unessential points, like the root of ordinary plants.

In the eyes of the botanist, however, it may do all this and much more, and yet be no root. It grows upwards like a stem, instead of downwards like a true root. The true root is the bunch of fibres that grow at the bottom of it. The bulb itself is an underground bud. All this difference of view arises out of the fact of the ordinary observer making one set of attributes essential, the botanist another.

97.

Relation between Names and Classes.—The Class growing out of the Name.

§ The manner in which common names come into existence belongs to the Natural History of Language rather than Logic. It is convenient, however, to notice the relation between the employment of them and Classification.

As soon as two or more persons agree in applying the same combination of sounds to the same combination of essential attributes a name has come into existence; the objects to which it applies being indefinite in number, and, to a great extent, unknown to the persons who first used the term. They may be infinite. They may be few. They may be single. They may be non-existent in nature, *i. e.* creatures of the imagination only. They may be words like animal; or words like planet; or words like universe; or words like dragon, Centaur, or Hippogriff, &c. They may be words of any extent, or no actual extent at all. All that they have to do is to apply to such and such objects, as often as they exhibit such and such attributes, objects which may appear often, or rarely, or never—objects which we may see every hour in our life, or objects that we can only contemplate in the most excited state of our fancies. It is no matter whether we do it from our experience, or our hallucinations; but so long as we group together certain attributes, and designate the collection by a certain combination of articulate sounds, we create names; and so far as the other individuals

with whom we have conversed agree in understanding such names in the same way, we introduce our creations into language.

In this way common terms become current amongst considerable masses of men; the objects to which they apply being either alike or different in unessential attributes only. It often happens that at first the number of such objects is but small; commensurate with the limited experience of the first authors of the term. As time, however, goes on, as the number of speakers increases, and as experience enlarges, new objects are continually brought under the same denomination; so that the magnitude of the class increases in respect to the number of individuals that it contains.

Nor is this all. The larger the number of such individuals the greater the chance of differences between them. Hence, the number of unessential attributes increases, and doubts arise as to whether some of them may not be essential. The name that began with the object A, and was extended to B (between which and A there was no notable difference), may lose some of its intelligibility when it has arrived through C, D, E, &c., to X, Y, or Z. Nevertheless, so long as it applies to a certain number of objects, it is a common (or class) name, against which the worst that can be said is that the class to which it is attached is not a very natural one.

Such is the case when the name precedes the class, or (in other words) where the class grows out of the name, as is the case in ninety-nine hundredths of the ordinary language of common life.

98.

Relations, &c.—The Name growing out of the Class.

§ There are cases, however, where the process is reversed, and where the name grows out of the class. Such are the scientific terms of the chemists, botanists, zoologists, &c., where, *after* a full and sufficient knowledge of certain groups of individuals, and the determination of their essential attributes, we find that our class is one for which the rougher, looser, uncertain, and empirical phraseology of the current language, supplies no term sufficiently exact; a fact which forces upon us the invention of a new one.

EXTRACT.

"We have adverted much less than is usual with logicians to the ideas of a class and classification.—We have considered names as having a meaning quite independent of their being the names of classes.—As soon as we employ a name to connote attributes, the things, be they more or fewer, which happen to possess those attributes, are constituted, *ipso facto*, a class.—By every general name which we introduce, we create a class, if there be any existing things to compose it.—Classes, therefore, mostly owe their existence to general language. But general language also, though that is not the most common case, sometimes owes its existence to classes."—MILL, b. i. c. 7, § 1.

99.

Classification.

§ Whether the class originate in the name, or the name in the class, it always happens that, as

time goes on, names show a tendency to change their signification. If it were not so, language would be greatly more uniform than it is.

Let a name originally apply to a few individuals, and let the difference between those individuals be slight. Let all the birds, for instance, to which the name *swan* applies be either white or whitish. At any rate let none of them be of a colour opposite to white. Let whiteness pass for an essential attribute of *swan-ship* (or *swan-hood*). What happens when a bird, black in hue, but in all other respects like a swan, presents itself? Are we to abandon the essentiality of the attribute whiteness? Or are we to deny to the new bird the name swan? It is not necessary to decide. All that it is, at the present time, necessary to notice is the undoubted fact, that there is hereby introduced into the question of names and classes a disturbing force of no slight importance.

We get a certain amount of disturbance from a swan that is simply *black*. But this is not much. There are other attributes that create greater complications. Let the swan that serves for our illustration be not merely a swan with certain *unswan-like* attributes, but let it have some of the characteristics of the *goose*. Let these be either actually essential, or considered to be so. What follows? Not only doubts as to whether the bird be a swan or not, but doubts as to whether it may not be a goose. Or it may be something intermediate, to the two—neither swan nor goose, but some third sort of bird, anonymous, but capable of being named.

From birds let us go to bows—rain-bows. Observe the hues thereof. There is a decided red, a decided yellow, a decided blue, and a decided green. But this decidedness is not general. Where the blue and green join, the colours pass one into the other. So they do where the red becomes yellow, or the yellow red. So they do on all the confines of all the colours. When are we to say that that blue or red end, and green and yellow begin; and *vice versâ?* Where is the line of demarcation, the boundary; the line which, lying between the *con*-fines, may be said to *de*-fine them? Mark this last word, this compound of *de* (= *from*), and *finis* (= *end, limit, boundary*). Mark it, for it will appear in the sequel.

Some such line is evidently wanted.

Some such line is evidently wanted; but it is by no means as evidently attainable. It is only attainable where the transitions, though in many respects gradual, are still capable of being distinguished. When all the gradations are imperceptible, the name that served well enough for the central, typic, normal, or standard forms of a class becomes uncertain and indefinite on its confines.

In many of the complications thus engendered, the essential attribute steps in and helps us. But it is far from doing so in all, inasmuch as it is itself, in a vast number of cases, a matter of doubt. It is not every two or three speakers that agree as to what constitutes a swan as opposed to goose, or any other bird. Just as little is it every one who would fix upon the same point in a rainbow for the red to become orange, or the orange yellow.

Let us say, however, that, in certain cases, this can be done, and we come to the consideration of—

100.

Definitions.

§ We have seen from what the word *Definition* is derived; and we anticipate its meaning. A definition is a *boundary*—a boundary by which all the individuals of a given class are included. So *in*cluded, they are separated from everything else; everything else being *ex*cluded from them.

Wherever there is a definition there is a name; but it is not all names that either are susceptible of definition, or require to be defined. Definitions are wanted where the import of a name becomes doubtful; the import of names becoming doubtful whenever the essential character is obscure, overlooked, or controverted.

The Name indicates the Class.

The Definition explains the Name.

Hence, whilst a Name constitutes a term, a Definition constitutes a Proposition; a Definition being

A Proposition explanatory of a Term; in all of which the Term to be explained is the Subject, the Term by which the explanation is made, the Predicate—

Subject. *Predicate.*

A Definition is a Proposition declaratory of the meaning of a term.

Such is a definition of a Definition.—(*See Mill*, b. i. c. 8, § 2).

All definitions *de*note the objects of the class to which they apply. Nevertheless, it is not every denotation that is a definition. To point at a man crossing the street is to *de*note him. To lay your hand on him and to say *this is he*, is also to denote him. Nevertheless, pointed fingers and the use of words like *this* and *he* are not considered to be modes of definition. That they partake of its nature is clear. Still, it is not the habit of language to identify them.

Words susceptible of definition must *con*note, as well as *de*-note, something; this being only another way of saying that they must be common (or class) names.

Dialogue.

A. John is a man.

B. But what is a man?

A. Man is everything to which the combination M A N applies—this being the name of a class.

B. What constitutes that class?

A. Certain attributes, such as animality, rationality, and others of either less importance or involved in these.

B. The definition, then, of M A N is that it is a name connoting certain attributes.

A. Yes; or a name which, when predicated of any subject, implies that that subject possesses them. In such a sentence as *John is a man*, the word M A N is the predicate. In *Man is a rational animal*, it is the subject.

It is not always that we can define a class, or (to speak more accurately) the meaning of a class-name. How can we do so when it runs into another by imperceptible gradations?

EXTRACT.

"A name ought to be like a boundary, which clearly and undeniably either shuts in or shuts out every idea that can be suggested. It is the imperfection of our minds, our language, and our knowledge of external things, that this clear or undeniable inclusion or exclusion is seldom attainable, except as to ideas which are *well within the boundary*. At and near the boundary itself all is vague. There are decided greens, and there are decided blues; but between the two colours there are shades of which it must be unsettled by universal agreement to which of the two colours they belong. To the eye, green passes into blue by imperceptible gradations. Our senses will suggest no plan, on which all agree, at which one is to end and the other to begin.

"But the advance of knowledge has a tendency to supply means of precise definition. Thus, in the instance above cited, Wollaston and Fraunhofer have discovered black lines which always exist in the spectrum of solar colours given by a glass prism in the same relative places. There are definite places in the spectrum, by the help of which the shade of any colour therein existing may be ascertained, and the means of definition given."—*Formal Logic*, p. 35.

101.

Classification by Type.

§ It is only, then, as knowledge advances, that certain definitions become possible. What are we to do in the mean time? The answer to this was found in the fact that, although some of the members of a given group may be on the debateable land between two classes, there are others which lie *well within the boundary*.

Say that some lie in the very centre of the in-

closure, equally distant from the confines of any of the classes with which its frontiers may come in contact; as is the case with centres of each of the coloured bands of the rainbow; as is the case with the red where it is equidistant from the purple on one side and the orange on the other. We can, in such cases, take such members of the class in question as standards, samples, or types, of the group to which they belong, and, so doing, arrange the remainder around them; the nearest being the most unequivocal members of the class, the next nearest being somewhat less, the more remote intermediate to some other class, or (possibly) of doubtful position.

To do this is to classify by *types*, as opposed to the classification by means of *definitions*.

In the former we take a central object and group others round it, without much caring whether the outsiders (so to say) belong to the same class as those of the interior.

In the latter we draw a line round a certain number of objects, without much caring whereabout, within the inclosure, they lie, provided only that they *do* lie within it.

102.

Equivocal Names.

§ The same combination of sounds does not always make the same word. Where there is a difference of meaning there is also a difference of name.

In the following propositions there is but one combination of sounds, viz. L, I, G, H, T.

Yet the number of names is two.

Light is contrary to darkness ;
Feathers are *light ;*
Feathers are contrary to darkness.

Change the language, and the equivoque becomes transparently manifest.

Lux est contraria tenebris ;
Plumæ sunt *leves ;*
Plumæ sunt contrariæ tenebris.

Words of this kind are called *equivocal*, having one form, but two meanings.

PART III.

PARTS OF SPEECH.

103.

Parts of Speech.

§ What is meant by a Part of Speech? In *one* sense every word that exists in language is a *part of speech*, inasmuch as it is by means of words that the speech by which man communicates with man is constituted; human speech being made of words. But these words are, again, made up of syllables; the syllables being, again, made up of certain elementary sounds. If so, every syllable is a part of speech, and so is every elementary sound.

But this is not what the grammarian means when he talks of a Part of Speech; as he often does. Sometimes, indeed, he talks or writes about *the* Parts of Speech, as if there were something special and particular, requiring the use of the definite article to denote them. Open any ordinary grammar, and it is an even chance that the first sentence runs thus—"The parts of speech are eight" (or "nine" as the case may be), "Noun, pronoun, verb," &c.

Sometimes the opening sentence of grammar is

to the effect that "Grammar is the art of speaking and writing correctly," but the ordinary opening is the one just given.

Such is the importance of the parts of speech —noun, pronoun, verb, participle, &c.

104.

Parts of Speech.—Number, Criteria, &c.

§ Nouns, pronouns, verbs, participles, adverbs, conjunctions, prepositions, interjections, and the like, are the parts of speech now under notice; and there is something beyond what is found in the ordinary grammars to be said concerning them.

There is something to be said concerning the *number* of them:

Something also concerning the *criteria* by which they are separated from each other.

105.

Parts of Speech.—Number of them.

§ And first concerning the *number* of the parts of speech. Sometimes it is said that the parts of speech are eight, sometimes that they are nine, sometimes that they are no more than three. In Latin, where the article is wanting, the list runs —noun, pronoun, verb, participle, adverb, preposition, conjunction, interjection. Total, eight.

In English we have an article (*an* and *the*), which makes our parts of speech, from a Latin point of view, nine.

But some writers, instead of speaking of nouns, speak of substantives and adjectives, by which they make two parts of speech out of one; in which case their list runs—substantive, adjective, pronoun, &c.

Finally, there are many who limit the parts of speech to the noun, the verb, and the particle; referring to the first, the substantive, the adjective, and the pronoun (including the article), to the second the participle, to the third the remainder.

All, however, agree in this, viz. the recognition of the terms noun, substantive, adjective, pronoun, article, verb, participle, adverb, preposition, conjunction, interjection, particle, along with other names less general, such as numeral, cardinal, ordinal, relative pronoun, personal pronoun, &c.

106.

Parts of Speech.—Criteria.

§ So much concerning the extent to which grammarians differ in respect to the number of the parts of speech, and so much concerning the extent to which they agree in admitting, that in some sense or other, nouns, verbs, &c., are parts of speech. How do we account for their agreement, how for their difference?

The reason for their agreement lies in the fact of certain fundamental principles lying at the bottom of all forms of speech, however different from each other in detail.

The reason for their difference is not so simple. Sometimes it arises out of the actual difference of language, one language wanting something that the other has; this being the case with the Latin as

compared with the English in respect to the article. An Englishman can say—

The son of *the* father;
The son of *a* father;
A son of *the* father;
A son of *a* father.

The Roman could only say *filius patris*.

Generally, however, there is a difference between the views taken concerning the marks, signs, characters, tests, or criteria by which one part of speech is separated from another. "Why," says one writer, "make the two classes of substantives and adjectives when the single class of nouns would suffice?" "Why," writes another, "make a class of nouns in the first instance, when the moment you come to the practical details of your grammar, you have to divide it into substantive and adjective?"

107.

Parts of Speech.—Criterion, the Place of a Word in a Proposition.—Categorematic, Syncategorematic and Hypercategorematic Words.

§ The reader may easily see beforehand what will be the criterion by which the place of a word as a part of speech will be determined. It will be a noun, pronoun, verb, participle, &c., according to the part it takes in the structure of a proposition.

For further preliminaries see §§ 21—25.

These will lead us to the notice of three new terms—compounds of the word *category*.

Categoria is, in the first instance, an *accusation*, the language from which it is derived being the

Greek. To *accuse* is *to charge with—to impute to—to attach a certain character*, or even *a characteristic—to mark—to define—to place in a class.* Hence, *category* comes to mean *class*, there or thereabouts.

A word which can, by itself, form a term is called *categorematic.*

A word which cannot, by itself, form a term, but can, by itself, form a part of one, is called *syncategorematic—syn = with*, and implying union or conjunction with other words.

A word which, by itself, can form a term and something more (a predicate, for instance, and a copula) is *hypercategorematic—hyper = over* and implying excess.

The words in §§ 21, 22, and 23 are *categorematic.*

The words in § 24 *hypercategorematic.*

The words in § 25 *syncategorematic.*

108.

Categorematics, &c.

§ Categorematic words are either nouns or pronouns, and if a word belong to neither of these classes it is other than categorematic, *i.e.* it is something either less than categorematic or more than categorematic.

Categorematic words by themselves and single-handed, can form terms, *i.e.* either subjects or predicates or both.

Hypercategorematic words are verbs. They can form, by themselves and single-handed, predicates and copulas at once.

Syncategorematic words are adverbs and prepositions; to which add articles.

The position of the article is peculiar, as will soon be shown. At present, however, it stands in the same group with adverbs and prepositions.

Participles, conjunctions, and interjections also require a separate notice.

109.

Categorematics.

Categorematic words fall into two divisions, according to the kind of term they are capable of forming. Every word that can form a subject, can form a predicate also. The converse, however, is not the case. There is a large class of words which can form predicates, but cannot form subjects. A word that forms both subject and predicate is either a substantive or a pronoun. A word that can form predicates only is an adjective.

110.

Categorematic Words Subjective or Predicative.

§ This is the way we express ourselves when we adopt the language of the grammarian, taking it as we find it, and treating the words substantive, adjective, and the like, as if they were ordinary terms of common life, the meaning whereof is generally known—as, indeed, it actually is. I have already stated that no one is likely to investigate subjects, predicates, and the like, who has not made a previous acquaintance with nouns and verbs. This is not as

matters ought to be, but as they are. The logical terms might, much more advantageously, be learned before those of the grammarian, the import of which they most especially explain.

To proceed: the categorematic words which can form predicates only may, if necessary, be called predicative; those that form subjects and predicates as well, being called subjective. No more complex word than this is wanted. No such word as subjectivo-predicative, or the like, need be coined. Whatever can be a subject, can be a predicate also; and the simple term subjective does as well as a longer and more compound word.

The subjective categorematics, then, coincide with substantives; the predicative with adjectives, *to a certain extent.*

111.

Categorematic Words Nominal (Subjective) and Quasi-Nominal (Predicative).

§ The word subjective and substantive, predicative and adjective, coincide to a certain extent—to a certain extent, but not altogether. There is a considerable class of subjective terms which a grammarian would hesitate to call substantives; in other words, it is only *some* of the subjectives that are substantive. In order to understand this, we must look upon our subjects and predicates in a fresh light. How far are subjective and predicative words *names?* Something upon this question has already been written in § 68; where it is stated, that although such a word as *whiteness* is a name, such a word as *white* is not. *Whiteness* is the

name of an attribute. *White* is no true name at all. It is only a word which suggests one. Many doubt this; many deny it. Many say that *white* is a name. Many say that *white* is the name of *white thing;* also that *white* is the name of the attribute *whiteness.* But a little consideration will show that *white* the adjective, and *white* the substantive (*i.e.* the equivalent to *white thing, white person,* &c.), are in different classes. And a little consideration will show that the *name* of the characteristic attribute of white things is *white-ness,* (not *white.*)

That words like *white* are neither the names for *white objects* nor the names for the attribute of *whiteness* becomes plain and clear after a very little consideration. The question whether they are *names* at all, is somewhat more complicated. It is possible, and not difficult, to define the word *name* in such a manner as to include not only adjectives, but a great many other words besides. Hobbes' definition (for instance) does this, which is to the effect that a name is an arbitrary word, serving for a mark, and raising in our mind a thought like some thought we had before, and which when pronounced to others may serve as a sign of the thoughts of the speaker.

A definition of this latitude would convert not only adjectives, but interjections, into names.

A definition of this latitude, even if it suit the logician, is unfit for the grammarian, who finds it convenient, if not necessary, to limit the word *name* to substances. Common language does the same. It is difficult to imagine a name without some object named. And what can this be but a

substance? At the same time adjectives so invariably *suggest a name*, that though they are not names themselves, they are nearly so—very nearly so. They are names within a little. They are all but names. They are so near to names that if we call the subjective categorematics nominal, we may call the predicative quasi-nominal, words.

Let Subjectives, then, be called *nominal*, from *nomen = name.*

Let Predicatives be called *quasi-nominal*, from *quasi = as if, as it were.*

Instead of *nominal word* we may say *name.*

112.

Names.—Convertible or Inconvertible.—Pronouns or Substantives.

§ Names are either convertible, like *I*, *thou*, *he*, *this*, *that*, &c., or inconvertible, like *man*, *horse*, *stone*, &c. (See §§ 93, 94.)

A convertible name is a Pronoun; an inconvertible name a Substantive.

113.

Pronouns names of Substances.—How far Individual.

§ The first fact to be attended to in the notice of the pronoun is the fact of its being a *name* at all. That it is one has already been stated. It has also been stated, that in order to be one, it must apply to a substance. In this it differs from the adjective, which is no name at all.

On the strength of its being a *name*, on the strength (we may say) of its *nominal character* (or *nominality*), a pronoun can play the part of a substantive in a proposition, and be subject or predicate, just as the speaker chooses to make it.

That a pronoun *is* actually a name—a name of a substance—is clear. What do we mean by *I*, b *thou*, by *this*, by *that*, &c.? Most undoubtedly a substance; a substance with all its attributes, many or few, as the case may be. The *what*ever or *who*ever answers to the word *this*, is an object of which either the senses or the imagination can take cognizance. It may be a *man*, a *horse*, a *stone*, a *Phœnix*, or a *cardinal virtue;* still it is an object, and when we know *what* or *who* is meant we can change the pronoun into a substantive, and say *man*, *horse*, &c., instead of *this*, *that*, &c. The fact is, that in their application, pronouns and substantives are connected with exactly the same class of objects, the *something* which they denote being the same, the way in which they denote it being different. Contrast with this use of words like *I*, *thou*, &c., that of words like *red*, *white*, &c., and you will see the difference between the pronoun and the adjective, and the extent to which the former is an actual name, whereas the latter is only a word suggestive of a name.

A pronoun, then, is a kind of substantive—at any rate, it is a name applied to substances. There is, however, only one kind of substantive with which it agrees; with the important class of common (or general) names it has little to do. All pronouns (as has been already stated) are individual, or singular, or proper names. None are common.

They are all words like *John* or *London*, rather than words like *man* or *town*.

Nevertheless, there is no single member of any class of objects whatever to which such a pronoun as *this* or *that* may not apply. It may mean a *man*, a *horse*, &c., as aforesaid. Surely this is anything but individuality, singularity, or propriety. Is it not something rather the opposite? Is there not an idea of generality, plurality (I had almost said impropriety), attached to a name which may denote any one object out of a million (or more) indifferently? What can well be commoner than a term which will denote anything or everything? Individual names have been said to apply to things of which there is one only (one and no more than one), and singular has been said to mean much the same as individual. The name, however, of the things that such a word as *this* can apply to is legion. Yet *this* is an individual, or singular, name.

Proper names, too, seem at first, to be as unlike pronouns as they well can be. A proper name is a name *appropriated* to some particular individual; *appropriated* in such a manner as to be incapable of any application elsewhere. To name a man *John*, and to call him *Thomas*, is not to name him at all. It is to *misappropriate* two terms at once, to rob *Thomas* without enriching *John*. Yet one and the same object may be called *this* and *that*, *I* and *thou*, and no misappropriation occur. Nevertheless, *this* and *that*, *I* and *thou*, &c., are proper names.

The explanation of this apparent complication is simple. It lies in the fact, so essential to their constitution, of pronouns being convertible, or variable, names. A pronoun may mean anything whatever,

and apply to any amount of objects real or imaginary. But it can only mean, denote, or signify *one object, or group of objects, at a time.* As long as John speaks of himself, *I* means *John*, but when Thomas talks of *his* self, *I* means *Thomas.* As long as a certain *white* stone is nearer to me than a certain black one, *this* means *white stone.* Change their places, and it is better expressed by *that;* the *black stone* being what answers to *this.*

Pronouns, then, in so far as they denote but one object (or one collection of objects) *at a time*, are individual, singular, or proper terms. They depart, however, from the character of the true proper names, like *John* and *London*, in being able to express any amount of different objects *at different times.* In short, they are (as aforesaid) variable or convertible names.

114.

Pronouns the Names of Substances.—How far Common?

§ If pronouns depart in some respects from the character of the true and typical individual, singular, or proper, how nearly do they approach that of the common, or general, names? The exact measure of the distance is as unimportant as it is unattainable. It is only certain that there is a broad line of demarcation between them. A common name, however generic it may be, always denotes objects that have a certain real or supposed relation to each other, objects with a certain amount of attributes in common. An *oak* and a *seaweed*, are equally vegetables, a *mite* and an *elephant* equally

animals; but no one would call a *book* a vegetable, or an *inkstand* an animal. Yet an *oak*, a *seaweed*, a *mite*, an *elephant*, a *book*, an *inkstand*, a *griffin*, a *colour*, a *virtue*, may all be denoted by words like *this* and *that*; indeed there are no two objects in the whole range of the real or the imaginary universe, that are so unlike each other, as not to be brought under the designation in question, and that easily, and without the creation of either obscurity or ambiguity of language.

Though a pronoun is a name, it is not a class-name. It applies, indeed, to objects numerous enough to form a class; but this is not sufficient. Objects, to form a class, must not only exist in certain numbers, but bear to each other a certain amount of resemblance. This is done by their having certain attributes in common.

This means that, whilst common names are connotative, pronouns are simply notative.

Connotative names (§ 94) are founded upon the existence of more attributes than one; notative on the existence of one only. Hence, a pronoun is in the same class with words like *John* and *London*, rather than with words like *man* and *town*.

115.

Pronouns the Names of Substances.—Simply Notative (Denotative).—The Attribute they denote that of Relation.

§ It is in their convertibility that the peculiar character of the pronouns exists.

Except so far as it is convertible, a word like *I* is neither more or less than an expression like *the*

present writer, *R. G. Latham*, or any other designation of the author of the page now under notice.

Now this convertibility of the pronouns arises out of the *nature* of the attribute that it expresses.

The attribute expressed by a pronoun is, always and exclusively, an attribute of *Relation*, and it is to the fact of relations being changeable, that the properties of the pronoun are due.

Relations change. Qualities are (what is called) inherent. For an object to be called *red* it must, *in, and of itself*, possess the quality of *red*ness. For an object to be designated as *this*, it requires no peculiarity of constitution at all. It merely requires to be in a certain relation to the speaker, or some other object. It may become *that* without any alteration whatever *of itself*. It need not even change its place. It is enough for the speaker to change his, or for a different speaker to talk about it.

A pronoun, then, is the name of a substance, denoted by a single attribute, that attribute being the attribute of relation.

As the name of a substance, it can form the subject of propositions, and, as the ordinary substantive can do no more, it is, in that respect, substantival.

As a name founded on the denotation of a single attribute, it connotes nothing, and consequently, can be applied to anything, though only to one object *at a time*.

But as that single attribute is the attribute of relation, and as relations can change, pronouns can be applied to any number of objects *in succession*, however different.

116.

Pronouns as compared with Proper Names.

§ I here use proper names in the ordinary sense of the grammarians; meaning by it names like *John*, *London*, &c.

What do they connote? Nothing.

What do they note or denote? Less than the pronouns; and be it remembered that the pronouns denote but one real attribute.

How can a word that denotes less than a single real attribute denote anything at all? This we must investigate. We must investigate it in order to see in what respect the pronoun differs from the proper name.

The information that a proper name gives us is purely, absolutely, and exclusively negative. What do I know of the individual called *John* from the combination J O H N? I guess that it means a human being of the male sex; but this is only from knowing that it is to such objects that it generally applies. It may mean a *dog*, a *horse*, a *ship*—anything.

All that the name really tells me is this, viz. that the object to which it applies bears that name, or is supposed to bear it; that it is not a *Thomas*, a *Charles*, a *London*, a *Julius Cæsar*; that it is not, in short, anything not called *John*, or rather that it is not anything called by a name other than *John*. Certainly, this is little enough. Yet more than this I am unable to find in the ordinary proper name. It simply excludes so many others.

Now this is what is done by the pronoun. Words

like *I* and *this*, &c., exclude words like *thou* and *that*, &c. But they do something more. They tell us something positive. What *I* may mean altogether I cannot learn from the word itself. It most probably means a human being. It is even chances that, meaning a human being, it means a person of the male sex. But it may mean something different. In Æsop's fables it means a *lion*, *tiger*, *dog*, *fly*, &c. In Homer it means *gods*, *goddesses*, *demons*, &c. It may mean anything that any one may imagine to be endowed with speech, and to use it in talking about itself. Nevertheless, it means a speaker of some sort.

In like manner *thou* means an object spoken to.

Again—*this*, however little it may tell us as to the nature of the object that it denotes, tells us that it is nearer to some speaker than the object designated *that*.

This is more than is done by the ordinary proper name, the difference between which and the pronoun it has been the object of the present section to illustrate.

117.

Pronouns as compared with Adjectives.

§ Relation is an attribute. Quality is no more —no more and no less.

The *red-ness* or *white-ness*, of an object is one of its attributes. The *this-ness*, or *that-ness*, of one is the same. The words are somewhat strange. The things, however, are alike. From *red* and *white*, we get the abstract forms *red*-ness and *white*-ness, and we can get the same from *this* or *that* if we

want to do so, without violating the rules of language.

There is something, then, common to the pronoun and the adjective; something common, notwithstanding the substantival character of the former upon which so much has already been written.

To say,

The rose you speak of is *red*,

and to say,

The rose you speak of is *this*,

is to utter a pair of exceedingly similar propositions; propositions which agree in giving a certain attribute to a certain flower. The first gives it that of *red*-ness, the second that of *this*-ness.

Yet there is a great difference in the import of the two predicates. The former, in giving us *redness*, gives us but one out of the many attributes that constitute the substance *rose*. The latter, in giving us *thisness*, gives us the rose itself, *i.e.* the self-same substance under another name.

The name *rose* is the name of substance, *i.e.* of the aggregate of so many attributes.

The name *this* is the name that that substance bears so long as it is in a certain relation to some other substance.

Red is no name at all. It is a word which suggests, or implies, the name *redness*. But when we have got this, what is it? It is no name for a *rose*, but only a name for one of its qualities. Neither is it the name for the qualities of a rose exclusively. It is the name of one of the qualities of a *brick*, an *Indian*, a *soldier's coat*, &c., &c.

The difference between what is implied by a name expressive of a relation and a name expres-

sive of a quality is the difference between a part and a whole, and this is the difference between a pronoun and an adjective.

118.

Pronouns as compared with Abstracts.

A pronoun is the name for a substance.

It is the name of a substance based upon one (and only one) of its attributes.

But that attribute, being the attribute of relation, has the peculiar properties just indicated. It applies to a whole substance, and applies to any amount of different substances *at different* times.

In short, as a name, it is variable, convertible, temporary, ephemeral, momentary, transferrible, a name *pro hâc vice* (so to say).

The great majority of the substances to which pronouns apply are concrete; *i.e.* when we come to know, we find that, though known only through one attribute, they have many.

An abstraction is a substance with one attribute only; *i.e.* the attribute which gives it its name. *Redness*, for instance, is a substance of which we can only say, in the way of predication, that it is *red*.

It may be objected that this is no substance at all. Perhaps it is not etymologically. It is certainly not so to the senses. It is a substance, however, to the intellect; and it is a substance in grammar. It is something that the *mind* can contemplate *in and by itself*. It is a something of which we may talk as we talk of the most concrete objects in existence.

No matter how immaterial, unsubstantial, or unreal, such somethings as goodness, whiteness, &c., may be, no matter how little any of our senses can take cognizance of them, no matter how difficult it may be for even the intellect to realise any *definite* notion of them, they are, still, in the eyes of the philologue and grammarian, substances, or something possessing the grammatical attribute of a substance. He can, for instance, say, *Goodness* is the condition of *happiness;* or, *Happiness* is the reward of *goodness.* He can say, *in goodness, from goodness, by goodness,* &c.; and this is all he could do if the word before him were *house,* or *man;* or the name of some object remarkable for its power of striking the senses by its physical properties of tangibility, visibility, or audibility. The writer* from whom I take this statement, admits and insists upon this property of abstract terms, though he adds, that "this indispensable and necessary use of language, in the common business of life, is the root of the most glaring fallacies, when we have occasion to reason on the fundamental principles of things in general."

An abstract name, though it has a substance, has nothing concrete answering to it. A pronoun has always a substance, and generally a concrete one (*i.e.* an object of more than one attribute), to which it applies.

This is the difference between a pronoun and an abstract name.

The substance that answers to a pronoun may be, and generally is, concrete.

* Sir Graves Haughton, *Prodromus*, p. 11.

The substance that answers to an abstract name never is, and cannot, *ex vi termini*, be concrete.

(119.)

Criticism.—Use of the Word Noun.

§ If the doctrines of the preceding sections are true, the existing phraseology of the ordinary grammars is exceptionable; complications arising out of the use of the word *noun*. The effect of it is to separate the substantive too much from the pronoun, and to connect it too closely with the adjective.

In the first place, noun is derived from the Latin *nomen* = *name*. But the present treatise denies that adjectives are names, and gives reasons for the denial.

The present treatise maintains that a name implies a *nominé* or object named. Now there is no *nominé* to an adjective. It is no answer to this statement to say that *white*, *red*, *old*, *new*, &c., are the names of substances, things, or objects. They are not so. *White thing*, &c., are names; but the nominal part lies in the word *thing*. All that the words *white*, &c., suggest is, the existence of a certain attribute as one amongst others constituting a substance. For this attribute (as aforesaid) *white*, *red*, &c., are not the true names. The true names are *whiteness*, *redness*, &c.

The exact form which the language of a grammarian should take, in order to obviate these difficulties, is by no means an easy question. Neither is it one which any single writer is likely to determine. The practice of teaching, along with the investigations necessary in the higher branches of

philology, will, sooner or later, decide what portions of the present phraseology should be kept, and what allowed to grow obsolete. Meanwhile, it is convenient, for the present, to forget as much as possible the connection between the words *noun* and *name*—adjectives being nouns, but not names. It is also convenient to ignore as much as possible the element *pro* in the word *pro*-noun, or, at any rate, forget that it means *for*. This is needful because the pronoun is really as much of a noun as the substantive itself, and more of one than the adjective. To a certain extent it is, doubtless, a substitute. Every pronoun, like every proper name, has its equivalent. To every proper name there is the common, or general name of the class to which the particular individual under notice belongs. Thus, wherever there is a *John* or a *Bucephalus* (as usually understood), there is a *man* or a *horse*. In like manner to every pronoun there is a corresponding substantive, *this* and *that* always meaning something (*house*, *man*, &c., as the case may be), though meaning it in a different manner.

As far, then, as this is substitution, pronouns are substitutes for nouns. But proper names are also substitutes for common ones. Be it so. It follows that, with a change of view, nouns are substitutes for pronouns, and common names for proper.

Now the evil of making the noun the standard and the pronoun the substitute, makeshift, or shadow of the noun lies in the circumstance of its being extremely likely, as a matter of fact in the history of language, that the pronoun is, in many instances, the older word of the two. The evidence upon this point lies within the domain of another

investigation. At present, it is sufficient to indicate its existence.

A third point upon which we may be chary is the recognition of the use of the word *noun* as the name of a *genus*, to which adjectives and substantives are species. At any rate, we ought to give the same generic character to the pronouns; some of which are substantival rather than adjectival (*I*, *thou*, *he*); others adjectival rather than substantival (*this*, *that*, *some*, *many*).

The use of the word *appellative* to denote the words capable of forming both subjects and predicates, with which power it has the application of the ordinary word noun, and includes substantives and adjectives, though recommended by the present writer in an earlier work,* is called for only occasionally; on occasions, however, it is useful.

(120.)

Criticism.—Plurality and Non-plurality of Attributes.

§ In all the previous sections, when the subject admitted, much was said concerning the extent to which a given substance had one, or more than one, attribute. Some had many, some few. Between those, however, which had only one, and those which had more than one, the difference was evidently considered to be important. Indeed, it was this which made the distinction between individual and common names.

* Preliminary Dissertation I. to the fourth edition of *English Language*.

Of these two classes, each fell into subordinate divisions.

Common names differed chiefly from each other in being more or less generic, *e. g. man* was more generic than *Englishman*, *animal* than *man*, *organized being* than *animal*. Individual names did the same. Proper names implied no attribute at all; pronouns, the attribute of relation; abstracts an attribute, which, whatever it was, appertained to a substance which had no other attribute but it. Of all these classes the characters were well marked.

The attributes of the proper name were fractional, so to say, *i. e.* less than unity.

Those of the pronoun and the abstract substantive agreed in being but one, or in their *one-ness*; but between them there was this difference—when the substance which the pronominal name denoted was known, it might be, and generally was, *as a substance*, one of many attributes; the *one-ness* of the attribute belonging to the name. In other words, the non-plurality of attributes was *nominal*.

Meanwhile, the non-plurality of attributes in the case of the abstract name was *real*; *i. e.* the substance itself, when known, having one and one only.

Change the name of a substance expressed by a pronoun, and you may get a concrete substantive.

Change the name of a substance (*redness*, for instance) denoted by an abstract name, and—But why proceed? The thing cannot be done. Whilst every substance expressed by a pronoun has a second name, substances expressed by abstract names have but one.

Need more be said to show that, in the eyes of the present writer, at least, the plurality or non-plurality of attributes is of the highest importance? It makes all the difference between notation and connotation. For the value of *this* the reader is referred to the work so often quoted, Mills' *Logic*; where the bearing of the latter upon language as an instrument of thought is fully, but not too fully, illustrated.

What, however, if we consider (what may be called) the *named-ness* of an object an attribute? In such a case, the true and typical proper name, like *John* or *London*, instead of being a word which gives us no attribute at all, is the name of an object with a name—the name itself, or rather the fact of the name being borne by it, being, if not an actual attribute, an approach to one. If this be the case, every object that has a name has, *ipso facto*, an attribute.

Considering, then, the possession of a name as one attribute, it follows that words like *I*, *thou*, *this*, &c., which, over and above the fact of their being named, give us a relation as well, may be said to have two, and, having two, to be connotative. At any rate they are names implying a second attribute.

I submit that, as far as this is an objection, it is one easily remedied (should need be) by a slight change in the terminology. The material fact of names that give us a relation being different from names that give us neither a relation nor anything equivalent to it, still remains.

But this is not all. It may be said, that, even according to the view taken in our preceding section of the import of names like *John* and *London*,

they are relational. All that a name like *John* tells us is, that the object which bears it is other than *not-John*—the universe being *not-John* and *John*. This, it may be said, involves a relation. Be it so. The difference between the name of an object contemplated in its relation to the speaker, or some object known to the speaker, and the name of an object viewed in relation to everything else, is still of great practical importance.

121.

The Attribute of Quantity.—Quantity a Relation.

§ The three attributes to which the chief prominence is given by writers on the philosophy of grammar are—(1) the attribute of quality; (2) the attribute of quantity; and (3) the attribute of relation.

Quantity, from the Latin word *quantus* = *how great*, properly applies to *magnitude* rather than *number*, that is, if we look to its derivation only. The answer, however, to the question *how many* is, in ordinary parlance, a case of *quantity*.

Q. How many are there?

A. Three. This means—

There are three—or

The number is three.

Here *three* is the predicate, just as *white* is the predicate in the words *snow is white*. Can we talk of the *three-ness* of anything? Yes. The phrase, though awkward, is allowable. At any rate there is such a thing as the *triple character* of an object.

Little need be said respecting the attribute of

quantity, except that, whatever it may be in other points of view, it is in the eyes of a grammarian an attribute of relation, so that the place of a numeral in a proposition is that of the pronoun rather than the adjective. Indeed, in most grammars (perhaps in all), the numerals and pronouns are noticed together.

122.

The Attribute of Quantity.—Cardinals and Ordinals.

§ The relation, however, between the cardinal and ordinal numbers is sufficiently remarkable to command a short notice.

It most nearly resembles that of words like *this* and *that* on the one side, and *here* and *there* on the other. Compare such a series as *first*, *second*, and *third*, with *this*, *that*, and *t'other* (to use a familiar abbreviation), or *this*, *that*, and *yon*, and the extent to which both have the character of ordinality is manifest. *First*, *second*, *third*, is a sequence of which the words *nearest*, *not so near*, and *further*, give almost a translation. And what are these but *this*, *that*, and *yon*, under another form? The relations in space are identical.

Again—like *this*, *that*, and *you*, the words *first*, *second*, and *third*, imply the existence of a substance to which they correspond. These are truly names; though convertible. This, however, we have learnt already from their place as pronouns.

The relations of the cardinals to words like *here*, and *there*, is less clear. Neither is it so clear that *here* and *there* stand in the same relation to *this* and *that*,

as *one* and *two* do to *first* and *second*. Let us mark, however, the points in which they agree. That *here*, like *this*, implies a closer, and *there*, like *that*, a less close proximity is obvious. And they imply it in the same way. *This* and *that* attach themselves to substances; *here* and *there*, to certain points in space; the objects occupying those points making no part of the idea. And this is the case with *one* and *two*.

If this view be accurate, the cardinal numbers are more or less adverbial in character. Be it so. They may be this, and yet retain much of their pronominal character. But they are adjectival also. We can say *one man*, *two men*, &c., just as we can *a few men*, *many men*. Equally adjectival are *here* and *there;* words which, etymologically speaking, are dative cases of the demonstrative pronouns.

The ordinals answer to the question *which?* the cardinals to the question *how many?*

Q. Which is this?

A. The first, second, &c.

Q. How many are there?

A. Three.

To this extent, then, the relation between the cardinality and ordinality of the numerals is peculiar. It is *not* that of abstract and concrete. If it were so, the phenomenon which the numeration of (I believe) every language on the face of the earth would exhibit would be most anomalous. It would exhibit a reversal of the very general rule that the abstract is derived from the concrete, and not the concrete from the abstract; inasmuch as, in all cases known to the present writer, the cardinal is the simple, the ordinal the derived form; the

cardinal being the analogue of the abstract, the ordinal of the concrete.

In one respect, indeed, there is actually an abstraction and concretion. The cardinal gives us the number *minus* any particular object to which it applies. The ordinal, on the other hand, has always something with which it *concerns* itself. Neither relation, however, is the relation of *red* to *redness*, or *redness* to *red*. On the contrary, both the cardinals and the ordinal *may* (if necessary) take each their own proper abstract. We may talk of the captain of a class in school being proud of his *first-ness*, just as the second may be said to be vain of his *forwardness*.

On the other hand, the word *one-ness* has been found necessary in more than one passage of the present work.*

123.

The Article.

§ The part of speech now coming under notice is one which, in some languages, commands no attention whatever, inasmuch as it is not found in them. The Latin language has no article. At the same time

* The points which the cardinals and ordinals have in common with the concretes and abstracts have had more stress laid upon them in a previous treatise of the author's than the present. In Preliminary Dissertation I. to his *English Language* (last edition) he considers the relation between them to be so far those of the abstract and concrete substantives as to look upon the fact of the ordinals being the simpler in form as an approach to a philological paradox. Without exactly thinking this, at present, he looks upon the development of the two series as one of the most interesting questions in language.

each and all of the languages derived from the Latin have one, or more than one. The French has the article *le* = *the*, and *un* = *one*. So have the Italian, the Spanish, &c. But the Wallachian article is the most remarkable. It *follows* the noun to which it belongs, instead of preceding it. It also coalesces with it, so that the two form one word. Thus if *om* = *man*, the combination *om-ul* = *the man*. In this case the article is said to be *post*-positive, or placed after the substantive.

Now this post-position of the article is by no means a rare fact. Neither is its amalgamation with the substantive. What occurs in the Wallachian occurs in the Icelandic also. So it does in the Danish, Swedish, Norwegian, and Feroic, derived from it.

If these facts be rightly interpreted, they will suggest the likelihood of the article being one of those parts of speech which originate during the later rather than the earlier stages of language; as, indeed, it is.

They will also suggest the manner in which a part of speech, originally non-existent in a language, may be developed. If the Latin be the mother-tongue of the French, &c., and these contain articles, how came those articles there? In the original Latin they were wanting.

The investigation of this will tell us that, although the so-called articles of the modern languages are wanting in the old Roman, the materials out of which they might be made, created, evolved, or developed, were present. The Latin had the word *unus* = *one*. It had also the words *ille*,

illa = *he* and *she*. Now the French *un* = *a* = *unus*, the indefinite article having grown out of the numeral. And the French *le* = *ille*; the definite article having grown out of the demonstrative pronoun,—oftener called the personal pronoun of the third person, but really the demonstrative.

Neither was the French process of evolution or development peculiar. The articles of all the allied languages arose out of these same pronouns, *unus* and *ille*. Only, however, in Wallachian did it *follow* the noun. This is sufficient to show that, in one respect, at least, the article is, if no full and true pronoun, at least, pronominal in its origin. Should, however, the instances from the tongues just cited be held insufficient, it may be added that, *mutatis mutandis*, the origin of the articles in the languages allied to our own is the same. What is *the* but a word of the same origin with the demonstrative *th-is* or *tha-t*? What is *a* but *an*; and *an* but *án* (Anglo-Saxon) and *ane* (Scotch); and *án* or *ane* but *one*?

So much, then, for the *origin* of the article, and the points in which it agrees with the pronoun. Those in which it differs from the pronoun are, at least, of equal interest.

A pronoun is essentially categorematic. If it were not so it would not be a pronoun.

An article is essentially *syn*categorematic. If it were not so it would not be an article.

An article is *syn*categorematic at least; and in many cases it is something more. It not only attaches itself to its substantive, but it may actually coalesce, amalgamate, or become incorporate with it. At any rate, it may join on to the body of the

word, as has been suggested in § 27, and as the name indicates.

Such being the case, the impropriety of putting the article at the head of the list of the parts of speech, as is done in many grammars, is apparent. Separated from the pronoun out of which it originates, and connected with the substantive, adjective, or noun, with which its real relations are only indirect, it is quite out of place; only taking its proper position when in contact with the pronoun.

Pronominal, however, as it is, it is still *syn*-categorematic; and (so being) supplies an instance of a part of speech losing its categorematic character, and becoming something else. How is, this done? The first point to be remembered is, the fact of every pronoun having a synonym, *i. e.* a substantive into which it may be translated. Every *this* is *this* something—*this man, this stone*, &c. Now when the two names are thus joined, the result is a substance *plus* its relations.

Let the two ideas so far combine that the two words which form them partake of the nature of a compound.

Let one of the words undergo a change of form, the result of which will be that the word in combination with the substantive will be slightly different from what it is when separate and independent.

The result, too, will be that out of the root of *this* and *that* we get *the*, a word incapable of existing by itself, but common enough, under the name of the definite article, in conjunction with a substantive.

And out of the numeral *one* we get *an* and *a*, words incapable of existing by themselves, but common enough, under the name of the indefinite article, in conjunction with a substantive.

Dialogue.

Question.—What are the words in English that come under the title of article as thus explained, *i. e.* what are the words in English which are, at one and the same time,

a. Pronominal in origin; and

b. Incapable of existing, except in conjunction with either a substantive or some other pronoun?

Answer.—*An* (or *a*) and *the.*

Question.—Are there any others?

Answer.—Not in the ordinary grammars. More than one competent writer, however, has suggested that *no* is an article. To be this, it must, of course, be considered as different in its construction from the ordinary negative. In which case it certainly comes under the conditions of an article. It has no independent existence. It *has* an existence when coupled with a substantive or another pronoun. It = *not one*, and *none*, in power. But we can by no means use it, as we can those words, categorematically. It seems, in short, to be truly articular.

Question.—Are there any others?

Answer.—The construction of *every* is exactly the construction of *no*. We can say *every man* as we can say *no man*, and *every one* as we can say *no one*; but we cannot say *every* and *no* alone.

Question.—What do you say to *many a-*, and *never a-*, in such phrases as *many-a-one* and *never-a-one?* Are they articular?

Answer.—Certainly. But they are simply the indefinite *a* with a certain prefix. *Every* (= *ever* + *ilk* = *each*) is in a different category. It is not only articular, but a separate independent article.

The recognition of *every* and *no* as articles, are measures of the extent to which the previous doctrine as to the essential characteristics of the article alters the phraseology of the ordinary grammars.

It now only remains to ask, what are the logical conditions which more particularly evolve or develope the article? For these we may look to § 26.

1. *Every* expresses a universal affirmative;
2. *No*, a universal negative;
3. *A* and *the*, the particular affirmative; the former indefinitely, the latter definitely.

DIALOGUE.

Question.—Are there no articles except those that express the quantity and quality of propositions?

Answer.—The words that express the quantity and quality of propositions (*an* and *the*, by the way, do this, and something more) are the chief. At the same time there are others. Though we can say,

This hat is *mine*,

we cannot say,

This hat is *my*;

so that *my*, *thy*, *our*, and *your*, are articular in respect to their construction — articular in construction, and pronominal in origin. If not actual articles, they are closely akin to them.

124.

The Substantive.

§ An inconvertible subjective name is called a Substantive.

In other words—

A Substantive is an inconvertible name, capable of forming by itself, and single-handed, either subjects or predicates.

More than this it is unnecessary to say, inasmuch as the function of the ordinary substantive has already been investigated in the sections that treat of names.

125.

The Adjective.

§ A word capable of forming the predicate, but not the subject of a proposition, is called an Adjective.

The extent to which an adjective is no name, but only a word suggestive of one, has already been noticed.

So has the relation between the adjective and the abstract substantive.

So has the fact of the adjective being the word expressive of an attribute.

So has the fact of the particular species of attribute expressed by the adjective being that of quality.

Adjectives express qualities; pronouns, relations

126.

The Adjective.—Its relation to the Participle and the Verb.—States and Actions.

§ The ordinary division of attributes into qualities and relations has been made.

A further division of the particular class of qualities is still necessary. It is one that concerns the philologue and grammarian exclusively. The logician has but little to do with it. We shall

arrive at it by attending to certain shades of meaning illustrated by the following sentences :—

Ice is solid water.
Water is liquid ice.

Each of these is not only correctly constructed as a proposition, but is true as a matter of fact. Take the two together, and what do they imply? Change—change from solidity to liquidity; at any rate, change of some kind. How is this change effected? Does the water in becoming ice change itself from a liquid to a solid? Does the ice in becoming water change itself from a solid to a liquid? Or are some fresh agents brought in by which water is solidified and ice liquified? Say that there are, and that these agents are heat and cold, and we get the proposition that

Heat is the cause of ice becoming water,
and
Cold is the cause of water becoming ice.

So that now we get the idea not only of change but of agency.

And now for *solid* and *liquid* water write *solidified* and *liquified.*

Ice is solidified water;
Water is liquified ice;
Ice is water solidified by cold;
Water is ice liquified by heat.

Fio in Latin means *I become.* Hence *solidi-fied* and *liqui-fied* mean *become-solid* and *become-liquid.* The abstract names that correspond to these two words are *solidi-fication* (=*the becoming-solid*) and *liqui-faction* (= *the being-made-liquid*). Why are they different? Why does one end in

-fication and the other in *-faction ?* Why not say either *solidifaction* and *liquifaction*, or *liquidification* and *solidification ?* There is no great reason why we should not. The difference between a thing *becoming solid* (or *liquid*) and *being-made solid* (or *liquid*) is rarely of much importance in ordinary language. Both expressions, however, suggest the idea of change; one the idea of change effected spontaneously by the object itself, the other the idea of change impressed upon it from without.

Now *solid* and *liquid* are adjectives, whereas *solidified* and *liquified* are participles, whilst *solidify* and *liquify* are verbs. This shows the extent to which adjectives, participles, and verbs, are allied.

They are allied, but different, and the difference between them consists in the idea of change and agency implied by the participle and the verb. *Solidity* is a state; *solidification* an action. Yet the *solidity* of water in the shape of ice, and the *solidification* which water undergoes in order to become ice, are equally attributes of water.

For *liquify* write *thaw.*

For *liquified* write *thawed.*

To the right of each write *the water is.* Thus

The water is liquid.

The water is thawed.

From *thawed* eject the *-ed*, and substitute for it *-ing—the water is thaw-ing.*

For *is thawing* write *thaw-s;* as, *the water thaws.*

What is the result? Even this—that the predicate and copula have coalesced in one word, and that *thaws* = a predicate + a copula.

The adjective has become first a participle, afterwards a verb.

How? By changing the state expressed by the word *liquid* into the action denoted by the word *liquified.*

The slightest departure imaginable from the expression by which we denote the permanent state or condition of an object has this effect. To say that

Water has the property of liquidity,
Water is endowed with liquidity,
Water becomes solid under certain circumstances,
Water can become solid,

and the like, is to make water (the substance) more or less of an agent, and its attribute more or less of an action.

To have the attribute of liquidity, is to act the part of a possessor or owner.

To *be endowed* with the same is to be acted upon by some imaginary endower.

To *become* anything is to pass from one state to another, through one or more intermediate ones.

The water that *can* become solid has certain powers—no matter whether exercised or not.

And so on through a whole list of similar expressions.

Except when we mentioned the words *heat* and *cold*, we have hitherto spoken as if, in the changes under notice, it was the *water* that was the agent. But what if, instead of saying,

Water becomes ice,

we say,

Water is made into ice?

In such a case water is anything but an agent. On the contrary, it is extremely passive; the agent being elsewhere. In propositions like—

Cold changes water into ice,
Cold freezes water,
Cold solidifies water,

we get the agent in question,—the agent which, at the first view, appears to make the ice. Yet it only makes it through the action of the water.

However, the agency is now complete; and we have both the cause (*cold acting on water*) and the effect (*solidification*). We have also the substances —*ice*, *water*, and *cold*—as well as the attributes, viz. *solidity*, *liquidity*, *power of being changed from liquid to solid*, and *vice versâ*, *power of changing*, &c. The cold acts upon the water, producing a result.

Now this action proceeding from the *cold* effects a result in the *water*—passing, or making a *transit* (so to say), from the one to the other. The action, energy, manifestation of power, or whatever we choose to call it, is now at its *maximum*. This is the case with the class of verbs called *transitive*. There is the agent and the object, and there is the relation between the two. The ordinary conditions of a state (a word implying permanence) are wholly absent. The only state in the matter is a state of change; and this is scarcely a state at all.

Where the verb is transitive the term is many-worded, for a transitive verb implies the existence of some object upon which it acts; and a transitive verb, unaccompanied by a name, is a contradiction in terms. The absence of such a name renders it intransitive, even though in form it be transitive.

I move my limbs is a proposition of which the predicate is a many-worded term.

Subject.	*Copula.*	*Predicate.*
I	am	moving-my-limbs,

the word *move* being transitive.

I move = I am moving—Here the verb *move* is intransitive, merely meaning, *I am in a state of motion.*

The water freezes—This is what we say when we look upon the solidification of water as an action of the water itself; *freezes* being intransitive.

The cold freezes the water—This is what we say when we look upon the action of cold as the cause of the water becoming solid; *freezes* being transitive.

There are, then, degrees in the extent to which an attribute may be an action rather than a state.

1. *The sun is bright*—Here we think more of what the sun *is* than what it *does.*

2. *The sun is a bright body*—Ditto.

3. *The sun is a shining body*—The notion of action now begins. Nevertheless the word *body* limits it. We think quite as much of the sun being a *body* as of a body *shining.*

4. *The sun is shining*—The idea of action becomes stronger.

5. *The sun shines*—The idea of action becomes stronger still.

6. *The sun dazzles*—Stronger still.

7. *The sun dazzles our eyes*—Here we have agent and object—doing and suffering—action and passion; and the verb has attained its *maximum* of verbality.

127.

The Verb.

§ A word capable of forming by itself both the predicate and the copula of a proposition, is called a Verb.

Verbs are categorematic, and something more, *i. e.* hypercategorematic.

They have two parts—(1) one copular, (2) the other predicative.

Subject.	*Copula + Predicate.*
I	speak

is the verbal form of

Subject.	*Copula.*	*Predicate.*
I	am	speaking.

128.

The Participle.

§ The predicative element of the Verb, when isolated and treated separately, is called a Participle.

A participle (*i. e.* a verb *minus* the copula) is in all respects an adjective, the quality whereof consists in an action rather than a state.

Like the adjective, the participle is predicatively categorematic.

If all propositions were perfectly simple, *i. e.* if there were no such things in language as complex terms, the parts of speech just enumerated would comprise all the words admissible into propositions, or, what is the same thing, all the words, with few

exceptions, that constitute language. But all terms are *not* simple; and the existence in language of complex ones creates the occasion for other classes of words, or other parts of speech. There exist in language parts of speech, or classes of words, for the admission whereof into propositions a certain degree of complexity in either the subject or predicate is a condition. These parts of speech, or classes of words, are two in number—Adverbs and Prepositions.

129.

Adverbs.

§ A word inadmissible in a simple, but admissible in a complex term, and therein requiring the presence of only a *single* categorematic, or hyper-categorematic, element is called an Adverb.

John is speaking loudly =
John speaks loudly.

All words that can take the place of *loudly* in a proposition are Adverbs.

But—

A verb = predicate + copula.

Add to which, that

It is its predicative or adjectival element which is modified by the adverb; a part of speech which is really as much of an ad-*adjective* as an ad-*verb*.

Adverbs give the *manner* or *mode* in which the action denoted by the verb takes place. Of these there are several species, inasmuch as not only the general character and degree of an action come under the denomination of a *mode*, but the con-

ditions of time and place as well, along with others of less importance.

He speaks ;

He speaks *loudly ;*

He speaks *very* (degree) loudly ;

He speaks very loudly *now* (time) ;

He spoke *there* (place).

From *modus* (= *mode*) we have the logical terms *modal* and *modality ;* terms by which we express the function of the adverbs.

For an adverb to find its place in a proposition all that is necessary is a word denoting some action, to which the idea of the manner in which, or the conditions under which, it takes place is added.

130.

Prepositions.

§ A syncategorematic word requiring for its introduction into a term *two*, or more, categorematic elements (those being subjective), is called a Preposition.

Hence—

Prepositions connect subjectives, when more than one of them occurs in a term.

In such an expression as, *I am come from London by way of Windsor, and am going to Bristol through Bath,* all words which can take the place of *from, to, of,* and *through,* are Prepositions.

Pre = *before ; positio* = *a placing,* or *position.* Now, although words like *from, to,* &c., in the currently-studied languages, precede their subjective categorematic, it is by no means a matter of necessity that they should do so. Indeed, in many

languages they *follow*. If so, the so-called *pre*-position is really a *post*-position (*post* = *after*).

Hence, the term preposition, though current, is exceptionable, being too specific.

Observe—The inconvenience of the ordinary classification into nouns (containing substantives and adjectives) and pronouns is made manifest by a sentence of this section—"Prepositions connect pronouns and subjectives, &c." Some more familiar term was wanted here. To have said that prepositions connected *nouns* would have been wrong; inasmuch as adjectives are nouns, and adjectives, except so far as they are attached to some substantive or pronoun, are *not* parts of speech to which a pronoun can attach itself.

To have said that prepositions connected *pronouns* would also have been wrong. The statement would have been too narrow. They connect substantives as well.

It would also have been wrong to have said that they connected *substantives*. They also connect pronouns.

As soon as we understand the fact of prepositions indicating a *relation*, we see the impossibility of their finding a place, either in a simple term or in a term containing only one name. For a *relation* to exist there must be at least two related objects.

131.

Conjunctions.

§ A word which connects either two terms of the same kind, within the same proposition, or else two propositions, is called a Conjunction.

Mark, the words *of the same kind*. The *copula* connects two terms, viz. the subject and predicate; but these are *not* of the same kind.

In the proposition—

All men are black or white,

the conjunction *or* connects *black* and *white*—both predicates.

In—

The day is bright,
because
The sun is shining,

the conjunction *because* connects two propositions.

Conjunctions are extra-terminal; *i. e.* they lie beyond the term.

Conjunctions are extra-terminal. Nevertheless, though they lie beyond the boundaries of any *single* term, they imply the existence of *two*.

132.

YES *and* NO.

§ For the present we may call these simply Affirmatives and Negatives.

Yes = *It is so.*

No = *It is not so.*

The single words stand as the equivalents to whole propositions.

Is this enough to make them separate parts of speech?

Not alone. Several words are in the same predicament; and they are words belonging to different divisions of grammar.

Here and *there*, in answer to the question, *where?* may do so:—

Where are you? Here.

One, two, &c., do the same, in answer to *how many?*

How many are there? Two.

Yet *one* and *two* can scarcely be called adverbs.

Can *yes* and *no?* They are certainly adverbial rather than anything else. For the present, however, they are dealt with as parts of speech, *per se.*

They constitute a proposition. At the same time (being answers to a question) they imply a previous one.

133.

Interjections.

§ A part of speech that exists wholly independent of propositions is called an Interjection.

Words like *oh! ah! pish!* &c., are Interjections.

134.

Inflection.

§ We have now gone through what are called the parts of speech, by which is meant the noun, pronoun, verb, &c., of the ordinary grammars.

So doing, we have looked at them from one point of view only. We have considered them solely and wholly with a view to the place which they severally take in the structure of the proposition.

Now, although it has not been stated, *totidem verbis*, that this mode of treatment is different from

that of the usual works on grammar, it has been more than once suggested that such is actually the case. More than once has the reader been reminded that the tests or *criteria* by which the parts of speech of the present treatise are determined are, in some degree, peculiar. Yet they are by no means either very doubtful or very obscure. Why, then, are they either wholly absent or imperfectly exhibited in the usual works upon language? Have the grammarians overlooked them altogether? Or has the present writer overlooked certain facts that modify their application?

The answer to this involves the consideration of the phenomena of what is called Inflection.

Firstly, that of the term itself.—Let a word be changed in respect to its form, and let these changes be compared to the *bends* of a trained tree; only instead of the English word *bending*, let us use the Latin term *inflectio* (from *flecto* = *I bend*), and say that "certain words, under certain conditions, are *inflected*," or "exhibit *inflections*."

Next, let us consider the functions of a preposition. It is clear that the words so called are merely so many means to an end; that end being the expression of certain relations between certain substantives and pronouns—certain substantives and pronouns, sometimes single, sometimes conjoined with, or attended by, an adjective. Of these means there may, certainly, be more than one sort; at any rate, we know of no necessity for the expression of the relation in question being limited to one form. We may make this clear by taxing our ingenuity in the formation of an artificial lan-

guage, one of the conditions of which should be that there should be no prepositions. We may do it more easily still, by simply comparing such a pair of words as *father's son*, with the three words, *son of father*. In the former the appended sound of the final *'s* does the work (there or thereabouts) of the word *of* in the latter. And why can we not go further? why not say *fatheri*, *fathero*, *fathert*, or something of the same sort, for *to father*? Why not say *fatherl*, or *fathera*, for *from father*, and so on? The answer to this question is, that it is not the custom of the men and women who speak English to do so. That the Latins, however, did so is well known. So did the Greeks. So did our own ancestors to some extent. In Latin—

Pater = *father*.	*Patres* = *fathers*.
Patris = *father's*.	*Patrum* = *of fathers*.
Patri = *to father*.	*Patribus* = *to fathers*.

That there is a broad difference between the system which gives us such a single word as *patri*, and the system which gives us such a combination as *to a father*, is clear; and it is highly probable that, with such a difference existing, there is also a name by which it is expressed.

What is this name? Like many others, it will involve a metaphor. The idea which gives us the names for such a form as *patri*, &c., is the idea of *falling* or *declining* from an *upright* position; an idea which brings us to such terms as *case* (from *casus* = *fall*), and declension (from *declino* = *decline*).

Let *father* in English, and *pater* in Latin, be the original categorematic forms — forms capable of

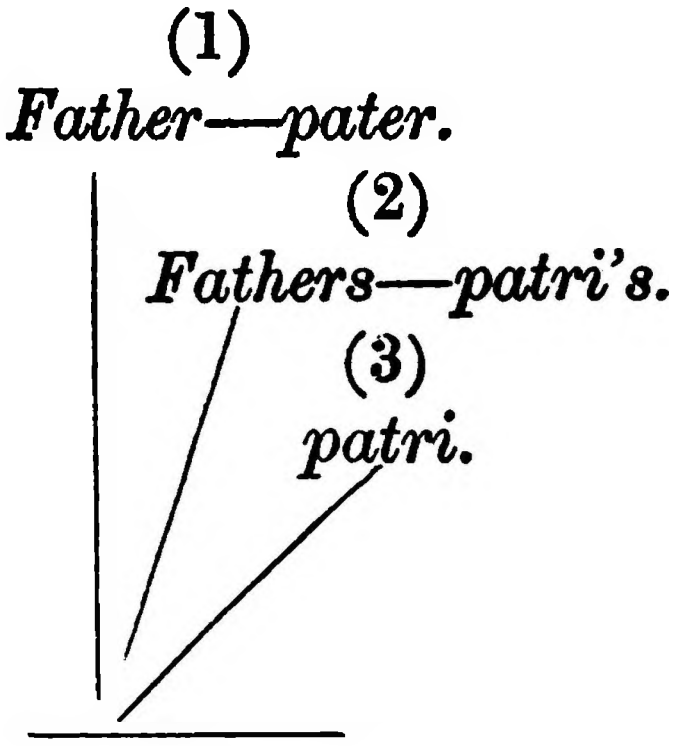
making either the subjects or predicates of propositions *by themselves.*

Let *father's* and *patri's* be considered to be the same words, though in a less upright, independent position. In short, let us call them *fallings-off* from the original; only, instead of *fallings-off*, let us use the Latin word *case.*

Patris and *father's* will, then, be *cases* of *pater* and *father;* and—

The system that gives us the series *pater, patris, patri,* will be a system of what is called declension.

Carry the metaphor still further. Let an upright line represent *pater,* and let the several slants it would give in falling represent the cases.



No. 1 is *upright.* In reality, it is no case (or falling) at all. It is customary, however, to call it the Casus Rectus, or Upright Case; and, inaccurate as the expression is, it is not very inconvenient.

Nos. 2 and 3 are *Oblique, i. e.* Oblique Cases; and so they are called in grammar.

Certain inflections are the equivalents to prepositions.

A categorematic word *plus* the equivalent to a

preposition, is in the same predicament with a categorematic word *plus* a preposition itself. Such a word as *patri's* can no more form a term than such a combination as, *of a father*.

And this explains a common statement in books of logic, viz. that it is only nouns in the Casus Rectus that are categorematic. In an oblique case, a noun, for all its importance, and all its otherwise categorematic character, can only be the part of a term.

135.

Inflection.—Number.

§ The previous section has shown that the relation which two words in the same term bear to each other may be expressed by declension, instead of by separate words in the shape of prepositions.

Are there any other modifications of meaning which may be expressed either by the same or similar means?

We have seen that there are. The difference between pat*er* and pat*res*, between fath*er* and fath*ers*, is a difference of *Number*.

136.

Inflection.—Gender.

§ In Latin *dominus* = *master*, whilst *domina* = *mistress*; and this difference of form, as indicative of a difference of sex, is carried throughout the cases and numbers.

Dominus,	*a master.*
Domino,	*to a master.*
Domini,	*masters.*
Dominorum,	*of masters,* &c.

As opposed to—

Domina, *a mistress.*
Dominæ, *of a mistress.*
Dominarum, *of mistresses*, &c.

This difference is a difference of *Gender*.

137.

Inflection.—Gender.—Of Pronouns.

§ In ordinary substantives the phenomenon of gender is of no great importance.

But it exists in Pronouns also, where it modifies the statements of §§ 90–96.

In Latin *ille* = *he*, whereas the form for *she* is *illa*.

What do these words tell us? They tell us that the object to which they apply is in a certain relation to the speaker, *i.e.* that it is the object *spoken of*, rather than the object *speaking*, or the object *spoken to*.

But they tell us something more. They tell us that the object designated by ille is a *male*, the object designated by illa being a *female*.

Now the sex of an object is not only one of its *attributes*, but it is one of its *qualities*. If so, pronouns expressive of sex are pronouns and something more, *i.e.* pronouns with an adjectival power superadded.

138.

Inflection.—Degrees of Comparison.

§ Instead of *more wise* and *most wise*, say *wiser* and *wisest*, and you have a pair of single words

acting as the equivalent to a pair of combinations.

This is the expression of a difference of *Degree* by either a declension or something akin to it. At any rate, it is the expression of a *mode* by means of an *inflection*.

139.

Inflection of Verbs.—Conjugation.

§ Like nouns and pronouns, verbs are inflected, the time (past, present, or future) at which an action takes place, and the agent does it (the *speaker*, the object spoken *to*, or the object spoken *of*), being the chief elements in the complex idea expressed.

In Latin—

Voco = *I call;*
Vocas = *Thou callest;*
Vocat = *He calls;*
Vocamus = *We call;*
Vocatis = *Ye call;*
Vocant = *They call;*
Vocavi = *I called;*
Vocavisti = *Thou calledst;*
Vocavit = *He called*, &c.;

all of which is so much inflection.

The inflection of verbs is called their conjugation. Hence—

The conjugation of verbs, and the declension of nouns and pronouns, are two species of the genus inflection.

140.

Criticism.

§ We are now in a position to see the possibility of the phenomena of inflection traversing, complicating, and modifying, the doctrine founded upon a basis exclusively logical.

The close relations that logically exist between the verb and noun have already been noticed (§§ 126–128). What, however, would be the effect of a verb, on one side, being so fully conjugated, and a noun, on the other, being so fully declined as for neither of them to appear without some sign of either their nominal or verbal character attached to, and inseparably connected with, it? The logical affinity would be concealed by the inflectional differences.

Now this is no imaginary case. In English the word *envy* is either a *verb* or a *noun*, and we may say either *I envy him*, or, *I look upon him with eyes of envy*.

In Greek the syllable *fthon* (φθον) has the same power. Between, however, the Greek language and the English there is this difference: the former never uses the syllable *fthon* by itself. If it be nominal in its power, it has certain inflections attached to it that are peculiar to nouns; whereas, if it be verbal, a verbal inflection is assigned to it.

No noun in Greek ends in *-ein*. Many verbs do; indeed, *-ein* is a verbal, or conjugational, inflection, and by no means a nominal or declensional one. What, however, if a word so ending take the place, in a proposition, of a substantive? There is,

to a certain extent, a conflict between the logical and formal tests.

And this really exists. The combination *to fthonein* (το φθονειν) = *envy*, the substantive. Yet it has the outward signs of a verb; and a verb it is, if we look to the form only. Look, however, to the meaning, and it is a noun.

That this complication would be abolished if we abrogated the inflections is clear, since such a word as *fthon* might (like *envy*) as easily be a noun as a verb. But, on the other hand, it might as easily be a verb as a noun; for a word with no characteristic signs at all may be anything or everything, as a part of speech. In *I go up*, the word *up* is an adverb. In *I go up the tree*, it is a preposition.

Separated from its inflections, the root *fthon* would have been what we may call *indifferent*, *i.e.* would have been, like the word *up*, a word as capable of being one part of speech as another. This, indeed, is the case with the word lately quoted — *envy*. It has nothing about it more nominal than verbal, or more verbal than nominal.

141.

Determination of Forms by Inflection.

The smaller the amount of inflection, the greater the number of indifferent words; *i.e.* words like *up* and *envy*, as opposed to *fthon-os*, and *fthon-ein*, which may be called *determinate*.

142.

Criticism.

Without going further into these details, we may see from the little already written that the grammarian who undertook the arrangement of the parts of speech according to the logical properties of the words of the language under notice, might find his classification traversed by the apparent contradictions suggested by their inflectional forms. And such has actually been the case. The etymological test has been opposed to the logical, and *vice versâ*.

It is maintained, however, by the present writer that this antagonism is apparent rather than real. It is held, too, that even if it were more real than it is, it would affect but a small portion of the wide field of language. In languages where inflections are rare, and the forms of the words indifferent, the etymological difficulty has no existence, there being no *formal* test by which the *logical* can be traversed. And even in languages where inflections are abundant, the only parts of speech which can create any difficulty are the verbs and nouns—these being the only two in which any notable amount of inflection occurs. The extent, however, to which a verb is allied to the noun, has already been exhibited.

It is undoubtedly true that in such a sentence as *they spoke*, the idea is wholly verbal. But abstract from it the ideas of the agents (expressed by *they*), and look upon the action without regard to the time in which it occurred, and the idea becomes

that of the *act of speaking* in general, an idea purely substantive. In like manner—

To err, is human ; *to forgive*, divine,

gives us the truly substantive ideas of—

Error is human, *forgiveness*, divine.

Instances of this kind could be multiplied, if necessary, *ad infinitum ;* enough, however, has been written to show that the difference between the logical and inflectional tests is less real than apparent. That a word expressive of the same idea may sometimes appear as a pure verb, sometimes as a participle, and sometimes (as in the infinitive mood, the gerunds, and supines) as a substantive, is admitted in all grammars—though not, perhaps, so explicitly as it should be

143.

Pronouns and Participles as compared with Substantives and Adjectives.

§ To proceed. It has been the object of the preceding sections to show that—

All words forming different portions of a proposition are different parts of speech.

Is the converse of this true ? Is it true that—

All words forming the *same parts* of a proposition are the same parts of speech ?

Not according to the present classification. A pronoun takes the same place in a proposition as a substantive, and a participle as an adjective. Nevertheless, pronouns and participles are separate parts of speech. Of course this may be altered by altering the definition of the term part-of-

speech. It is doubtful, however, whether this will be done.

The difference of idea conveyed by a participle as contrasted with the ordinary adjective, and the pronoun as compared with the substantive, has already been explained. It is the difference between an action and a state, a quality and a relation.

144.

Recapitulation.

To recapitulate.—Words fall into two primary divisions :—

I. Those that are wholly independent of propositions ; and,

II. Those whose existence depends upon the existence of a proposition.

The former class contains the interjections only.

The second falls into three divisions ; the *first* containing such words as YES and NO (= *it is so*, and *it is not so*), words equivalent to a whole proposition. They are answers to questions, and, as such, imply the existence of a previous proposition.

The *second* contains the conjunctions, words whose place lies *between* two terms, but not *in* any term at all. These terms must be of the *same* kind, *i.e.* either subjects or predicates. They need not, however, be within the same proposition; indeed, they rarely are so. If so, conjunctions are of two kinds—

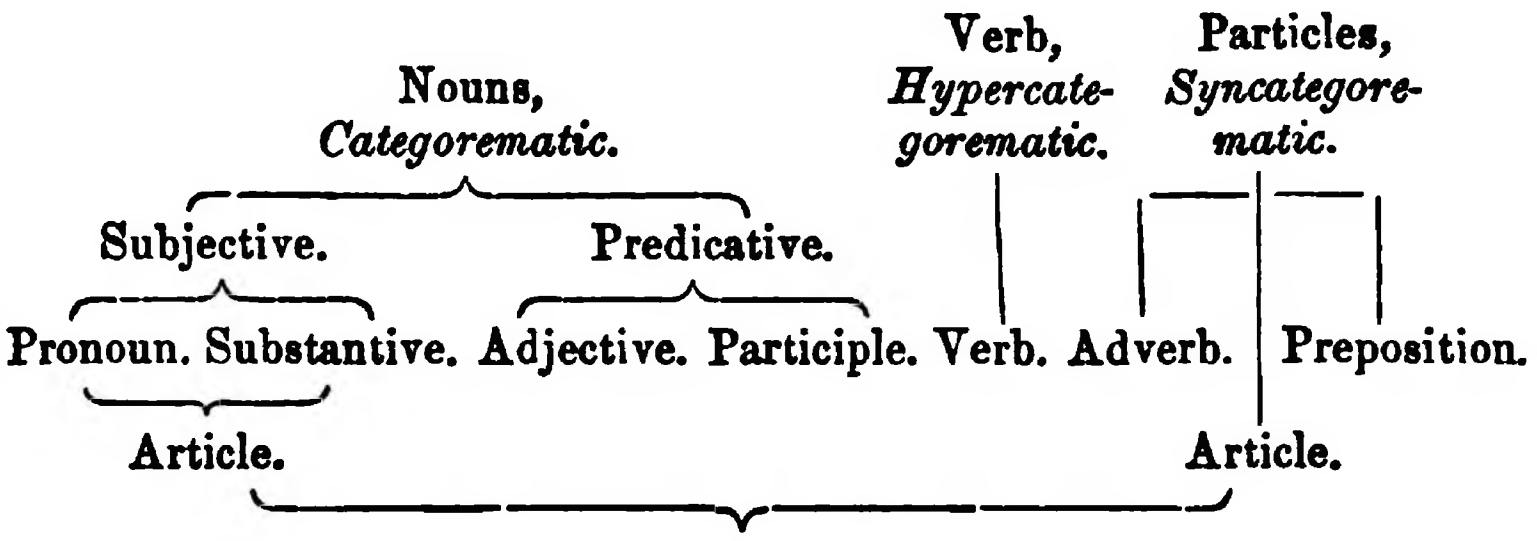
Interterminal, or between the terms of the one and the same proposition ; *e. g. all men are black or white.*

Interpropositional, or between two different propositions; *e. g.*—

The day is bright,
because
The sun shines.

Of *copulas*, or words that connect different terms, *i.e.* the subject with the predicate,—there is no instance in language; consequently, there is no such part of speech as the copula. The word that serves as a copula is always a copula and predicate beside. For the explanation of the apparent paradox, see § 15.

The *third*, and most important class, contains those words which enter into the structure of terms, sometimes by forming whole ones, sometimes by forming parts of ones, and sometimes by forming terms, and something more. These are as follows:—



The reasons of the several places of the above-named classes of words are by no means obscure, and they are often given in the ordinary grammars with sufficient perspicuity.

Nothing but the name of a substance either really existing, or capable of being perceived by the senses, or conceived by the imagination, can form the Subject of a proposition.

This is expressed in the current grammatical

definition of a substantive as the *name of anything we can see, hear, feel,* or *discourse of* (*i. e.* reason about).

Such a substance must either possess or be without certain attributes; *e. g.* it must either be *white* or *not white.* Hence, any word which suggests the name of an attribute may form a Predicate; *e. g.*—

Snow is white;
Soot is not white.

But we may also predicate of any substance that it may be equal to, or identical with, another; *e. g.*—

A man is an animal.
A bird is not a quadruped.

This shows that the name of a substance may enter into the structure of a proposition either as subject or as predicate.

Every object or entity must be endowed with certain qualities or attributes; *e. g. snow is white —man is mortal.* That the names of such qualities or attributes can become the predicates of propositions, has been shown above.

In order, however, for it to be a subject, it must be something more than a word suggestive of a name. It must be the name itself.

With substantives the name denotes the object directly.

With pronouns it denotes it indirectly, *i. e.* through its relations.

Verbs express actions implying that a certain object comports itself in such and such a manner. It *is* something, or it *does* something, or it *suffers* something. So run the usual expositions of the meaning of the word verb.

Nothing but a word of this kind can be at once predicate and copula. The predicate element denotes the particular state or action; the copula element, its existence, or, to speak more generally, its applicability or non-applicability to the subject.

In order for a proposition to be simple, its terms must be simple.

The only sorts of words which can be admitted into complex terms are words which either express, 1st, the relation that *two* or more nouns bear to one another, or, 2ndly, the mode (or manner) in which states or actions take place. And it follows from hence that the only words admissible into a term where there is but *one* noun (or nominal element) must be words expressive of the mode (or manner) of a state or action. Words of this kind are called Adverbs, because the predicate with which they combine generally coalesces with the copula, and becomes a verb.

The only other class of words must consist of those that denote the relation that one out of two or more nouns in a term bears to the others.

This explains the nature of *adverbs* and *prepositions*.

When the words that find their places within the limits of a term have been exhausted, we come to the conjunctions that, belonging to no single term, connect two.

145.

Place of the Article.

§ The place of the article is peculiar. In respect to its origin, it is pronominal. So it is in respect

to its import, for it is certainly a relation that it expresses. But its place in a proposition is that of a syncategorematic (and not a categorematic) word.

Its true relations are found in the remarks upon the Wallachian and Icelandic languages in § 123; wherein it is shown to coalesce with the substantive, and to become not only a part of a *term*, but also a part of a *word*. In such a condition it partakes of the nature of an inflection; so that a substantive *plus* an article is in much the same condition as a substantive *plus* the equivalent of a preposition.

The question now arises as to whether inflections can be called parts of speech.

They are not called so at present, however much they may be equivalent to them.

Nevertheless, it is safe to call an article a *sub*-inflectional word—*i.e.* a word which, without being actually an inflection, approaches one.

146.

Development of Inflections.—Conclusion.

§ This leads to a fresh series of investigations, a series of great importance and interest, but foreign to the present work.

The history of the article has been the history of either an actual inflection or something closely akin to it, developed out of a word originally separate and independent.

What if other inflections are in the same predicament? What if the signs of case in nouns have similarly originated out of prepositions? What if the signs of persons in verbs are pronouns?

What if—but instead of raising further questions on these points, let us simply say that the natural history of language tells us that all this, and much more like it, actually takes place. As, however, it is the Natural History of Language, and not of Logic, that gives us information on these points, the present treatise concludes with a mere indication of the question.

1861.

PREFACE.

It has been said that Grammar is a dry study. And, perhaps, the way in which it has been commonly taught justifies the assertion. But let it be viewed as an essential stepping-stone to the study of *Language*, a subject than which, surely, no nobler can occupy the human mind, and Grammar may be redeemed from the despised position it has held in our schools as a system of difficult and unmeaning technicality. Let us be first interested in feeling that our intellectual life, as a nation and as individuals, is intimately interwoven with the recognition of the rules and principles of the language through which we express our ideas; and, feeling this, we shall think it worth while to impress the mind of even a young pupil with some degree of interest in the origin and growth of our language. It is therefore desirable to begin, as the following work does, with some insight into its history. To an intelligent mind, every step in grammar will open new ideas and fresh associations; but to secure this, our grammatical studies must be as thorough as possible, and must habitually lead us to trace connecting links with the groundwork of other languages than our own. The present work will, it is hoped, be found to embody

all that is desirable and necessary as an outline; and the pupil who thoroughly masters its contents, will be qualified to enter with profit on the study of some of the larger works on language which enrich our libraries.

The order observed is, it is believed, the most generally desirable and natural; though not strictly in accordance with the common modes of teaching, in introducing some preliminaries in the way of Logic, among the earlier stages of progress. The arrangement has been adopted on well-digested grounds, and as the result of a long experience in teaching. The same experience has prompted the addition of Questions and Exercises which will help to complete the usefulness of the book. The portions in small print are intended rather for the use of the teacher, or the more advanced learner, than for a young pupil.

ENGLISH GRAMMAR.

HISTORICAL SKETCH.

1. THE English language was introduced into Britain from Germany.

2. The original British was akin to the present Welsh.

§. How far the Welsh differs from the English may be seen from the following specimens :—

Parts of the human body.

English.	*Welsh.*	*English.*	*Welsh.*	*English.*	*Welsh.*
Head	Pen.	*Teeth*	Dannedd.	*Arm*	Braich.
Hair	Gwallt.	*Tongue*	Tafod.	*Hand*	Llaw.
Eye	Llygad.	*Ear*	Clust.	*Leg*	Coes.
Nose	Trwyn.	*Back*	Cefn.	*Foot*	Troed.
Mouth	Ceg.	*Blood*	Gwaed.	*Nail*	Ewin.

Names of animals.

Horse	Ceffyl.	*Lamb*	Oen.	*Goose*	Gwydd.
Cow	Buwch.	*Goat*	Gafr.	*Crow*	Brân.
Calf	Llo.	*Dog*	Ci.	*Bird*	Adar.
Sheep	Dafad.	*Fox*	Llwynog.	*Fish*	Pysg.

Numerals.

One	Un.	*Five*	Pump.	*Nine*	Naw.
Two	Dau.	*Six*	Chwech.	*Ten*	Deg.
Three	Tri.	*Seven*	Saith.	*Twenty*	Ugain.
Four	Pedwar.	*Eight*	Wyth.	*Hundred*	Cant.

3. The language of Cornwall resembled the Welsh and was akin to the original British.

§. At the present time the Cornish is no longer spoken. During the reign of Henry VIII., however, it was the ordinary language of the peasants and miners of Cornwall. In the parish of

Landewednack, the church service was read in that language so late as the year 1690. A few specimens of it are still preserved in writing; and a few of its words are incorporated in the provincial dialect as it is now spoken.

Parts of the human body.

English.	*Cornish.*	*English.*	*Cornish.*	*English.*	*Cornish.*
Head	Pen.	*Teeth*	Dyns.	*Arm*	Brech.
Hair	Bleu.	*Tongue*	Tavat.	*Hand*	Lof.
Eye	Lagat.	*Ear*	Scovorn.	*Leg*	Coes.
Nose	Tron.	*Back*	Cheiu.	*Foot*	Truit.
Mouth	Genau.	*Blood*	Guit.	*Nail*	Ivin.

Names of animals.

Horse	March.	*Lamb*	Oin.	*Goose*	Guit.
Cow	Bugh.	*Goat*	Gavar.	*Crow*	Bran.
Calf	Loch.	*Dog*	Ky.	*Bird*	Ezn.
Sheep	Davat.	*Fox*	Louvern.	*Fish*	Pysg.

Numerals.

One	Onan.	*Five*	Pymp.	*Nine*	Naw.
Two	Deu.	*Six*	Whe.	*Ten*	Dek.
Three	Try.	*Seven*	Seyth.	*Twenty*	Ugenis.
Four	Peswar.	*Eight*	Eath.	*Hundred*	Cant.

§. The following list will show that the language under notice was not confined to the British Isles; but was spoken by the oldest inhabitants of France, as well as by the oldest inhabitants of England. It was the language of ancient Gaul, as well as of ancient Britain; and at the present time, there is one province of France, Bretagne or Brittany, where it is still spoken.

Parts of the human body.

English.	*Breton.*	*English.*	*Breton.*	*English.*	*Breton.*
Head	Penn.	*Teeth*	Dant.	*Arm*	Brech.
Hair	Bleo.	*Tongue*	Teod.	*Hand*	Dourn.
Eye	Lagad.	*Ear*	Sconarn.	*Leg*	Garr.
Nose	Fry.	*Back.*	Chein.	*Foot*	Troad.
Mouth	Guenon.	*Blood*	Goad.	*Nail*	Ivin.

Names of animals.

Horse	March.	*Lamb*	Oan.	*Goose*	Oaz.
Cow	Vioch.	*Goat*	Chaour.	*Crow*	Vran.
Calf	Leue.	*Dog*	Chy.	*Bird*	Ein.
Sheep	Danvat.	*Fox*	Louarn.	*Fish*	Pysg.

Numerals.

One	Unan.	*Five*	Pemp.	*Nine*	Nao.
Two	Daou.	*Six*	Chuech.	*Ten*	Dec.
Three	Tri.	*Seven*	Seiz.	*Twenty*	Ugent.
Four	Pevar.	*Eight*	Eiz.	*Hundred*	Cant.

§. But the Welsh, the Cornish, and the Breton are by no means the only languages of the great and important family to which they belong. The Gaelic of Ireland, the Gaelic of the Highlands of

Scotland, and the Manx of the Isle of Man, are all related to each other, and somewhat more remotely to the Welsh, Cornish, and Breton.

English.	*Irish.*	*Scotch.*	*Manx.*	*English.*	*Irish.*	*Scotch.*	*Manx.*
Head	Cean.	Ceann.	Kione.	*Goat*	Gabhair.	Gabhar.	Goayr.
Hair	Folt.	Folt.	Folt.	*Dog*	Cu.	Cu.	Coo.
Eye	Súil.	Sùil.	Sooil.	*Fox*	Sionnach.	Sionnach.	Shynnagh.
Nose	Sron.	Sròin.	Stroin.	*Goose*	Geodh.	Geodh.	Guiy.
Mouth	Beul.	Beul.	Beeal.	*Crow*	Feannog.	Feannag.	Feeagh.
Tooth	Fiacail.	Fiacal.	Feeackle.	*Bird*	Ban.	Eun.	Eean.
Tongue	Teanga.	Teanga.	Chengey.	*Fish*	Iasg.	Iasg.	Eeast.
Ear	Duas.	Duas.	Cleaysh.	*One*	Aon.	Aon.	Unnane.
Back	Druim.	Druim.	Dreem.	*Two*	Do.	Dhà.	Dhaa.
Blood	Fuil.	Fuil.	Fuill.	*Three*	Tri.	Tri.	Tree.
Arm	Gairdean.	Gairdean.	Clingan.	*Four*	Ceathar.	Ceithin.	Kiare.
Hand	Lamh.	Lamh.	Lave.	*Five*	Cùig.	Cuig.	Queig.
Leg	Cos.	Cos.	Cass.	*Six*	Sè.	Se.	Shey.
Nail	Iongna.	Iongna.	Ingin.	*Seven*	Seacht.	Seachd.	Shiaght.
Horse	Each.	Each.	Agh.	*Eight*	Ocht.	Ochd.	Hoght.
Cow	Bo.	Bo.	Booa.	*Nine*	Naoi.	Naoi.	Nuy.
Calf	Laogh.	Laogh.	Lheiy.	*Ten*	Deich.	Deig.	Jeih.
Sheep	Caor.	Caor.	Keyrrey.	*Twenty*	Fitche.	Fichead.	Feed.
Lamb	Uan.	Uan.	Eayn.	*Hundred*	Ceàd.	Ceud.	Keead.

§. The class to which all these forms of speech belong is the Keltic; of which the Welsh, Cornish, and Breton form the British, the Irish, the Scotch, and the Manx the Gaelic, branch. Hence—

4. The English language was originally foreign to the soil of Ireland; the old language of which is still spoken under the name of Erse or Gaelic.

5. The English language was originally foreign to the soil of Scotland; the old language of which is the same as that of Ireland.

6. The English language was originally foreign to the Isle of Man; the old language of which is still spoken under the name of Manx.

§. Though none of these languages is the origin of the present English, they deserve attention from having been spoken in England, and from certain English words being derived from them.

Welsh.	*English.*	*Welsh.*	*English.*	*Welsh.*	*English.*
Basgawd	*Basket.*	Deentur	*Tenterhook.*	Masg	*Mesh.*
Botwm	*Button.*	Fflaim	*Fleam.*	Mattog	*Mattock.*
Brân	*Bran.*	Fflaw	*Flaw.*	Mop	*Mop.*
Crog	*Crook.*	Ffynnell	*Funnel.*	Rhail	*Rail.*
Cwysed	*Gusset.*	Grual	*Gruel.*	Rhashg	*Rasher.*
Cyl	*Kiln.*	Gwiced	*Wicket.*	Rhuwch	*Rug.*
Dantaeth	*Dainty.*	Gwn	*Gown.*	Sawduriaw	*Solder.*
Darn	*Darn.*	Gwyfr	*Wire.*	Tacl	*Tackle.*

7. The Latin language was the language of the Romans; and when the Roman conquest of Britain was effected, the Latin was introduced.

§. That the Latin differed from both the British and the English may be seen from the following specimens:—

Parts of the human body.

English.	*Latin.*	*English.*	*Latin.*	*English.*	*Latin.*
Head	Caput.	*Tooth*	Dens.	*Arm*	Brachium.
Hair	Crinis.	*Tongue*	Lingua.	*Hand*	Manus.
Eye	Oculus.	*Ear*	Auris.	*Leg*	Crus.
Nose	Nasus.	*Back*	Tergum.	*Foot*	Pes.
Mouth	Os.	*Blood*	Sanguis.	*Nail*	Unguis.

Names of animals.

Horse	Equus.	*Lamb*	Agnus.	*Goose*	Anser.
Cow	Vacca.	*Goat*	Caper.	*Crow*	Corvus.
Calf	Vitulus.	*Dog*	Canis.	*Bird*	Avis.
Sheep	Ovis.	*Fox*	Vulpes.	*Fish*	Piscis.

Numerals.

One	Unus.	*Five*	Quinque.	*Nine*	Novem.
Two	Duo.	*Six*	Sex.	*Ten*	Decem.
Three	Tres.	*Seven*	Septem.	*Twenty*	Viginti.
Four	Quatuor.	*Eight*	Octo.	*Hundred*	Centum.

§. The word *street* is of Roman origin. So are the words *-coln*, and *-chester*, in words like Lin*coln* and Man*chester*.

8. The English language was originally spoken in Germany, and the chief population which introduced it was that of the Angles, or Engles.

9. The Angles, or Engles, introduced the English language, and they called the southern part of the island Engla-land.

10. By the native Britons, and by the Romans, the Angles or Engles were called Saxons. The language, too, was often called Saxon.

§. At the present time, the Welsh, the Irish, the Scotch, and the Manxmen of the Isle of Man call the English Saxons.

11. By joining the two names we get the term Anglo-Saxon; a word employed to denote the English language in its earliest known form.

§. *Parts of the human body.*

English.	*Anglo-Saxon.*	*English.*	*Anglo-Saxon.*	*English.*	*Anglo-Saxon.*
Head	Heáfod.	*Tooth*	Tóth.	*Arm*	Earm.
Hair	Hær.	*Tongue*	Tungu.	*Hand*	Hond.
Eye	Eáge.	*Ear*	Eáre.	*Leg*	Scince.
Nose	Nasu.	*Back*	Bæc.	*Foot*	Fót.
Mouth	Múth.	*Blood*	Blód.	*Nail*	Nagel.

Names of animals.

Horse	Hors.	*Lamb*	Lamb.	*Goose*	Gós.
Cow	Cú.	*Goat*	Gát.	*Crow*	Craw.
Calf	Cealf.	*Dog*	Hund.	*Bird*	Brid.
Sheep	Sceáp.	*Fox*	Fox.	*Fish*	Fisc.

Numerals.

One	An.	*Five*	Fif.	*Nine*	Nigon.
Two	Twá.	*Six*	Six.	*Ten*	Tyn.
Three	Threo.	*Seven*	Seofon.	*Twenty*	Twentig.
Four	Feower.	*Eight*	Eahta.	*Hundred*	Hund.

The Anglo-Saxon being of German origin, resembled the ancient language of Germany.

§. In like manner, the present English resembles the modern German.

Parts of the human body.

English.	*German.*	*English.*	*German.*	*English.*	*German.*
Head	Haupt.	*Tooth*	Zahn.	*Arm*	Arm.
Hair	Haar.	*Tongue*	Zunge.	*Hand*	Hand.
Eye	Auge.	*Ear*	Ohr.	*Leg*	Beine.
Nose	Näse.	*Back*	Rücke.	*Foot*	Fuss.
Mouth	Mund.	*Blood*	Blut.	*Nail*	Nagel.

Names of animals.

Horse	Pferd.	*Lamb*	Lamm.	*Goose*	Gans.
Cow	Kuh.	*Goat*	Ziege.	*Crow*	Krahe.
Calf	Kalb.	*Dog*	Hund.	*Bird*	Vogel.
Sheep	Schaaf.	*Fox*	Fuchs.	*Fish*	Fisch.

Numerals.

One	Ein.	*Five*	Fünf.	*Nine*	Neun.
Two	Zwei.	*Six*	Sechs.	*Ten*	Zehn.
Three	Drei.	*Seven*	Sieben.	*Twenty*	Zwanzig.
Four	Vier.	*Eight*	Acht.	*Hundred*	Hundert.

§. The English, like the Germans in general, had a term by which they used to designate those who were of a different language from themselves. This was *wealh*, signifying *foreigner;* from which was derived the adjective *wealisc* or *wylisc.* The plural of *wealh* was *wealhas* (*foreigners*); hence, the present word Wales, wherein the name of the people stands for that of the country.

12. The Danes invaded England. They failed, however, to change the name of the island, and they failed to establish their language.

§. That the Danish, though different from both English and German, resembles each, is shown by the following specimens :—

Parts of the human body.

English.	*Danish.*	*English.*	*Danish.*	*English.*	*Danish.*
Head	Hoved.	*Tooth*	Taud.	*Arm*	Arm.
Hair	Haar.	*Tongue*	Tunge.	*Hand*	Hand.
Eye	Oje.	*Ear*	Ore.	*Leg*	Bein.
Nose	Næse.	*Back*	Rygge.	*Foot*	Fods.
Mouth	Mund.	*Blood*	Blut.	*Nail*	Nagel.

Names of animals.

Horse	Hest.	*Lamb*	Lamm.	*Goose*	Gós.
Cow	Ko.	*Goat*	Gjede.	*Crow*	Kræge.
Calf	Kalv.	*Dog*	Hund.	*Bird*	Fugl.
Sheep	Faar.	*Fox*	Ræve.	*Fish*	Fisk.

Numerals.

One	En.	*Five*	Fem.	*Nine*	Ny.
Two	To.	*Six*	Seks.	*Ten*	Ty.
Three	Tre.	*Seven*	Syv.	*Twenty*	Tyve.
Four	Fire.	*Eight*	Aatte.	*Hundred*	Hundred.

13. The Danish for *town*, *village*, or *settlement* is *by*; so that where the names of places end thus, we have Danish localities. They are numerous in certain parts of Great Britain, but scarce in others.

§. They are numerous in—

(1.) Lincolnshire ; whence the Danes penetrated into Nottingham, Derby, Leicester, and Northampton.

(2.) In Yorkshire ; whence they áre to be traced into Westmoreland and Cumberland, spreading into parts of Lancashire and Cheshire.

(3.) In the parts about Yarmouth.

§. Between the Danes and the Norwegians, the difference was but slight. Both invaded Great Britain. The Danes, however, attacked England rather than Scotland. The Norwegians settled chiefly in Scotland, the Western Isles, and Ireland. Until the reign of Henry VII. the Orkney and Shetland Islands belonged to Denmark.

14. The battle of Hastings introduced the language of William the Conqueror and his followers; which was neither British nor German, but Norman, or Anglo-Norman.

§. It resembled the modern French.

Parts of the human body.

English.	*Norman.*	*French.*	*English.*	*Norman.*	*French.*
Head	Chef	Tête.	*Ear*	Oreilles	Oreille.
Hair	Chevoels	Cheveux.	*Back*	Dos	Dos.

Three	Treiz	Trois.	*Eight*	Uit	Huit.
Four	Quatre	Quatre.	*Nine*	Neuf	Neuf.
Five	Cinque	Cinq.	*Ten*	Dix	Dix.

§. This language continued for about two centuries to be spoken by the descendants of the Norman conquerors. As these formed the aristocracy of the island, it came to pass, that, besides the original Welsh, and the Latin as used by the clergy, two distinct tongues were spoken by two different classes of the population—the Anglo-Saxon, and the Anglo-Norman. The latter was destined to give way. In the reign of Henry III. it had ceased to be the exclusive language of the great barons. Under Edward III. and Richard II. flourished Chaucer, Wickliffe, Mandeville, and the earliest of the genuine English writers. Meanwhile, the English itself had undergone considerable changes, and was different from what it was before the Conquest. It was less like the Anglo-Saxon, and more like the present language. In respect to its grammar, it had lost many of the older forms. In respect to its vocabulary, it had adopted a great number of Norman words; especially those relating to law, war, and chivalry. During the sixteenth century other influences came into play. The revival of learning increased the importance of the Latin and Greek languages, from which a great number of new words were introduced. Some of these have kept their place, others have been ejected. At the present time, however, our language, though essentially and fundamentally English, is one of the most mixed languages in the world.

§. The extension of the English language *beyond* the British Isles is a recent event when compared with its extension *over* them. In the reign of Queen Elizabeth the first English colony, that of Virginia, was planted in North America; and it was only natural that the emigrants who left England should take their

language with them. Upon the shores of America it came in contact with the numerous dialects of the native Indians; and upon these it steadily and effectively encroached. Numerous languages then became entirely lost, and, at the same time, the tribes which spoke them. Sometimes they were wholly exterminated; sometimes they were driven far into the interior of the land. In a short time populous cities stood upon the hunting-grounds of the expelled tribes, and the language of the mother-country became naturalized in a New World. The subsequent settlement of Maryland, Georgia, and the remaining States of America completed the preponderance of the English language from the boundaries of Canada to the Gulf of Mexico.

During the Protectorate of Cromwell, the island of Jamaica was taken from the Spaniards, and from that time forwards the English has been the language of a greater part of the West Indian Islands.

In Canada, it first took root after the taking of Quebec in the reign of George the Second. As Canada, however, had been previously a French colony, the European language that was first spoken there was not the English but the French. Hence, when Quebec was taken, the language of the country fell into two divisions. There were the different dialects of the original Indians, and there was the French of the first European colonists. At the present moment, both these languages maintain their ground; so that the English is spoken only partially in Canada, the French and the Indian existing by the side of it.

At the Cape of Good Hope the English is spoken in a similar manner; that is, it is spoken partially. The original inhabitants were the Caffre and Hottentot tribes of Africa, and the earliest European colonists were the Dutch. For these reasons Dutch and English, conjointly with the Hottentot and Caffrarian dialects, constitute the languages of the Cape of Good Hope. In Guiana, too, in South America, English and Dutch are spoken in the neighbourhood of each other, for the same reason as at the Cape.

In Asia the English language is spoken in India; but there the original languages of the country are spoken to far greater extent than is the case in either America or Africa.

Australia and New Zealand are exclusively English colonies, and, consequently, in Australia and New Zealand English is the only European language that is spoken. In each of these settlements it encroaches upon the native dialects.

Malta, Gibraltar, Heligoland, Guernsey, and Jersey, and many other localities of less note, are isolated spots, which, being portions of the English dominions, use the English language.

ORTHOËPY AND ORTHOGRAPHY.

15. The first part of Grammar treats of Orthoëpy and Orthography; in close connection with which stand Accent and Prosody.

16. *Orthoëpy* signifies the right *utterance* of words. It deals with language as it is *spoken* and determines how a word is to be *pronounced*. *Orthography* signifies the right use of *letters*. It deals with language as it is *written* and determines how words should be *spelt*.

§. In speaking, we represent our ideas and thoughts by means of *words;* which words are composed of certain elementary sounds. In the word *go* there are two such; in the word *got*, three; and so on. As long as we limit ourselves to *speaking*, these elementary sounds are all that require notice. They address themselves to the *ear*.

They are capable, however, of being represented by certain signs called *letters;* by which we are enabled not only to speak but to *write*. Letters address themselves to the *eye*. In the word *go* the letter *g* is the sign of its first, the letter *o* the sign of its second, sound.

§. All languages were spoken long before they were written; and, at the present moment, there are numerous forms of speech which have never been reduced to writing at all. Hence, letters come later than the sounds they express, and orthography is subordinate to orthoëpy.

But as a picture never exactly and perfectly represents the object from which it is taken, so the orthography of a language never exactly and perfectly represents the orthoëpy; in other words, there is always some difference between language as it is spoken and language as it is written. Sometimes there are more sounds than letters. Sometimes words change their pronunciation as they pass from one people or from one generation to another; whilst no corresponding change is made in the manner of writing them.

Sometimes fresh sounds from other languages are introduced; and, as no fresh letters are brought to represent them, they must be represented, as they best may, by the letters already in use.

17. There are forty Elementary *Sounds* in English, thirty-four of which are simple and six compound.

§. *Vowels.*	1.	The sound of	the letter	*a*	in	*father.*

Nasal.	29.	,,	letters	*ng*	,,	*king.*
Breathing.	30.	,,	letter	*h*	,,	*hot.*
Liquids.	31.	,,	,,	*l*	,,	*low.*
,,	32.	,,	,,	*m*	,,	*mow.*
,,	33.	,,	,,	*n*	,,	*no.*
,,	34.	,,	,,	*r*	,,	*row.*
Diphthongs.	35.	,,	letters	*ou*	,,	*house.*
,,	36.	,,	,,	*ew*	,,	*new.*
,,	37.	,,	letter	*i*	,,	*pine.*
,,	38.	,,	letters	*oi*	,,	*voice.*
Compound Sibilants.	39.	,,	,,	*ch*	,,	*chest.*
,,	40.	,,	letter	*j*	,,	*jest.*

The real sound of the *ch* in *chest*, is that of *tsh*, or nearly so. Thus:

Church might be spelt *tshurtsh.*
Chide ,, ,, *tshide.*
Chirp ,, ,, *tshirp*,&c.

The real sound of the *j* in *jest* is that of *dzh*, or nearly so. Thus:

Join might be spelt *dzhoin.*
Jump ,, ,, *dzhump.*
Jet ,, ,, *dzhet*, &c.

18. The *Letters* of the English language are twenty-six in number, their form, order, and names being as follows:

Roman.	*Italic.*	*Name.*	*Roman.*	*Italic.*	*Name.*
1. A a	*A a*	*a*	14. N n	*N n*	*en*
2. B b	*B b*	*bee*	15. O o	*O o*	*o*
3. C c	*C c*	*cee*	16. P p	*P p*	*pee*
4. D d	*D d*	*dee*	17. Q q	*Q q*	*cue*
5. E e	*E e*	*e*	18. R r	*R r*	*ar*
6. F f	*F f*	*eff*	19. S s	*S s*	*ess*
7. G g	*G g*	*jee*	20. T t	*T t*	*tee*
8. H h	*H h*	*aitch*	21. U u	*U u*	*u*
9. I i	*I i*	*i*	22. V v	*V v*	*vee*
10. J j	*J j*	*jay*	23. W w	*W w*	*double-u*
11. K k	*K k*	*kay*	24. X x	*X x*	*eks*
12. L l	*L l*	*el*	25. Y y	*Y y*	*wy*
13. M m	*M m*	*em*	26. Z z	*Z z*	*zed*

§. The arrangement of the *alphabet* is artificial; the arrangement of the *sounds* (as in § 17) is natural. The vowel sounds come first, then the semi-vowels, then the mutes, &c.

§. The English letters are sometimes reckoned at twenty-four; in which case *i* and *j*, as well as *u* and *v*, are considered the same. They were originally expressed by the same letters.

19. Syllables are made up of certain elementary sounds taken together, as *man*, from *m*, *a*, and *n*; words which consist of one syllable, and no more, being called monosyllables.

20. Words which consist of two syllables, and no more, are called dissyllables.

21. Words which consist of three syllables, and no more, are called trisyllables.

22. Words which consist of four syllables, and no more, are called quadrisyllables.

§. In words like *miss*, *less*, *butt*, &c., we see one and the same letter repeated in the same syllables. Why is this? It does not

indicate that the double sound is to be pronounced; for, if we try to utter it, we shall find it difficult to do so. It is simply a mode of expressing the shortness of the previous vowel.

§. ACCENT is the leaning of the voice on one particular syllable in a word, to bring it into prominence. This stress or accent may be expressed by a sign, thus ′, placed over the part of the word to which we wish to give especial importance. Some words are accented on the last syllable, as *brigáde, preténce, assúme.* Some are accented on the last syllable but one, as *fáther, árgue, archángel.* Some on the last syllable but two, as *ántidote, fórtify.* And some, though not so large a class, on the last syllable but three, as *ábsolutely, lúminary.*

§. In a certain class of words, the accent is *distinctive*, i.e. it lies sometimes on the one, sometimes on the other syllable; the change being accompanied by a change of meaning. In such a sentence as

The *éxports* from London are great; the *imports* to London are great also, the words *éxport* and *import* are substantives. In

America *expórts* corn, and *impórts* cloth,

they are verbs.

§. This gives us the rule that accents on the first syllable make substantives, whilst accents on the last syllable make verbs. Each of the following words can be either a substantive or a verb.

Absent.	Compress.	Contrast.	Extract.	Permit.	Rebel.
Abstract.	Concert.	Converse.	Ferment.	Prefix.	Record.
Accent.	Concrete.	Convert.	Frequent.	Premise.	Refuse.
Affix.	Conduct.	Converse.	Import.	Presage.	Subject.
Augment.	Conflict.	Desert.	Incense.	Present.	Survey.
Colleague.	Conserve.	Descant.	Insult.	Produce.	Torment.
Compact.	Consort.	Essay.	Object.	Project.	Transfer.
Compound.	Contract.	Export.	Perfume.	Protest.	Transport.

§. Sometimes the change of accent converts *substantives* into *adjectives.* We speak of the month *Aúgust*, and of an *augúst* person. Thus it is with *compact, invalid, minute, supine.* Some words, without losing their position as nouns, or as verbs, change their meaning in changing the accent, as, *e. g. désert* (a wilderness), *desért* (merit). The verb *cónjure*, by a change of accent, becomes *conjúre.*

ETYMOLOGY.

23. The second part of Grammar treats of Etymology. Etymology exhibits the changes of form which words undergo.

24. Changes are effected by either Composition or Derivation.

25. When two or more separate words are joined

together the result is a *compound;* as *rose-tree, gentleman, far-sighted, mid-ship-man.*

§. It is sometimes difficult to determine whether a word be really compound, *i. e.* whether it be not *two* words. In this case the accent helps us. When it lies equally on each we have *two* words. Where one is more strongly accented than the other we have a compound.

All blúe bélls are not blúebells.
All bláck bírds are not bláckbirds.

26. When a word is modified in form by either the addition of a new sound or by some internal change the result is a *derivative;* as *long, leng-th.*

27. Etymology, besides teaching us the changes that words undergo, takes cognizance of the several Parts of Speech; which, in English, are ten in number, viz. Pronoun, Article, Substantive, Adjective, Verb, Participle, Adverb, Preposition, Conjunction, Interjection.

28. Speech consists of (1) commands, (2) questions, and (3) statements.

29. The combination of words by which these are effected is called a Proposition.

30. There are three kinds of Propositions; one to express commands, one to express questions, and one to express statements.

31. Propositions which convey commands are called Imperative, as—

Do this.
Do not delay.
Walk.

32. Propositions which convey questions are called Interrogative, as—

What is this?
Who are you?
Is it here?

33. Propositions which convey statements are called Declaratory, as—

Summer is coming.
I am here.
This is he.

34. Besides being Imperative, Interrogative, or Declaratory, Propositions are either Affirmative or Negative.

Summer is early.
Summer is not early.

§ A Declaratory Proposition is often described as a sentence in which something is either affirmed or denied ; whilst, in an Imperative Proposition, something is either ordered or forbidden ; and, in an Interrogative Proposition, something is asked.

35. Declaratory Propositions are the commonest.

36. In respect to their structure Propositions consist of Terms and Copulas.

37. Terms are of two kinds, Subjects and Predicates.

38. The Subject is the term by which we indicate the person or thing concerning which the statement is made or the question asked. In Imperative Propositions it denotes the person to whom the command is given. Thus :—

Summer is coming.
What is this ?
Make [*thou*] *haste.*

39. The Predicate is the term by which we express what we declare, ask, or command.

40. There is no Subject without its corresponding Predicate; no Predicate without its corresponding Subject; and without both a Subject and Predicate there is no such thing as a Proposition.

§. Without Propositions there are no Questions, Commands, or Declarations; and without Questions, Commands, or Declarations, there would scarcely be such a thing as Language. The little which there would be would consist merely of exclamations like *Oh! Ah! Pish*, &c.

41. In Declaratory Propositions the Subject precedes the Predicate. We say *Fire is hot*, rather than *Hot is fire*.

42. In Interrogative Propositions the Predicate precedes the Subject; as *What is this?* rather than *This is what?*

43. In Imperative Propositions the name of the Subject is usually suppressed; *e. g.* we say, *Shut the door*, instead of *Shut thou the door*.

NAMES.

44. Names are either Proper or Common.

45. Proper names are appropriated to certain individual objects. Common names are applied to a whole class of objects.

§. *George*, *Mary*, *London*, &c., designate one particular person or place.

Man, *father*, *town*, *horse*, &c., represent objects of which there is a class or collection.

46. Besides being either Proper or Common, names are either Invariable or Variable.

§. Words like *stone*, *tree*, *man*, &c., denote certain objects which constitute a class including an indefinite number of individuals. To any of these the name may apply. It cannot, however, apply to an object belonging to a different class. It is nonsense to call a *tree* a *stone*, or a *stone* a *tree*. Each name applies to the individuals of a certain group, and, as it cannot be applied otherwise, it is an *invariable* name.

All names, however, are not invariable. The word *I*, for instance, is *variable*. It changes its meaning with the person speaking. When William says *I*, it means William; when John says *I*, it means John. So, again with *you*—it denotes the person to whom I happen to be speaking at the moment, but the next moment I may alter its meaning by speaking to some one else. The same applies to *that*, *this*, *these*, and several other words.

If a *mother* say *I*, it means a *mother* and a *female*; if a *father*

say *I*, it means a *father* and a *male*. Even if an inanimate object be personified and be supposed to speak about itself and to say *I*, it means that inanimate object. It denotes the speaker, whoever he may be ; but it is not the invariable name of any speaker whatever. Or, it denotes the object spoken of, whatever it may be ; but it is not the invariable name of any object whatever. The word *this* means a *table*, when the speaker is talking of *tables*, a *dog* when he is talking of *dogs*, &c.

47. Names are changed according to their Gender, their Number, and their Case.

48. There are three Genders—the Masculine, the Feminine, and the Neuter. The Masculine Gender denotes Males ; the Feminine, Females ; the Neuter, objects which are neither Male nor Female.

49. Of true Gender, there are but few examples in English.

50. When we speak of one object, we use the Singular, when of more than one, the Plural, Number.

51. Case is the form which certain words take to express their relations to others. In the present English, the cases are three—the Nominative, the Possessive, and the Objective.

§. *The child calls. Charles reads.* Here the words *child* and *Charles*, stand in the nominative case ; but if we say *the child's book*, or *Charles' horse*, we use these words in the possessive case, having changed their form accordingly.

PRONOUNS.

52. A Pronoun is a variable name ; which can form, by itself, *either* the Subject or the Predicate of a proposition.

53. Pronouns undergo more changes than either Substantives or Adjectives. Many of them have both the Numbers (as *this* and *these*), all the three Genders (as *him*, *her*, *it*), and all the three Cases (as *he*, *his*, *him*).

54. There are seven classes of Pronouns besides the Article (which is a separate part of speech, though

pronominal in origin) and the words *self*, *one*, and *others*, which partake of the nature of Substantives:—1. Demonstrative; 2. Interrogative; 3. Relative; 4. Personal; 5. Possessive; 6. Indefinite; 7. Numeral.

1. Demonstrative.—*This*, *that*, *he*, *she*, &c.
2. Interrogative.—*Who?*
3. Relative.—*Who.*
4. Personal.—*I*, *thou*, &c.
5. Possessive.—*Mine*, *thine*, *ours*, &c.
6. Indefinite.—*Any*, *each*, *all*, &c.
7. Numeral.—*One*, *two*, *three*, &c.

55. The Demonstratives fall into two divisions, the True and the Personal.

56. The True Demonstratives are *this*, *that*, and *yon*. *This* applies to near, *that* and *yon* to distant objects. *Yon* is undeclined. *This* and *that* are declined in respect to number only.

Singular, *this*.	Plural, *these*.
Singular, *that*.	Plural, *those*.

57. The Personal Demonstratives are *they*, *he*, and *she*.

58. *They* is found in the plural number only.

Nominative, *they*.
Genitive, *their*.
Objective, *them*.

59. *He* is found in the singular number only.

	Masculine.	Feminine.	Neuter.
Nominative:	*he*	—	*it*.
Possessive:	*his*	*her*	*it-s*.
Objective:	*him*	*her*	*it*.

60. *She* is undeclined; being found only in the Nominative Case of the Feminine Gender, of the Singular Number.

§. The nature of the demonstrative pronouns is only understood through their history. In the older stages of our language, the words *this* and *that* were fully declined and had both possessives and objective forms. More than this, they had two other cases—the dative and the instrumental. To say that this inflection is wholly lost, would be inaccurate. It still exists, though in an altered form and as a different part of speech. Thus:—

Certain words, which at the present time are adverbs, were originally demonstrative pronouns.

There was a dative case, of the singular number and feminine gender, meaning *in that place;* the word *place* being understood.

Then was in the objective case, masculine gender, and singular number. It meant *at that time; time* being understood.

The word *the* in such expressions as *all the more, all the better, the more the merrier*, is more remarkable still. It means *by so much;* and was, originally, an instrumental case. The Anglo-Saxon form was þy (*thy*); corresponding in power to the Latin *eo* (*eo majus*). Its present identity of form with the definite article is accidental; the origin of the two words being different.

§. In like manner *here* was the dative feminine of *he*, and meant *in this place.*

§. *It*, in its present form, has no apparent connection with *he;* of which, however, it is the true neuter. The older form is *hit.*

Its is altogether a strange word. The original form was *his* for both the masculine and neuter. Indeed, until the time of Elizabeth, the word *its* seems to have been unknown. It is said never to occur in the original text of the Bible, *his* being used exclusively: —*If the salt have lost his savour, wherewith shall it be seasoned?*

The feminine of *he* was *heó.* This has been lost. In Anglo-Saxon, however, the inflection was—

Masculine.	Feminine.	Neuter.
He	*heó*	*hit.*

Beside which there was an accusative form, *hine. Him* was originally dative.

§. In the plural, the changes have been greater still. Instead of *they, their*, and *them*, the Anglo-Saxons said *hi, hira, hem;* all of which forms were true inflections of *he*, and all of which are now lost. To make up for them, the existing plurals have been borrowed from another quarter.

§. *She* was originally the feminine of *se*, and served as the definite article:—

Se hlaford = *the lord.*
Seo hlafdige = *the lady.*

At the present time *se* no longer exists, and *seo* stands in the place of the Anglo-Saxon *heo.*

§. These changes being understood, it is easy to see how inaccurate it is to talk of *she* being the feminine of *he*, and *they* being the

plural of *he*. The different words belong to different systems, and are no more the masculines and feminines of one another, than (to use a well-known illustration) *puss* is the vocative case of *cat*.

61. The Interrogative is *who*; of which the neuter form is *what*; the possessive, *whose*; and the objective, *whom*.

Again,—*why* was originally the instrumental form *hwi*; meaning, *for what reason*: in Latin, *quâ causâ?* As to *whose*, it is only in appearance that it ends in *-e*. The proper spelling is *whoes*; where *s* is the ordinary sign of the possessive case.

§. It is a common, though reprehensible practice to say that *which* is the neuter of *who*. It is a wholly different word. The true sign of the neuter gender is *-t*. The word *which* is a compound of *like*; the fuller form being *whilk*, and the oldest form of all being *hvaleik*, *i.e. what-like*.

62. The Relatives in respect to their Etymology are Interrogatives. It is only in their Syntax that they differ.

§. The inflexion of the demonstratives, interrogatives, and relatives is nearly identical; for which reason the three divisions have been grouped together. In all, the neuter ends in *-t*; the possessive case in *-s*; the objective in *-m*—*it*, *what*; *his*, *whose*; *him*, *whom*. In all there was, originally, a fuller inflection. Thus, the adverbs *where* and *when* were originally dative and accusative cases from *who*; in other words, the remarks that applied to *here*, *there*, and *then*, apply to *when* and *where*.

63. The true Personal Pronouns are *I*, *me*, and *we*; *thou* and *ye*.

64. *I*, *me* and *we* are called the Pronouns of the First Person. They denote the speaker.

65. *Thou* and *ye* are called the Pronouns of the Second Person. They denote the person spoken to.

66. *I* is found in the nominative case and the singular number only.

67. *Me* has no nominative, but only an objective, case. Its possessive is *my*.

68. *We* is found only in the plural number.

Nom. *we*. Poss. *our* Obj. *us*.

69. *Second Person Singular.*

Nom. *thou* Poss. *thy* Obj. *thee.*

Thee and *thy* were, originally, one and the same word.

70. *Second Person Plural.*

Nom. *ye* or *you.* Poss. *your* Obj. *you* or *ye.*

§. A little consideration will show that the distinction between the true Personals and the Demonstratives which serve as such is natural. In the first place, there is the absence of gender on the one side, its presence on the other. In the next, it is clear that, whatever may be the case with *he* and *she*, the plural forms *they*, *their*, and *them* are closely connected with *this* and *that*.

He means *that man.*
She —— *that woman.*
They —— *those persons or things.*

§. As to the words *I* and *me*, they have no etymological connection whatever.

71. The Possessive Pronouns, six in number, are *mine*, *thine*, *ours*, *yours*, *hers*, *theirs.* They are all derived from either the true Personals or the Demonstratives that serve as such.

72. *Mine* and *thine* belong to the language in its oldest form, and are adjectives rather than cases.

73. *Ours*, *yours*, *hers*, and *theirs* are of recent origin, and are formed after the manner of possessive cases, as is shewn by their termination.

§. As *our*, *your*, *her*, and *their* were themselves possessive, we have, in the words under notice, instances of a case formed on a case. The analysis, then, is, *ou-r-s*, *you-r-s*, *he-r-s*, *thei-r-s*.

§. It is clear that under the head of true possessives we must not include those which are merely the possessive cases of personal pronouns, as *my*, *thy*, *our*, *your*, *her*, *their*.

§. The INDEFINITE Pronouns are, one and all, without declension. The history, however, of many of them is important. Some are compounds, though the fact of their being so is disguised.

Such.—The Anglo-Saxon form is *swylc.* In the old Saxon (*i.e.*

the Saxon of Germany), we find *sulîc*. That this is *so-like* is shewn by the still older form *svaleiks*. A similar combination has already been noticed, viz. *which* for *who-like*.

Each.—The fuller forms are *ælc*, *jeglich*, and *iegelich*, all of which contain the sound of *l*, now lost. This shews that *each* is, also, a compound of *lik* or *like*. In Scotch, the word *ilka*, in the sense of *each one*, still represents the Anglo-Saxon. The Scotch, too, say *whilk* instead of *which*.

Aught in the sense of *anything*.—The fuller forms of this word are *âwet*, *awiht*, *êowiht*, in which we have the almost obsolete substantive *whit*, as in the phrase *not a whit*. By prefixing the negative sign *n* we get—

Naught in the sense of *nothing*.

Any.—The fuller and older form is *ænig*, from *án = one*.

THE NUMERALS.—The Ordinal numbers are formed from the Cardinals.

§. Between *one* and *first* there is no etymological relation. *First* is a superlative form, derived from the root *fore;* in Anglo-Saxon, *fyrmest*.

Between *two* and *second*, there is no etymological relation. *Second* is from the Latin *secundus*, meaning the *following*.

Third, *fourth*, &c., are derived from *three*, *four*, &c., by the addition of *th*, subject to slight variations. In *third*, *th* becomes *d*, and the letter *r* is transposed. In *fifth*, the vowel is shortened.

§. The difference between the termination *-teen* and *-ty*, as they appear in the words thir-*teen* and thir-*ty*, requires notice. In both cases they are connected with the word *ten*. Indeed, they may be said to mean *ten*. They differ, however, in their way of doing so. *Teen* means simply *ten;* so that *thirteen* is *three* and *ten*. *Ty*, however, was originally *tig*, and meant a *collection of ten*, just as *sixpence* means a single *sixpenny piece* rather than six separate pennies. Hence, *thirty* means *three collections of ten*.

74. *Self* is more or less of a Substantive. It has a plural number, which it forms in *-s*, being declined like *shelf;* as *shelf*, *shelves;* *self*, *selves*.

75. *Self* is generally found in composition, as *myself*, *ourselves*, &c., when it is called the Reflective Pronoun. The true Reflective, however, is wanting in English.

76. *Other*, like *self*, is more or less of a Substantive. It is declined like *mother*, and has a plural in *-s*; as *other-s*.

77. *One*, like *other* and *self*, is more or less of a Substantive. It is declined like *nun*, and has a plural in *-s*—*e. g. my wife and little ones are well.*

§. The identity of form between the words *one*, the indefinite pronoun, and *one*, the numeral, is entirely accidental. The numeral has no plural number; besides which, the meaning and the origin of the two words are different. The word under notice is derived from the French, and is the *on* in such expressions as *on dit*. This, in its turn, is from the Latin *homo* = *man*. The German for *on dit*, at the present time, is *man sagt* or *man says*, and, until long after the Norman Conquest, the same mode of expression prevailed in England. *One* is often called the Indeterminate Pronoun.

ARTICLES.

78. The Articles are four—*an*, *the*, *no*, and *every*.

79. *An* is called the Indefinite, *the* the Definite, Article.

80. When *an* precedes a consonant the *-n* is ejected. We say *an egg*, *a lion*.

§. It is not usual to look upon the word *no* as an article, though some grammarians have done so. It is still more uncommon to make an article of *every*. There is good reason, however, for doing it. All the four words under notice agree in having no separate and independent existence. Wherever they occur, they occur in union with a noun or pronoun. Thus we say *a man*, *the man*, and *no man*. We can say *every one is ready*, but we can not say *every is ready*.

§. *Articulus* is the Latin for a *joint*, and *articles* take their name from the circumstance of their being united or *joined* to some other words. In many languages they actually combine. Thus in Danish *bord* is *a table*, whilst *bordet* is *the table* (*table the*).

§. *An* is the numeral *one*, in Anglo-Saxon *án*, in Scotch *ane*. It is the original form, from which *a* is the derivative. Hence, instead of saying that the indefinite articles are "*a* and *an*," we should say that the indefinite article is "*an* or *a*."

SUBSTANTIVES.

81. A Substantive is a word which can, by itself, form either the Subject or the Predicate of a proposition. In this it agrees with the Pronoun. The Substantive, however, is an invariable, the Pronoun a variable, name.

82. Substantives have two Numbers; the Singular and the Plural. They have also two Cases; the Nominative and the Possessive.

§. It is often said that Substantives have not only Number and Case, but also Gender. This, however, in the strict sense of the term, is not the case. Of true gender, we found instances amongst the pronouns; where *him*, *her*, and *it* were truly the masculine, feminine, and neuter forms of *he*. *Wha-t*, too, was the neuter of *who*; the sign of which consisted in the letter *-t*.

Of gender like this, there is no instance to be found amongst either the Substantives or the Adjectives of the English language.

There is something, however, which approaches it. There are, in the English language, three different ways of expressing difference of sex.

1. By using entirely different words.

Masculine.	*Feminine.*	*Masculine.*	*Feminine.*
Boy	Girl.	King	Queen.
Brother	Sister.	Uncle	Aunt.

2. By prefixes; forming compound words:

He-goat, *she*-goat. | *Man*-servant, *maid*-servant.

3. By derivation.

Masculine.	*Feminine.*	*Masculine.*	*Feminine.*
Act*or*	Act*ress.*	Abbot	Abb*ess.*
Baron	Baron*ess.*	Duke	Du*chess.*
